Scientific Methods of finding Feeding Standards.—Different methods have been employed by investigators in order to determine the maintenance requirements of C. The Ger., Thaer, about a century ago, evolved a feeding standard by the simple process of feeding an animal on hay, weighing it at intervals, and so arriving at its rate of growth. The hay ration was then partly replaced by some other feeding stuff and the amount of the substituted ingredient increased or decreased until the original rate of growth was again obtained. In this way, Thaer was able to measure the hay equivalents of many feeding stuffs, and then to state, empirically, the hay ration necessary to keep up a normal rate of growth. These standards were useful in their day, but when, later, chemical analysis was applied generally to the investigation of feeding stuffs, it was seen that what animals required was not a certain quantum of food per head a day, but such an amount as would ensure a certain rate of protein, carbohydrate, and fat. Rations stated in these terms were proposed by Grouven in 1859, and five years later, Wolff, the leading Ger. authority on feeding stuffs for animals, prepared a series of standard rations in terms of digestible protein, carbohydrate, and fat for different animals under different conditions. These standards, annually revised, were pub. in the Ger. Agric. Calendar until 1906, and were then modified by Lehmann, and these modified standards gave place ten years later to the Kellner standards. Kellner, by the balance method of investigating metabolism, determined that the maintenance ration of a 1000-lb. steer should provide 6 lb. of starch equivalent, which should comprise a minimum of between 0.5 and 0.7 lb. of digestible protein. Previously Lawes and Gilbert, at Rothamsted, had used the comparative slaughter method for determining the relation between the consumption of fodder and the amount of vendible flesh produced, and the sources of fat in the animal body. This method definitely estab. that the chief source of fat in the body is the carbohydrate in the feeding stuff; and, further, that a fattening animal retains only about 5 per cent of the protein consumed, while a young growing beast may retain as much as 25 per cent for conversion into flesh. This method

is costly and involves a great deal of labour in sampling and analysing carcasses, but after some years' intermission was once again employed in Cambridge and elsewhere in the investigation of difficult problems connected with the process of winter fattening of C. Kellner devised the apparatus known as the respiration chamber for the purpose of sampling and analysing the gaseous excreta, with the view of striking a complete balance between the constituents of the fodder consumed and the total excreta of the animal. From these and other experiments, he determined that the proportions of the main food constituents required to produce 1 lb. of fat in the animal body were: protein, 4.25 lb.; fat (in cereals) 1.90 lb.; carbohydrate, 4.00 lb.

Cattle Statistics.—The chief C.-raising countries are the Argentine Republic, the U.S.A., Canada, and Australia, each having a large export trade in live animals or meat or both. A general estimate of the actual number of head of C. in the various countries of the world gives the following figures: All India, 161,000,000 (oxen), plus 45,000,000 buffaloes; U.S.A., 66,000,000; Soviet Russia, 51,000,000; Brazil, 40,500,000; Argentina and Uruguay, 40,500,000; China, 22,000,000 (excluding 12,000,000 buffaloes); Germany, 20,500,000; France, 16,000,000; Australia, 14,000,000; Union of S. Africa, 11,000,000; Poland, 10,500,000; Canada, 8,000,000; England and Wales, 6,700,000; Eire, 4,000,000; Scotland, 1,310,000; and N. Ireland, 740,000. European C., however, are used chiefly for domestic consumption, and, in a less degree, for the export trade in hides and skins. Among the essentially stock-raising countries for the export trade, Argentina leads the world, as may be deduced from the fact that its production is nearly 40,000,000 C., with a pop. of 10,000,000, whereas the U.S.A., while producing 66,000,000, has a pop. over twelve times as great. More than 250,000,000 ac. in the Argentine Republic are used for C.-raising, and production has almost doubled in the present century. It increased by some 12,000,000 head since the beginning of the First World War, which of itself gave an immense impetus to its development. The number of beef C. in the Argentina decreased in the decade following the war, as also was the case in the U.S.A. and Australia; this was the natural result of increased production in the European countries. While Argentina owes its great and characteristic industry to a large extent to the introduction of C. by the Spaniards, the importation of Brit. breeds in later years has greatly fostered the industry. Over 3000 bulls, chiefly from England, were imported in the first two or three years of the present century, and bulls to the value of over \$2,000,000, chiefly from England and the U.S.A., were imported in 1907, huge prices being paid by wealthy Argentines for the best stud-bulls. Again, a large number of *estancias* are in the hands of Englishmen, and throughout the Pampas are a great many Eng. managers of estates. The favourite breed

is the Durham, and it may be remarked here that Bovril C. are Durhams, a preference due, it is said, to the C. being fed on lucerne. The next favourite breed is the Hereford, almost pure bred, which have long usurped the place of the semi-wild animals of over seventy years ago. There are also some fine specimens of Aberdeen Angus, a useful breed which is a better milker than the Hereford, stands the cold, and yields beef of a high quality. For C. in Africa, see under TSE-TSE-FLY.

See T. B. Wood, *Animal Nutrition*, 1924; J. Hammond, *Farm Animals, their Breeding, Growth, and Inheritance*, 1940; F. H. Garner, *The Cattle of Britain*, 1944; J. Anderson, *The Semen of Animals and its Use for Artificial Insemination*, 1945; E. R. Cochrane, *The Milk Cow in England*, 1946; L. Hogben, *Principles of Animal Biology*, 1946; S. J. Watson, *The Feeding of Livestock*, 1948.

Cattle Plague, see RINDERPEST.

Cattleya, genus of Orchidaceae, the species of which grow wild in tropical America. It is noted for the large and beautiful flowers, and some of its members are cultivated in Eng. greenhouses. *C. labata* is the best-known species in Britain.

Cattolica, tn in the prov. of Girgenti, Sicily, 14 m. N.W. of Girgenti. It has sulphur works and salt mines. Pop. 8000.

Catullus, Gaius Valerius (87-54 or 57 B.C.), Rom. lyric poet, was admitted as a youth to the best society at Rome, which at that time included Cicero, Cornelius Nepos, Clnna the poet, and Hortensius. There is much uncertainty on the dates of his birth and death. Jerome, in the *Eusebian Chronicle*, under the year 87 B.C. has 'Gaius Valerius Catullus . . . nescitur' and, under 57 B.C. 'Catullus xxx etatis anno Romae moritur.' Some historians, keeping St. Jerome's calculation of C.'s age as 30, give the terminal dates as 84 B.C.-54 B.C. There is, however, internal evidence (the poet's allusion to the prosecution of Vatinius) that he lived to the month of Aug. 54 B.C. In 56 B.C., on his way home from Bithynia, he visited his brother's grave near Troy—an event to which he alludes in his poems. He played no part in public life, but passed his time between his villas on the lake of Como and at Tibur (Tivoli). As the reader would gather from many of his verses, which seem struck out in a white heat of party furore, he was filled with a violent dislike of Cæsar, who, nevertheless, showed the poet every courtesy. The Lesbia who inspired most of his splendid passionate love poetry is thought to have been the sister of the notorious P. Clodius Pulcher. As a poet, C., 116 of whose poems are still extant, is remarkable for his mastery of the Lat. language, which he endows with the sweetness, flexibility, and melody of Gk.; for his beautiful imitations of many Gk. metres; for his sympathetic expression of every phase of feeling, and for his consummate art. A paraphrase of Callimachus's *The Lock of Berenice*, and the weirdly imaginative *Attila*, are two of his finest elegies. His epic narrative of the mar-

riage of Peleus and Thetis contains fine descriptive passages. Among the numerous Eng. translations of C., mention should be made of those by Robinson Ellis (1871), a verse translation in the original metres, H. Macnaughton (1899), and F. A. Wright (1926). Robinson Ellis is also the author of an excellent Commentary (1876).

Catulus, Gaius Lutatius, Rom. general in the first Punic war; made consul 242 B.C. After the most inglorious period of the war for Rome (248-3 B.C.) during which Rome attempted no fresh naval operations, wealthy private citizens offered the State a new fleet of 200 ships, with which C. gained a decisive victory near the Ægation or Ægadian Is. (q.v.) on the W. coast of Sicily, which compelled the Carthaginians to abandon to the Romans their last bases, Lilybæum and Drepanum (241) and so ended the war.

Catulus, Quintus Lutatius, Rom. general, and consul with Marius, 102 B.C. The following year the united armies of C. and Marius succeeded in defeating the Cimbri, but C. was ignored. This led to resentment, and C. joined Sulla in the Civil war. He was amongst the proscribed on Marius's list, so committed suicide. He was a very cultured man, being both a poet and an orator.

Catulus, Quintus Lutatius (d. 61 B.C.), son of the preceding, shared his father's hatred of Marius. He was made consul with Marcus Aurelius Lepidus, 78 B.C. C. was of a generally quarrelsome disposition, for he had disputes with Lepidus, Pompey, and Cæsar, but he was nevertheless an ardent patriot.

Catumbella, riv. of W. Africa, rising in the N. of Benguela and entering the Atlantic 14 m. N.E. of the vil. of Benguela. The whole dist. is unhealthy, but the vil. of C., at the mouth of the riv., being less so than Benguela, is rapidly superseding it.

Caub, or Kaub, tn. in the Prussian prov. of Hesse-Nassau, on the r. b. of the Rhine, 30 m. W.N.W. of Wiesbaden by rail. It has slate quarries. Blucher crossed the Rhine near C. in Jan. 1814. Pop. 3000.

Cauca, riv. of Colombia, S. America, rising in the Andes and flowing 600 m. N. to join the Magdalena near Tacaloa. Its valley is fertile, healthy, and very beautiful, and is rich in minerals and forest trees. Also the name of a dept. of Colombia with an area of 11,660 sq. m. and a pop. of 427,400. Gold is found there in moderate quantities. The chief tn. is Popayán.

Caucalis, genus of Umbelliferae, consists of herbs with multiplied leaves and white flowers, and is found in S. Africa and N. hemisphere. In Britain the species are called bur parsley or hedge-parsley. *C. (or Turilis Anthriscus)* and both *C. daucoides* and *C. latifolia* are found on chalky soils in cornfields.

Caucasus is the name of the great mt. range extending for some 150 m. from the peninsula of Taman on the Black Sea to that of Apsheron on the Caspian. The breadth at the widest is some 150 m. From the luxuriant plateau of grasses and forests to the N., the mts. rise in a suc-

cession of terraces, the parallel chains being divided by high plains cut up by narrow fissures of great depth. The S. slopes towards Georgia present magnificent scenery; towards Kur they are much steeper, and often sheer precipices. From the central ridge, where the perpetual snow-line is 10,500 ft. high, six peaks are thrown up with an elevation of over 16,000 ft. Mt. Elbruz reaches an altitude of 18,540 ft., and next to it come Koshtantau, Dikhtau, and Kazbek. Whilst the central spurs are granitic or pure granite, mica- and talc-schists and other metamorphic rocks are found about the granitic axis. In spite of the absence

Paul Popper

GEORGIAN PEASANT

of volcanoes, there are many signs of volcanic action in past ages. To E. and W. are thermal springs. Most of the streams of the C. unite with one of the four chief rvs., the Kuban and the Rion, flowing to the Black Sea, and the Terek and the Kur, flowing to the Caspian. The Kur and Rion are S., the other two N., of the mts. Of the carnivorous animals the most important are wolves, lynxes, panthers, and jackals, whilst wild boars and the aurochs (*Bos urus*) are still found. Forests cover 56 per cent of the C. area. The flora is characterised by the plenitude of arborescent growths, the variety of aquatic plants, and the preponderance of pines. There are many ac., especially southwards, under vine cultivation. Large crops of rye and wheat in N. Caucasia, and of maize, rice, and tobacco in Transcaucasia are harvested each year. Mulberry-trees for the silk industry, melons, apricots, peaches, and nuts are grown. The output of petroleum from the wells of Baku was 8,800,000 tons in 1928-29 and over 20,000,000 in 1934-35. Aluminium, iron, lead and zinc, copper

ore, manganese, salt, and a poor quality of coal are also mined. The chief products are petroleum, silk, corn, and manganese; these reached an annual value of £10,000,000 before the First World War; no reliable figures are available for the post-war period. Through the deep fissure of Darial Gorge the Russians with great difficulty constructed a military road, which rises to 8000 ft. above sea-level. The main railway from Russia has its terminus in Vladikavkaz, whilst another line connects Baku, via Tiflis, with Poti and Batum. N. and S. of the central chain of C. are the old provs. of Ciscaucasia and Transcaucasia. Vladikavkaz and Tiflis, the chief tns. of the two provs., are connected by the military road. To-day these two regional names have given place to the following names of ters. and republics: (N. of the Caucasus) Krasnoda ter., Orjonikidzi ter., Daghestan, Autonomous S.S.R., N. Ossetian Autonomous S.S.R. and other smaller autonomous divs.; (S. of the Caucasus) the Georgian, Azerbaijan, and Armenian S.S.R's. In 1897 the census gave the rapidly increasing pop. of Caucasia as 9,291,000. No comparable figure can be given for the present day owing to the altered political divs. of Caucasia; but the combined pop. of Azerbaijan, Georgia, and Armenia was 8,052,000 in 1940. Ethnologically the pop. of the region consists of very various races. Though certain anthropologists employ the term Caucasian to indicate the white, as opposed to the yellow or Mongolian peoples of Caucasia, they recognise that the groups of white men are separated alike by distinctions of race and language. More than half the pop. is composed of foreigners, the chief of whom are Tatars (Kalmyks, Turkomans, etc.), Semitic peoples (Jews and Arabs), Iranians (Kurds, Persians, and Armenians), and Europeans (Gks., Gers., and Slavs). The Caucasians fall into four groups, in each of which considerable affinity prevails. They are: (1) The S. or Kartveli div., including Georgians, Imeretians, Mingrelians, Laz, and Gurians. (2) The E. div. of Tchetchens and Lezgians. (3) The Ossetians of central Caucasia, an Aryan race who call themselves Irun. (4) The W. div., comprising the Kabardians, Abkassians, and the Circassian or Cherkess race. In the Kartveli and E. stocks combined there are five times as many people as in the remaining two groups. All the languages are harsh. Many are absolutely peculiar to the region, and their origin is still a moot point. Thus some ethnologists connect the Georgians with the biblical Hittites; others see in their tongue Aryan or Turkoman affinities. As regards religion in Caucasia, the Caucasians, Tatars, and Iranians are Moslems; the Armenians are Christians of the Gregorian Church. Until the Russian revolution the Russians and Georgians were Christians of the Orthodox Gk. Church. A few belong to nonconformist denominations. Generally speaking, the Caucasians are hospitable, superstitious, and revengeful. Their respect for

property is still very small. Placed like a buffer between Europe and Asia, they have been obliged all through hist. to fight hard for their independence. This was at last broken in 1859 by the capture of the Lezghian leader and prophet, Shami. In 1870 Russia finally succeeded in establishing her rule throughout Caucasus. Yet the inhab., in spite of the Russian Govts., managed, until the Russian revolution, to retain their tribal customs and social organisation.

In Nov. 1914 the Turks intended attacking through Transcaucasia, but the Russians anticipated this and attacked them from Kars towards Erzerum. In the ensuing new year the Turks again attacked, but were again routed. In March 1915 the Turks assaulted Batum, and once more suffered defeat. In May 1915 the Russians commenced offensive operations and advanced towards Lake Van. They overcame all Turkish opposition in this area, but did not press on beyond the mts. towards Mosul. In Jan. 1916 the Russian attack was renewed against Erzerum on their right flank, which fell to them in the middle of Feb. The Grand Duke Nicholas pressed closely on the heels of the retreating Turks towards Erzincan. On the Black Sea coast the Russians had also captured Trebizond. They made another advance in the summer, again routing the Turks. The situation of the Turkish forces was now desperate; rations were scarce and morale very low; but the Russian revolution put an end to all offensive action by that nation and the Russian forces eventually withdrew in Jan. 1917, in accordance with the preliminary negotiations of the Brest-Litovsk treaty (q.v.). With the collapse of Russia Germany once more saw a prospect of attacking India through Persia and Afghanistan. To prevent this a small Brit. force under Maj.-Gen. L. C. Dunsterville set out from Bagdad for Baku in Aug. 1918. The main object of the force was to make a rallying point for the Armenians, who were naturally hostile to the Turks, and who had promised support. The Armenians were joined by many Russians in their desire to be rid of the Turkish yoke. On the arrival of the Brit. force at Baku, however, the Armenians and Russians did not fulfil expectations, and when in Sept. the Turks attacked in overwhelming numbers the Brit. force was compelled to re-embark and leave Baku to its fate, as the Baku levies would not offer any serious resistance to the enemy even in their own cause. As a result of the First World War, Caucasus became a unit of the Union of Socialist Soviet Republics, with the title of Transcaucasian Soviet Federal Socialist Republic. It contained three republics—the Azerbaijan, Armenian, and Georgian—with a central executive committee at Tiflis. They were recognised as independent states just after the war, but a Bolshevik movement in 1921 seized the executive power, and they became members of the U.S.S.R., each adopting a soviet form of gov. Azerbaijan, on its W. side, borders the Caspian Sea,

and Georgia borders the Black Sea on its E., both meeting just W. of Tiflis. Armenia lies to the S. of the S.W. portion of Azerbaijan and S.E. portion of Georgia. In 1936 each of the three republics was declared a separate Constituent Republic of the U.S.S.R. See A. F. Mummery, *My Climbs in the Alps and Caucasus*, 1895; D. W. Freshfield, *The Exploration of the Caucasus*, 1896; E. A. Martel, *Côte d'Azur russe*, 1908; F. Nansen, *Through Caucasus to the Volga*, 1931; D. Tutaeff, *The Soviet Caucasus*, 1942.

Cauchon, Pierre (d. 1443), bishop of Beauvais. Famous for the part he played in the trial of Joan of Arc. He seems to have been a member of the Burgundian faction but violated the obligations of his ministry by cruelty, besides espousing the Eng. cause. He was expelled from his see in 1429 and betook himself to the Eng. court. On the capture of Joan of Arc in his diocese, C. asserted his right to put her on trial, and, it is said, he resorted to the meanest infamies in order to secure her condemnation. Excommunicated by Calixtus IV.

Cauchy, Augustin Louis, Baron (1789-1857). Fr. mathematician, b. in Paris. Received instruction first from his father, and was afterwards educated at the École des Ponts et Chaussées (1807). Began his career as an engineer, but took up the study of mathematics soon afterwards, and was appointed to the chair of mathematical physics at the univ. of Turin (1831). Was loyal to the deposed king, Charles X., who made him tutor to his grandson (1833), and then created him baron. C. travelled about with his young pupil, the duke of Bordeaux, and returned in 1838, finally accepting a post at the École Polytechnique. He wrote many articles on mathematics and physics. C. is renowned for his memoir on wave-propagation, for which he received the Grand Prix of the Institute of 1816.

Caucus is a word whose derivation is still a moot point. About 1725 it appeared in Boston as the name of a political club. In America it is still restricted to a meeting of party managers who choose the candidates to be proposed at the forthcoming election or to select delegates for a nominating convention. In England the term is applied in a derogatory sense to such a rigorous system of party organisation as Mr. Joseph Chamberlain introduced at the foundation of the Birmingham Liberal Association in 1878, when it became almost a principle that voters must vote with their party.

Cauda-Galli Grit, term applied in N. Amer. geology to the lowest subdivision of the Devonian system. The name (literally cock's tail) is derived from a common fossil of this name, with a feathery form, and supposed to be a seaweed. See CORNIFEROUS PERIOD.

Caudata, or **Urodela**, name applied to an order of Amphibia which has for its distinguishing characteristics that the species are scaleless, have a well-developed tail which persists throughout life, and usually two pairs of limbs. There are about 100 species, and they occur all over the

temperate N. hemisphere. Newts, salamanders, and mud-eels are representative of the order.

Caudebec, name of two places in the dept. of Seine-Inférieure, France. C-en-Caux, on the Seine, is famous for its fifteenth-century church; pop. 2100. C.-les-Elbeuf manufs. cloth; pop. 8,800.

Cauderan, com. of Gironde dept., and suburb of Bordeaux, France; has chemical and chocolate manufs. Pop. 20,000.

Caudillo, Sp. for commander, a title applied especially to Gen. Franco (*a.v.*).

Caudine Forks (*Furculæ Caudinæ*), pass in anct. Samnium, near the tn. of Caudium, formed by two narrow wooded gorges, between which lay a plain, grassy and well watered, but entirely enclosed by mts. (Livy, l.x.). Here the Romans suffered a crushing defeat by the Samnites in the second Samnite war (321 B.C.).

Caudium, anct. tn. in Samnium, Italy, on the road from Beneventum to Capua, later the Appian Way. It was probably once of great importance as the cap. of the Caudini, but at the period of its first mention in hist., at the time of the Samnite wars, was very small and unimportant.

Caudry, tn., 8 m. S.E. of Cambrai in the dept. of Nord, France; has breweries and distilleries and manufs. textiles. Pop. 12,460.

Caul (from *καυλός*, a cap), close-fitting cap of network worn by women in the fifteenth and sixteenth centuries; hence a portion of the amnion or thin membrane covering the fœtus which sometimes remains round the head of a child after birth. Many superstitions are connected with this retention of the C. To be born with a C. (Byron was an example) was considered lucky, and still is in out-of-the-way places. It was considered a protection against drowning either to the original owner or to any future purchaser. A C. used to fetch large sums, from £10 to £30 sometimes, among seafaring men.

Caulaincourt, Armand de (1772-1827), Fr. general, who served under Napoleon. He suffered the vicissitudes of fortune in his earlier career, for he was degraded from the rank of captain in the army and had to serve as a private. He was afterwards reinstated through the intervention of Lazare Hoche. C. was accused of being instrumental in the arrest of the duc d'Enghien, but he stoutly denied it. He tried to dissuade Napoleon from embarking on the Russian war; he accompanied him to Poland, but was recalled to Paris. He took an active part in diplomatic service during Napoleon's regime, and was appointed minister of foreign affairs, but retired from service after the second restoration. See *Mémoires du général de Caulaincourt, duc de Vicence, grand écuyer de l'Empereur* (2 vols.), containing accounts of Napoleon's conversations, Paris, 1933 (Eng. translation by H. Miles, 1935).

Caulerpiæ, fossil genus of siphonous or green algae which is scattered through nearly all the marine formations. Recent species of *Caulerpa* have been found in warm S. climates and in the Mediterranean.

Caulfield, tn. in the co. of Bourke, Victoria, Australia, 6 m. S.E. of Melbourne by rail. Pop. 41,000.

Cauliflower, variety of *Brassica oleracea*, or cabbage, and is known botanically as *Botrytis cauliflora*. Like the broccoli, *B. asparagoides*, it is formed of a fleshy inflorescence modified into a flattened head of abortive flowers, and it differs from the broccoli in being whiter and less hardy. It is said to have been imported from Cyprus in the sixteenth century, but it is now naturalised in Britain, growing in a rich soil under more careful conditions than cabbage. When the head begins to show, the large surrounding leaves are drawn up and tied around it to make it of a very white appearance. There are sev. varieties of C., but they differ negligibly in quality, early dwarf Erfurt being about the best.

Caulking, in wood shipbuilding, the process of driving oakum, or untwisted rope, into the seams of the outside and deck planks of a ship, and finally coating the oakum-filled seam with tar or resin, in order to render the joints of the planking watertight.

Caulonia, vil. in Calabria, Italy, 45 m. N.E. of Reggio on or near the site of the anct. C. or Aulonina, a colony of the Achæans. The exact site is unknown and depends upon the identification of the R. Sagra, N. of which, according to Strabo and Pliny, was C.

Caulopetræ, name applied to the fossil stems of some tree-ferns which bear spiral markings like those of the leaf-scars of recent species. They occur in Brit. coal formations, and *C. anglica* is a common species.

Caunt, Benjamin (c. 1815-61), Eng. pugilist of Hucknall-Torkard, Nottinghamshire, son of a tenant of Lord Byron. In 1835 he was defeated by 'Bendigo' (W. Thompson). In 1837 he attracted attention as a fighter by defeating W. Butler. His style was never very scientific, but he was resolute, powerful, and courageous; over 6 ft. in height; 14 st. 7 lb. in weight. He became champion of England in 1838, after beating Bendigo in seventy-five rounds. In 1843 he became proprietor of the Coach and Horses public-house, St. Martin's Lane, London.

Caurus, anct. city on the S. coast of Caria, in Asia Minor opposite the is. of Rhodes, to which C. belonged for a long period. It was the bp. of Protogenes, the painter, a contemporary of Apelles, and was noted for its fruit.

Cauquenes, tn. in Chile, S. America, cap. of the prov. of Maule, 75 m. N.E. of La Concepción. Wheat and vines are grown in the neighbourhood. Pop. 10,000.

Caura, riv. of Venezuela, rising in the sierras of the S. and flowing N.N.W. to the Orinoco. The ter. of C. stretches on either side (22,485 sq. m.) with large forests of tonka beans.

Caus, or Caux, Solomon (1576-1628), Fr. engineer, . at Dieppe; appointed mathematical tutor to the Prince of Wales in 1612. He entered the service

of the elector palatine in 1613, and laid out the gardens at Heidelberg Castle. He returned to France and became engineer and architect to the king in 1623. His books include *Institution harmonique* (1615) and *Raisons des forces mouvantes avec diverses machines* (1615), in which he describes the process of machine movement propelled by steam with so much resemblance to that of Della Porta that the invention of the steam engine has been ascribed to him by some writers.

Cause, Causation, Causality.—*In Logic.* In physical science the truths to be discovered generally relate to the connection of cause and effect, and we usually call them 'laws of causation' or 'natural laws.' By the 'cause' of an event we mean the circumstances which must have preceded in order that the event should happen. Nor is it generally possible to say that an event has one single cause and no more. There are usually many different things, conditions, or circumstances necessary to the production of an effect, and all of them must be considered causes or necessary parts of the cause.

Aristotle distinguished four kinds of causes for the existence of a thing: (1) The Material Cause, the substance or matter composing it. (2) The Formal Cause the pattern, type, or design, according to which it is shaped. (3) The Efficient Cause, the force employed in shaping it. (4) The Final Cause, the end, motive, or purpose of the work.

In Philosophy.—Causality. In systems of rationalism, is considered in the problem whether reality exists at all beyond our own thoughts. Thus Descartes held that the certainty that reality exists could be reached through the medium of causality. In the growth of empiricism, the supposed truth that every event must have a cause is held to be derived, in a sense, from experience; for it could not very well be supposed to be in the mind of any one who had not witnessed instances of causation. But critics of empiricism ask whether it be really true that every event must have a cause, in the future as well as in the past, and affirm that all that mere experience could tell us would be that certain particular events in the past have had a cause. Locke includes causation among the truths that are necessarily and universally true, i.e. truths that are due to some capacity of the mind that goes beyond the mere collection of past experiences. The Idea of Cause enters into the consideration of the belief in an identical self, another important problem in the growth of empirical philosophy. The necessity of the causal relation conditions Berkeley's advance from the mere existence of ideas to his conception of the world as a universal and rational system of signs, dependent upon God. He found, as he thought, a basis for the reality of causation, in that free activity of Spirit, which is rationally intelligible, though not picturable to the imagination. But this position still leaves unanswered the question. What is the impression from which the idea of cause is derived?

Again, if the belief in the necessity of a cause does not go back to any intuitive or demonstrative truth, it must come from observation and experience, a position which Hume considers in the form: Why do we believe that any particular cause will necessarily be followed by some particular cause? And the only reason there can be is that we have found this effect to follow in the past: 'Thus we remember to have seen that species of object we call flame, and to have felt that species of sensation we call heat. We likewise call to mind their constant conjunction in all past instances. Without any further ceremony, we call the one cause, and the other effect, and infer the existence of the one from that of the other. Thus, in advancing, we have insensibly discovered a new relation betwixt cause and effect, when we least expected it. This relation is their constant conjunction.' Kant agrees with Hume, that necessary and universal judgments go beyond experience; but Hume denies the existence of such judgments, whereas Kant affirms their existence and demonstrates, that in mathematics and physics necessary *a priori* judgments are constantly made and that therefore their possibility is satisfactorily explained. Hegel partly supports Kant's phenomenalism, agreeing that causality is a category (*q.v.*), but holds that a series of causes never goes back to an original cause, but only to an infinite regress of finite causes, none affording an ultimate explanation. See also KNOWLEDGE; SENSATION AND SENSATIONALISM.

Cause Célèbre, term used to signify any lawsuit of great public interest or importance apart altogether from any question of legal principle, *e.g.* the Palmer poisoning case, the Tichborne claimant case, the Hansard libel prosecution, the Dreyfus case, the trial of Madame de Steinheil. The expression *Cs. Cs.*, according to Wharton, was the title of a series of reports collected by Gayot de Pitaval of decisions of interest in Fr. courts in the seventeenth and eighteenth centuries.

Causerie (Fr.), short, informal article or lecture on any subject of literary interest, either art, the drama, or literature itself. The name owes its origin to the *Causeries du lundi* of Sainte-Beuve, which, however, often cease to be informal and become very elaborate essays. Matthew Arnold frequently used the C. form of essay, and it has become a regular feature of many periodicals and newspapers.

Causses (Lat. *calx*, lime), name of the plateaux sloping westward from the Cévennes in the depts. of Lozère, Aveyron, Gard, and Hérault. They are of limestone formation, dry, sterile, and cut by numerous streams, the Tarn, Jonte, and Dourbie among others. Into deep canyons which divide the main plateau into four main and sev. smaller O. The chief are the C. of Sauveterre, Méjan (4200 ft. at its highest point), Noir, and Larzac. Surface pits, underground streams, and stalactite caves are a great feature of the dist. Owing to the sterility of the soil and the rigours of the climate there are

few industries; the chief is the rearing of sheep from whose milk Roquefort cheeses are made. On the S. border of the Causse Noir is 'the dolomite city,' Montpellier-le-Vieux.

Caustics: 1. In chem. are substances which have the power of corroding or burning up living tissues. This they generally do by their avidity for water, a substance which is necessary to the tissues, and so its extraction causes death. The most commonly used is silver nitrate or lunar caustic, which is employed to destroy warts, cancerous growths, poisons, etc., and leaves the surface black after operation. Caustic potash and caustic soda are the hydroxides of potassium and sodium respectively, while caustic lime is the unslaked oxide of calcium (CaO).

2. In optics, are curves or surfaces formed by the reflection or refraction of light at the surface of a reflecting or refracting medium. They are produced by spherical aberration. When a narrow pencil of rays of light is incident at the centre of a lens or mirror, all the rays are brought to one focus, but if the pencil is broad this is not the case, the rays from the periphery or margin come to a focus at a different point on the axis from those from the centre. Thus, if we take two rays arriving at points in the lens at different distances from the centre, after refraction they will cross one another before crossing the axis. At this point of intersection there will be increased illumination, and the surface formed by the intersections of the whole series of rays is a surface of increased illumination known as a caustic surface, and converging at a point on the axis known as the focus. If a section of this surface is taken through the axis in any plane it will take the form of a cuspidal curve, called a caustic curve, with its point at the focus. A similar effect is produced when a broad pencil of light meets a reflecting surface, and the curve is then more easily seen and generally observed. Thus, when light is shining on a cup of tea, the tea surface cuts in the caustic surface in a caustic curve seen as a bright curve on the tea culminating at the bright focal point at the cusp.

Cauterets, fashionable watering-place, 3250 ft. above sea level, in the beautiful valley of the Lavedan in the dept. of Hautes-Pyrénées, S.W. France. Its twenty-four thermal sulphurous springs draw many invalids. C. is popular as a centre for climbers on the Pyrenees. Pop. 1300.

Cautery, name given to an instrument or a process for heating or burning the tissues of the body. It provides counter irritation over an inflamed part, destroys diseased or dead tissue, or, in some cases where a white heat is applied, is useful for performing operations in parts which are either difficult to get at or vascular in nature. Its application near a bleeding artery is very efficient to check the flow of blood. There are various forms of C., and the heat applied in them varies according to the nature of the operation to be performed. The actual C. is an

instrument with a blade or head of steel or platinum heated in a lamp or fire before application. The thermo-C., as in the form called Paquelin's C., has a hollow head kept hot by means of a contained benzol lamp or the passage of hot vapour. Galvano-C. contains a wire or wires along which an electric current passes, so that the heat emitted can be varied by altering the strength of the current. Of late years it has been found that C. by concentrated heat rays from the sun possesses many advantages over the other and earlier methods.

Cautin, coastal prov. of S. Chile, producing wheat, cattle, lumber, tan-bark, and fruit. It is traversed by the Río Tolten, forming its S. boundary, and the C. or Río Imperial, which rises in the Andes and flows 180 m. westwards to the Pacific. Cap. Temuco on the Río C. Pop. about 385,000.

Caution, or Cautionry, in Scots law, means an obligation by which one person becomes pledged as security or surety for another, either to do a certain act or pay a sum of money, or as guarantor for the good conduct or fidelity of the other. Such obligations must always be in writing, otherwise they are unenforceable. As in the Eng. law of suretyship so in the Scots law respecting a C. the *cautioner* is under no greater liability than the prin. debtor or person for whom he answers. The cautioner where sued by the third party or creditor has a right to obtain relief against the prin. debtor. Co-cautioners, bound by the same writing, are jointly bound to the creditor, and no one co-cautioner can insist on the obligation or liability being divided *pro rata* among all, though each has a right of contribution against the others afterwards. The cautioner, where bound as full debtor for the prin. debtor, or jointly and severally with the latter, may be sued for the whole debt, and no longer, in the absence of any stipulation to the contrary, has any 'benefit of discussion,' i.e. right to call upon the creditor to demand payment from the prin. debtor besides registering the debt or charge. The cautioner is exempt from any further liability where the prin. debt comes to an end or where the creditor alters the position of the prin. debtor without obtaining the cautioner's consent, as e.g. by giving him time to pay or discharging him altogether.

Cautley, Sir Proby Thomas (1802-71), Eng. soldier and engineer, b. in Suffolk. He served for some years in the Bengal artillery until he undertook the reconstruction of the Doab Canal. His great work was the construction of the Ganges Canal, a masterpiece of engineering, opened in 1854.

Cauvery, riv. of S. India, which rises in the W. Ghats of Coor, traverses the plain of Mysore, and flows through two mouths into the bay of Bengal. Its course, which is never navigable, is interrupted by twelve anicuts or dams for irrigation. The chief anicut, which crosses the Coleroon, is 2200 ft. long. Electric power for Mysore is produced from the beautiful C. Falls. Near these are the ls. of

Sivasamudram and Seringapatam, sacred to every devout Hindu. The C. waters a very fertile country of over 1,000,000 ac.

Caux (so called from the chalk soil) is the name of an old dist. corresponding to that of the modern Havre, Dieppe, and Yvetot. It is in Normandy, facing the Eng. Channel. Its people live by pasturage and agriculture.

Cava dei Tirreni, tn. and episcopal see of Campania, Italy, 6 m. N.W. of Salerno by rail. It is situated 980 ft. above sea level in a fertile and well-cultivated valley, surrounded by high hills, and is a favourite holiday resort. It has manufs. of silk, woollens, cotton, and linen. About a mile to the S.W. is the famous Benedictine abbey of La Trinità della Cava, founded by St. Alferius in 1025 and possessing valuable archives now the property of the nation. Pop. of com. 27,000.

Cavaignac, Jacques Marie Eugène Godefroi (1853-1905), Fr. politician, son of Louis Eugène C. He early declared himself an ardent republican. He served in the Franco-Prussian war in 1870; became republican deputy for Saint-Calix (Sarthe) in 1882; served as under-secretary of war (1885) and as minister of marine and of the colonies under President Loubet (1892). He was minister of war in the Brisson Cabinet, 1898, when he played a prominent part in the Dreyfus case. He discovered the document, which incriminated Dreyfus, to be a forgery, but resigned his position rather than consent to a new trial of Dreyfus, in whose guilt he was a firm believer. His book on the *Formation de la Prusse contemporaine* dealt with the events of 1806-13.

Cavaignac, Louis Eugène (1802-57), Fr. soldier and politician, b. in Paris. Entered the army as an engineer in 1824; served in Morea and afterwards in Algeria, where he won great distinction. In 1848 the provisional gov. made him governor-general of Algeria, but the troubles of the revolutionaries in Paris led to his recall as minister of war. He was appointed dictator to quell the insurgents, and drove them with great bloodshed to the barricades. In the same year he was made president of the council. He was defeated as a candidate for the presidency of the republic by Louis Napoleon and retired into the ranks of the opposition, which led to his imprisonment at the *coup d'état* of 1851. On his release he retired into private life until his death. See life by A. Deschamps, 1870.

Cavaillon, tn. on the Durance, in the dept. of Vaucluse, S.E. France. It has Rom. and medieval remains, including a cathedral, and is a commercial centre for melons and early vegetables, and for the silk and preserved fruits industries. Pop. 11,750.

Cavalcanti, Bartolommeo (1503-62), Florentine noble and orator, who led a revolt against the Medici, and was afterwards employed by Pope Paul III.

Cavalcanti, Guido (c. 1250-1300), It. poet and philosopher. His father was one of those whom Dante mentions in the *Inferno* as condemned to torture among the Epicureans and atheists, but Guido

himself was a friend of the great poet, who dedicated his *Vita Nuova* to him. By his marriage with Beatrice, daughter of Farinata Uberti, C. became head of the Ghibelline faction in Florence, and when the leaders of both Guelphs and Ghibellines were driven out by the people of Florence, he was banished to Sarzana and returned to Florence only to die. He wrote in prose on philosophy and oratory, but his most famous work is the seventy-line metaphysical *Canzone d'Amore*, beginning 'Donna mi priega.' He wrote many ballate, canzoni, and sonnets of great beauty and sweetness, but there is a tendency in many of his poems towards too great an admixture of metaphysical borrowed from Plato and Aristotle, which, while adding to the depth, spoils the sweetness. The best ed. of his works is *Ercole's Guida Cavalcanti e le sue Rime*, 1885. See also D. G. Rossetti's rendering of sev. of his poems in *The Early Italian Poets*, 1861, reprinted in 1874, and revised and rearranged in 1892 as *Dante and his Circle*.

Cavalcaselle, Giovanni Battista (1820-1897), It. author and art critic, b. at Legnano. In 1846 he went to Germany, where he met J. A. Crowe (1825-96) (q.v.) and returned to Italy with him. In 1848 he was banished for his share in the It. revolution; he accompanied Crowe to London and collaborated with him in *Early Flemish Painters* (1857). In 1858 he returned to Italy and pub. his *History of Painting in Italy* (1864-71), and the lives of Titian (1876) and Raphael (1883), in all of which he was assisted by Crowe. In 1861 he became secretary to Giovanni Morelli (1816-91), the art critic and patriot, then engaged as president of a commission appointed to bring all works of art, which could be considered public property, under gov. control. In 1878 he was appointed chief of the National Art Gallery at Rome. The great *History of Painting* was under revision by Crowe until his death in 1897, when it was continued by S. A. Strong (d. 1904) and Langton Douglas; vols. I. and II. appearing in 1903, and vol. III. in 1909.

Cavalier (Low Lat. *caballus*, poor horse), originally a horseman, horse-soldier, hence knight, gallant. In Eng. hist. the name is familiar as that applied by themselves to the adherents of the Stuarts in the contest between Charles I. and Parliament, their opponents being nicknamed Roundheads. The name survived till the extinction of the C. Parliament (Exclusion Bill, 1679), being then replaced by Tory. The connotation 'haughty' or 'supercilious,' showing a thoughtless and selfish arrogance, was not prevalent until a century later (Wyd.). The variant 'chevalier' was used as a title in certain orders of knighthood and was also a name particularly applied to the Younger Pretender.

Cavalier, Jean (1679-1740), Camisard leader, b. at Ribaute, the son of a peasant. In 1702, when the persecuted Protestants of the Cévennes rebelled against Louis XIV., C. became one of their first leaders, and sev. times defeated the royal generals,

obtaining excellent terms from the marquis de Villars in 1704. He fought at Almanza in 1707, and later entered the Eng. service, where he became a general.

Cavalleri, Buonaventura (1598-1647), It. mathematician, devoted his life more especially to the study of geometry. From his youth upward he was the victim of a cruel disease, which his work helped him to forget. In his *Geometria indivisibilibus continuorum nova quadam ratione promota*, 1635, he expounded his celebrated 'theory of indivisibles,' which has been invaluable in the determination of centres of gravity and volumes, and has contributed not a little to the development of the integral calculus. He applied his method with equal success to areas and solids. According to his conception all space may be regarded as made up of an infinite number of parts, which represent the limit of decomposition which the mind can imagine anything to undergo. There are further treatises of his on trigonometry, logarithms, and conic sections.

Cavalla (Kavalla), tn. and port in a bay of the same name, in the dept. of C., Gk. Macedonia. Cap. of that dept. and centre of a tobacco-growing dist. Mehmet Ali was born here. It was Turkish ter. until the Balkan war, 1912-13. C. has been identified with Neapolis (Acts xvi.). Pop. (dept.) 120,000; (tn.), 51,000.

Cavalli, Francesco (1602-76), It. musical composer, b. at Crena, his real name being Pier Francesco Caletti-Bruni. He took the name of C. from his patron, a nobleman at Venice, where he became a singer at St. Mark's in 1617, rising eventually to be *maestro di cappella*. He wrote numerous popular operas, which are dramatic and humorous, though often exaggerated. On the occasion of the marriage of Louis XIV. in 1660 C. was invited to France to produce his opera *Serse* (*Xerxes*) and two years later he returned to produce *Ercole amante* (*Hercules as Lovers*). C. therefore did something to acclimatise opera in France and his recitative won the admiration of Lully, the founder of Fr. opera.

Cavalli, Giovanni (1809-79), It. artillery, b. at Turin, and studied cannon-founding in Sweden. In 1846 he returned to Italy, and his experiments in the construction of breech-loading guns resulted in great improvements in the practicability and capability of those weapons.

Cavallini, Pietro (c. 1250-c. 1330). It. painter. Was a pupil of Giotto at Rome. Like many of his contemporaries he was also a master of mosaic work, a sculptor, and an architect. His great 'Crucifixion' fresco at Assisi is still fairly well preserved, and recently some valuable paintings of his at the church of Santa Cecilia, in Rome, have come to light. It is said he helped his master in the mosaic of the Navicella at St. Peter's Church. Is believed by some to have influenced Cimabue and Giotto.

Cavallo, Tiberius (1749-1809), It. electrician, settled in England about 1771, and remained here for the rest of his life. He invented chemical apparatus and

many extremely sensitive and accurate instruments for measuring the force of electrical current. In his *Treatise on the Nature and Properties of Air* he discussed Dr. Priestley's recent discoveries, rejected the phlogiston hypothesis, and noted for the first time the nature of the influence of light and air on plant life. His *Treatise on Electricity* (1777), proved him also to have been a natural philosopher of no mean order.

Cavallotti, Felice (1842-98), It. politician, poet, and dramatist, b. at Milan. In 1860 he pub. a tract, *Germania e Italia*, against foreign rule, and joined the Garibaldian forces, fighting with them again in 1866. In this year he became editor of the *Gazzetta di Roma*, and both there and in the *Gazzetta di Milano* wrote numerous bitter lampoons against the monarchical national gov., his policy being always democratic and radical. In 1872 he entered Parliament as deputy for Cortesona, and on the death of Bertani in 1886 became leader of the party of the extreme Left, succeeding in greatly strengthening the party and increasing his own popularity. He was a violent adversary of Crispi, and was famous for the frequent lawsuits and duels in which he was involved. He was killed in a duel with Count Marcola, editor of the *Gazzetta di Venezia*. He wrote some beautiful lyric poetry, including *Inticaglie* (1879) and *Il Libro dei Versi* (1898); and among his dramas are *Aleibade*, *Messeni*, and *Cantico de' Cantici*. His works in nine vols. were pub. at Milan in 1896.

Cavalry. The hist. of C. can be said to begin only with the beginning of the age of chivalry. It is, of course, obvious that the horse was used in armies previous to this, but it had not been used for the purpose of mounting a number of men who by sheer weight and impetus would carry all before them. Horses had been employed in warfare as far back in the hist. of warfare as we can go, but their employment had been various. The earliest type of horse of which we have any evidence was incapable of carrying a well-armed man of the period. In the armies of Egypt and Assyria we find the horse used, but only as a chariot-pulling animal. Later we find a number of mounted men used in the army, mainly, however, for the purpose of strategy. It was necessary to know what the movements of the opposing forces were, and for this purpose mounted men were used. With the beginning of the age of chivalry, however, we find that a battle resolves itself very largely into a matter of C. charges. The knights in armour, mounted on great chargers which were themselves at a later date clad in armour, swept down upon the infantry and usually carried the position. This was practically the state of affairs during the fifteenth century, but the overthrow of the feudal C. had by then become largely a matter of time. The new tactics had shown that bowmen and infantry could disperse and rout a cavalry force. Thus at Stirling Bridge the 'schiltrons' of Wallace, at Crécy the use of archers

protected by stakes, and at Bannockburn the tactics of Robert Bruce had broken the furious charges of feudal C. Other tactics would have to be adopted by the C. before they could again vaunt their superiority over the infantry. Other influences also were at this time at work. The introduction of gunpowder and the consequent use of fire-arms had led to many innovations in the art of war. The C. began to be armed with fire-arms in addition to the lance which they carried, and their greater speed and mobility gave them a great advantage over the foot soldier. For the next century a duel was waged between the C. and the infantry.

with exceedingly great advantage. The Ironsides of Cromwell showed their fearlessness and courage in the charges against the pikemen and musketeers. They had certain advantages over the C. of modern times, but on the whole their work was as dangerous as it was until comparatively recent times, and they proved themselves to be the most useful 'arm' that a general had. But again C. declined; during the wars of the early years of the eighteenth century they found insufficient employment, and during the Seven Years war they were found to be lacking in dash and ignorant of manoeuvring. Under Frederick the Great the Prussian C. reached again a

'THE CHARGE OF THE LIGHT BRIGADE AT BALAKLAVA'

Haris

A painting by R. Caton Woodville.

First was invented some means of attack to give the C. an advantage over the infantry, and in turn the infantry were equipped to overcome the new tactics of the C. By this time both were armed with fire-arms, and also the use of cannon had become common to both. The C. again triumphed, since their mobility gave them a great advantage. Again, the influence of the religious wars of the seventeenth century on C. cannot be overrated. It was essential that the C., having charged the enemy, should not go too far either in pursuit or in search of plunder. The battle of Lewes may be quoted as an example where the C., having overthrown the enemy, lost the day owing to too prolonged a pursuit. The mercenary soldiers had already shown their superiority to feudal levies, but they had also shown that they were not to be depended upon in the matter of a quick return to the battlefield. The C. of the Protestants in the Thirty Years war, however, showed that, actuated by the highest motives of patriotism, they could be used

high standard, only to decline at the end of the Seven Years war. During the early stages of the revolutionary wars C. was practically non-existent. A species of mounted infantry was used, but these were mounted only for the advantages of mobility. Under Napoleon the work of the C. was revived, and the C. were used in combination with the artillery. The mass of infantry to be charged were first of all riddled by a heavy artillery fire, and then the C., which had been massed within easy striking distance, were launched against it, to continue and finish the work made easy by the disorder and confusion created by the fire of the artillery. During the campaigns of the nineteenth century the C. did not on the whole play an important part. Following immediately on the Napoleonic wars they were practically disbanded, and during the latter part of the century the question of substituting to a large degree mounted infantry was mooted, and the plan found strong advocates. For it was argued that the conditions of warfare had changed in such a

degree that the use of C. in the sense that it was used by Napoleon was no longer possible or necessary. The only use of mounted men is for purposes of mobility, and a large number of supernumerary C. were, until the First World War, always necessary at the beginning of a campaign. It was always found to be easier to recruit efficient riflemen for mounted infantry than it was to recruit trained C. men. The S. African war of 1899-1902 again saw a great revival of C. owing to the ideal nature of the area of operations for their employment. On the Brit. side many yeomanry regiments were sent to the front and many C. units were raised in S. Africa. The Boer force was practically a mounted infantry army. Just before the First World War it was maintained by a large number of authorities that we had again reached a normal stage in the evolution of C., and that the concentrated fire of shrapnel and quick-firing guns would make it possible for the C. to support the work of the artillery and penetrate the masses of infantry confused by the artillery fire, i.e. that it was possible to return to the evolutions of Napoleon. In the First World War, however, C. played only a minor part on the W. front. At the outset they performed their traditional function of moving well in advance of the infantry as a protective screen and then drawing off to a flank as the opposing infantry drew towards each other. On the W. front, however, the early settling down to trench warfare precluded C. action in any form, but on the E. front all combatants were able to employ C. at all times. The best C. exploits of the war were those of the Brit. in Palestine and Mesopotamia. But C., as an effective arm, has all but ceased to be of importance in a 'major' war. The experience of the First World War showed that tanks and armoured cars, being far less vulnerable and far speedier, should take over some of the duties of reconnaissance, pursuit, and protection previously performed by C. C. played no part in the defeat of the Sp. Republicans by Franco (1936-39), the chief factor in his victory being the Ger. and It. air forces. Similarly, in Poland, the Ger. air raids on that country ended the campaign in three weeks (1939), combined with attack by massed tanks and motorized units. There were C. units on the Polish side, but they may almost be said to have been reminiscent of the Middle Ages. In the Brit. service the C. estab. was greatly reduced in the first decade after the First World War, and, later, most C. regiments were converted into armoured car or light tank units (see also ARMY). Armoured cars have in recent years been found invaluable in such differing types of country as the plains of Iraq and the mts. on the N.W. frontier of India. A Brit. C. regiment is divided into four 'squadrons', each of which has two 'troops'. In the field each brigade of C. is, or was, supported by a battery of horse artillery.

In the U.S.A. C. first came to the fore during the Civil war. It was efficient in

all branches and adaptable to all circumstances. Sheridan's pursuit of Lee in 1863, Stuart's impenetrable screen in 1863-64, the C. battle of Brandy Station (June 9, 1863), and Sheridan's destruction of Early's army in the Shenandoah were all first-class operations. The wide spaces of America provide a natural theatre for C. action which the C. was not slow to demonstrate in Indian wars. In the modern U.S. Army the tank service forms part of the infantry arm.

It is often said that the experience of the First World War sounded the knell of C., and that the fundamental duties of C. can now be more efficiently performed by the aeroplane and the armoured car. On the W. front, C. was of the first importance in the earliest phase when the opposing armies were as yet feeling their way. Afterwards, during the protracted period of position warfare, they could act only as infantry and as a mobile reserve. It is clear from a report of Sir Douglas (later F.-M. Earl) Haig to his gov. that during the period of infantry and artillery action the true function of the C. corps was to move on the flanks, and he makes the implicit admission that as there were no flanks, or, in other words, as the flanks rested on neutral States or impassable obstacles, that function was in abeyance. In the final period, the C. were ready to revert to their historic rôle of pursuers, but by that time the morale of the Ger. armies was broken. Many of the foremost allied leaders testified to the great service performed by the C. in the early weeks of the operations on the W. front; Sir Douglas Haig stated that 'it has been proved that C., whether used for shock effect under suitable conditions, or as mobile infantry, have still an indispensable part to play in modern war.' Gen. Pershing observed that 'the splendid work of the C. in the first few weeks of the war more than justified its existence and the expense of its upkeep in the years preceding the war.' Gen. von Kluck, the commander of the First Ger. Army, lamenting his lack of C., stated that during the Brit. retreat of Aug. 1914, the chief factor that enabled the Brit. Army to escape was that his (von Kluck's) forces did not possess the effective means of compelling it to turn and resist, namely, the three divs. of Marwitz's C. (*Journal of the U.S. Cavalry Association*, April 1920). More favourable opportunities occurred in Palestine, where the Brit. yeomanry co-operated with the Australian and New Zealand mounted infantry. The former were, of course, armed like the regular Brit. C., but the dominion forces were armed with rifle and bayonet, and it was only later that the Australian Light Horse Div. were trained in the use of the sword, and that the dominion troops became gradually assimilated to C. proper. At the commencement of the operations in Palestine, the yeomanry attacked with the sword, advancing in the customary double rank formation; whereas the dominion troops advanced at a rapid walking pace only, with rifle slung and

bayonet held in the hand. The success of the attacks was due largely to the thorough preparation by machine-gun and field-gun fire. Later, under Gen. (later Lord) Allenby, the greatest C. leader of modern times, the C. reverted, with *éclat*, to their appropriate rôle of pursuer, and in this theatre of operations with entire success. It is important to bear in mind that the Fr., Belgian, and Ger. military authorities, almost of necessity from the geographical position of their nations, considered a warfare of position as the most probable form for the next war in which their nations were likely to be concerned. In the training of Fr. C., the tactical principles on which emphasis is laid are rapidity, mobility, and ability to manoeuvre, always with a view to actual fighting on foot; and these tactics must conform to the modern development of fire power. In the frontal attack, dismounted C. units should, according to the Fr. theory, act in co-operation with units armed with machine guns, the function of the whole force being to turn the enemy's flanks and to cover the advance of reserve units. As a result of the Russo-Jap. war, where the C. of both belligerents was so obviously inferior, continental opinion, especially that of the Ger. general staff, was that only a first-class and highly trained C. would be of any real use in a modern major war. Again, the view of the Ger. staff was that while charges by regiment and brigade were still feasible the charge by div. was a past chapter. They regarded the lance as superior to the sword, but argued that only shaken and surprised infantry were really vulnerable to C. attack. Finally, they held that C. must be able to fight mounted as well as dismounted, and not relegated to the rôle of secondary infantry. The view of one school of Brit. thought after the First World War was that while C. had to some extent been superseded, as a primary factor of strategical reconnaissance, by the air arm, this supersession really operated to help the C., and permitted it to develop still more fully its capabilities in tactical reconnaissance—a function which the aeroplane could not perform at all. Modern Brit. cavalry experts were opposed to mixed brigades and favoured the adoption of divs. of three brigades of C. instead of four, each brigade to consist of three regiments, so that the unit could be easily controlled by one leader, the regimental commander. Light guns, such as the 13-pounder rather than the 18-pounder, were considered the most suitable weapon for artillery of the C. div. of the future, the essential requirement being that the guns should keep up with the C. A proportion of howitzers should be added for the purpose of overwhelming enemy detachments which could not be reached by field guns of flat trajectory. Finally, each machine-gun squadron should carry no more than twelve guns, each squadron being organised into three troops of four guns each. There was no finality in these views, which were essentially those of the traditional Brit. C.

school. They favoured a C. div. exclusively composed of that arm, machine-gun units and other auxiliaries being under the control of the div.; while armoured car units and motor machine-guns should not be included, but only attached as occasion may require. The extensive use of aerial reconnaissance in the Second World War largely discounted the view of the limitations of the air arm in that sphere noted above. C. played no part in the operations on the W. front in the Second World War, but it rendered considerable service on the E. front. Thus C. were combined with light mobile units in the operations of Marshal Rokossovsky against the Ger. Ninth Army in the summer offensive of 1944, and again in his operations to outflank Minsk and Bobruisk in the same offensive. Russian C. were often used in great enveloping manoeuvres to cut off the retreat of Ger. forces in the Caucasus and other regions of the S. Russian front. For the list of individual C. regiments, see DRAGOON; DRAGOON GUARDS; GREYS; SCOTS; HUSSARS; LANCERS; LIFE GUARDS; YEOMANRY. See Maj. M. W. Nicholson (U.S. Army), *Modern Cavalry*, 1922.

Cavan, mrlt. tn. on a trib. of the Annalen, in the co. of Cavan in N. Ireland. Most of the co. offices are in C., but a grammar school, founded by Charles I. (rebuilt in 1819), is the most conspicuous building. In the prov. agriculture is the chief industry, but the climate is moist and cold, and the soil poor. Besides potatoes and oats, flax is cultivated for a declining linen industry. Cootchill and Belturbet are the other tns., the Erne and the Woodford the other rvs., of importance. Pop. of co. 76,000, of which 80 per cent are Rom. Catholics; of tn. 3,000.

Cavan, Frederick Rudolph Lambart, tenth Earl of (1865–1946), Brit. soldier, colonel of the Irish Guards and of the Beds and Herts Regiment. He served in the S. African war 1899–1902, and was mentioned in dispatches. Commanded 1st Battalion Grenadier Guards 1908–12. Had retired before the First World War, but returned to active service, and commanded the Brigade of Guards, and later the Guards Div. and the 14th Army Corps. He was sent to Italy to take command of the Brit. troops in the operations on the Piave (1918). After the war, he was general officer commanding in chief, Aldershot, 1920–22, and chief of the Imperial General Staff, 1922–26; head of the War Office section of the Brit. delegation to the Washington Conference, 1921. Promoted to general in 1921; promoted to field marshal 1932.

Cavatina, term applied in music to a simple melody, having no second nor a *da capo* part. It is also sometimes used of any kind of light and smooth air, and frequently of those occurring in a grand scena. It is much the same as an *aria* or a short aria in one section. The term is used by Mozart. In eighteenth-century opera a C. is found inserted as a relief in a long stretch of orchestrally accompanied recitative. C. also denotes a piece of instrumental music, as for example in

what is popularly known as Raff's C., the piece by which that composer is chiefly remembered.

Cave, Edward (1691-1754), printer, combined both at Norwich and London the functions of journalist and printer. In 1731 he began to pub. the *Gentleman's Magazine*, in which parl. debates were for the first time reported at some length. C. d. 'with his hand 'gently pressing' Samuel Johnson's. The latter had become his parl. reporter in 1740, and afterwards his friend.

Cave, George, first Earl (1856-1928), Eng. lawyer, b. in London, second son of Thomas Cave, M.P. Educated at Merchant Taylors' School, and at St. John's College, Oxford. Called to the Bar 1880; took silk 1904, and enjoyed for many years a considerable Chancery practice. M.P., Kingston div. of Surrey, 1906-22. Solicitor-general in Coalition Gov. and knighted 1915. In 1916 became home secretary; in 1919 a lord of appeal in ordinary. Lord chancellor in Bonar Law's ministry, 1922; retained that office in Baldwin's till 1924. See Sir C. Mallet, *Lord Cave: a Memoir*, 1931.

Cave, William (1637-1713), divine, took his M.A. degree at St. John's College, Cambridge, in 1660. He was vicar of Islington 1662-91; rector of All-Hallows the Great, Thames, 1679-83; vicar of Isleworth 1690-91. The twelve books he wrote on early church hist. were once standard works.

Cave Animals, term which is applied equally to animals whose remains have been found in a fossil state in caves and to living creatures which have adapted themselves to an existence in the dark and quiet shelter discovered by their ancestors. They are often distinguished from their kindred by the specific term *spelæus* (Lat. *spelæum*, a cave), e.g. the fossil hyena and tiger are known as *Hyæna spelæus* and *Felis spelæus* respectively, while the living blind-fish is called *Amblyopsis spelæus*. Their frequent lack of vision has also been obtained for many of them, as for deep-sea and underground dwellers, the prefix *Typhlo-* (Gk. τυφλός, blind), e.g. *Typhlichthys*, a genus of blind fishes. The chief characteristics of animals of this type are their reduced or absent eyes and consequent well-developed sense-organs, such as antennæ and feelers, lack of colour, and their predaceous carnivorous habits occasioned by lack of vegetable matter in the darkened home. Among the gastropod molluscs sev. species of snails have been found in Austrian caves which have developed blindness as the result of their mode of life. Blind cave-dwellers are represented also in the Crustacea and Arachnida by sev. species, notably by *Cambarus stygius* and *Antrobia mammothia* respectively. In the orthopterous insects a genus of small cockroaches of a peculiar nature has been discovered in caves of the Philippine Is.; the females are devoid of sight and of all power of flight. The Carabidae and Silphidae are well-known families of coleopterous insects which include sev. cave-dwellers, usually sightless, e.g. in the

carabid genus *Anophthalmus* found in Europe and America, and the Amer. genus of Silphidae, *Adelops*. Rising higher in the animal world we come to the phylum Pisces, and here there are numerous fishes which shun the light and prefer a cavern for a home. The *Amblyopsis*, which occurs in the Mammoth Cave of Kentucky, is a colourless fish, about 5 in. in length, in which the eyes and optic nerve are imperfect; in the same family, i.e. Amblyopsidae, are found the *Chlorogaster*, which has normal sight, and *Typhlichthys*, a blind and colourless fish whose home is near the Mississippi. A blind salamander, *Typhlotriton spelæus*, inhabits the Rock House Cave in Missouri, and other cavernicolous amphibians are the *Typhlomolge kathburni* and *Proteus anguinus*, the olm, the latter being a native of Carinthia. Its eyes are completely hidden, and when exposed to the light the colourless creature turns black. If such C. A. have lost their sight as a result of living for many generations in the dark they would provide evidence in favour of Lamarck's theory of inheritance of acquired characters. It is, however, possible to adopt the opposite view that the ancestors of these animals became blind as the result of a mutation (sport), and that they could then survive in dark places only, where functional eyes would in any case be useless.

Caveat, formal notice or caution given by a party interested, to a court, judge, or public officer, against the performance of certain judicial or ministerial acts. In a more restricted sense a C. denotes (1) a caution entered in the Probate, Divorce, and Admiralty Div. to stop the granting of probates of wills or letters of administration; (2) a notice given to the bishop by a party who disputes a particular right of presentation to prevent the institution of a clerk to a benefice; and (3) a notice lodged at the patent office to prevent the registration of any invention under the patent laws.

Caveat Emptor (Lat., let the buyer be on his guard), legal maxim which in the law relating to a contract for the sale of goods means that a purchaser must take all reasonable precautions in buying from another, for as regards the quality of a thing sold in the general circumstances of the sale he will not be allowed afterwards to repudiate the sale because he has not obtained all he wants. The Sale of Goods Act, 1893, however, has destroyed the maxim of some of its force by implying in every contract of sale conditions that the goods sold shall correspond to their description, that they shall be reasonably fit for the purpose for which the buyer wanted them, provided he made that purpose known to the seller, that the bulk shall correspond to the sample, and that the seller has a right to sell the goods; with the result that on the breach of any such condition the buyer can rescind the contract.

Cavedone, Giacomo (1577-1660), It. painter, b. at Sassuolo, near Modena; studied under the Caracci and Guido, and was much influenced by Titian, whose

works he studied at Venice. Most of his work was done for churches in Bologna, and is in both oil and fresco. His colouring, design, and execution are all good. His best pictures are: 'The Nativity,' 'The Virgin and Child in Glory,' 'The Holy Family,' and 'The Adoration of the Magi.'

Cavell, Edith Louisa (1865-1915), nurse, b. Dec. 4, at the vicarage at Swardeston, Norfolk; eldest daughter of the Rev. Frederick Cavell. Educated there, in Somerset, and in Brussels. In 1895 she entered the London Hospital as probationer. After experience of many hospitals in England, she went to Brussels in 1906 to assist in establishing a modern training school for nurses. Was appointed, 1907, first matron of Dr. Depage's clinic—the Berkendael medical institute. Also organised the hospital of St. Gilles. In Aug. 1914, at the outbreak of the First World War, Dr. Depage left to organise military hospitals, and Miss C. remained in charge of the institute, which became a Red Cross hospital for both Gers. and their enemies. Many soldiers were left behind in the retreat of the Fr. and Brit. forces, and some of those caught were executed. On Aug. 5, 1915, Miss C. was arrested and placed in solitary confinement in St. Gilles prison. On Oct. 7, she was one of thirty-six brought to trial before a court martial. Mr. Brand Whitlock, the U.S.A. Minister, after sending two letters to Baron von Lancken, civil governor of Belgium, offering to take charge of her defence, was informed she had confessed. She had been defended by Sadi Kirschen of the Brussels Bar—who, however, was not allowed to see her beforehand, or to inspect documents. She was charged with having assisted 130 persons to escape from Belgium. The prosecution were assisted by her own statement that she had received letters of thanks from the repatriated. The trial ended on Friday, Oct. 8. At eight in the evening of the 11th, the Amer. legation learned that she had been condemned to death three hours before and would be shot at two the next morning, Oct. 12. She was allowed to see the Rev. H. S. T. Gahan, and the sentence on her and one other was carried out as arranged. On May 15, 1919, her body was brought to Norwich Cathedral. A memorial to her, designed by Sir E. L. Lutyens, was erected after the First World War, near Trafalgar Square.

Cavendish, surname of the ducal house of Devonshire (q.v.).

Cavendish, Lord Frederick Charles (1836-82), second son of the seventh duke of Devonshire. He married a niece of Mrs. W. E. Gladstone. He was private secretary to Lord Granville, 1859; elected M.P. for Barrow-in-Furness, 1865; was Gladstone's private secretary, 1872; financial secretary to the Treasury, 1880. In 1882 he was chosen by Gladstone to succeed W. E. Forster as chief secretary to the lord-lieutenant of Ireland, Earl Spencer, not only as a most capable and thoroughly high-minded man, but as having framed a financial scheme for

land purchase. He landed at Dublin on May 6; he passed the afternoon with Lord Spencer in Dublin Castle, and about six o'clock he walked with the under-secretary, Thomas Henry Burke (q.v.), into Phoenix Park. They were there set on and brutally murdered by a gang of assassins, belonging to the secret society of Invincibles, in front of the viceregal lodge. The weapons used were amputating knives specially imported for the purpose. James Carey, a member of the Dublin corporation, turned informer, twenty persons were arraigned, and five were executed and others sentenced to penal servitude. Carey sailed for S. Africa, but was murdered on board by Patrick O'Donnell, who was hanged in 1883. The assassins did not know who Lord Frederick was, but they meant to murder Burke. The late secretary, Forster, had narrowly escaped assassination. The murder had far-reaching political consequences for Ireland, and 'Well has it been said that Ireland seems the sport of a destiny that is aimless' (Morley, *Life of Gladstone*). Lord Frederick is buried at Chatsworth, and a fine statue is erected to his memory at Barrow-in-Furness. Piggott's forged letter of C. S. Parnell condoned this murder.

Cavendish, George (1500-62?), Eng. historical writer, was the eldest son of Thomas C., a clerk in the Exchequer. He married Margery Kemp, a niece of Sir Thomas More, and became gentleman-usher to Cardinal Wolsey, being wholly devoted to his service through prosperity and disgrace. After Wolsey's death he wrote his patron's biography, which was circulated in MS., and probably was made use of by Shakespeare in his portions of *Henry VIII*. In 1641 it was first printed as *The Negotiations of Thomas Wolsey*; the genuine text, however, did not appear till 1810, a better ed. appearing in 1815. It is a valuable authentic record of the period.

Cavendish, Henry (1731-1810), Eng. natural philosopher, b. at Nice, educated at Cambridge. His dislike of strangers amounted to an eccentricity. A millionaire and the possessor of a unique library, C. devoted his whole life to chemical and physical research, and found time also to work at mathematics and to read papers before the Royal Society. Not only did he discover the extreme lightness of hydrogen—which led at once to balloon experimenting, etc.—but before 1783 he had ascertained the constituents of water and atmospheric air, and had conducted his famous experiments on the density of the earth. Sir Humphry Davy spoke enthusiastically of the extreme accuracy of his work.

Cavendish, Margaret, Duchess of Newcastle (c. 1625-73), was the second wife of the duke of Newcastle (1592-1676), and is best known as the writer of his life. Formerly she had been maid of honour to Henrietta Maria. Husband and wife were inordinately fond and proud of one another. Walpole describes her as a 'fertile pedant' with an 'unbounded passion for scribbling.' Her maids were

expected always to be prepared to 'register her Grace's conceptions.' Her works are marred by diffuseness and illogical sequence of thought. Sir A. W. Ward, however, describes the *Life* of her husband as 'one of the lesser classics of English biographical literature' and Charles Lamb's exuberant appreciation of the work and of its authoress the 'princely women, the thrice noble (her husband being duke, marquess, and earl of Newcastle) Margaret Newcastle' is well known. Her *Select Poems* were ed. by Brydges in 1813, and her *Autobiography* in 1814. The latter, ed. by Lower, was pub. together with her *Life of the Duke of Newcastle* in 1872.

Cavendish, Thomas (1560-92), circumnavigator, commanded a ship in Sir Richard Grenville's expedition to Virginia (1585), and in the following year fitted out three small ships from Plymouth, in which he sailed round the world (1586-88) by way of the Magellan Straits, the E. Archipelago, and the Cape. During this voyage he discovered Port Desire, Patagonia, burnt three Sp. cities, and captured Sp. treasure. He d. at sea off Ascension, broken-hearted because his second expedition was not so successful as the first.

Cavendish, William Duke of Newcastle (1592-1676), was educated at St. John's College, Cambridge. James I., pleased with his learning and charm of manner, made him Viscount Mansfield, and Charles I. appointed him governor of his son Charles in 1638. C. had previously entertained his sovereign at Welbeck, when Ben Jonson, whom he patronised, composed the masque. When the Civil war broke out he proved a staunch Royalist, and made a generous contribution of £10,000 to the king's treasury. Collecting troops at his own expense, he won Yorkshire for his cause by the victory of Adwalton Moor (1643). In that year he captured Hull, but in the following, after the rout of Marston Moor, went abroad, where he lived in straitened circumstances till the Restoration, when he returned to England. In spite of his splendid devotion, King Charles II. restored to him only a part of his estates.

Cavendish, Sir William (c. 1505-1557), founder of the family of C. b. at Cavendish. Second son of Thomas C. of Cavendish, clerk of the pipe, and brother of George C. (q.v.). Treasurer of the royal chamber under Henry VIII., Edward VI., and Mary I. Was one of the commissioners appointed by Henry VIII. to suppress the monasteries. Was three times married, his third wife being a Derbyshire heiress. With the aid of her purse he planned the sumptuous mansion at Chatsworth, which his wife completed. See Kennet's *Memoirs of the Cavendish Family*, 1737; J. Grove's *Lives of all the Earls and Dukes of Devonshire*, 1764.

Cavendish-Bentinck, see BENTINCK.

Caversham, Baron, see KNOLLYS, FRANCIS.

Caversham, tn. in the Henley div. of Oxfordshire, England, on R. Thames, opposite Reading. Most of it is now

included in the co. of Berkshire. Pop. 10,000.

Caves, or Caverns (Lat. *cavus*, hollow), hollow places formed in the earth or in rock. They may be produced by the action of water or by the destruction and displacement of strata through an earthquake or landslide. The regular beating of waves upon the seashore wears away the softer portion of the cliff until cavities are formed. Fingal's Cave, Staffa, is an excellent example of marine erosion. The sand and gravel, carried up by the sea, have also a great eroding power upon rocks. In rock-salt dists. large C. are formed owing to the free solubility of the sodium chloride in water. In France and Switzerland large caverns have been formed under the glaciers, owing to the shifting of the ice. C. are, however, more frequently formed by the chemical than by the mechanical action of water. Carbonic acid, which is present in most waters, derived either from the air or from decaying organic matter in the soil, acts upon mineral rock, forming salts, which are carried away in solution, leaving cavities behind. Large subterranean galleries, caverns, and channels have been formed in various dists. by underground streams and rivers. A riv. that has left its course above ground eats its way through the earth, until it can finally empty itself into the sea. Whenever such a riv., for some natural cause, has abandoned its subterranean water-course, the channel it has occupied gradually dries up, and tortuous underground passages remain, linking together the C. previously made by the water. The holes through which the rivers have descended on their downward course below the earth are known as sink-holes. The direction of the caverns and channels can frequently be ascertained above ground by examination of these entrance-holes. Fine specimens of such sink-holes are found in Kentucky and Florida. In limestone dists. calcareous deposits are left on the walls of subterranean C. This is due to a double chemical process. First, the carbonic acid acts upon the calcium carbonate (or limestone), forming the soluble bicarbonate. When this solution is left standing on the walls of the cave the reverse process takes place, and glistening crystals of calcium carbonate remain. If water, laden with calcium bicarbonate, comes trickling through the roof of the cave, in the course of ages similar deposits are formed in the shape of icicles. These deposits slowly grow in size as the water drips from them, and where the solution falls on the floor of the cave dome-shaped mounds appear. The incrustations hanging from the roof are known as stalactites, and those on the floor stalagmites. Sometimes the stalactites and the stalagmites may become united, when it appears that the roof of the cave is supported by pillars. Sometimes these formations are of a pure dazzling white but more often are coloured by some foreign matter in the water. When the cave is lit up artificially, the effect is extremely beautiful. Some of the finest

specimens of such C. are to be found in Austria, whilst in England most beautiful specimens can be seen at Cheddar. C. are also formed under sheets of lava in volcanic dists., such as parts of S. America and Iceland. The lava collects over a mass of ice (or over snow which is then solidified); melting of the ice subsequently takes place, and a hollow is left beneath the lava. The Fossa della Palomba, at Etna, was probably formed by the evaporation of water below the lava into steam, which afterwards found an outlet and escaped. The remains, such as bones and rude implements of

bones. One of the largest and most famous C. in the world is Mammoth Cave in Kentucky, U.S.A., situated some 85 m. S.W. of Louisville. It consists of a perfect maze of great chambers, grottoes, and domes linked by numerous passages and galleries. The extent is over 4 m., and was evidently formed ages ago by the action of water in the prevailing limestone formation. The main cave is over 40 ft. wide by 300 ft. in length and about 125 ft. high. One of the domes attains a height of 300 ft., and there are sev. others only slightly less in height. In some of the grottoes there is a dazzling

INTERIOR OF A CAVE, SHOWING STALACTITES AND STALAGMITES

domestic use, that have been found by means of excavation prove that men in prehistoric times inhabited C. Human bones have been discovered, embedded sometimes in mud and frequently in calcareous matter. This latter fact—that bones have been covered in limestone crystals—shows that the C. must later have been deserted, and the stream of water returned to its former subterranean course. Bones of mammals belonging to the Pleistocene period have also been found. From the remains of bones discovered, it appears in general that the animals that visited C. resembled large hyenas or bears, but in a few C. remains of herbivorous animals have also been discovered. In the C. at Kirkdale, near York, as many as 300 hyenas have from time to time been found. The bones in the Australian C. have obviously belonged to kangaroos or allied genera of marsupials. In the Brit. Is., thirty-three different species of mammals and five of birds have been deduced from

formation of stalagmites and stalactites. The cave contains a stream which links up with Green R., which is not far away. An interesting development in evolution is that in this cave stream, shut off from the light there are found a number of species of blind fish. Mention should be made of the famous C. in Bermuda: these include Shark's Hole, Walsingham C., the Leamington C. and Crystal C.—these last perhaps the finest in the Is. In Jamaica are the Oxford C. in the May Bay mts. 1000 ft. above sea level. The galleries and halls, which extend for sev. hundred yards under the mts., contain curious stalagmites and stalactites. *See also CAVE ANIMALS. Consult Sir W. B. Dawkins, Cave Hunting; Researches on the Evidence of Caves respecting the Early Inhabitants of Europe, 1874; Hovey, Celebrated American Caverns, 1882; A. Badin, Grottes et cavernes, 1886; E. A. Martel, Les Abîmes, 1886, La Spéléologie au vingtième Siècle, 1905-6, and La France ignorée, 1928; O. Penzance, Kent's*

Caves of a Thousand Buddhas (Ch'ien-to-tung), most famous repository of early Chinese painting, situated in the cliffs of a riv. valley, on the edge of a sandy desert, 25 m. from the small tn. of Tunhuang, in N.W. Kansu, 710 m. from Lanzhou. They are really Buddhist shrines, over 400 in number, hollowed out of gravel rock. They vary greatly in size, the largest containing images of Buddha more than 100 ft. high, the smallest being little more than niches in the wall. Although the earliest date from the middle of the fourth century A.D., the majority belong to the Tang (618-936) and Sung (960-1276) dynasties. The C. were dug out and painted by the monks and usually paid for by high officials and wealthy merchants, whose portraits and those of their families are often depicted along the walls. Many of the images have disappeared or been renovated, but the wall paintings, depicting secular and religious scenes, are still in a wonderful state of preservation, far better indeed than those at Ajanta (q.v.). For many centuries the C. were one of the greatest religious centres in all Asia, visited by monks from many countries. But in the twelfth century, probably owing to unsettled political conditions, they were abandoned to the mercy of plundering bands and priests of other religions and to the destructive agencies of wind and sand. First reported to the W. world in 1892 by an Englishman, Capt. Bower, the first serious work on them was done by Sir Aurel Stein (q.v.), who found in the long-buried library a treasure-house of early Buddhist and Asiatic literature, which has since yielded thousands of vols., many of the most important of which are now in the Brit. Museum.

Cavia, see CAVY.

Caviare, roe of the sturgeon prepared for eating. It is a favourite *hors d'œuvre* or savoury. The variety known in Russia as *ikra*, which is loosely granulated and almost fluid, is the best. A coarser kind called *pajussnaral* is a common article of food in E. Europe. Hamlet's remark that 'His play . . . was caviare to the general' proves that it was a known delicacy in Shakespeare's day.

Caviglia, Enrico (b. 1862). It. soldier and senator, b. at Finalmarina, son of Pietro C. Educated at Military Academy of Artillery and Engineering and the School of War. Took part in the campaign of Eritrea, 1886-89. He followed the Jap. forces as a spectator of the Russo-Jap. war, and participated in the Libyan engagements of 1912; and in the First World War, as a major-general, he directed the decisive operations of the battle of Bainsizza (July 1917) and commanded the Eighth Army at the victory of Vittorio Veneto (June 1918). Nominated senator, Feb. 22, 1919—in

which year he was minister of war for some months. Drove d'Annunzio from Fiume, Dec. 1920. Marshal of Italy, 1926.

Cavite, cap. of the prov. of Cavite, Luzon, Philippine Is. It is situated on Manila Bay, 3 m. from the city of Manila, is a fortified seaport and a naval station of the U.S.A., the N. part of the tn. serving as a coaling station. It is an old tn. containing narrow streets and buildings of stone with upper storeys of wood; it possesses five churches and a high school. It is the chief naval base of the Philippine Is., and during the nineteenth century was the scene of political troubles. An Amer. squadron under Commodore George Dewey wrested it from Spain in May 1898. Pop. of the prov. 160,000; tn. 13,000. The chief products of the prov. are sugar, rice, coffee, and indigo. In the Second World War C. was captured by the Jap. on Jan. 3, 1942. Recaptured by Amer. forces on Feb. 13, 1945. See further under PACIFIC CAMPAIGNS OF FAR EASTERN FRONT, IN SECOND WORLD WAR.

Cavour, tn. of Turin, Piedmont, Italy, 7 m. S.E. of Pinerolo. It has marble and slate quarries, manufs. silk, and has a tanning industry. Pop. 7000.

Cavour, Camillo Benso, Count (1810-1861), It. statesman, b. at Turin, of an aristocratic family of Piedmont. He was educated for the army at the Military Academy at Turin till 1826, when he obtained a commission in the engineers and was engaged in works of defence at various fortresses. During his leisure he studied Eng. politics, and developed his strong liberal views which caused him to be regarded with suspicion. In 1831 he resigned his commission and devoted himself to social problems, practical agriculture, and foreign travel. He visited Paris and London, and gained a profound knowledge of European politics. He then managed his father's estates at Lizi, and founded the Society of Agriculture of Piedmont. In 1847 he started at Turin a newspaper, *Il Risorgimento*, for the purpose of spreading the ideas of constitutional reform. In Jan. 1848, the revolution in Sicily broke out, and C.'s speech on the constitutional questions had the utmost influence, not only on the people, but also on the Piedmontese king, Charles Albert, who was induced to grant a constitution. C. was not offered a seat in the first ministry, but his articles in his paper powerfully stirred the growing national enthusiasm against Austria and the tyrannies of the different kingdoms and principalities into which Italy was split up. He felt that the moment had come for war with Austria, and his skill and enthusiastic patriotism were powerful enough, and war was declared, 1848. The defeats at Custoza and Novara led to an armistice, the abdication of Charles Albert in favour of his son Victor Emmanuel II., and peace. C. was not disheartened, and threw himself still more ardently into his ideal of freedom from Austria and a united It. kingdom. His difficulties were immense, for he had, in addition to all the external

force of Austria and the supporters of the dynasties in Tuscany, Naples, etc., to face the divided policies of Mazzini and the republicans and the danger of an anti-papal and anti-clerical movement, which would have destroyed his schemes. In 1850 he became minister of agriculture and commerce, and in 1851 of finance, but he resigned on a difference with the Prime Minister, d'Azeglio. He then travelled in France and England to discover the trend of foreign opinion in regard to the It. problem. In 1852 he returned and was appointed Prime Minister, a post which he filled, with short intervals, till his death. He now began his masterly scheme of foreign policy, which made a united Italy possible, and ranks his name with Bismarck in later European history. He placed Sardinia and Piedmont among the powers by sending a well-disciplined force to the Crimea, while Austria remained neutral. He secured the benevolent neutrality of England, and in 1858 formed an alliance with Napoleon III., followed by a victorious joint campaign against Austria (Magenta and Solferino). The agreement of Villafranca, brought about by the sudden withdrawal of Napoleon, left Venetia in the hands of Austria, and bitterly disappointed C., who resigned, but later returned to office. He had ceded Nice, Garibaldi's bp., and Savoy to France in return for the alliance, for which he was upbraided by Garibaldi and his supporters. The adhesion of the central states of Italy followed, and the subsequent defeat of the Neapolitan kingdom in Sicily and Naples by Garibaldi. Save for the question of Rome and the papal temporal power and Venetia, C.'s policy had succeeded. Victor Emmanuel II. was king of a united Italy. A violent scene with Garibaldi in the Parliament broke him, worn out by anxiety and overwork. He d. at Turin in June. The regeneration of Italy had been his ideal, and his life's work had been given to that end. See De la Rive, *Le Comte de Cavour: récits et souvenirs*, 1892; G. Buzziconi, *Bibliografia Cavouriana*, Turin, 1898; Countess E. Martiengo Cesaresco, *Cavour*, 1898; D. Zanichelli, *Cavour*, 1905; A. J. White, *Early Life and Letters of Cavour, 1810-1848*, 1925, and *Political Life and Letters of Cavour*, 1930.

Cavy, or **Cavia**, genus of rodents found in S. and Central America, typical of the family to which the capybara or carpincho belongs. The Cs. have rough hair, well-developed ears, no tail, reduced toes, four on the fore feet and two on the hind feet. The guinea-pig, *C. cobaya*, known to us as a domestic pet, is descended from *C. porcellus*, the restless C., a species with greyish fur. The Patagonian C. is a large animal of the same family *Capitatus*; it resembles somewhat a long-legged hare, and has the same number of toes as *Cavia*. See also GUINEA-PIG.

Cawdor, par. of Nairn, Scotland, 3½ m. S.W. of Nairn. In the fine old medieval castle the murder of King Duncan is popularly supposed to have taken place,

but it actually occurred sev. centuries before the castle was built. Pop. 800.

Cawley, William (1802-68), Eng. regicide. He founded St. Bartholomew's Hospital, Chichester, 1826. C. was fined for refusing knighthood, 1829. He was M.P. for Chichester, 1827; for Midhurst, 1840, and was an active member of the Long Parliament. He was excepted from pardon, 1860, and fled to Belgium, and then to Switzerland, his property being granted to James, duke of York. See M. Noble, *Lives of the English Regicides*, i., 1798.

Cawnpore, or **Cawnpur**, city (and dist.) on the S. bank of the Ganges, in the Allahabad div. of the United Provs., India. Lucknow lies 40 m. to the N.E. Once an important frontier station under the E. India Company, it is now known as the junction of three railway systems, the East India railway, the Great Indian Peninsula railway, and the Bombay, Baroda, and Central India railway. The chief articles of commerce are various leather goods, such as harness and shoes. The dist. was once a centre of the indigo trade. Historically the city will long be remembered as the scene of a series of massacres of men, women, and children by the Nana Sahib in July 1857. Gen. Wheeler, who with a small force tried to protect the European residents, was encamped for twenty-one days in a bare field fully exposed to the fire of the insurgents. The well of C., which enjoys an evil notoriety because of the atrocious butcheries committed in its vicinity, is now marked by a white marble memorial. Pop. 245,000.

Caxamarca, see CAJAMARCA.

Caxias: 1. Tn. of Maranhão, Brazil, formerly known as Aldes Atlas, on R. Itapicuru, 180 m. S.E. of Maranhão, with which it has riv. connection. It has rice and cotton industries. Pop. 70,000. 2. It. colony in Rio Grande do Sul, Brazil, 60 m. N.W. of Porto Alegre. Pop. 45,000.

Caxton, William (1422?-91), first Eng. printer, b. in Kent. In 1438 he was apprenticed to a silk mercer, and the latter dying in 1441, young C. was dispatched to Bruges to finish his term. Here he set up business for himself, and in 1464 and 1468 he was employed, as governor of the company of Merchant Adventurers, in negotiating commercial treaties with the dukes of Burgundy. The second time his mission was quite successful, and about 1469 he entered the household of the Duchess Margaret, sister of Edward IV., and wife of Charles the Bold of Burgundy, as commercial adviser. There is some doubt as to where C. actually learnt the art of printing. Many—among them Wynkyn de Worde, his disciple—say it was at Cologne, between 1471 and 1474, in company with Colard Mansion, who was his partner at Bruges, where he printed his first book in 1474 or 1475. This was a trans. of a Fr. romance entitled *The Recuyell of the Histories of Troye*. In 1476 his second printed work (completed in 1474) appeared, *The Game and Playe*

of *Cheese*, another trans. In 1476 C. was duly installed in Westminster. Lord Rivers's version of *The Dictes or Sayengis of the Philosophers*, 1477, has the distinction of being the first issue from C.'s printing press in his own country. Thence forward C. pub. some eighty books, many of them his own translations of famous Fr. legends and cycles of romance. His *Myrrour of the World*, 1481, is the first vol. he issued with woodcut illustrations, whilst as many as seventy woodcuts were inserted in his ed. of the *Golden Legend*—his own compilation from a Fr. work of the thirteenth century, containing lives of the saints. But by his fellow countrymen he will be remembered above all for his services in fixing the Eng. language, which was in a changing, somewhat chaotic condition, and in bringing the literary masterpieces within the reach of those who could read. Twice he printed Chaucer's *Canterbury Tales*, and he brought out also Gower's *Confessio Amantis*, 1483, and Malory's *Morte d'Arthur*.

Cayambe, volcanic mt. of the Andes, in Ecuador, practically on the equator, having a tn. of the same name (pop. 3000) at the foot. Altitude, 19,255 ft.

Cayenne, old name for Fr. GUIANA (q.v.).

Cayenne, port and the cap. of Fr. Guiana, at the mouth of the Cayenne on the N.W. of the is. of that name. It has two quays, but no docks, and only a shallow harbour. There is a wireless station. The staple exports are gold, cocoa, hides, and spices, whilst it imports wines, manufactured goods of all kinds, and corn. The inhab. live on bread and wine, and are subject to attacks of yellow fever. Pop. 13,800.

Cayenne Pepper, see CAPSICUM.

Cayes, Les, or Aux Cayes, seaport on S. coast of Hayti, 98 m. S.W. of Port-au-Prince. It is an episcopal see and exports coffee and logwood. Pop. 15,000.

Caxamarca, see CAJAMARCA.

Cayey, tn. of Puerto Rico, W. Indies, in the Central Cordillera, 25 m. S. of San Juan. It is a summer resort, and the centre of a rice and cotton dist. Pop. 12,000.

Cayley, Arthur (1821-95), Eng. mathematician, b. at Richmond, in Surrey. He was educated at King's College, London, and Trinity College, Cambridge. Senior wrangler of his year (1842), he was also winner of the Smith prize. He became a fellow of his college, but in 1846 he left Cambridge, and three years later was called to the Bar. He practised as a barrister for fourteen years, and then returned to Cambridge as Sadlerian prof. of mathematics. He wrote over 800 papers and memoirs, which, collected and pub. by the Cambridge Univ. Press, form a monument to his fame as one of the greatest of mathematicians. He possessed honorary degrees of almost every foreign univ., and was a fellow of the Royal Society. He d. at Cambridge, and a portrait and bust of him are to be found at Trinity College.

Caylus, Anne Claude Philippe de Tubières, Comte de (1692-1765), archaeologist, served with some distinction in the Sp. War of Succession (1709-14), and

then travelled abroad, visiting Greece and the E. His life was zealously devoted to the collection and study of antiquities and the promotion of art by patronage and writing, but he was also notorious for his intimate knowledge of the most disreputable side of Parisian life. His great work was his *Recueil d'antiquités égyptiennes, étrusques, grecques, romaines, et galloises* (6 vols., 1752-55), but he also wrote a treatise on Rom. coins under the emperors, and a memoir (1755), in which he explained the exact nature of the encaustic painting of the anets. The copper-plate engravings which he himself made of Bartoli's copies from anct. pictures are excellent.

Caylus, Marie Marguerite Le Valois de Villette de Muray, Comtesse de (1673-1729), Fr. noblewoman, b. in Poitou, the granddaughter of Théodore Agrippa d'Aubigné. She was taken to Paris and educated at court by her aunt, Mme de Maintenon, and in 1688 married the comte de C., who d. in 1704. She won a great contemporary reputation as a beauty and wit, and left a book which was ed. as *Souvenirs* by Voltaire in 1770.

Cayman, see CAIMAN.

Cayman Islands are three low-lying is. of the W. Indies, which were colonised by the Brit. from Jamaica, 178 m. to the E.S.E., of which they still form a dependency. Columbus, who discovered them, named them Tortugas after the turtles which abound, and which are even to-day the chief export of the is., together with tortoise-shell and shark skins. The first account of the is. is the report of the third voyage of Columbus on his return from Porto Bello to Hispaniola in 1503. Therein it is stated that the is. were covered with turtle, which swarmed also on the coasts in such multitudes as to look like ridges of rock. There is also an early description of Grand Cayman by Capt. Wm. Jackson who visited the is. in 1643 in an abortive attempt on Jamaica. He says: 'The island is much frequented by English, Dutch and French ships, that come purposely to salt up ye flesh of these Tortoises.' In 1655, when Jamaica was taken, the C. I. became a regular source of food supply for the soldiers and fleets of England cruising the Caribbean. Coconuts are grown on Little Cayman and Cayman Brac. The is. are rich in timber, and their inhab. are clever shipwrights. Georgetown is the chief tn. of Grand Cayman. The total pop. of the group is some 6800. No survey of the is. has yet been made, and area of the group is variously estimated to 92 to 140 sq. m.

Cayor, dist. of Senegal, Fr. Equatorial Africa, until 1883 part of the kingdom of Djolof. It is now under the direct control of France, and is traversed by the railway from Dakar to St. Louis. Pop. about 100,000.

Cayos, see CAICOS.

Cays, name given to the is. off the coast of Brit. Honduras. The prin. are Turneffe (a corruption of Terra Nova), St. George's Cay, Eng. Cay, and Ambergris Cay. They are much resorted to for bathing and fishing, and there are sev.

'week-end' residences in St. George's Cay. This latter was the headquarters of the log-cutters or bay-men as they were called. It was here that the bay-men and the Brit. sloop *Merlin* defeated a force of 2000 men under Gen. O'Neill, the governor of Yucatan, in a battle on Sept. 10, 1798, the anniversary of which is still annually celebrated in the colony.

Cayster, or **Caystus**, anct. name of a riv. of Asia Minor, 75 m. long, which flows into the gulf of Scala Nova, 35 m. S.E. of Smyrna. The modern name is Kuchuk Meinder (Little Mæander).

Cayuga: 1. Co. of New York State, U.S.A., bounded on N. by Lake Ontario, and on W. by Lake C. It has deposits of salt, gypsum, and limestone. Area, 722 sq. m. Pop. 65,000. 2. Lake of New York State, U.S.A., lying partly in Tompkins co., and forming the boundary between C. and Seneca cos. Length, 38 m.; average width 4 m. At the head lies Ithaca.

Cazalès, **Edmond de** (1804-76), Fr. political writer, b. at Grenade, Haute-Garonne. He was an active revolutionist and a Rom. Catholic. In 1843 he took holy orders, became director of the ecclesiastical seminary at Montauban (1845), and served in the Constituent Assembly of the republic in 1848. Author of *Etudes historiques et critiques sur l'Allemagne contemporaine*, 1853, and *Nos Maux et leur remède*, 1874.

Cazalla de la Sierra, tn. of Seville, Spain, 40 m. N.E. of Seville in the Sierra Morena. It has Rom. and Moorish remains. Pop. 1500.

Cazembe, or **Kazembe**, formerly a native kingdom of Central E. Africa, adjoining Lake Mweru; now included in N. Rhodesia. It is named after one of the governing chiefs, whose settlement is near the Luapala R., about 30 m. S. of the lake. It produces manioc, maize, cotton, ivory, iron, and copper.

Cazin, **Jean Charles** (1840-1901), Fr. painter, b. at Samer, Pas-de-Calais, the son of F. J. C., a famous doctor; studied in France and England, where he came into contact with the Pre-Raphaelites. In 1889 he was made an officer of the Legion of Honour. Though his earliest works are on religious subjects, he excelled in landscapes into which figures were introduced. Among his best pictures are 'The Flight into Egypt', 1877; 'Ishmael and Ishmael', 1880; 'Souvenir de fête', 1881; and 'Journée faite', 1888.

Cazique, see CACIQUE.

Cazorla, tn. of Jaen, Andalusia, Spain, 41 m. S.E. of Linares, on the N. slope of the Sierra C. It has numerous anct. remains and two castles. Pop. 6200.

Ceadra, see CHAD, Sr.

Cean-Bermúdez, **Juan Augustin** (1749-1829), Sp. writer, b. at Gijón in the Asturias. He studied architecture and drawing, but not apparently with any great success, and, having a small pension from the gov., he was enabled to devote himself entirely to his literary pursuits as the historian of Sp. art. His first pub. was the *Diccionario Histórico de los mas ilustres Profesores de las Bellas*

Artes en España, 6 vols. 8vo (1800); and his others are: *Descripción Artística de la Catedral de Sevilla* (1804); *Descripción del Hospital del Sangre* (1804); *Carta sobre el Estilo*, etc., *de la Escuela Sevillana* (1806); *Diálogo sobre el Arte de Pintar* (1819); and lastly the *Nolucias de los Arquitectos y Arquitectura en España*, 4 vols. 4to (1829), a work founded upon materials collected by Eugenio Liaguno. He also pub. a memoir of his friend Jovelanos.

Ceanothus, genus of Rhamnaceæ, of which the species, natives of America, are cultivated as ornamental shrubs. *C. Americanus*, red root or New Jersey tea, is a beautiful shrub when in flower and dyes wool of a fine strong nankin-cinnamon colour. Sev. other species grow well in this country and flourish in shrubberies.

Ceará, N. state of Brazil, bounded N. and E. by the Atlantic, Rio Grande do Norte and Paraíba, S. by Pernambuco, and W. by Piauí; lying partly on the great Brazilian plateau, its formation is that of terraces cut up by water-courses and high hills (2400 ft.); the climate is very hot and it is subject to severe and destructive droughts. On the higher ground, cattle are raised and some horses. The chief products are cotton, sugar, coffee, etc.; *manicoba*, or C. rubber, also grows there. The cap. is Fortaleza (q.r.), also called C. Pop. 1,994,000, chiefly coloured races and their mixtures with whites. Area 40,200 sq. m.

Ceará Mirim, tn. in Rio Grande do Norte, a N. prov. of Brazil. It takes its name from the riv. on which it is situated; it contains good pasture land, where cattle are raised, and manufs. cotton and sugar. Pop. 18,000.

Cebes, of Thebes, a Gk. philosopher, is the reputed author of the *Pinar*, or *Tabula*. In the Middle Ages this book was very popular, and was trans. into many languages, including Arabic. It professes to be an interpretation of an allegorical picture in a temple. Like *Pilgrim's Progress*, it draws a picture of the snares and temptations of this life, and concludes that the true end of learning is to mould character. C. appears in Plato's *Phædo* as an eager debater, zealous in his search of the highest virtue. This C. was a disciple of Socrates. However, although the author of the book was inspired by the Platonic theories of pre-existence and education, most scholars now attribute the *Tabula* either to another philosopher, Cebes of Cyzicus, time of Marcus Aurelius, or to an unknown author of the first century A.D.

Cebidae, large family of Primates which is divided into four sub-families, represented by the howling monkeys, saakis, teetes, and Capuchin monkeys. They inhabit trees of the Neotropical region and sev. fossil forms have been discovered.

Cebionites, genus of coleopterous insects of the family Malaodermidae, to which the glow-worms belong. They are moderate-sized beetles with soft skins, and are often found on plants in marshy places; the larvae are carnivorous. *Cebrio gigas* is common in France.

Cebu, is., Philippines; area 2000 sq. m. It is intersected by fine mt. ranges. The chief products are sugar, copra, tobacco, and hemp. There is a flourishing export trade, and salt, pottery, and making of sacks are some of the most prosperous industries. Excellent mangoes abound, and good sponges are found off the coast. The is. continued, under the U.S.A., the prosperity it enjoyed under Sp. rule. The first Sp. settlement was in 1565. Pop. 900,000 to 1,000,000. The cap. tn., Cebu, is situated on the E. coast, N. of the centre. It is a port of entry and a municipality; the port is well protected from storms. The streets are wide and well laid out, and good roads traverse the surrounding country. C. is an episcopal see, and the bishop's palace is famous for its internal decoration. The Augustinian church possesses the miraculous image of the Santo Niño. The leper hospital was removed in 1906 to the is. of Cullon. The cathedral, finished in the eighteenth century, contains a cross said to have been erected by Magellan, the great explorer, who was killed in the neighbouring is. of Mactan. Jap. forces landed on C. is. on April 11, 1942, but the Amers. recaptured it in 1945. Pop. about 80,000.

Cebus, genus of monkeys typical of the family Cebidae, which belongs to S. America. The species have a well-developed thumb, a hairy prehensile tail, and thirty-six teeth. They include the Capuchin monkeys (*q.v.*), and were at one time common in Britain as the companions of hurdy-gurdy players.

Ceccano, tn. of prov. Rome, Italy, on R. Sacco, 5 m. S. of Frosinone. The fine church of Santa Maria al Fiume was practically destroyed in the Second World War and the church of San Nicola was badly hit. Pop. 12,200.

Cecchi, Antonio (1849-96), b. at Pesaro in Italy. He was a great traveller and explorer, and took part in the Marquis Antinori's expedition to Abyssinia (1876), being responsible for their route from Zella to Shoa. Two years later he went on an expedition to explore the Galla country, taking with him Chiarini, but they were captured and imprisoned. C. was set free in 1880, his companion having succumbed during the confinement. He was next sent on a mission to Massowah by the It. gov. and succeeded in concluding a treaty of commerce with the sultan of Zanzibar (1885), at the same time pursuing his explorations along the coast. He wrote sev. books of travel.

Cech, Svatopluk (1846-1908), b. at Ostrédec, in Bohemia, one of the best-known poets of Bohemia. His poems, inspired by national enthusiasm, have appeared in collections, the first in 1874. The most notable are *Vaclav z Michalovic, Lesetinsky Korar* (The Smith of Lesetin), and *Bezne otroka* (The Songs of a Slave). His best-known novels (notable for their satirical wit) are *Povídky, Arabesky a Humoresky* (1878-80), and *The Candidate for Immortality* (1884).

Cecidomyia, typical genus of the family of dipterous insects known as Cecidomyiidae, the species of which are charac-

terised by being minute and fragile, with longish antennae furnished with whorls of hair. The larvae are small maggots which live on vegetable or animal substance, and frequently produce galls on plants. *C. destructor*, the Hessian fly of N. America, is well known as a destroyer of wheat; *C. tritici*, the wheat-fly, has a larva which feeds on the pollen of wheat and the ear consequently produces no grain; *C. salicina* is common in France on willows.

Cecil of Chelwood, Edgar Algernon Robert, first Viscount, b. Sept. 14, 1864, long known as Lord Robert Cecil, third son of the third marquess of Salisbury. Educated at Eton, and at Oxford (Univ. College), where he was a prominent speaker at the Union. Called to the Bar in 1887, became K.C. in 1899. Became a prominent member of the Conservative party. He was M.P. for Marlebone, 1906, but resigned his candidature, 1910, on account of his opposition to Tariff Reform. He stood for Blackburn as a Unionist Free Trader, but was defeated. In 1911 (by-election) he was elected as Independent member for the Hitchin div. of Hertfordshire. He held that seat until raised to the peerage. He was an early friend of the women's suffrage movement, and author of the corresponding Bill introduced Oct. 31, which when passed made women eligible to sit in Parliament.

He came into the Coalition Gov., formed during the First World War, in May 1915; being first of all under-secretary for foreign affairs, till 1916; minister of blockade till 1918; assistant secretary of state for foreign affairs, 1918. In 1919 he was in Paris as chairman of the Supreme Economic Council, and assisted in drafting the Covenant of the League of Nations (*q.v.*). In 1920 he attended the first Assembly of the League at Geneva, as representative of the Union of S. Africa. He became Lord Privy Seal in the Conservative Gov. of 1923, and was raised to the peerage in the same year. In the second Baldwin administration, formed Nov. 1924, he was chancellor of the Duchy of Lancaster; and he frequently represented Sir Austen Chamberlain on the Council of the League. He was prin. Brit. representative on the Disarmament Commission at Geneva in 1926-27; and in 1927 he resigned from the gov. to devote himself to the strengthening of the League, in regard to which he had found his colleagues lukewarm. In 1919 he became joint president of the League of Nations Union; and in his book *The Way of Peace* (a collection of essays and addresses) he fully explains the seriousness with which he took the League. His uncompromising attitude towards war is evident from this passage in the introductory chapter: 'There are some who believe that, terrible as has been the material injury, there has been great compensation in the strengthening of the moral fibre of the race. I can see no sufficient evidence to support this belief. On the contrary, morality and religion seem to be weaker than they were, luxury and vice more rampant.'

Awarded the Nobel peace prize for 1937. Other pubs.: *A Great Experiment: an Autobiography* (1941); *A Real Peace* (1941); *All the Way* (autobiography), 1948.

Cecil, Henry, see under EXETER. PEERAGE OF.

Cecil, Lord Hugh Richard Heathcote, first Baron Quickswood of Clothall (b. 1869), fifth son of the third marquess of Salisbury. He was educated at Eton and Univ. College, Oxford. After acting as private secretary to his father, he became a prominent figure in the House of Commons as Conservative member for Greenwich, 1895-1905. He was a supporter of Arthur Balfour's Education Act, 1904, and later one of the leaders of the Unionist Free Traders in opposition to Joseph Chamberlain's policy of Tariff Reform. He was defeated in a three-cornered election for Greenwich, 1906; and was without a seat in the Commons until, in 1910, he was returned unopposed for Oxford Univ. An ardent High Churchman, he supported the Enabling Bill; and, when it became an Act, he was elected a member of the Church Assembly which it set up in 1920. In 1926 he was in favour of a measure that would have facilitated the demolition of old churches in the City of London, defeated in the Commons; and in 1928 he was wholeheartedly in favour of the ill-fated Prayer-Book Measure. He is the author of an admirable book, *Conservatism, 1510-1911* (1912). He has also written *Liberty and Authority* (1910); *Nationalism and Catholicism* (1919); and *Natural Instinct: Basis of Social Institutions* (1923).

Cecil, James Edward Hubert Gascoyne- and **Robert Arthur Gascoyne-**, see SALISBURY, MARQUESS OF.

Cecil, John (1558-1626), Eng. priest and political agent, b. at Worcester; educated at Oxford, Rheims, and Rome, where he became secretary to Cardinal Allen. He later went to Spain, and was employed by Father Parsons in various treasonable missions between Spain and England. He also acted as a spy for Burghley and Sir Robert Cecil. In 1594 he went to Spain to ask the aid of Philip for the Scottish Catholics, and acted with great success on numerous political-religious missions to France and Rome.

Cecil, Robert, Earl of Salisbury (1563?-1612), statesman, succeeded his father, Lord Burghley, as secretary of state (1596-1608). He was one of the commissioners who tried Essex for leaving Ireland without permission (1600). James I. rewarded C., who had helped him to the crown, by the gift of an earldom, but wanting C.'s estate at Theobalds for himself, obliged him to take Hatfield in exchange. The 'crook-backed' earl, as he was called, was an excellent speaker.

Cecil, Thomas, see under EXETER. PEERAGE OF.

Cecil, William, see BURLEIGH, BARON. **Cecilia**, saint, in the Catholic Church the patron saint of the blind and of music. Tradition credits her with having been a blind Rom. maiden who was martyred in the time of Alexander Severus (230), but later research corroborates the opinion of

Fortunatus, bishop of Poitiers (d. 600), that she lived in Sicily and was put to death by Marcus Aurelius about A.D. 176. There is a church in the Trastevere in Rome dedicated to her. Her festival falls on Nov. 22, and was always a musical celebration on account of her supposed love of music. Many Eng. poets have composed odes to her, the best known being that of Dryden, set to music by Handel in 1736 and by Sir Hubert Parry in 1889. She has been made famous in literature by Chaucer's *Seconde Nonne's Tale*, and immortalised on canvas by Raphael, Rubens, and Domenichino. Feb. 11 is the festival of another St. Cecilia who suffered martyrdom in Africa under Diocletian (303-4).

Cecropia, genus of tropical Amer. plants of the order Moraceae. The wood is very light, and ignites readily by friction; the fruit resembles a raspberry and has an agreeable flavour; the bark is fibrous. *C. peltata*, the trumpet-tree or snake-wood, is a native of W. Indies and S. America, and the stems are made into trumpets by the Indians. It is noted as an example of myrmecophily in which ants live in the hollow stems, obtain food from the tree, and guard it against the ravages of leaf-cutting ants.

Cecrops, in Gk. mythology the traditional first king of Attica, and, according to Pausanias, the founder of its future political life. He divided the people into twelve communities, and instituted the laws of property and marriage; he abolished the sacrifice of blood, and was the legendary giver of the olive-tree to Attica. His tomb was in the Erechtheum at Athens.

Cedar, or **Cedrus**, genus of Coniferæ which contains three species, *C. Libani*, *C. of Lebanon*, *C. atlantica*, the silver or Mt. Atlas C. of Algeria, and *C. deodara*, the deodar fountain-tree of India. These species, which are probably only varieties of a former plant, agree in having a fragrant, durable, light red wood which is used in building and cabinet-making. They are evergreen shrubs with needle-shaped persistent leaves, have wide-spreading branches, thick trunks, and the seeds take two or three years to ripen. They are cultivated in Britain on account of their handsome appearance, and in India they are thought to be sacred, and are planted near temples. The resin which exudes from the trunks was formerly used in embalming, and an oil was prepared from it. The name of *C.* is given to about fifty other trees, especially to sev. of the genera *Cedrela*, *Chamaecyparis*, *Cupressus*, *Juniperus*, and *Thuja*. The bastard C. of Jamaica is *Guazuma tomentosa*, and the white-wood *C.* is *Tecoma Leucocylon*.

Cedarberg, or **Cedar Mountains**, mt. range in Clanwilliam co. Cape Prov., S. Africa, so called from the profusion with which it is covered by the native cedar (*Widdringtonia juniperoides*). Highest peak, Sneeuwkop, 6300 ft.

Cedar-bird, or *Ampelis carolinensis*, passeriform bird common to N. America, and is closely related to the waxwing.

It is a songless bird, gregarious in habit, swift of flight, and has a voracious appetite, feeding on berries, fruits, and insects. It is known also as the Amer. or Carolina waxwing.

Cedar Creek, riv. of N. Virginia, U.S.A., rising in Shenandoah co., and flowing N.E. to enter the Shenandoah R., 3 m. E. of Strasburg. Near it the Confederates, under Early, were defeated by the Federals, under Sheridan, on Oct. 19, 1864.

manuf. of machinery, carriages, tools, cigars, textiles, etc., and in pork-packing, brewing, and railway industries. It is the seat of the Coe College, founded 1881. Pop. 62,100.

Cedar Resin, name given to the exudation of cedar-trees and allied species of Coniferae. It was at one time employed in embalming.

Cedrela, genus of tropical Meliaceae, many of the species of which yield a

National Building Record

PLASTERWORK CEILING AT TOTNES, DEVON

Cedar Falls, city of Black Hawk co., Iowa, U.S.A., 60 m. N.W. of Cedar Rapids on the Cedar R., and 93 m. N. of Dubuque. It has large manufs. of lumber, furniture, flour, etc., for which water-power is utilized. Pop. 9300.

Cedar Gum, resin obtained from *Callitris arborea* used in medicine and in making varnish. It has a fragrant odour, and in appearance is yellow and transparent.

Cedar Mountains, see CEDARBERG.

Cedar Oil, which is an essential oil frequently used in mounting sections, is obtained from *Juniperus virginiana*. This tree, although known as the N. Amer. red-cedar or pencil-cedar, is not true cedar.

Cedar Rapids, city, Linn co., Iowa, U.S.A., on Cedar R., 63 m. S.W. of Dubuque, and on sev. railways. The water-power of the rapids is utilised in the

compact, scented, and beautifully veined timber. *C. toona*, the bastard cedar, toon, or cedar-wood of S. India, has a bark which is a powerful astringent. *C. australis* is the Australian red cedar, and *C. odorata*, the W. Indian cedar, is made into cigar-boxes.

Cedrist, or Cœrulignone, volatile solid occurring in the form of dark blue needles when in the crystalline condition. It was discovered by Reichenbach, who obtained it from coal-tar products, and its chemical constitution is represented by the formula $C_{15}H_{11}O_2$. It is prepared in the pure condition from the distillation products of beechwood tar.

Cedron (*Simaba* (cedron), small tree of the order Sinarubaceae, indigenous to New Granada. Has a fruit like a plum, containing a seed like a large almond. Is a febrifuge and an antidote to snake-bite.

Cedrus, see CEDAR.

Cefalù, seaport of Sicily, standing on the N. coast. at the foot of a mt., 36 m. S.E. of Palermo. It has a fine Norman cathedral, and remains of Norman fortifications, while traces remain of the anct. Gk. tn. of Cephalædium. There are rich marble quarries near. Sardine fishing is an important industry. Pop. 16,000.

Ceglie, tn. of Lecce, Apulia, Italy, 27 m. N. of Brindisi. Pop. 19,000.

Cehegin, tn. of Murcia, Spain, 30 m. N.W. of Lorca. The anct. Legisa. Cereals, wine, hemp, honey, and esparto grass are among its products, and it manufs. paper. There are rich quarries of black marble near. Pop. 15,000.

Ceiling, architectural or building term for the upper interior covering of a room, hall, church, or other building. The derivation has been much disputed. Lat. *celare*, to carve, *celare*, to hide, have been suggested, but the most probable source is Fr. *ciel*, Lat. *cælum*, sky. The term ceiling should not be confused with roof, the C. being 'the undercovering of a roof or floor concealing the timbers' (Murray. *New English Dictionary*); thus such magnificent timber work as may be seen in Westminster Hall or Middle Temple Hall or the stone vaulting of cathedrals, etc., should not be treated as Cs. In the fourteenth century the construction of Cs. proper developed, so that what was merely the underside of the room above became an ornamental feature of the room below. Fr. and It. Cs. of the sixteenth century were moulded in plaster, gilded, and painted. In 1520 Raphael executed for the Vatican a reproduction of a C. from the Golden House of Nero, and the classical mouldings have been a favourite source of decorative design among architects, notably to the brothers Adam at the close of the eighteenth century. In modern times a return to the early timbered Cs., where the constructional beams remain visible, has become popular. The wooden C. of St. Albans Cathedral is one of the earliest examples of the class in England. Among other fine examples are the It. C. at Holyrood, and those at Haddon Hall; Sizergh Hall, Westmorland; the Red Lodge, Bristol; houses in Fore Street, Totnes, etc. (See illustration. p. 393.)

Ceiram, see CERAM.

Celakovsky, Franz Ladislav (1799-1852), Bohemian poet and philologist, early became a passionate enthusiast for Slavonic language and literature. His *Slavanské národní písní* (1812-27) was a collection of Slavonic national songs, and he wrote a book on *The Philosophy of the Slavonic Nation in Proverbs*, besides translating a number of Russian national songs into the 'kindred Bohemian.' Deprived of his editorship of the leading newspaper of Prague, and of his professorship at the univ. because of his criticism of the severity of Emperor Nicholas in quelling the Polish insurrections, he accepted a professorship at Breslau in 1842, and in 1849 returned to Prague to die, his calamities having embittered and warped his nature. His *Ruze stolieta* (hundred-

leaved rose) is considered his finest poem.

Celandine, name applied to sev. diverse plants. The genus *Bocconia* containing the W. Indian C., and the genus *Chelidonium* containing the common C., are both members of the family Papaveraceæ, while *Ranunculus*, to which the lesser C. belongs, is the typical genus of Ranunculaceæ. *C. majus*, the common or greater C., occurs in Britain; the flowers are small, have four yellow petals, and are in simple umbels. *R. ficaria*, the lesser C., figwort, or pilewort, resembles a buttercup, and has nine yellow petals; it was of this plant that Wordsworth sang. The lesser C. is common everywhere amongst grass in spring.

LESSER CELANDINE

Celanese, see under ARTIFICIAL SILK.

Celano, Thomas of (fl. 1250), musical composer, belonged to the order of Minor Friars. He wrote the long thirteenth-century hymn *Dies iræ, dies illa* which is interpolated in the *Requiem* or *Mass for the Dead*. The traditional plainsong setting has been introduced into instrumental music, as for example in Saint-Saens's *Danse Macabre*. He wrote biographies of St. Francis and St. Clara. See also DIES IRAE.

Celastraceæ, order of dicotyledonous plants, containing about forty genera, in tropical and temperate countries. The species are trees or shrubs, with simple, stipulate, often leathery leaves, and small, usually hermaphrodite flowers. The calyx consists of four or five free or united sepals, the corolla of four or five petals, the stamens, four or five in number, and the carpels, two to five in number, are inserted on a flattened disk. There are usually two ovules in each loculus of the ovary, and the seeds have usually a bright aril; the fruit varies. The chief genus is *Euonymus*, the spindle-tree, the wood of which is used for butchers' skewers; the fruits are crimson berries, each containing one to four seeds with an orange-coloured aril. *E. europæus* is common in hedgerows; other species are cultivated in gardens.

Celaya, city on the Rio Laja, 22 m. W. of Querétaro, in the state of Guanajuato.

Mexico. Its elevation is 6500 ft. and it manufactures woollens, saddlery, etc. Pop. 26,000.

Celbridge, small tn. on the Liffey. 12 m. W. of Dublin in the N.E. of co. Kildare, Eire. Pop. 800.

Celebes, is. of peculiar shape, belonging to the Dutch in the E. Indies. It is situated E. of Borneo and separated from that is. by the strait of Macassar. In shape it is a long narrow strip of land running from N. to S., with three finger-like extensions running E., N.E., and S.E. respectively. Each extension is separated by gulfs named Tomini, Bolo, and Boni. Minahassa, the name given to the N.E. extremity of the N. arm, is of volcanic origin: it is 7500 ft. high, and terminates in Mt. Kena. In the S., in Macassar, the elevation runs up to 10,070 ft. in Bobokaraeng, and 10,000 ft. in Bonthaeng. One of the characteristics of this is. is the number of lakes, most of them large, and situated at a considerable height above sea-level. Lake Poso, the central lake, is 1640 ft. above sea level, and Lake Tondano in Minahassa 2000 ft. Sadang is the name given to the chief riv., which is in the W. of the is., but it is of very little use for navigation. A N. wind prevails most of the time, and that, together with the sea breezes and rain, tends to temper the great heat, and thus make the climate an exceedingly healthy one. Gold, sulphur, and coal (lignite) are all found in the C. No large carnivorous animals are found here, nor has it the elephant, rhinoceros, or tapir, but the fauna is a specialised one. Reptiles are very numerous. The chief exports are coffee, trepang, nutmegs, copra, copal, and tobacco, and the trade is mainly done from the ports Vlaardingen or Macassar, and Kema in Minahassa. The Dutch built factories on the is. in the latter half of the seventeenth century, and have retained possession ever since. The inhabitants are mostly Malays. Total area 73,000 sq. m. The interior is inhabited by heathen tribes, who worship demons and spirits, cultivate the soil, and rear pigs and buffaloes. The S. and most of the coasts form Muslim principalities. The peninsula, Minahassa, is mainly Christian. The greater part of the is. is practically independent, but the Dutch have concluded treaties with all the native princes. Manado was shelled by Jap. destroyers on Dec. 30, 1941, with slight damage. On Jan. 10, 1942, Jap. forces protected by cruisers landed at Minahassa, despite Dutch resistance. On Jan. 19 Amer. bombers hit the Jap.-occupied airfield at Manado (N. Celebes), shooting down a number of Jap. fighter planes. But by the next day Jap. forces were in command of the whole of Minahassa, and there were further landings at Kendari (S.E. Celebes) on Jan. 24. The Jap. were in possession of the is. until the end of the war in 1945. The pop. is estimated at over 4,200,000.

Celebes Sea, arm of the Pacific Ocean, surrounded by the Sula Is. and Mindanao on the N., Celebes on the S., and Borneo on the W.

Celeriac, see CELERY.

Celery, or *Apium graveolens*, a European species of Umbelliferae found wild in the marshes of England near the sea. In its wild state the plant is poisonous, but when cultivated the blanched leaf-stalks are valuable as purifiers of the blood, and may be eaten raw with cheese and salt, stewed as a vegetable, or made into soup. The form known as celeriac is grown on the Continent on account of the turnip-like flavour of the roots, and it is used chiefly in made dishes or in sauces. In the cultivation of C. the plants are raised from seeds sown in a light, rich, well-drained soil from the end of March to the

CELERY

beginning of May. When they are a few inches high they are transplanted into another bed until they attain a height of 6 or 7 in., upon which a final transplantation is made, and the plants are placed in a row in a trench and gradually earthed up until they receive no light. The soil in this case should be very rich, well fertilised, and well drained, and the goodness of the C. is dependent on its rapid growth and the solid stalk of the leaves.

Céleste, Madame (1815-82), Fr. dancer and actress, b. in Paris. As a child she learnt dancing at the opera ballet, and when only fifteen was offered an engagement in New York, where she made her first appearance at the Bowery Theatre. She then came to England and played Fenella in *Masanello* at Liverpool and in London, 1831. In 1834 she returned to the U.S.A., where she created a great sensation; according to the story President Jackson introduced her to his Cabinet. She returned to London in 1837, gave up dancing and appeared at Drury Lane. Her best part was Miami in *Green Bushes* by Buckstone. She was manageress of the Adelphi Theatre with B. Webster, and subsequently of the Lyceum. She retired in 1876 and d. in Paris.

Celesti, Andrea (1637-1706), painter of the Venetian school, b. and d. at Venice.

C.'s works are very attractive, especially in colouring, in which he resembles Paul Veronese. He painted landscape, hist., sacred and profane, and *genre*; cabinet pictures, gallery pictures, and altarpieces. Five of his best pictures are in the gallery of Dresden, one of which is the sack of a city by night; it is the largest picture in the collection, being very nearly 23 ft. long by 13 ft. high.

Celestina, La, secondary title popularly given to the *Comedia de Calisto y Melibea*, a Sp. novel of sixteen acts (five more were added later), written in dialogue and usually dated at 1483 or 1497. The author is unknown, though it is highly probable that he was a certain Jew, Fernando de Rojas. Although certain resemblances may be traced between the characters and those in the work of Juan Ruiz, an earlier writer (q.v.), it is nevertheless the daring and eminently successful originality that impresses the reader of L. C. Not only does the novel contain types of all contemporary classes, the best drawn of whom are C., Melibea, and Calisto, but it is remarkable also for its intense tragic power. It was soon trans. into Fr., It., Lat., and Eng., by J. Mabbe in 1631.

Celestine is the name of five popes. C. I. (422-32) had a peaceful rule. He was the first to take an active interest in the churches of Britain and Ireland. C. II. (1143-44) removed the interdict which his predecessor had put upon King Louis VII. of France. The policy of C. III. (1191-98) was marred by hopeless indecision. After he had crowned Henry VI. emperor of Germany, he let him do as he liked, nor had he the courage to use his weapon, the interdict, against the recalcitrant Prince John of England. Pope C. IV. d. before consecration (1241). The fifth and last pope of the name resigned the chair of St. Peter after five months (1294), and for this great refusal figures in Dante's *Inferno*. He was canonised in 1313. *See also* CELESTINES.

Celestine, or Celestite, mineral consisting of strontium sulphate, SrSO_4 . It occurs as large well-developed orthorhombic crystals and as fibrous amorphous masses; it frequently has a light blue colour, whence the name C. The crystals are isomorphous with barytes, but are not so abundant; they possess a hardness of 3, and a sp. gr. of 3.9. Both forms are found in Triassic rocks; near Bristol it has been found that the strontium forming part of the mineral has been taken up by plants; in Gloucestershire the mineral is put to industrial uses. Other localities are Sicily (a colourless variety), Hungary, Jena (fibrous), Strontian 14, in Lake Erie, and Frankstown, Pennsylvania (fibrous). It is also a constituent of some mineral waters. Celestite is used in the manufacture of other compounds of strontium, such as the hydrate, which is employed in the refining of beet-sugar, and the nitrate, which produces the 'red fire' used in theatres and pyrotechnic displays.

Celestines were a religious order founded about 1256 by Peter di Morrone, afterwards Pope Celestine V. Though the C.

are counted a branch of the Benedictines, their form of gov. was much more akin to that of such mendicant orders as the Franciscans. Peter tried with ill success to persuade both the Benedictine monks of Monte Cassino and the Franciscan spirituals to coalesce with his brotherhood. At one time there were many Celestine monasteries in Italy, France, and the Netherlands, but the order is now practically extinct.

Celeus, king of Eleusis in Attica, extended a friendly hospitality to Demeter, when she was seeking for her daughter Persephone. Demeter found solace in nursing Demophoon, C.'s son, but was prevented by the child's mother from making him immortal by holding him over the fire.

Celibacy, term now generally used in the sense of a state of complete abstinence from marriage (Lat. *caelebs*, unmarried), but formerly including the state of a widow or widower. Considered generally, medical opinion holds that the chances of life are greater for married than for single persons, and, from the point of view of the interests of the State, it is obvious that widespread habits of permanent C., or of delay in marriage to a late period of life, must be disastrous. It is thus that C. has been frequently discouraged by legislation. In A.D. 9 (*Lex Julia et Papia Poppaea*) the Emperor Augustus decreed that celibates could not inherit unless related to the deceased in the sixth degree, limitations were placed on inheritances from husband to wife, and vice versa, if the union was childless, and preference was also given to candidates for office according to the number of their children. Taxation of bachelors has at times been enforced and still more often proposed. It is, however the enforcement of C. upon the clergy, or upon the adherents of particular religions, or upon special classes of those adherents, that makes C. of particular historic interest. To trace that hist. throughout the ages would be to write the hist. of asceticism: it must suffice to call attention to the self-mutilated priests of Cybele, the Galli, to the Rom. vestal virgins, and to the C. of the ant. Buddhist monasteries, and to confine this article to the C. of the secular clergy in the Christian Church. The C. of the monastic orders is a matter of vow on entering the order. Heb. religion made the priesthood hereditary from father to son, and the C. of the Essenes sect was a foreign idea due to contact with Hellenism and the E. mystics. St. Paul, speaking on the subject, asserts that a missionary can work more freely without the burden of a wife and children, but reserves for the apostles the right to take a wife with them in their journeys. It has been freely admitted since the Renaissance by the learned churchmen that C. was no rule of the apostolic church, and that view has not been rejected by the latest Catholic authority. Clerical C. grew slowly; its hist. can be traced first merely as a custom rather than as a discipline. The first clear rules come from the fourth century, where bishops and priests were

not allowed to marry, but might retain their wives if married before ordination. The lesser orders, deacons, etc., might marry only one wife, who must not be a widow or have been a concubine. Gradually, as the clergy became administrators of rich endowments, the feeling grew stronger that church revenues must be kept for the church and not be used to support the families of priests, and more stringent rules were put in force. The synod of Elvira, a local Sp. synod, A.D. 305, was the first to place the ban on the marriage of the higher clergy; at the council of Nicea, 325, a law to enforce C. on all the clergy was rejected. Paphnutius, a bishop of Egypt, warned the council against imposing so heavy a yoke, and defended the sanctity of marriage. The decretal of Pope Siricius, 385, commanded C. on bishops, priests, and deacons, and the separation from their wives on those already married. Popes Leo (461) and Gregory the Great (604) extended the rule to subdeacons. The struggle for the enforcement of C. continued; it was constantly resisted and frequently openly and freely disobeyed. Marriage of priests was still recognised sporadically, and where this was not the case, the practice of having concubines, *subintroductæ*, was often followed. Pope Gregory VII., Hildebrand, 1073, took such strong measures that he is often regarded as the author of the rule. Marriages of priests were declared null and void, the wives were treated as concubines, and heavy punishments inflicted on them; no priest who broke the rule could perform the Mass, and the lay people were warned against going to such priests. That the rule was not submitted to without a long struggle is shown by the fact that in 1450 John de la Bere, bishop of St. David's, refused to enforce the rule among his clergy, as he derived 400 marks yearly from their women. It was a subject of violent dispute at the Reformation, and finally was one of the most marked lines of difference between the Rom. and the Protestant Churches. At the revolution in France, by the constitution of 1791, all restrictions on the marriage of priests were abolished, but few priests took advantage of it. It remains to add that in the Orthodox Gk. Church priests usually marry before taking priest's orders, but may not re-marry; bishops must not continue their married life, but are usually monks.

Cellje, see CILLI.

Cell, in biology, the living unit of which all living forms are composed, according to the generalisation first propounded by Schleiden and Schwann (1838). The study of cells is *cytology*. The plant C. consists of a microscopical mass of protoplasm usually enclosed within a wall of a carbohydrate called cellulose. The animal C. usually possesses no obvious boundary wall, and is capable of changing its shape in many ways. Some animals and plants consist of one C. only; such are the Protozoa among animals and the bacteria among plants. Most living forms are multicellular, but the hist. of every

organism can be traced back to a single C., namely the fertilised egg. A single C. is the unit of structure of every living organism, and is capable of assimilating food material and growing, of changing its structure to adapt itself to particular conditions, and of reproducing other Cs. with which it may or may not retain some connection. Thus every C. owes its origin to some pre-existent C. It develops, fulfils its functions, and is at length destroyed or divides into other Cs. Knowledge of the structure and composition of the living C. is too inadequate to estab. any theory of the chemical and physical conditions which may have brought the original C. into existence.

Structure.—All Cs. consist of protoplasm. This term was first applied by von Mohl (1846) to the C. substance of plants, and subsequently included the similar substance previously observed in animal Cs. Protoplasm is a very complex mixture, consisting of organic compounds of the elements carbon, hydrogen, oxygen, nitrogen, phosphorus, sulphur, calcium, iron, sodium, magnesium, and potassium.

Owing to its colloidal nature, protoplasm is semipermeable, and this property enables liquid food to enter a C. and to be retained by it. The recognition of the colloidal nature of protoplasm is comparatively recent, and the different views held by various workers with regard to the structure of protoplasm are probably due to the different aspects presented by different phases of a colloidal system.

The protoplasm of most Cs. is differentiated into a colourless, translucent, viscous fluid, the *cytoplasm*, in which is embedded a more granular body, the *nucleus*. Included within the cytoplasm may be particles of food reserve and waste products; such inclusions are termed *metaplasm*. The cytoplasm may also contain bodies known as *mitochondria*, which are possibly of importance in respiration, and a *Golgi apparatus*, thought to be concerned in secretory activities of the C. The outermost boundary of the cytoplasm of some animal Cs. may be modified to form a membrane. The C. wall, when present, is not part of the C. proper; it is regarded as an enclosure probably secreted, or even excreted, by the cytoplasm. During the growth of the C., spaces termed vacuoles may form within the cytoplasm, and are filled with fluid, the C. sap. They occur more commonly in the Cs. of animals than of plants. Some Protozoa have contractile vacuoles which were formerly thought to excrete waste substances, but are probably more important for pumping out water.

The nucleus has a definite membrane enclosing a colourless fluid, the *karyolymph*, or nuclear sap, embedded in which is a delicate network, the *reticulum*, of *linin*. Distributed on this are granules of *chromatin*, so called because of its great capacity for absorbing certain stains. The chromatin is frequently irregularly distributed, forming small accumulations, *karyosomes*, on the reticulum. Within the nucleus there are often one or more

masses of chromatin; each of these is a *nucleolus*. It may function as a reserve supply of chromatin or may be extruded during nuclear div. as a waste product when supplies are plentiful. The nucleus is also believed to contain *chromosomes*, though these can only be demonstrated at the time of C. div., as described below.

The nucleus plays a very important role in the life of the C. Deprived of its nucleus, a C. may live for a few days, but death eventually occurs. In some way the nucleus controls the metabolism and distribution of food, initiates C. division, and is intimately connected with heredity. The mature red blood Cs. (corpuscles) of mammals are peculiar in lacking a nucleus, but in their early stages of development they are nucleate; the red corpuscles of other vertebrates contain a nucleus.

A small granule, the *centrosome*, is found in the Cs. of animals and of some plants. It usually lies in a clear area near, or even within, the nucleus; sometimes two centrosomes are present. They take an important part in the div. of animal Cs. and of some plant Cs.

Differentiation.—Cs. possess the power of developing certain qualities which enable them to perform their duties in the whole organism. Some single-celled organisms are capable of changing their shape, and thus accomplishing some extent of movement. The *amoeba*, for instance, can advance upon its food, envelop it, and incorporate it into its own substance, performing all the functions of movement, growth, digestion, excretion, and reproduction by itself, and on this account it is now often described as non-cellular, rather than unicellular, since it corresponds to the complete body of a higher organism rather than to one C. of that body. Except in the lowest multicellular organisms, it is necessary that there should be some div. of labour, that is, that the Cs. should become different from one another in function. Different degrees of differentiation occur; some Cs. become closely adherent to each other, forming the different kinds of epithelial tissues, some become altered in shape to form muscular or nerve fibres, and so on. Certain of the epithelial Cs. develop *cilia* or numbers of soft filamentous projections which are continually lashing to and fro. By this action, the mucus of the windpipe and air passages is gradually worked to the throat and then down towards the stomach, carrying with it the dust which might otherwise injure the lung. Certain Cs. specialise, as it were, in secretory function, as the mucus-secreting epithelial Cs., the fat Cs., and those which develop into ova. Others, as the nerve Cs. and nerve fibres, take for their special function the reception or communication of stimuli. Nerve Cs. are masses of protoplasm from which certain processes radiate, the long processes being nerve fibres. The actual mechanism or chemical action by which stimuli are transferred from one nerve C. to another is not known.

Reproduction.—Cs. may reproduce by

direct div., *amitosis*, or indirect div., *mitosis* (formerly known as *karyokinesis*). In the direct form of div. the Cs. are medially constricted and ultimately separate. The indirect form is a more complex process. The centrosome and the area in which it lies—the attraction sphere—divide into two parts which travel to opposite parts of the nucleus. The nuclear reticulum and membrane disappear, and the chromosomes become visible; each is already split longitudinally into two halves (*chromatids*). The daughter centrosomes, if present, subsequently separate from each other and travel to opposite poles of the nucleus and a spindle of fine fibres spreads between them. The chromosomes arrange themselves on the spindle, and generally half of each chromosome passes to each pole. The chromosomes are constant in number for each species, e.g. the sweet pea has seven pairs; *Drosophila*, the fruit fly, has four pairs. Frequently the chromosomes have definite shapes which appear in every div. The germ Cs. of animals contain only one chromosome of each pair, so that when fertilisation occurs the double number will be restored. These Cs. are consequently said to be formed by a reducing or meiotic div., in which the whole chromosomes of each pair pass to opposite poles. By this means the number of chromosomes is prevented from being doubled in every successive generation. The reducing also occurs once in the normal life hist. of a plant, but at various phases of the life hist., according to the type of plant. In all higher plants the reduction is at the time of spore formation.

The constancy of number and form of the chromosomes suggests that they would provide a suitable mechanism for inheritance, and genetic evidence supports the view that the nucleus plays a very important part in the transmission of characters. Breeding experiments with *Drosophila*, for instance, show that the hereditary characters are linked in four groups, which is in accordance with the chromosome number of four pairs. Indeed the relationship of genetics to cytology is so close as to constitute the composite subject *cyto-genetics*. See L. Doncaster, *An Introduction to the Study of Cytology*, 1921; C. D. Darlington, *Recent Advances in Cytology*, 1936; C. H. Waddington, *An Introduction to Modern Genetics*, 1939; R. A. R. Gresson, *Essentials of General Cytology*, 1948.

Cell, Voltaic, apparatus for generating electricity by chemical action. Prior to the experiments of the It. physicist Volta, electricity was known only in a *static* form; that is, charges might be stored in Leyden jars or other condensers, and could be utilised to obtain an instantaneous effect. Volta showed that by placing two dissimilar metals in contact, a mild but continuous disengagement of electricity occurs; he attributed the generation of the electricity to the mere contact of the two metals, but subsequent inquirers maintained that chemical action was promoted by the perspiration of the hand. It has since been demonstrated

that most chemical actions are accompanied by electrical disturbances, and whether such effects as Volta exhibited are altogether due to chemical action is mainly a matter of definition. Of all chemical actions, the most productive of electricity are those occurring between liquids and metals. In general it may be said that when a liquid acts upon a metal, the liquid becomes positively charged and the metal negatively charged. A simple form of C. may be arranged by partially immersing a plate of zinc and a plate of copper in dilute sulphuric acid. Very little chemical action is at first apparent except slow generation of hydrogen at the zinc plate. If, however, the plates are connected by a strip of metal laid across the top, a brisk chemical action is set up, but the hydrogen comes off at the copper plate; and if convenient arrangements are made, the passage of a current of electricity through the connecting strip or wire can be demonstrated. What happens is that negative electricity is produced in the zinc, and positive electricity flows through the wire from the copper to produce equilibrium; but as the chemical action is continuous, so is there always a difference of potential between the two plates, and thus a continuous 'current' is produced. The negative plate is always that which is the more powerfully affected chemically by the liquid; thus copper is positive in a couple consisting of zinc and copper, but negative in a couple consisting of copper and carbon. Such a C. as has been described has many disadvantages. First, the acid gradually weakens owing to the constant formation of zinc sulphate, and therefore the action becomes feebler. Secondly, zinc is often impure, and local chemical actions are set up by reason of the impurities; other small currents are produced, with a disturbing effect on the main current. In the third place, the hydrogen adheres to the copper plate and not only prevents the perfect contact of metal and liquid, but also reacts with the dissolved zinc sulphate, and tends to deposit a layer of zinc upon the copper, when there would result, not two dissimilar, but two similar, plates of metal. The last effect is called polarisation, and may be rectified by exposing the copper plate to the air, or by sending a current from another battery through in the reverse direction, or by simple mechanical brushing. V. Cs. have another disadvantage where any great quantity of current is required; the cost of material effectively prevents their competing with the more economical dynamo system. Still, there are light services where they are found convenient, such as the ringing of bells, experiments in the laboratory, lighting of moderate power (as in electric torches and the like), etc. They are then either used singly, when the wire from the more active plate becomes the negative terminal, and that from the less active the positive terminal, or in batteries, where all the negative poles may be linked together into one, and the positive poles similarly arranged, or the negative pole of one joined to the positive

pole of the next, and so on, the free wires acting as the terminals. The following are the best-known Cs., though some of them are now of little more than antiquarian interest:

Daniell's Cell.—A glass vessel contains a solution of copper sulphate, kept saturated by crystals placed on an annular shelf below the surface of the solution. A perforated copper cylinder stands in the solution, and within this a thin porous cylinder of unglazed earthenware; this contains dilute sulphuric acid, in which is placed a cylinder of zinc. The hydrogen produced by the action of the acid on the zinc is not deposited on the copper, but combines with the copper sulphate in the outer cylinder; the sulphate is thus constantly being used up, hence the necessity for extra crystals. A Daniell's C. has an E.M.F. of about 1.08, and remains constant for some hours.

Grove's Cell.—This differs from a Daniell's C. in containing nitric acid instead of copper sulphate, and platinum instead of copper. It consists of a flat rectangular vessel, partly filled with sulphuric acid, a U-shaped zinc plate, a porous pot containing strong nitric acid and a thin platinum foil. The disengaged hydrogen in this C. decomposes the nitric acid, giving off nitrous fumes. A Grove's C. has an E.M.F. of about 1.96.

Bunsen's Cell.—This resembles a Grove's C. in principle, the expensive platinum foil being replaced by a rod of gas-carbon. The C. consists of a glass vessel containing dilute sulphuric acid; within is a cylinder of amalgamated zinc; within that a porous vessel containing nitric acid and a rod of carbon. When arranged in battery, clamps have to be used to engage the carbon rods to the succeeding zinc cylinders. Such batteries were formerly much used on the Continent for experimental work. E.M.F. 1.91.

Smee's Cell.—This is a one-fluid C. in which polarisation is prevented by mechanical means. The C. consists of a sheet of platinum or platinised silver, placed between two plates of zinc, the whole being immersed in dilute sulphuric acid. The platinum is covered with finely divided platinum, from which the hydrogen rises more readily than from a smooth surface.

Bichromate Cell.—This consists of a zinc plate which slides up and down between two carbon plates dripping into a mixture of potassium bichromate and sulphuric acid, or chromic acid and sulphuric acid. This solution rapidly acts on the zinc, so that the zinc plate is clamped above the surface of the liquid when the C. is not in use. The E.M.F. is about two volts, but falls off after a while; for short experiments where a moderately high power is required these Cs. are very useful.

Lerlanché Cell.—This consists of a glass vessel about one-third full of a strong solution of sal ammoniac. The positive plate is a rod of zinc placed in this liquid; the negative plate is a rod of carbon placed in a porous pot which is tightly packed with manganese dioxide mixed with

carbon. The porous pot is sealed with pitch, only the top of the carbon rod projecting, and occupies the middle of the glass vessel containing the sal-ammoniac solution. The C. quickly becomes polarised, but with rest recovers of itself, and it is therefore well adapted for such intermittent service as the ringing of bells, etc.

Dry Cells are usually Cs. of the Leclanché type, in which the liquid sal-ammoniac is replaced by a paste or jelly consisting of sal-ammoniac and some absorbent material. They are very convenient and portable, and are well adapted for electric pocket lamps carried about on the person.

Latimer Clark's Cell.—One form of this C. consists of two glass tubes joining to form a common trunk; the bottom ends are closed with a platinum wire sealed in each, and the common neck is closed with a ground-glass stopper carrying a thermometer. In one branch is mercury covered by a paste formed by mixing mercurous sulphate, mercury, and zinc sulphate, and in the other is an amalgam of zinc and mercury. Crystals of zinc sulphate are placed in both bulbs, and the whole vessel is filled with zinc sulphate solution. The C. is not economical as regards voltage, but it is remarkably constant in E.M.F., and is therefore used as a standard C., having superseded the Daniell's C. for that purpose.

Minotto's Cell consists of an earthenware vessel at the bottom of which is a layer of powdered copper sulphate supporting a copper disk provided with a copper wire. Upon the disk is a layer of sawdust, on which rests a zinc cylinder; the whole is filled with water, from which, however, the wire from the copper disk is insulated. The C. is therefore a modification of a Daniell's C., the porous cylinder being dispensed with.

De la Rue and Müller's Cell consists of a glass tube 6 in. long, containing half an ounce of silver chloride, the remainder of the C. being filled with sal-ammoniac solution. The tube is closed with a vulcanite stopper through which a zinc rod 5 in. long and a silver wire 6 in. long pass. The hydrogen generated reduces the chloride to silver, which is deposited on the silver wire. E.M.F. about 1.03 volt. The advantage of the C. is its compactness. See also ACCUMULATORS.

Cellaria, genus of polyzoans in the group Flustrina, which is typified by the genus *Flustra*. In appearance it resembles a seaweed, and it is common on Brit. coasts.

Cellarius, Christopher (1638–1707) (whose real surname was Keller), Ger. classical scholar, was a student at the univ. of Jena and Gießen. He had taught in four gymnasia, including that of Weimar, before he became prof. of hist. at the univ. of Halle in 1693. His many text-books, as, for example, his *Latin Grammar*, *Antibarbarus Latinus* (1677), and *Latin Orthography* (1700) did much to raise the fallen prestige of classical studies. Other of his manuals were among the first authorities on the Samaritan language.

Celle, tn. in the prov. of Hanover, Germany, 23 m. N.E. of Hanover, on the Lehrte–Hamburg railway. The tn. was founded in 1292, and from the fourteenth century until 1705 was the residence of the dukes of Lüneburg-C., a branch of the house of Brunswick. The former ducal palace, which includes the court of appeal (*Oberlandesgericht*), containing a fine library, is a Late Gothic building, commenced in 1485, but considerably added to at the end of the seventeenth century. The tn. church contains the ducal burial vaults, and Sophia Dorothea, the divorced wife of George I. of England, is buried there, also Caroline Matilda, the divorced wife of Christian VII. of Denmark. Woollen yarn, tobacco, biscuits, umbrellas, etc., were the manufs. before 1939. Near by is Belsen, notorious for the concentration camp under the management of Kramer and his fellow criminals. See under REISEN. Pop. 25,550.

Cellier, Alfred (1844–91), Eng. musical composer. In company with Arthur Sullivan he was a chorister at the Chapel Royal, St. James. In 1862 he became organist at All Saints Church, Blackheath. He then went to Belfast as director of the Ulster Hall concerts and conductor of the Philharmonic Society. Returning to London, he was appointed organist at St. Albans, Holborn, but in 1871 he went to Manchester to conduct at the Prince's Theatre. For the next eight years he conducted at Manchester and at London theatres, at the same time composing operas and operettas; of his earlier works *The Sultan of Mocha* was the most successful, but he achieved his greatest success in 1886 in *Dorothy*, a comic opera, the libretto being written by B. C. Stephenson. He owed a good deal to his friendship with Sir Arthur Sullivan, but his writing is remarkable for its delicacy and pleasing melody. He composed settings of Gray's *Elegy* (for orchestra and chorus). *The Mountebanks*, libretto by W. S. Gilbert, was produced after his death, in 1892.

Cellini, Benvenuto (1500–71), It. artist, fortunately wrote his own life. It reads like the most extravagant of adventure tales. B. in Florence, he was expelled from his native city because of his implication in some civil broil. After living in Bologna, where he became an excellent flautist, he eventually arrived in Rome. Here he became court musician to Pope Clement VII., made silver vessels of every description, and finally in 1527, according to his own account, actually killed with his own hand the Constable de Bourbon, who was attacking Rome, and later mortally wounded the prince of Orange. A little while after he had been pardoned for slaying his brother's murderer, he killed by accident a rival goldsmith. But Paul III. set him free in 1534, as he wanted some dies in the mint engraved. Later, being falsely accused of embezzling pontifical jewels, he was thrown into an oubliette of St. Angelo. The intercession of Cardinal d'Este alone saved him from death. His sojourn at

the court of Francis I. was cut short by his murderous attack on the plaintiff in a lawsuit. Finally C. returned to Florence, where he executed his famous bronze 'Perseus with the Head of Medusa' (in the Loggia dei Lanzi, Florence), under the patronage of Cosmo de' Medici. The merits of this masterpiece are such as to make it one of the most typical and unforgettable monuments of the Italian Renaissance. Of his many other works of art there have survived to this day the famous silver salt-cellar of Francis I. (now at Vienna), a medallion of his patron, Clement VII., and some gold medals. As an artist he has perhaps been overrated, for his knowledge of anatomy was small and his designs often weak.

BENVENUTO CELLINI

But his versatile genius, which made him at once a goldsmith, sculptor, and engraver, led him also to write, and to-day his fame largely rests on his unique and diverting autobiography. J. A. Symonds, who trans. it into Eng., says that from its pages 'the Genius of the Renaissance, incarnate in a single personality, leans forth and speaks to us.' Here the author narrates with a frankness that disarms the moralist the whole story of his amours, his passionate devotion to arts, his shameless self-worship, and self-assertion running into almost incredible extravagances, the devout complacency with which he could contemplate a well-achieved homicide, and his alleged supernatural visions and angelic protection during adversity. See trans. by T. Nugent, 1771, 1812; J. A. Symonds, 1888; T. Roscoe, 1822, 1904; A. Macdonell (Everyman's Library), 1903; R. H. Cust, 1910; also life by R. H. Cust, 1912.

Cellular or **Areolar Tissue**, loose connective tissue consisting of fibres running in all directions and forming meshes called areolae. There are two

kinds of fibres: white fibres, which are soluble in boiling water to form a solution of gelatin, and yellow elastic fibres, insoluble in hot water. In the spaces of this tissue are found lamellar cells, flattened cells usually attached to bundles of white fibres; plasma cells, not flattened; granular cells, packed with deeply staining granules; and leucocytes which have left the blood capillaries. It is the commonest connective tissue in the body, being found in the skin and also covering all the internal organs.

Cellulitis, diffuse inflammation of cellular tissue, caused by septic invasion. The tissue may regain its healthy condition if treated by rest and hot fomentations, but suppuration may occur which may endanger neighbouring structures. An important variety is pelvic C. or parametritis, in which there is inflammation of the cellular tissue about the uterus. This condition may be consequent upon abortion or delivery following operations. It may be anterior, when, if the inflammation proceeds to an abscess, the pus is discharged into the bladder, vagina, or groin. Inflammation of the posterior tissues may cause fixation and torsion of the uterus. Remote parametritis is characterised by abscesses appearing some distance from the seat of the disease. Pain should be treated by anodynes, and an effort should be made to reduce the inflammation by careful diet and hot counter-irritants. When an abscess is formed, it should be localised if possible, an incision made, and the pus drained off. Sulphonamides and penicillin are of great value in the treatment of C. After-treatment include a prolonged period of rest.

Celluloid, **Xylonite**, or **Pyroxylin Plasto**, artificial colloid prepared from a mixture of nitrocellulose with camphor. It was first prepared by Parkes and Spill in England, in 1856, but the improvements in the manuf. introduced by Hyatt, of Newark, New Jersey, revolutionised the industry and made it predominantly Amer. The name Xylonite is given to it by the leading Brit. manufs. the Brit. Xylonite Company. The nitrocellulose is first made from substances composed essentially of cellulose, such as rags or, more particularly, tissue-paper. Shreds or strips of the latter are steeped in a combined bath of sulphuric and nitric acids of such composition as not to produce the explosive gun-cotton. Nitrocellulose is thus produced, and great pains are taken to extract the excess of acid, the presence of which produces deterioration in the final product. This is done by thorough washings and the water is either pressed out by hydraulic pressure or replaced by alcohol. Drying by heating would be too dangerous owing to the risk of explosion. The next process is to break up the cakes of nitrocellulose and add to it camphor dissolved in ethyl alcohol in the proportion of two of nitrocellulose or pyroxylin to one of camphor, and mix the whole thoroughly up in a kneader. In some cases flake camphor is added to

the pyroxylin and the mixture in boxes sprinkled with alcohol until it settles down into a dough. At the same time colouring substances and a fixing compound are added, and the whole is made homogeneous. It is then rolled and worked in heated rollers and pressed by hydraulic pressure machines, and a cake produced of the material containing a quantity of the liquid solvent, which must be removed by keeping the substance in a heated room for prolonged periods. When all is removed shrinking has occurred, and the substance is ready for working in various processes. C. is buff in colour, but may be bleached by means of bleaching powder or other bleaching agent, and can also be made transparent in various colours. It is coloured by mineral colours, while coal-tar dyes are employed for colouring the transparent varieties. In the latter there is more need of a stabiliser or fixing compound than in the other varieties, since the generation of acid is more liable to cause deterioration. A substance is required that reacts with this acid to give products of reaction that will be harmless to the material, and it is found that compounds of urea serve this purpose very well. C. brought in contact with a flame burns more rapidly than paper, camphor distils off, and a good deal of free carbon is evolved. There is always a slight odour of camphor about it, except in the very best produced, especially when it is scratched. Non-inflammable C. has not yet been developed with sufficient success to become a commercial product. It is non-explosive at ordinary working temps. and is plastic at 75° C. Its hardness and elasticity at ordinary temps., together with its invulnerability, have led to its wide application in articles of daily use. Thus, for knife handles, piano keys, combs, and mirror backs its use is general, and its ease in working up has led to the imitation of such natural products as ivory, horn, and bone. Imitation marble is made by pressing together plates of differently coloured material, while imitation tortoise-shell can be and is much produced by pressure and heat on yellow plates between yellow coloured with brown. In recent years, C. has been largely displaced by such modern plastics as bakelite, nylon, perspex, etc.

Cellulose, organic substance secreted by the protoplasm to form the primary cell-wall of all plants, but it is not essentially present in all successive layers of the cell-wall after thickening has taken place. It is a carbohydrate, and its chemical composition is formulated as $C_6H_{10}O_5$; its characteristic reaction is that it turns blue when treated with sulphuric acid and iodine. C. is remarkable for its insolubility, and only an ammoniacal solution of oxide of copper will dissolve it without change. When soaked in strong nitric and sulphuric acid gun-cotton is obtained from it; when boiled for a long time with dilute hydrochloric or sulphuric acid it is converted into glucose. It is well known to us in a very pure state as cotton-pith, vegetable ivory,

and parchment-paper. As it occurs so freely in vegetable matter it naturally enters into our diet to some extent, but in man it is not nearly so easy of digestion as it is in ruminating animals.

Cellulose Acetate is a substance formed by treating purified cellulose, in the form of cotton or bleached cotton linters, with acetic anhydride in the presence of sulphuric acid. It is a pale yellowish, transparent, non-inflammable mass and can be prepared in three chief forms

soluble in alcohol, insoluble in water;

insoluble in water;

insoluble in water, alcohol, and ether. The first manufacturing process for C. A. was patented in 1894 by C. F. Cross. Miles in 1905 improved the quality of the product by introducing the process known as ripening, while the research work of the brothers Dreyfus during and since the First World War has resulted in the development of the acetate-silk industry. (See ARTIFICIAL SILK.) The C. A. as prepared on the commercial scale is a mixture of sev. acetate compounds. It is precipitated with water in the form of flocks, washed free from acid, dried and dissolved in acetone. The resulting clear viscous solution is filtered and delivered to spinning machines. Amongst its other uses are aeroplane dope, non-inflammable films, lacquers, and non-shatterable glass.

Celosia, tropical and temperate genus of *Amarantaceae*, cultivated in England on account of the curious inflorescence, which is crested and flattened, and gives the plants the popular name of cockscomb. This appearance is due to the monstrous condition of the floral axis which has now become a common characteristic of the plants through cultivation. *C. cristata*, the common cockscomb, and *C. coccinea*, both natives of the E. Indies, vary in height from 6 in. to 2 ft. and the colours from red to white.

Celsia, genus of *Scrophulariaceae*, known to Asia, Africa, and the Mediterranean. The flowers are nearly regular, and there are only four stamens. *C. orientalis* and *C. sublanata* are the most noteworthy species.

Celsius, Anders (1701-44), Swedish astronomer, b. at Upsala. He was prof. of astronomy in the univ. in his native town from 1730 to 1744. He travelled much in Germany, Italy, and France. In 1733 while in Nuremberg he pub. numerous observations of the aurora borealis which he had made himself. He invented the centigrade thermometer.

Celsius, Magnus (1621-79), Swedish astronomer, b. at Alfta, Helsingland. He was a prof. of mathematics and astronomy at Upsala, where he discovered the Helsing runes and deciphered them. He d. at Upsala.

Celsius, Olof (1670-1756), son of Magnus C., b. at Upsala. He held the post of prof. of theology and oriental languages

at the Upsala Univ., and was also a provost of the cathedral. He was a great botanist, and made himself famous by his researches on the plants mentioned in the Bible. He was the patron and instructor of Linnaeus.

Celsius, Olof, the Younger (1716-94), Swedish historian and poet, son of Olof C. b. at Upsala. For some years he held the appointment of assistant librarian at the Upsala Univ., where he became prof. of hist. in 1747. Later he entered the Church and went to Stockholm, and in 1777 he was made bishop of Lund. He was one of the original members of the Swedish Academy. He wrote, among other works, a hist. of Gustavus I. (1746-1753), and a hist. of Eric XIV. (1774), and was famous for his brilliant style and keen criticism. He d. at Lund.

Celsus (c. A.D. 178), one of the earliest opponents of Christianity, lived during the reigns of the Antonines, and is believed to have been a friend of Lucian. He was the author of *The True Word* (*Ἀληθὴς Λόγος*) which was being preserved for us in fragments by Origen, who undertook to refute C.'s arguments, and did so in his work, *Contra Celsum*. The heathen's attitude may be somewhat Platonic, with a tendency towards Epicureanism, but essentially it is that of the man of the world whose religion is mere agnosticism, and who has brilliance without depth. He upbraids the Christians for their absurd credulity, their party schisms, their exorcism of demons, and for the disreputable character of their proselytes, who are rogues, poisoners, thieves, and idlers, women and slaves.

Celsus, Aulus, or Aurelius, Cornelius, Latin writer on medicine and surgery. Little or nothing is known of his life, but he probably lived in the reigns of Augustus and Tiberius. He wrote sev. works, of which only one remains entire, his treatise *De Medicina* in eight books. Books I. and II. deal principally with diet and principles of therapeutics and pathology; III. and IV. with internal diseases; V. and VI. with external diseases and pharmaceutical preparations; and VII. and VIII. with diseases calling for surgical treatment. His method in dealing with disease is apparently to allow nature to take its own course, though he also advises a free use of the knife on occasions. His treatise on surgery points to the fact that many of the most delicate and serious operations were performed in his time. It is not clear whether C. wrote a separate treatise on surgery apart from what is contained in books VII. and VIII. of his *De Medicina* or whether he also wrote a separate work on pharmacy. According to Seyffert, C. was the author of an encyclopedic work called *Artes* in more than twenty books, of which all that remain are books 7-13 (*sic*) *De Medicina*.

Celsus, P. Juventius, Rom. jurist, son of a jurist, Juventius C. (fl. c. A.D. 75); b. c. 67, d. c. 135 or about the year when Hadrian d. Was accomplice in a conspiracy against Domitian along with

Nerva and others, but contrived to exculpate himself and his companions. Subsequently he was highly favoured by Nerva and his son, Trajan. He was praetor at some time and twice consul, but the date of the first is not recorded, though the second is said to have been A.D. 129. He was a friend of Hadrian. He received legal instruction from his father and early began the practice of law. Only fragments of his legal commentaries are extant. Among these are a digest of thirty-nine books, seven of which are a commentary on the *Lex Julia et Papia Poppaea* (prohibiting the marriage of senators and freedwomen and all free-born with actresses or women of openly bad character) an attempt (with other *leges* of a similar kind) to restore virtue to private life by a system of rewards and penalties. In these fragments there are sev. passages which betoken great self-confidence and dogmatism; for where most jurists prefix their opinions with a *videtur* (or as we should say, 'it is submitted that etc.') C. stated his opinions unreservedly. But that he was an eminent jurist is shown by the fact that he is so often quoted by many of the most famous jurists of a later time—Pomponius, Ulpian, Paulus, and Maccianus.

Celt (from Low Lat. *cellis*, a chisel), has been used by both Eng. and Fr. archaeologists to designate the stone and bronze axe-heads used by the primitive peoples of Europe. The normal length of a stone C. is 7 in., but it varies from 1 to 20 in.; a bronze C. may be 10 in. long, but is usually 5 or 6. The earliest stone Cs. were made of schist, slate, or shale, but the latter were of porphyry, flint, or agate, stones which allowed of a high polish and a fine cutting edge. Most stone Cs. and some bronze ones are flat blades of oval section, sharpened more at one end than at the other. The better bronze axe-heads often had flanged edges, a stone ridge or elevation, between the blade and the part to which the handle was fitted, and a socket or hollow for the handle. Cs. served as axes, chisels, adzes, etc., and were superstitiously regarded as 'thunderbolts,' or as implements endowed with strange curative powers.

Celtiberi, powerful people of ant. Spain, said to have sprung from the intermarriage of Sp. aborigines (Iberians) and Celtic invaders from Gaul. They inhabited an inland dist. (approximately the present S.W. of Aragon and N. and E. of Castile). Celtiberia, however, was often used to include country right to the Guadalquivir's sources. The C. were one of the bravest and noblest peoples of the peninsula. Subdued by Hannibal, they served as Carthaginian mercenaries against Rome, later becoming Rom. mercenaries (Livy, xxiv. 49). T. Sempronius Gracchus subdued their country, 179 B.C., but they were always rebelling. Finally Scipio Africanus conquered them by the destruction of Numantia (133). They joined Sertorius later, but after his death (72) became quite Romanised. See Hübner's article in Pauly-Wissowa's *Real encyclopädie*, III., 1886-93.

Celtic Language and Literature, see GAELIC.

Celtic Ornament, which grew out of the Iron Age decoration in the Brit. Isles, may, for historical purposes, be divided into two periods: the pre-Christian, extending from 250 B.C. to A.D. 600, and that which followed the introduction of Christianity, and attained its highest excellence in the eleventh or twelfth century. In the earlier stage the metal most commonly used was bronze, and the chief fields of decoration were shields, scabbards, bracelets, harness mountings, and horse trappings. Repoussé work of low and high relief, done on thin plates which were afterwards riveted into position, has been found throughout the Brit. Is. in the beds of rivers and lakes, in earth houses, crannogs, and grave mounds, where also other products of C. art are constantly being found. Sometimes the repoussé design is enriched by champlevé, enamels of yellow, blue, green, and red, or by patches of coloured vitreous pastes. This is the case with a unique oval bronze shield, rescued from the Thames, where there are twenty-seven settings of red enamel. During these early centuries the C. artists depended on divergent spirals and elliptical curves for their designs, engraved lines or dots like a diaper filling up the pattern, which thus showed up against the plain groundwork. Many fresh elements of ornament, such as fretwork, with involved patterns, diagonal frets, and oblique lines, interlaced work and diapers of I- and Z-shaped designs, were added as further embellishments when paganism gave way before the new religion. And, further, there were now bells, croziers, shrines, churches, and above all the MSS. of the gospels and psalters as fresh openings and encouragement for the C. artist. The Book of Kells in Trinity College, Dublin, and the Lindisfarne Gospels in the Brit. Museum, with their beautifully illuminated pages, their elaborated patterns of an almost inexhaustible variety, offer the finest illustration of the art of this period. But the enamelled metal work which still flourished is nobly represented by the Ardagh Chalice, and the Tara and Rogart Brooches and the Cross of Cong are fine examples of filigree and chasing work in gold and silver.

Celtis, Konrad (1459-1508), Ger. humanist, attended the lectures of Agricola at Heidelberg, and there founded a literary society. After travelling abroad and working to spread Ger. culture, he accepted in 1497 the chair of poetry and eloquence at Vienna, and became librarian to Maximilian I. It was whilst he was in his library that he discovered the map of the Rom. Empire pub. by Peutinger. Among his own pubs. were *Odorum libri* (1513).

Celts, generic name of an anct. people, the predominant element in central and W. Europe before the rise of Rom. power and the influx of Ger. tribes. Great confusion has resulted from inaccurate use of the words Celt and Celtic. The dark-complexioned people of France, Great

Britain, and Ireland have been called Black C., while the tongues of the races of W. Scotland and Ireland are commonly termed Celtic. More properly they are Gaelic. Anct. writers never used the word of dark peoples. The Celtic characteristics were great stature, fair hair, and blue or grey eyes. All fair-haired peoples N. of the Alps were called *κελτοί*. Physically there were two main groups closely allied: Scandinavians (Teutonic in modern writers), and peoples of France, Switzerland, and Italy (Celtic or Alpine race), standing midway between the Teutonic and the Mediterranean race (dark). C. appear to have settled in Gaul between 1200 and 700 B.C. Some had dwelt in the Alps and the Danube valley from the Stone Age. Others passed into Italy in the Bronze Age. In the sixth century B.C. they spread into Spain, and from intermarriage with the native Iberians in the N.-central parts, were called Celtiberi (q.v.). About the fourth century B.C. a great wave of C. invaded Italy, occupying Rome after the battle of the Allia, 390 (Liv., v. 34). Bought off, they retired to Sena Gallica. The Bituriges (a name still surviving in Berry) were the chief tribe. Others were the Arveni, Senones, Ambarri, and Ædui. These Gauls are often also called Cimbri. The most dreaded tribes came from the Baltic and the N. Ocean; hence the peoples now called Teutons were named C. The height of their power was about 400 B.C. In the third century they had spread as far as Greece and Asia Minor. Their raids were the terror of antiquity, but Cæsar and Augustus reduced them to inactivity. Under the latter, Galatia, where numbers of C. had settled, became a prov. They founded no lasting state alone and preferred a pastoral to an agr. life. Their strength made them formidable foes, but they lacked discipline. Cato described them as 'devoted mainly to warfare and witty conversation.' In the Brit. Isles they remained independent for centuries. These island C., who were but colonists, were far less civilised than the continental C. During the 400 years after Cæsar's expedition to Britain they became closely allied with their Rom. conquerors. They wore a sleeved blouse and trousers, fitting close to the ankle, with a tartan plaid across the shoulder fastened by a brooch, much like the costume of Highlanders in Queen Anne's time. They often had gold or bead ornaments, and enamel on their armour. The C. of Gaul and Belgium wore plated armour or chain-mail coats. They could work various metals (copper and iron), and discovered bronze. Among their weapons were swords, daggers, bows, pikes, slings, and javelins. They used two-wheeled chariots in war with a bronze scythe projecting on either side, and were notoriously good seamen. They had Druids, or priests, who performed magical ceremonies, which survived in the forms of the 'ordeal,' augury, exorcism, etc. The clan system was deep-rooted. They had musical, poetical, and literary tastes, and were distinguished for dramatic talent.

Reading museum has interesting relics of the tn. of Silchester, an old Celtic centre.

The group of languages which are commonly known as Celtic belong to the Indo-European family. They now comprise Welsh, Breton, Irish, and Scottish Gaelic, and Manx. Cornish has died out. These are in close relation with the Italic and Germanic groups. See J. Beddoe, *Celtic Races of Britain*, 1885; W. F. Skene, *Celtic Scotland*, 1886-90; A. H. Keano, *Man, Past and Present*, 1899; J. Rhys, *Celtic Folklore*, 1901; D. Mathew, *Celtic Peoples and Renaissance Europe*, 1933; H. Hubert, *The Greatness and Decline of the Celts*, 1934; V. C. Childe, *Prehistoric Communities of the British Isles*, 1940; J. A. MacCulloch, *The Celtic and Scandinavian Religions*, 1949.

Celyphus, genus of dipterous insects which resemble little beetles rather than two-winged flies, on account of the enlarged scutellum which hides the reduced abdomen. *C. abjectus* inhabits Java. *C. scutatus* the E. Indies.

Cement, material used for binding surfaces together or for uniting particles in one mass. There are many varieties manufactured in various ways according to the purposes to which it is to be put. The chief kinds used for building purposes are Rom. C., Portland C., and the plaster of Paris Cs. These prepared from pitch are known as bituminous Cs., and then there are glues, pastes, etc., used for small operations. The manufacturing process of building Cs. consists of the formation of silicates and aluminates of calcium by the intense heating of lime with clay, the first being derived from chalk or limestone by driving off the carbon dioxide. It has been shown by Newberry that the chief hardening constituent of C. is tricalcium silicate ($3\text{CaO} \cdot \text{SiO}_2$), and that dicalcium aluminate is the chief setting agent. The usual composition is found to be about 22 per cent of SiO_2 , silica, 7 per cent of Al_2O_3 , alumina, 62 per cent of lime, and small quantities of iron, soda, magnesium, and sulphuric acid. Roman C. may be termed a natural C., as opposed to the artificial nature of Portland C. It was unknown to the Romans, and is also called Parker's C. from the name of its inventor (1796). It is a very quick-setting C. (less than thirty min.), and was much used before the invention of the cheaper and stronger Portland C., which has ousted it from its superior position. It is prepared from the nodules known as septaria which are found in shale, especially in the Isle of Sheppey and its neighbourhood. It is similar to hydraulic lime, being quick in setting, and owing to the fact that it sets rapidly under water is used extensively in hydraulic works, such as breakwaters, piers, sea-walls, etc. The nodules consist of about 20 per cent of silica and 15 per cent of alumina. They are calcined to drive off the carbon dioxide and ground fine. Portland C. is the most widely used C. and is manufactured in enormous quantities; America takes the lead in this respect. It is, unlike Rom. C., an artificial product prepared by the admixture of chalk and clay. It was invented by

Joseph Aspdin, of Leeds, in 1824, and was primarily an Eng. industry, the seat being the lower reaches of the Thames and Medway, where mud was plentiful, and this locality still produces the greater part of the C. made in Britain. The process of manuf. has now reached a high state of perfection, and is divided into three parts: (1) the preparation of the raw materials; (2) calcining the clinker; (3) crushing and grinding the finished product. There are two processes, the wet and the dry, which are used according to the nature of the materials used the dry process being used where the materials are too hard for the wet treatment. The original method is the mixing of riv. mud and soft chalk; the wet is the natural process, and this will be described first. The materials are mixed in a wash mill, which consists of a basin of brick or masonry with a masonry pier in the middle. On the latter is fixed a vertical revolving shaft to which horizontal arms are attached. From these hang harrows or vertical iron bars which dip into the materials mixed with water and rotate with the shaft. This thoroughly mixes up the sludge and breaks up any of the lumpy parts. The product is known as slip or slurry and passes out of the mill through a grating of such div. as to let pass any particles under a certain fineness. Stones accumulate at the bottom of the mill basin and can be easily removed, while any hard lumps of chalk must be ground by rollers. In the dry process the materials are dried before admission to the mixing, and various methods of drying are adopted. Briefly, these are the drying drum and the drying kiln. The first consist of a revolving cylinder or drum, through which the materials are gradually passed while the whole is heated. In the kiln there are two walls. In the interior space is a furnace, while the materials pass through the space between the two conical brick walls, damp being fed in at the top and dried material taken out at the bottom. As the kiln is kept full, the process can be kept continuous in operation. The materials before drying are crushed in a 'ball mill,' which consists of a rotating drum containing steel balls which, by means of steps, drop across from side to side. After crushing and drying the materials must be mixed in the right proportions, and this is done in mixing bins. Then the mixed materials are passed through a tube mill and thoroughly ground. This mill consists of a long tube revolving on its axis and filled with hard flint pebbles, the finely divided powder passing through gratings into a casing. After either of these processes the material is ready for calcining. This can either be done with the materials in the form of bricks as resulting from the wet process, or with powder from the dry process. The best form of kiln is the rotary kiln, although others are sometimes used. It consists of a long, cast-iron tube lined throughout with firebrick and slightly inclined to the horizontal. The material enters at the upper end and the blast or

burning material at the lower. A chimney at the top serves to create a blast and carry away the gaseous products of combustion. The whole rotates at a fixed slow speed. The usual method of calcining is by means of coal dust, which is carried into the kiln by an air blast and on reaching the heated portions takes fire and gives out an intense heat. The final process consists in the grinding of the clinker product. This is very important, since it is found that the finer the grinding the more satisfactory and strong the resultant C. The grinding is similar to

employed in testing and the results which should be found can be seen in a report issued by the Engineering Standards Committee, to be obtained from their offices, 28 Victoria Street, S.W. We now come to the plaster Cs., which are of various kinds, but have the most important constituent in common. This is gypsum or sulphate of lime, which in the dehydrated state is known as plaster of Paris. Cs. of this class are used in internal work, being partly soluble. *Plaster of Paris* is manufactured as follows: The gypsum ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$), found in many

Cement Marketing Board

A GROUP OF SLURRY MIXERS

that employed in the case of the raw materials, taking place in tube mills, but is performed in two stages. First there is a coarse grinding and then a fine. The finishing process is such that on sifting through a 180-mesh sieve (i.e. one with 32,400 holes to the sq. in.) the residue is generally about 15 per cent; at any rate it must not be more than 22½ per cent. The next item in the process is testing the C. This is done both with neat C. and also with a mixture of one part C. and three parts sand, as is generally used. The C. is gauged with as little water as possible and moulded into briquettes with a waist section of 1 sq. in., and the tensile strength, or crushing strength, is measured in testing machines. This is done at intervals, for instance, on the first day, the seventh, fourteenth, etc., the strength gradually increasing. Full particulars of the methods

localities, especially in the clays of ancient riv. basins, is deprived of a portion of its water of crystallisation by heat, and powdered very fine. It is then very eager for water, and on its addition rapidly crystallises in small hard crystals in which the water is taken up. Thus a hard mass is produced, which is found useful in internal plastering and uniting metal with glass. It is fairly hard but not sufficiently so for places liable to be knocked about, such as skirtings, dados, etc., and special compositions are made for this purpose. Among these are *Keene's C.*, which is made by soaking the plaster of Paris in strong alum solution and then recalcining it, and *Parian C.*, treated in a similar way with strong solution of borax. Other types of C. are Grapier and Le Farge, made by finely grinding the hard lumps left when hydraulic limes are slaked and sieved.

They consist of unchanged limestone and calcium silicates. There are also Cs. called iron Cs. or iron ore Cs., in which ferric oxide replaces a large part of the alumina. There must always be some alumina present, for all attempts to prepare Portland C. in which the whole of the alumina is replaced by iron oxide have met with failure.

Another class now much used is the magnesium oxychloride or Sorel's Cs., formed by the reaction between magnesium chloride, water, and prepared magnesite; the composition of the product varies with temp., proportion of ingredients, time of reaction, etc. Mixed with fillers, such as wood-flour, cork, talc, silica, asbestos, marble dust, etc., it forms the product much used as a sanitary, resilient stone flooring in large modern buildings. Another class of Cs., and a class of increasing importance, is that composed of Cs. with tar or pitch as their prin. constituent. Asphalt is a natural product which, heated and mixed with small particles of stone, forms a durable and easily worked surface. The surfaces of main and other roads are covered with a layer of pitch mixed with ground shale or sand and rolled, which, in addition to being free from dust, is easy to lay and keep up. Tar macadam has undoubtedly a great future before it in this respect. C. of this sort is also used to render walls damp-proof. The last class of C. is that consisting of various adhesives used in small quantities, such as gums, glues, pastes, and so on. Some have particular application for special work. Thus *Canada Balsam* is a resin obtained by piercing the bark of the Amer. balsam-fr. Its chief property is its transparency when set, which makes it eminently useful in optical work for cementing together glass surfaces. *Paste* is used for cementing paper and is made from flour or starch, the flour being rubbed up with water and boiled. The addition of water before boiling improves the quality, making it thinner and stronger. In large quantities C. is used for wall-papering and bill-sticking, and can be made by mixing a quarter of flour with a quarter of a pound of alum into a creamy consistency with warm water, and then pouring on boiling water and stirring. As this paste is liable to become mouldy and putrid, it can be made permanent by the addition of a little corrosive sublimate. *Liquid glues* are prepared from shellac, which is caused to dissolve by boiling with borax. A useful and cheap C. is the *Red C.*, or *Faraday's C.*, used by instrument-makers for cementing glass to metals. It is made by melting five parts of black resin with one part of yellow wax and then stirring in gradually one part of red ochre in fine powder and previously well dried. *Mastic C.* is made by mixing twenty parts of well washed and sifted sharp sand with two parts of litharge and one of slaked lime. This is mixed with linseed oil, which sets by its property of absorbing oxygen. It is used for repairing stonework. Sodium silicate is also used for closing the pores and resisting attack.

See A. C. Davis, *Portland Cement*, 1934; C. Lynam, *The Growth and Movement in Portland Cement Concrete*, 1934; F. Lea and C. Dorsch, *The Chemistry of Cement and Concrete*, 1935.

Cement Stone, name given in geology to a layer of rocks which exist at the bottom of the carboniferous deposits of N. Britain. It has the appearance of being deposited from shallow water either fresh or brackish between the freshwater deposits of the Old Red Sandstone and the marine deposits of the lower sandstone shales and carboniferous limestones. Conditions point to the fact that after the formation of the Old Red Sandstones in large inland lakes there was a subsidence of the land and the C. Ss. were formed in large shallow marine lakes or deltas. C. S. forms an excellent building stone, being extensively used in Edinburgh for that purpose.

Cemetery (from the Gk. κοιμητήριον, a sleeping-place), piece of ground which is specially set apart for the burial of the dead. The name was originally given to the underground burial-places of the Romans. The Gks. always made their Cs. outside the cities, and the Romans placed their tombs generally by the side of the public roads. In the early ages, the Christians used to hold their religious ceremonies in the Cs., and it is believed that this fact brought about the practice of always consecrating the ground that was to be used for the dead. In modern times it has become the rule for each sect or denomination to have its own burial-ground, and each C. is consecrated according to the formula peculiar to the sect to which it belongs. Sometimes one C. is allotted to various denominations for the convenience of every one living in that dist. In Germany the Cs. at Munich and Frankfort-on-Main are called Leichenhauser (houses of the dead), and are built so as to minimise the risk of premature interment. The Turks make picturesque Cs., as they are often surrounded by cypress-trees. The Campo Santo at Pisa in Italy is one of the most famous burial-grounds. See also BURIAL ACTS; BURIAL GROUNDS.

Cenchreæ: 1. (Now Kenkri) was a city on the E. side of the Isthmus of Corinth in the Peloponnesus, Greece. It was from this port that St. Paul embarked when he left Corinth for Jerusalem. 2. Also the name of an ant. Gk. settlement in the Troad, probably situated some distance N. of Eneke in the plain of Balafrich (N.W. promontory of Asia Minor).

Cenci, Beatrice (1577-99). It. girl whose fame rests on the tragic and sordid character of her family hist. She was the child of Francesco C., a wealthy, passionate man, who proved a dissolute liver and a harsh father, and of Lucrezia, his second wife. She was involved in a plot to murder Francesco, who was assassinated whilst he slept, and after torture and confession was beheaded with her mother in 1599. Shelley's magnificent tragedy, *The Cenci*, is historically inaccurate, but has nevertheless made Beatrice one of the most heroic and

tragedal of women. Modern research has revealed the fact that she had an illegitimate child by one of her father's stewards.

Cenis, Mont, pass, 6893 ft. high, on the border between the Graian and Cottian Alps in Savoy (France). The famous M. C. tunnel (opened in 1871) is not really under the pass itself, but lies below the Col de Fréjus, 17 m. to the W. It is 8 m. long. The railway runs through the Isère valley from Chambéry, and after crossing the valleys of the Arc and Maurienne reaches Modane (61 m. from Chambéry). One terminus of the tunnel is Bardonnèche, some way above Oulx, which is 18 m. distant from Modane. The carriage road, built by the Emperor Napoleon between 1803 and 1810, ascends the Arc valley for 16 m., from Modane to Lanslebourg, going down from the heights by way of the C. valley to Susa (37 m. from Modane), where the road meets the railway. Lanslebourg is only 8 m. from the hospice near the summit of the pass. The Little M. C. (7166 ft.), which is supposed to be Hannibal's pass, connects the main pass with the Étahe valley on the Fr. side.

Cenomani, offshoot of the Auleri, a people who inhabited Gallia Celtica, an ant. div. corresponding to the modern Maine in the dept. of Sarthe. This people helped the great rebel Vercingetorix in the rising against Caesar in 52 B.C., constituted under Augustus a *civitas stipendiaria* of Gallia Lugdunensis, and in 400 B.C. invaded Italy and occupied the ter. of the Etruscans they conquered, making Verona and Brixia their chief tns. They were allies of Rome in the Gallic war (225 B.C.) and in the second Punic war, but they helped the Gauls in the latter's revolt under Hamilcar (not the father of Hannibal) and only finally submitted to Rome following their defeat by Gaius Cornelius (197 B.C.).

Cenomani, name given by Fr. geologists to the lower portion of the Upper Cretaceous period.

Cenotaph (Gk. *κενός*, void; *τάφος*, a tomb), monument or memorial stone to the memory of someone whose body lies elsewhere. Cs. are very common for drowned persons. An added significance attaches to the word since the First World War. In England, the C., *par excellence*, is that which stands in Whitehall, London, near the end of Downing Street. The original C. was a temporary structure made of wood, erected hastily for the peace procession on July 19, 1919. The architect was Sir Edwin Lutyens, who drew up the plans overnight and submitted them to the gov. the next morning. The design is of striking simplicity, and has an air of dignity seldom found in such memorials. In 1920 it was decided that the temporary structure should be demolished and a permanent one erected on the same site. This gave rise to much criticism in the press; it was considered that the site was unsuitable owing to the busy traffic at this spot, and that the monument should be placed on one of the grass plots in Parliament Square near the House of Parliament. The original

view, however, prevailed, and no traffic problem has arisen. As the memorial is to all who d. or were killed in the First World War and who lie buried in every theatre of war, irrespective of creed, denomination, or belief, a purely Christian inscription was out of place. It was therefore decided to inscribe on it the words 'TO OUR GLORIOUS DEAD.' It was intended that the flags upon it should be of stone, the colours being driven in by a new process. This, however, was not carried out, and three bunting flags fly on two faces of the

D. McLeish

THE CENOTAPH, WHITEHALL, LONDON

memorial. The cost of erection was £10,000. Sir Edwin Lutyens gave his services without remuneration. It is still the general practice of all male civilians to uncover their heads in passing the C. out of respect for the dead who gave their lives in the First World War. On every anniversary of the signing of the Armistice (Nov. 11) a mass memorial service is held at the C. in which the royal family, the gov., and representatives of all important bodies, etc., participate. The service was, however, omitted during the war years 1939-45. A new inscription was unveiled by King George VI. on Nov. 11, 1946. It consists simply of '1939' and '1945' in rom. numerals. The dates of the First World War, in similar numerals, are carved high on the C., the '1914' looking S., the '1918' on the opposite face. The new dates are between them, to face W. and E. at the same horizontal level.

Censer (from Lat. *incendere*, to kindle),

vessel used in both Christian and pagan places of worship for the burning of incense.

Censorinus, Lat. grammarian and also a versatile writer, fl. about the middle of the third century A.D. He wrote a book called *De Acentibus*, which has been lost, and he also wrote a treatise called *De Die Natali* in the year 238, and dedicated to Quintus Cereilius (Cereilius). The work is extant, and deals with various subjects, such as astronomy, music, religious rites, natural hist. of man, etc.

Censors (Lat. *censere*, to assess, judge): 1. Originally the name of two Rom. officials, dating from the time of Servius Tullius. After expulsion of the kings (c. 510 B.C.), the office was held by the consuls, but special magistrates were again appointed 443 B.C. Till 351 only patricians were C.; the plebeian Marcus Rutilius was then chosen (Liv. vii. 22). In 339 Lex Publilia enacted that one must be a plebeian. In 131 both were plebeian for the first time. They were elected on the same day in Comitia Centuriata, with a consul presiding. The term of office, at first five years, was later limited to eighteen months. This magistracy was considered the highest dignity in the state, except dictatorship. The duties were three: (a) The original taking of the census, or register of citizens, and their property (held in *Campus Martius*); (b) the *regimen morum* (regulation of morals), most dreaded of all their powers, this superintendence gradually spreading to private as well as public life; (c) administration of the state finances, including regulation of *tributum* (property tax), and of *reccaliga*. These were usually leased out to speculators (*publicani*, 'farmers' of the taxes). Upkeep of public buildings and care of the treasury were entrusted to C. Their powers were vast and undefined; only his colleague's *intercessio* (veto) could overrule a censor's decisions. C. could degrade men from or promote them to the rank of senator or knight at choice, until Sulla's legislation, 81 B.C. They might class citizens with *severi* with no vote. They introduced various sumptuary laws. In 265 a law forbade reelection to censorship. In 338 they drew up the list of senators (*lectio senatus*). Their dreaded stigma, *nota censoria*, might be affixed to any name on their lists, but the successors of one pair of C. could remove it. Augustus exercised censorial powers himself as consul (8 B.C. and A.D. 14). Claudius, Vespasian, and Domitian revived the office. Trajan and later emperors acted as C. without actually assuming office.

2. The name is now extended to one who controls or censures the action of others; to critics of literary or artistic work, and judges appointed by gov. to examine plays or songs before their publication. It is also the title of the official head of non-collegiate students at Oxford and Cambridge. The C. of the Royal College of Physicians grant licences.

Censorship of the Drama, power that originally sprang from the royal prerogative.

The C. of the D. has existed ever since the rise of the Eng. drama in the period of the Renaissance. In the time of Henry VII. court entertainments were supervised by a master of the revels, and from that date to the middle of the seventeenth century, when all theatres were suppressed by law, playwrights were subject to the control of either the master of the revels or the court of Star Chamber. According to writers on the constitutional hist. of England, it is not certain at what date the lord chamberlain first began to exercise a direct control over plays, but the records of the lord chamberlain's office show that as early as 1628 that functionary either personally or through his subordinate, the master of the revels, licensed and exercised a general control over dramatists. From being an emanation of the royal prerogative his powers ultimately, in 1737, became statutory. The object of the Act of 1737 was mainly political, a fact which is sufficiently indicated by the preamble to the Act, which recites that its purpose was to 'restrain the political and personal satire which was then prevalent on the stage, which the gov. of the day found embarrassing, and which the censorship as it then existed was found ineffective to curb.' On the passing of this Act the lord chamberlain appointed a licenser or examiner of plays, with a salary of £400 a year, and that office has continued in spite of criticism down to the present time. The Act of 1737 conferred an unfettered power of veto on the lord chamberlain, and it was only when the Theatres Act, 1843, was passed that the legislature gave any indication of the principle on which the veto was to be exercised. Under the Theatres Act, 1843, the lord chamberlain has power (1) to prohibit the performance of unlicensed stage plays anywhere; (2) to license theatres in certain places; (3) a practically arbitrary right to ban any stage play which in his opinion is contrary to 'good manners, decorum, and the preservation of the public peace,' words which the joint committee of 1809 characterised as vague, and 'the only existing statutory authorisation' of this particular aspect of the lord chamberlain's powers. Under this Act all new plays and every addition to an old play must be sent to the lord chamberlain by the theatre manager who proposes to produce it at least seven days before it is intended to be performed accompanied by a fee for perusal of not more than two guineas. The lord chamberlain has local jurisdiction to license all theatres in the cities of London and Westminster, in Finsbury, Marylebone, the Tower Hamlets, and also in Windsor and other places where there is a royal residence. According to the report of the joint committee the co. councils license places to be used in their cos., and the univ. authorities of Oxford and Cambridge have a veto as to the performance of plays within their respective jurisdictions. Lineally descended from the control of court festivities vested in the master of the revels,

legally owing its origin to political exigencies as set out in the Theatres Act, 1737, the C. of the D. really has its roots deep down in the civil and religious intolerance of a bygone age. The social conditions, which in reality or apparently necessitated an autocratic exercise by the lord chamberlain of his supervisory powers over the drama, were also conditions pre-eminently incompatible with even the bare idea of liberty of discussion, far less of the constitutional freedom of the press. The kingship as yet was personal, the gov.-supporting body strictly aristocratic, in spite of the triumph of the parl. cause in the early Stuart period, and nothing which in any way prejudiced such traditions was to be tolerated for a moment. 'Players' were legally and socially regarded in the light of rogues and vagabonds, living rather by the charity of their masters than from any title to their earnings. So diametrically opposed are modern ideas to such conceptions that the institution of the C. of the D. was hardly likely to go unchallenged in the progress of time. But until recent years opposition to it was of no very open or sustained character, and three joint committees, in 1853, 1866, and 1892, respectively pronounced succinctly in favour of its continued existence.

The year 1908 and succeeding years, however, saw a remarkable manifestation of hostility to the C. of the D. on the part of a number of distinguished persons in the literary world, the exciting cause of which was the refusal by the lord chamberlain, on the advice of his examiner of plays, to license three plays—*Waste*, a skit on *An Englishman's Home*, and *Monna Vanna*. As a result of widespread criticism of his action in the press, a joint committee of both Houses was appointed in 1908 to inquire into the working of the C. of the D. A considerable number of well-known writers, actors, and theatre managers gave evidence before the committee. Generally speaking, the dramatists and other writers were against, and the actors and managers in favour of, the continued existence of the C. of the D. A remarkable feature in the evidence was the admission by the examiner of plays that in advising the lord chamberlain on the various plays submitted to him he proceeded on no principles that could be defined, but based himself on custom, and followed the precedents of the office: his practice was to refuse a licence where plays were avowedly adapted from the Scriptures, contained political allusions likely to jeopardise friendly relations with a foreign state, or had an immoral tendency. Since his inception of office in 1895 the examiner said that some 7000 plays had been submitted to him, of which forty-three were refused licences, though fourteen of these were subsequently reconsidered and the licences issued; the majority of his refusals were on grounds of immorality. The figures given by the examiner, however, in no way represented the true measure of his activity, for in countless instances

plays were only licensed after modifications to meet objections. The absence of principle or certainty in the quasi-judicial functions of the reader was exemplified by the refusal to license Shaw's *Mrs. Warren's Profession*, D'Annunzio's *La Citta Morta*, and *The Breaking Point*, while at the same time passing *Dr. Walkure* and *The Christian*, and other plays which, though dissimilar in treatment and action, yet contained parallel incidents. The gravamen of the dramatists' grievance was that the suppression of a play before production was an excessive use of executive power, and cast a stigma on the profession of the dramatist; and that it was an anomaly to place the drama under restrictions other than those imposed by the ordinary law of libel and blasphemy. The actors, on the other hand, feared that if the C. of the D. were replaced by magisterial and police control, an element of uncertainty would be introduced into their calling, and place in constant doubt the employment of numbers of persons who were not directly concerned with the ethics of the dramatic art. The committee recommended: (i.) That the lord chamberlain should remain the licenser of plays, with the duty of licensing any play submitted to him, unless he considered it indecent, offensively personal, calculated to do violence to the sentiment of religious reverence, to impair relations with any foreign power, to cause a breach of the peace, or to conduce to crime or vice, as representing in an invidious manner some living person, or some person recently dead. (ii.) That it should be entirely optional to submit a play for licence, and legal to perform an unlicensed play. Where any unlicensed play contravened the stated bounds the matter should be left to the director of public prosecutions. In spite of repeated questions in the House, and a petition to the king signed by sixty dramatists and a number of representatives of repertory theatres, dramatic societies, musicians, artists, and novelists, nothing was done to give legislative effect to the proposals of the joint committee. An account of the sittings of this committee together with a sane criticism of the present system of the C. of the D. is contained in the introduction to Bernard Shaw's *The Shewing-up of Blanco Posnet*, 1909. One weakness of the C. of the D. is that pornography when sugared with farce and fun is more likely to be granted a licence than when serious in intent. It is notorious that variety shows invariably escape the censor, and moreover the examiner of plays who considers only the text of the play has no control over its production. However, *Young Woodley* by John Van Druten, 1929, was refused a licence which was afterwards granted when a private performance had been witnessed. That the lord chamberlain's licence is an invaluable safeguard is proved by the alternative systems which at present obtain in the U.S.A. In 1927 the Wales Act was inaugurated in New York State, and by its terms a

theatre which has seen the performance of a play subsequently banned in the police courts may be padlocked for a whole year, to the heavy loss of its possibly innocent owner. In Boston theatres are licensed for a season, but licences may be suspended by order of the mayor, the police commissioner, and the chief justice. The work done in England by the lord chamberlain's dept. is in America carried out by the secretaries of watch and ward societies. Of the two the lord chamberlain's office is the more susceptible to public opinion. See V. C. Gildersleeve, *Government Regulation of the Elizabethan Drama*, 1908; F. Fowell and F. Palmer, *Censorship in England*, 1913; and M. L. Ernst and W. Seagle, *To the Pure*, 1929.

Census, enumeration of the inhab. of a state taken by order of its legislature. In ant. Rome C. meant an authentic declaration made usually every five years by every Rom. citizen before two magistrates called censors, of his own name and age, and of the name and age of his wife, together with a statement of the number of his children and slaves. The Rom. C. differed from a modern C. in respect of both its purpose and scope. Its object was mainly fiscal; but it was also designed to ascertain the number of men capable of bearing arms. Taxation depended on the results of the Rom. C. Livy states that it also showed the amount of a man's debts and the names of his creditors. Rom. citizens were divided according to the valuation of their property at the C. into six classes, each class containing a number of centuries or hundreds. As the richer classes contained far more centuries than the poorer, it is obvious that the influence of wealth was greatly preponderant in the Comitia Centuriata, the legislative assembly of ant. Rome. From the codes of Theodosius and Justinian, it appears that the scope of the Rom. C. became widened under the empire. It had become a complete register of the pop. and wealth of all the centuries included within the limits of the Caesar's dominions. Full as it was, however, it was in no sense a statistical record like a modern C., and was apparently in no way conceived to further the social progress of the people at large. The first actual enumeration of the people of England and Scotland was made in 1801. The topics of inquiry were the number of persons, the number of inhabited and uninhabited houses, and the number of families in each par. It attempted a classification of the employment of individuals under the very general divs. of agriculture, trade, manuf., and handicraft. The inquiry under this last head entirely failed, owing to the confusion engendered by the classification into families. The next C. was in 1811, and since 1801 the C. has been taken every ten years, excepting 1941. In the Cs. of 1811 and 1821 the official form of inquiry was modified so as to obtain a more accurate return of the occupation of the people. The heads of inquiry in 1841 were more numerous and minute, with the result that more accurate information was obtained. In reference to occupation,

the enumerators were directed to ascertain the employment of every person, distinguishing sex, instead of merely, as hitherto, the employment of families and males over twenty. Furthermore, the exact age of every person was ascertained, instead of quinquennial and decennial periods being taken, and the place of birth was also a subject of inquiry. The C. of 1851 was much facilitated by the system of registration of births, marriages, and deaths, which came into operation in 1837. Prior to that time the unchecked par. registers were the only available sources of information. The C. of 1851 showed a marked advance on its predecessors in regard to what may be termed social statistics. For the first time the number of blind, deaf, and dumb persons was recorded. It also made inquiry into the eccles. and educational condition of the country by ascertaining the amount of church accommodation at the command of each denomination, together with a return of the numbers of all the congregations on a particular day. This C. brought into prominence the sudden and startling decrease in the pop. of Ireland. In 1861 the C. exhibited for the first time the number of aliens and naturalised Brit. subjects in the United Kingdom. The pop. of Ireland continued to show a decrease. The first C. of Ireland was taken in 1813, but it was not till 1821 that it was in any true sense an accurate or complete record. In 1871 the C. was extended to cover the Brit. Empire (apart from indigenous non-white races in the colonies), and since that year the mode of taking the C. has in no essential been improved upon. The accuracy of this C. was ensured by the div. of the country into enumeration dists., with a clear indication of the various confusing local governmental or municipal subdivisions of the kingdom. One striking feature of the C. of 1871 was that the names of persons were required, and to facilitate inquiry a separate schedule or form was sent out to each householder. Special schedules were issued for Welsh people, persons in public institutions, on board ship, and homeless or houseless persons. In regard to the last mentioned the co-operation of the metropolitan and co. police was enlisted. The comparative rate of mortality in various occupations was also inquired into by classifying the living in the different occupations or professions with regard to age. Subsequent Cs. have still further widened the field of inquiry and elicited a mass of valuable information in the way of social and vital statistics; in 1901, for example, investigation was made into the evils of overcrowding by inquiries as to the number of persons occupying any particular room or part of a house. The following additions were made to those subjects in 1911: (a) the duration of existing marriages; (b) the number of children born to such marriages; (c) the industries or services with which workers were connected, as distinct from the occupations in which they were personally engaged; (d) in the case of persons born

outside England and Wales, whether they were residents or visitors in this country; (e) the number of rooms in all dwellings, instead as heretofore in dwellings of less than five rooms only. In contrast to the prejudice, especially in certain eccles. quarters and among the ignorant, excited by the earlier Cs., it was noteworthy some years ago, that the registrar-general expected fuller and more accurate returns than ever on account of the interest evinced by the public in the C., an interest which he attributed to the aid rendered by the press; to the co-operation of the parl. committee of the Trades Union Congress, and to the efforts of elementary school teachers who gave special C. lessons to children under their charge.

The total pop. in England and Wales was 8,892,536 in 1801; 10,164,256 in 1811; 12,000,236 in 1821; 13,896,797 in 1831; 15,914,148 in 1841; 17,927,609 in 1851; 20,066,224 in 1861; 22,704,108 in 1871; 25,974,439 in 1881; 29,002,525 in 1891; 32,527,843 in 1901; 36,075,269 in 1911; 37,885,242 in 1921; 39,947,931 in 1931; 41,460,000 (estimated) in 1941. The pop. of Great Britain and Ireland a month before the beginning of the First World War was officially estimated at 46,089,249. There were over 1,000,000 more females than males in England and Wales in 1911, and, by 1921, the excess, aggravated by the losses of men in the war (about 1,000,000), was 1,720,802, and in 1931, 1,670,143. It is significant that the loss of pop. owing to emigration, which was 164,000 in 1871-81, 600,000 in 1881-91, 68,000 in 1891-1901, rose again to nearly 500,000 in 1901-11, for it seems estab. that the number of emigrants is greatest during times of prosperity. In 1913 the total number of Brit. and N. Irish emigrants was 416,278, in 1926, 284,009, in 1930, 327,992, and in 1931, 213,057. Since then, owing to quota restrictions in the U.S.A. and Canada and elsewhere, the number has steadily declined. Moreover, in the decade immediately following the First World War, there was a steady flow of migrants to the dominions overseas, which was enhanced by schemes of state-aided migration; but during the world economic depression, 1930-33, emigration declined to its lowest point, and in 1933 less than 30,000 Brit. emigrants went to places out of Europe, while immigrants of Brit. nationality coming into Great Britain in 1932 and 1933 numbered 75,000 and 60,000 respectively. The C. of 1911 showed a slight net gain by excess of births over deaths, a result due, however, to a relatively greater reduction in the death-rate than increase in the birth-rate. This reduction was accentuated after the First World War by reason of the very marked progressive decline in the birth-rate. In 1924 the excess of births over deaths was 301,438; in 1933 it was only 112,093; in 1934, 153,771; in 1935, 153,102; in 1936, 139,187; in 1937, 126,292; in 1938, 176,142; in 1939, 149,732; in 1940, 45,542; in 1941, 76,472; in 1942, 113,297; in 1943, 223,270. Those very fluctuating totals are explained by

war-time conditions and afford no true guide on vital statistics.

Cent and Centime (from Lat. *centum*, a hundred), names of coins. The cent varies in value according to the country. Thus in the U.S.A. and Canada it is a bronze coin, the hundredth part of a dollar, worth nearly an Eng. halfpenny, whilst in Holland the cent is made of copper, and is the hundredth part of a guilder (1s. 8d.). The centime originated in France, being a hundredth part of the franc, and before the revaluation of the franc in post-war years was equivalent to a tenth part of the Eng. penny. It was adopted in Belgium, and also in Italy, Greece, and Switzerland under different names, but to-day it is only in circulation in Switzerland. In Spain the real (2d.) has been divided into 100 centimes. **Cental**, measure of 100 lb. in avoirdupois weight. It is used not only in Great Britain, but also in America and Canada. This denomination appears in the Board of Trade standards.

CENTAUREA CYANUS: CORNFLOWER

Centaurea, cosmopolitan genus of Compositae consisting of numerous species which are of no practical importance to man, and are often mere weeds. *C. cyanus*, the cornflower or blue-bottle, grows in Brit. cornfields and is often cultivated for its pretty many-coloured flowers; *C. moschata*, the purple or white sultan, and *C. suaveolens*, the yellow sultan, are garden flowers; *C. nigra* is the knapweed, and *C. Calceitrapa* the star-thistle.

Centaur, monsters, according to Gk. legends, which were half men and half beasts. The beast part is always depicted in art as being that of a horse. They were led by one named Chiron, and lived in the region of Mt. Pelion. They fought many fierce battles, but in the end Hercules killed most of them and drove the rest to Mt. Pindus.

Centaurus, the Centaur, β , constellation, only a small part of which is seen above the horizon in the lat. of Great Britain. It is situated under Virgo and Libra and between Argo and Scorpio, and was supposed to represent the centaur

Chiron. This constellation, which was mentioned by Aratus, is bisected by the Milky Way. It has sev. points of interest, not the least being that it contains Alpha Centauri, which is apparently our nearest neighbour in the stellar universe. This star is of the first magnitude (0.2), and the fourth brightest star. It has a very considerable proper motion, being as much as 368 in. a century. Alpha Centauri is distant from the earth 270,000 times the distance of the sun from our planet. In other words, its distance in light-year units is 4½, that is to say, light travelling at 186,330 m. a second takes that number of years to cover the intervening space between Alpha Centauri and the earth. Alpha Centauri is a double star, one revolving around the other in seventy-nine years, and there is reason to believe from perturbations observed that there is also a third, albeit invisible, companion. The two luminous stars have a probable mean distance of 2,232,000,000 m. from each other. One of the twin has an identical spectrum with the sun, and is thought to be of the same mass and luminosity. Its companion is about the same size, but considerably less bright. Alpha Centauri is historically interesting as affording the first authentic result of the calculation of a 'cele. parallax. Henderson publishing his determination of it in 1838. Alpha and Beta Centauri are known as the S. Pointers because they serve as a guide in finding the S. Cross.

Centaury, name applied to many plants, but most properly to *Erythraea Centaureum*, the common C., a species of Gentianaceae. It is an ann. herb with pink flowers, and was once gathered for the medicine of tonic property obtained from the flower-tops. The Amer. C. consists of the genus *Sabbatia*, and *S. angularis* has rose-pink flowers. The composite *Centaurea* (q.v.) is also often known as C. in popular language.

Centenary (Lat. *centenarius*), to do with a hundred), celebration of an event which happened 100 years ago, especially of the births and deaths of famous men.

Centering, see CENTRING.

Centerville, name of many post vils. and tns. In the U.S.A., the largest being the cap. of Appanoose co., Iowa, U.S.A., 30 m. S.W. of Ottumwa, on the Chicago, Pacific, and other railways, where many industries flourish. Pop. 8000.

Centetes, typical of the family Centetidae, a small, insectivorous mammal found in Madagascar. The single species, *C. caudatus*, the tenrec, is sometimes known as the tailless hedgehog, and is distantly connected with the hedgehog within the same order. In length it is from 12 to 16 in., its teeth are forty-three in number, the young have spiny hairs, and the female brings forth about twenty little ones at a birth.

Centigrade Thermometer, see under THERMOMETER AND THERMOMETRY.

Centimetre, measure of length in the international metric system, being, as its name denotes, one-hundredth (0.01) of a metre. It is thus one-tenth of a decimetre, and is equal to ten millimetres.

A C. is equivalent to 0.394 in.; a cubic C. (c.c.) to 0.064 cubic in., and a sq. C. to 0.155 sq. in.

Centipede, or *Chilopoda*, order of Arthropoda in the class Myriapoda, in some respects resembling insects. The number of legs varies greatly, some species having only fifteen pairs, while others have as many as 173 pairs, and the term C. is consequently misleading. The galley-worms, as they are sometimes called, have flat bodies consisting of numerous segments, all but the last two bearing a pair of legs, and the first body-segment bearing a pair of poison claws, while the head has three pairs of jaws and long antennae. The species are carnivorous, killing their prey with their poison-claws, which in some tropical

CENTIPIDE.

representatives are able to inflict fatal wounds upon man. They are creatures of night, light seeming to have little effect on them, as some are utterly devoid of sight and only one family has compound eyes. They lurk beneath stones or in houses, and at night attack small animals. The genera *Lithobius*, *Scutigera*, and *Geophilus* are known to Britain; *L. forficatus* is our most common species; *S. gigas* a large tropical C., which attains a length of 12 in.; and *G. electricus* glows in the dark.

Centlivre, Susannah (c. 1667-1723), Eng. actress and dramatist. She was the daughter of a Lincolnshire gentleman of the name of Freeman. Bath is the tin. that first saw her drama, *The Perjured Husband*, in the year 1700. She also wrote nineteen other plays, the best known of which are *The Gamester* (1705); *Love at a Venture* (1706); *The Busy Body* (1709); and *A Bold Stroke for a Wife* (1718). Her plays were collected in the year 1761, and some of them long held the stage.

Centner, weight varying in different countries. In Austria, Denmark, Germany, and Switzerland, where it is most commonly used, it is equivalent in the

metric system to fifty kilogrammes (50,000 grammes), and in the Imperial to 110-231 lb. (avoirdupois). Commercially its value is 100 lb.

Cento (Gk. *κέντρον*, Lat. *cento*, patch-work), composition put together out of passages borrowed from other writings. The manuf. of such an artificial work was a favourite literary exercise of the Romans. In the early centuries A.D., as later of the medieval monks. Virgil's *Aeneid* was especially subjected to this treatment. Thus on it were based both Ausonius's rapid survey of biblical hist. (fourth century A.D.) and Capitulus's attack on the immorality and luxury of monasteries (1535). The Empress Euloxia succeeded in stringing together a life of Christ from the Homeric poems.

Cento, tn. on the Reno, 16 m. N.N.W. of Bologna, with which it is connected by the canal of C., in Emilia, Italy. It is the bp. of Francesco Barbieri, the painter. Pop. 4320.

Centorbe, see CENTURPE.

Central Africa, British, see NYASALAND PROTECTORATE.

Central America, geographical div. extending from the Isthmus of Tehuantepec to the Isthmus of Panama. Mt. ranges traverse this portion of America from end to end. The Sierra Madre is the prin. range, which runs across Guatemala, and the highest point approaches close on 10,000 ft. These mts. extend S. into Nicaragua. The large volcanoes of Mexico and C. A. are situated on the Pacific side, and form a cordillera. These rise to great heights, as in Acateango in Guatemala (12,800 ft.) and Irazú (11,500 ft.) situated in Costa Rica. The amount of deposit from the volcanoes is very great, and covers a wide area. In some places this deposit has entirely blocked up the original structure of the country. Eruptions began in the Cretaceous period, and continue at the present time. The rocks are composed of lava and ashes, mostly andesitic and basaltic. Owing to the greatest elevation being on the Pacific side, the rivs. are shorter than on the Atlantic side. The prin. riv. is the Usumacinta, on the E. side, which is more than 600 m. long from its mouth to the Río de la Pasión. The average temp. on the low coast lands is from 80° to 73° F., and in those lands lying from 2000 to 5000 ft. above sea level the temp. is 73° to 63° F. Above this altitude frosts occur. The rainfall is exceptionally heavy on the Atlantic side, as much as 180 in. falling in the year in Alta Verapaz, Guatemala, while San Salvador has only 54 in. A more striking contrast exists between Greytown, with a rainfall of 244 in., and Rivas with 69 in. The flora ranges from Alpine to tropical. With regard to the forests, they are inferior in size to those found in the lats. in the E. hemisphere, but they are far more beautiful and luxuriant. In the volcanic regions the soil is extremely fertile, and yields in consequence splendid crops of rice, coffee, cocoa, and maize. The fruits grown are bananas, yams, pineapples, guavas, and citrons, while arrowroot,

beans, and tomatoes are largely cultivated. The woods found there are mahogany, cedar, logwood, and Brazil wood, cocoa palms, and mangroves also grow in this country. Of fibrous plants which grow in C. A. winter's bark, sarsaparilla, vanilla, and indiarubber are the representatives. Many beautiful orchids and flowers are peculiar to this country. With regard to the animals, these are as varied as the plants, but owing to the region being comparatively small, there are very few species that can claim to be peculiar to C. A. Pumas, jaguars, tapirs, monkeys, alligators, venomous snakes, vultures, and birds of brilliant plumage are found in great variety. There are as many as 260 species of birds, many of which are found only in this part of the world. Bats are so numerous that in some parts they have amounted to a plague, and whole vils. have been left deserted owing to the overwhelming swarms of these creatures. Insects are also present in large numbers, and are of the troublesome kind. The natives once consisted of the Maya Indians of the N., and there were smaller tribes in other parts of the country. At present the pure-bred Indian is mostly found in Guatemala and Yucatan, and only to a much less extent in other states. The greater part of the pop. is made up of half-breeds, but in Costa Rica Sp. people predominate. Scattered over the country may be found many very interesting remains, the prin. being the ruins of Palenque in Tabasco, Uxmal in Yucatan, Santa Lucia in Guatemala, and Copán in Honduras. C. A. is divided into republics named as follows: Guatemala, Honduras, Salvador, Nicaragua, Costa Rica, and Panama. Brit. Honduras is a crown colony belonging to England. The provs. of Chiapas, Tabasco, and Yucatan all form part of the Mexican republic. See T. A. Joyce, *Central American and West Indian Archaeology*, 1916; T. Gann, *Discoveries and Adventures in Central America*, 1928; H. G. Miller, *The Isthmian Highway*, 1929; W. W. Von Hagen, *Maya Explorer*, 1947; S. de Madariaga, *The Rise of the Spanish American Empire*, 1947; and *The Fall of the Spanish American Empire*, 1948; W. Beebe, *Book of Days*, 1948.

Central Asia (Russian) is nearly all comprised in the former prov. of W. Turkestan. There is some confusion over the precise delimitations of the great extent of country comprised under the old name of Russian or W. Turkestan—a ter. covering 1,534,000 sq. m., and supporting a pop. of over 16,000,000. Politically, Russian or Soviet C. A. comprises (Uzbekistan (q.v.)) on the frontier of Afghanistan, the foothills of the Tien Shan and Pamir Mts.; Turkmenia (q.v.), situated on the frontiers of Persia and Afghanistan, stretching from the Caspian Sea to the Amu-Darya R.; Tajikistan (q.v.), which lies on the frontier of Afghanistan and W. China; Kazakhstan (q.v.), the largest div., on the frontier of Sinkiang and stretching from the lower reaches of the Volga to the Altai, and from the mts. of the Tien Shan to the Trans-Siberian rail-

way; and Kirghizia (q.v.), also bordering W. China. Up to the revolution of 1917, Russian C. A. was divided politically into the khanate of Khiva, the governor-generalship of Turkestan, and the emirate of Bokhara; but after the revolution the Soviet Gov. abolished the governor-generalship of Turkestan (1920) and set up a Soviet republic in its place. Following a redistribution in 1924 of all these terrs., the new autonomous republics of Uzbekistan, Turkmenia, and Tajikistan were estab., advancing in 1929 to the status of Union republics; while the remainder of N. Turkestan, inhabited by the Kirghiz, were reunited to the S.S.R. of Kazakhstan (1924-25). But in 1926 Kirghizia formed its own autonomous republic, and in 1936 was, like Kazakhstan, elevated to the status of a Union republic. The Uzbek S.S.R. now includes the Kara-Kalpak autonomous S.S.R. On the N. Soviet C. A. is bounded by Siberia, on the W. by the Caspian Sea, on the S. by Persia, Afghanistan, and India, and on the E. by Sinkiang and Mongolia. There is a very sharp physical div. between the mountainous country to the E. and the deserts and steppes to the W. and N. The highlands are part of the orographical flange which skirts the N.W. border of the great tableland of C. A., and runs in a direction S.W. to N.E. The great border chains of the S. Tien Shan consist of the Alai Tau, Trans-Ili, Kunghel Alai Tau, Kokshal Tau, and Trans-Alai, etc., whilst many ranges, including the Chigiz Tau, Kandy Tau, Ferghana, Nura Tau Mts., etc., shoot off from these border chains in various directions. In both systems the heights of individual peaks vary from 10,000 to 20,000 ft., and Mt. Stalm attains an altitude of 24,590 ft. In this region, to the E. of the Akademva range is the Fedchenko glacier, 50 m. in length, and (excepting the Arctic) the largest in the world; whilst perpetual snow covers many summits. Deep depressions such as the 'Dzungar Gates,' Issykkul, etc., between the ridges spreading out westward have from time immemorial served as passes to the W. from the great central plateau. But the mean elevation of the passes is over 10,000 ft. The highlands are girdled by a belt of plains, known as the Balkash plains, whose average elevation is some 1250 ft., which in their turn are surrounded by the Aral-Caspian Depression—a great stretch of lowland occupying two-thirds of the whole prov., the altitude of which is rarely greater than 400 ft., sinking sometimes to below sea level. The Kara Tau Mts. separating the Syr-Darya and Chu Rts. are considered the line of demarcation. The higher girdle of plateau land, which is well drained by the Balkash, Ala-kul, Ili, and other rivs., which flow into Lake Balkash, support the countless herds and flocks of the Kirghiz. The Akkum steppe, with its wide expanse of shifting sands, encircles Lake Karakul. The lower and outer belt of plains belonging to the Turanian basin are watered by the Amu and Syr, which alone succeed in bridging the desert as far as the Aral Sea. The Murgab and Ted-

zhan dry up in the heart of the Kara Kum desert, whilst the Zeravshan gets no further than the gardens of Bokhara. In these plains the dividing line between oasis and desert is very clearly defined, whilst the only fertile soil is found at the base of the mts. The physical features of the country are perpetually changing. Hot desert winds are continually parching the numerous lakes; the sea of Aral, or the 'Blue Sea,' now fills only a fraction of its former basin; prosperous regions, where anct. civilisations flourished in Bokhara, Bactria, and Samarkand, have been swept away through the desiccation of riv. channels which were once their main arteries. The climate is continental, its salient feature being the scarcity of rain. Thus though precipitation is plentiful on the highlands, it is reduced to 11 in. at Tashkent, and is almost zero over the Transcasian steppes. The ann. variations in temp. are very considerable. Thus, whilst in Jan. the thermometer falls usually below freezing point, and has been known to register 10° F., a temp. of 100° F. in the shade and more is not uncommon in the summer time. Reflection from an arid soil aggravates the discomfort caused by the heat. The fauna include the Himalayan bear, marmot, badger, lynx, tiger, jackal, fox, wolf, antelope, zebu, hedgehog, etc.

Wild horses and camels are found, whilst the splendid *Ovis poli* abounds on the Pamir tableland. There are some 400 different species of birds, whilst the variety of insect fauna is almost countless. Arboreal vegetation is rare. Poplars, ash, juniper, maples, and pines occur, whilst apple and apricot orchards flourish on the lower mt. slopes.

In Kazakhstan the chief occupation of the agric. pop. is the growing of grain, cotton, rice, sugar-beet, and fodder-crops. There is also a large cattle- and sheep-breeding community, and livestock is exported. The recent industrial development of the country is based on its resources of coal, oil, salt, iron ore, copper, zinc, lead, and non-ferrous metals (of the last it has half of the entire deposits of the U.S.S.R.) on one hand, and the products of its agriculture on the other. The Karaganda coal basin has third place in Soviet coal-field output. There are extensive copper-refining centres. The chemical industry at Aktyubinsk provides fertilisers; here also oil wells are being developed to supplement the supplies found by the R. Emba, which are piped 550 m. to refineries at Orsk. The railway system, consisting in 1917 only of a line from Orenburg to Tashkent in Uzbekistan, has grown enormously and includes the Turksib route, connecting Novosibirsk with Alma Ata and Tashkent and sev. branch lines totalling over 4000 m. of track. The chief tns. are Alma Ata, the cap., with a pop. of 230,000; Karaganda, 166,000; and Semipalatinsk, 110,000.

In the four republics, vast deserts have forced the pop. to the oases and irrigated lands. The largest area of cultivation is around Tashkent in the sheltered

Ferghana valley; cotton and sugar-beet are the chief crops. Other fertile areas lie by Samarkand, and in the extreme S. near Tedzhen, Merv, and Stalinabad. Here, as on all the oases, cotton is the chief crop, and that, increasingly, of the Egyptian variety. Irrigation in the Vakhsha valley in Tajikistan has rendered 100,000 ac. of land capable of producing cotton crops. There is also some orchard cultivation, and a considerable co-operative silk industry. Mechanisation and the collective and state farm form of agriculture have been introduced. Merino and Astrakhan sheep are bred in Uzbekistan and Kirghizia; in the latter horse-breeding also is an important occupation. Industry is keyed to products of the Central Asiatic countries. Local cotton and silk production has built a large textile industry; vegetable oil is manufactured from cotton seed; and textile and agric. machinery is made at Tashkent. There are large chemical plants at Kara Bogaz on the Caspian Sea, and in the middle of the Kara Kum desert which provide fertilisers. Coal is mined in Kirghizia and Uzbekistan, and there are oil wells at Nefto Dag on the Caspian, near Bokhara, and in the Ferghana valley. Of the cities, Tashkent is the largest of C. A. with a pop. of 585,000; Samarkand (156,000) was once Tamerlane's cap.; Ashkhabad (126,000) cap. of Turkmenia, is the terminus of the Asiatic railway. Bokhara (50,000) is an anct. city, noted for its handicrafts; Frunze (93,000) is the cap. of Kirghizia and Stalinabad (83,000) of Tajikistan. These and other cities contain many mosques, old buildings, mud walls, and relics of the anct. feudal states, close to the twentieth-century factories and flats. In Kazakhstan, two-thirds of the people are Kazakhs, descended from the nomadic herdsmen, and the remainder are Russian. The descendants of the old Iranian dwellers in the S. republics of C. A. are the Tajiks who now form about 14 per cent of the pop. The later invaders of the land, the Uzbeks, Turkmen, and Kirgiz have remained; one-half of the whole pop. are of Uzbek stock. Pop.: Kazakhstan, 6,146,000; Turkmenia, 1,254,000; Uzbekistan, 6,282,000; Tajikistan, 1,485,000; and Kirghizia, 1,500,000. See A. E. Voicov, *Le Turkestan russe*, 1911; E. Mannin, *South to Samarkand*, 1936; E. K. Maillart, *Turkestan Solo*, 1938; E. S. Bates, *Soviet Asia*, 1942; J. S. Gregory and D. W. Shave, *The U.S.S.R.: a Geographical Survey*, 1944.

Central Australia, part of the N. ter. which, under the provisions of the Northern Australia Act of 1926 was divided into two parts, N. and Central, respectively; separated by the twentieth parallel of S. lat. It was administered by a gov. president and an advisory council. The Act of 1926 was repealed in 1931 and the whole of this ter. is now known as the N. ter., with Darwin as the headquarters of the administration and Alice Springs as that of the deputy in the S. It has a total area of 523,600 sq. m., lies between

129° and 138° E. long., as far as 26° S. lat. The estimated pop. is 10,800.

Central City, name of four small places in U.S.A., the largest of which is a tn. in Kentucky, with 4321 inhabs.

Central Criminal Court, estab. in 1834 for the trial of treasons, murders, and other felonies, and misdemeanours committed within the city of London and co. of Middlesex, and in certain specified parts of the cos. of Essex, Kent, and Surrey. Generally speaking the jurisdiction of the C. C. C. is assimilated to that of the criminal side of the assizes, and its judges or commissioners, like the assize or circuit judges, sit by virtue of commissions of oyer and terminer and jail delivery. The judges of the C. C. C. comprise the lord chancellor, who, however, never sits there, the judges of the high court, the recorder and common serjeant of London, together with the lord mayor and aldermen of the city of London, and such other persons as the Crown may appoint. In practice the recorder and common serjeant sit on the first two days of each session, after which one or more high court judges come down to try the more serious cases. The court is held at least twelve times a year, and more often if necessity arises. The dates of the sessions are fixed annually at a conference of the judges. The C. C. C., like the assize justices, has the power to try all offences committed on the high seas or within the jurisdiction of the Admiralty. The Admiralty jurisdiction extends over the territorial waters of the Brit. dominions, i.e. at a distance of 3 m. from low-water mark; but in the case of crimes committed on Brit. ships its jurisdiction extends not only over the high seas, but also in foreign rivers, 'as far as great ships go.' The C. C. C. also tries cases sent to it by king's bench div. It also has a transferred jurisdiction in cases removed to it from the various sessions of the peace within its dist.

Central Electricity Board, body estab. in 1927 under the Electricity Supply Act to control the production and supply of electricity in Great Britain, to concentrate production in the most efficient stations, to build and operate the 'grid' scheme for transmitting power in bulk from the main generating stations to the subsidiary distributing stations. In 1948 it ceased to exist, its functions being assumed by the Brit. Electricity Board.

Central Falls, manuf. city in Providence co., Rhode Is., U.S.A., on the Blackstone R., and the New York, New Haven, and Hartford railway, 4½ m. N. of Providence. Pop. 25,000.

Central Force, force which tends to produce acceleration towards a centre, or focus. If a stone be tied to a string, and be made to move uniformly in a circular path, there is always a tension in the string pulling the stone towards the fixed end. If the string be suddenly cut, the stone will move in a straight line tangential to the circle with the velocity it possessed at the time the string was separated. If the string remains intact the direction of the stone for the next

moment will be somewhat nearer the centre than if the string had been cut. This shows that during that moment a force acts on the stone pulling it towards the centre; this is called central or centripetal force. The idea of C. F. has a special importance in the hist. of astronomical research. Prior to the time of Kepler (1571-1630) it was believed that all revolutions of celestial bodies were performed in circles, but after much study of successive oppositions of the planet Mars, Kepler was convinced that the orbit of the planet was an ellipse, the

Kepler to calculate the relation between the orbit of a comet and a centre or focus was frustrated by mistaken notions as to the nature of a comet's tail.

Centralia: 1. City on the Crooked Creek, in Marion and Clinton cos., Illinois, U.S.A., 59 m. E. by S. of St. Louis. It is on the Illinois Central railway, etc., and besides having an important fruit market, has glass, granite, and iron works, woollen mills and cannery factories. Pop. 16,000. 2. City in Lewis co., Washington, U.S.A. Pop. 7000.

Central India, name used to denote a group of native or feudatory states bounded on the S. by the Central Provs., on the E. by Bengal, and on the N. by the United Provs. and Rajputana. This group is divided into two large divs., i.e. Baghelkhand in the E., and Bundelkhand in the W. Among the important sub-divs. of the group are Bhopal, Rewa, and Indore. The natives make articles of carved wood, painted and carved ivory, and brass. Silk, cotton, and woollen articles are also manuf. The climate is very hot and sultry. The area is 51,531 sq. m., and the pop. about 6,000,000.

Centralisation, term indicative of the system of concentrating administrative functions in the hands of the prin. depts. of the State. In political science it is the exact opposite of what is implied by the doctrine of *laissez-faire*, or that manner of carrying on the gov. of a nation in which the people are permitted to regulate themselves with as little interference from the central or supreme authority as is compatible with the conception of an independent political society. The irreducible minimum of the functions of the State, which, according to Herbert Spencer, comprise the duty of keeping order within the ter. of the State, and of defending its borders from external aggression, has in more recent times become so expanded that much that was formerly left to the discretion of local governing bodies has been transferred to State depts. With the remarkable increase in municipal trading in England, the introduction of so much legislation on the lines of social reform, and the great activity in matters appertaining to public health, the functions of such depts. as the Home Office, the Board of Trade, and the Ministry of Health have necessarily become even more comprehensive. There can be but little doubt that C. secures uniformity in institutions, and that what may appear to be encroachments by the State amount in the end to nothing more than an enlightened conception of what is connoted by the obligation to preserve internal order in a state. The same increase in central authority is everywhere observable among civilised nations, and although many schemes of 'decentralisation' have been mooted, it may be that such schemes really relate to the wider and altogether different idea of federalism. All powerful modern states are necessarily more or less under the sway of militarism, and this is probably the main factor in the dominance of C.

Paul Popper

A MARWARI WOMAN OF CENTRAL INDIA

-sun occupying one of the foci. He also concluded that the velocity of the planet was not uniform for any given arc, but that if points on the orbit were joined by straight lines to the focus, the areas described in equal times were equal. Kepler's knowledge of the laws of mechanics was necessarily not very profound, and he appears to have been guided by happy inspiration as well as aided by patient and prolonged calculation. Acting on the guiding principle of the uniformity of nature, he applied his 'laws' to other orbits, and subsequent observations and calculations fully confirmed his hypotheses. The general result of his researches was to facilitate astronomical prognostication, but even though his predictions were borne out by subsequent observations, he received little credit for his 'laws' until Newton demonstrated their perfect correspondence with generalisations obtained from a study of the laws of gravity. An attempt by

Central Provinces and Berar, autonomous prov. of India occupying the N. of the Deccan and lying between the Nerbudda and the Godavari Rs. It is bounded on the N. by the Central India States, on the S. by Hyderabad, on the E. by the states of Madras and Behar and Orissa, and on the W. by Bhopal, Indore, and the Khandesh dist. of Bombay. The prov. is divided into five main divs.: Jubbulpore, Nerbudda, Nagpur, Chhatisgarh, and Berar. There are also fifteen feudatory states. Originally a part of the Mahratta kingdom of Nagpur, the dist. became a prov. of Brit. India in 1861. In 1902 Berar, which had been under Brit. rule since 1853, when its ruler, the nizâm, relinquished it in payment of arrears of debt, was leased to Britain in perpetuity and amalgamated to the prov. A small part of the prov. was transferred to the new prov. of Orissa in 1936. The C. P. and Berar have a total area of 99,876 sq. m. (C. P. alone, 82,150 sq. m.) and a pop. of 15,472,000. The feudatory states are 13,082 sq. m. in area, and have a pop. of about 2,000,000. The prov. falls naturally into five areas: the central plateau region, which includes the forested heights and fertile, alluvial valleys of the Saptara Range; the Nerbudda valley to the N.E., an area largely devoted to the production of wheat and pulses; the Maratha plain to the S., in which is included Berar, and of which cotton is the staple crop; the Chhatisgarh plain—the valley of the Mahanadi—in the W., where rice and pulses are grown; and the hilly Chota Nagpur area in the N.E. The chief rvs. are the Nerbudda, the Mahanadi, the Tapi, the Wardha, and the Wain-ganga. The climate of the prov. is on the average cooler than that of most parts of India. The clemency of the weather and the healthy nature of the country are due to the rainfall, which is more abundant than in N. India, and occurs regularly in June. Nagpur (pop. 215,000), the cap. of the prov., is the centre of a cotton-spinning and weaving industry; Jubbulpore is another tn. of importance. The prov. is rich in coal, and the chief mines are at Warora and Mopani; manganese is also mined. Berar is purely agric. It is very fertile and yields cotton, millet and oil seeds. The railway systems of the prov. are the Great Indian Peninsula and its branch lines, the E. Indian, the Bengal-Nagpur, and the Indian Midland, but large tracts of the country are still without railway communication. The chief exports of the C. P. are cotton, wheat, linseed oil, rice, and hides. Five-sixths of the inhab. are Hindu, but there are considerable numbers of animist Gonds (aborigines) and some Moslems. A univ. was estab. at Nagpur in 1923, and there are affiliated colleges in Nagpur, Jubbulpore, and Amraoti. The natives are slow to adopt W. civilisation.

Centranthus, European and Mediterranean genus of Valerianaceæ, is represented in Britain by *C. ruber*, the red spur-valerian. It grows to a height of

1 or 2 ft., has a sweet scent, and is cultivated as an ornamental plant. The corolla has a spur in which honey is secreted, and only one stamen and one carpel are developed. *C. calcitrapa* is a native of the coasts of the Mediterranean and of temperate France.

Centrarohidae, or **Sunfishes**, family of perch-like fishes which inhabit fresh water of N. America. The species, of which about thirty are known, are compressed and somewhat oval in body and have a spot on the operculum. Most of them build nests, all are voracious, and many are valued as food. The genus *Micropterus*, which comprises the black bass, is found in Europe.

Centre, point which is equidistant from all points on the bounding lines or surfaces of a figure. Such a fixed point can only exist in a circle or a sphere, and the equal lines which may be drawn from the C. to the boundary are called radii. Irregular figures and solids, however, have a fixed point which is called a centroid (*q.v.*), or C. of mass. This point is such that the moment of the whole figure in any plane is the same as if the whole mass were collected at that point. If a figure is so regular that circles may be described within and without touching different points at regular intervals, the C. of such circles is often referred to as the C. of the figure.

Centre, Canal du, important canal in the dept. of Saône-et-Loire, France, joining the Saône and Loire. The canal is 75 m. long, stretching from Châlon-sur-Saône to Digoin, and serves the industrial region of Le Creusot and Montceau-les-Mines. It was constructed in 1781.

Centre-board, nautical device used to prevent a boat making too much lee-way by offering greater oblique resistance to the current. The device is used in small speed-boats, yachts, and other racing skiffs. The board consists of a movable keel which swings on a pivot and is lowered at pleasure through a slot in the bottom of the boat. Vessels with wall sides can acquire keel depth by means of a lee-board.

Centre of Gravity, fixed point in a body through which the resultant of the gravity-forces acting on all the molecules of the body may be said to act. From the earliest times it had been vaguely recognised that an attraction existed between all material particles, but it was Newton who estab. the fact that the tendency of bodies to fall to the surface of the earth was part of the general law of universal attraction. Owing to the great mass of the earth, it is extremely difficult to demonstrate on the earth's surface the existence of any gravitational force other than that in which the mass of the earth is an overwhelming factor. Every particle, therefore, tends to fall in a direction which we call *vertical*, that is, towards the earth's C. of G. The vertical line at any point of the globe may be determined by the use of the plumb-line, which consists of a weight attached to the end of a string. A force acts upon every particle composing a body in a

vertical direction; the directions of all the forces on all the particles will, therefore, be parallel, and a point can be found through which the same effect can be produced by a force equal to the sum of all the little forces. This point is called the C. of G. In the case of a sphere or circle, the C. of G. is the geometrical centre, in a cylinder it is the middle point of the axis, in a triangle it is situated on the line which joins the vertex to the middle point of the opposite side and at a distance from the vertex equal to two-thirds of that line; in each of these cases it must be supposed that the material is equally dense throughout. To determine the C. of G. of a body experimentally, it should be suspended from one point and allowed to hang freely; the C. of G. must then be in the vertical line passing through the point of suspension, otherwise the body would rotate by reason of a greater force acting on one side. By choosing another point of suspension a second vertical line may be established, in which the C. of G. is situated, and the point of intersection of these two lines will give the required centre. As the action of gravity can be reduced to a single vertical force acting at a single point, equilibrium depends on the relative positions of this point and the points at which a body is supported. If the body is supported at one point only, that point requires to be in the same vertical line as the C. of G. to establish equilibrium. If the body is supported on or from a number of points, the vertical line from the C. of G. requires to fall within the figure traced out by joining those points by straight lines. The broader the base, therefore, the more stable is the equilibrium, for the body may be tilted to a greater extent without bringing the line of gravity outside the base; so that the body when released simply resumes its former position. A body is said to be in *unstable* equilibrium when the slightest disturbance of position results in its toppling over, such as a stick balanced on the finger; in this case the vertical line through the C. of G. does not pass through the point of support if the stick is moved. If a body is moved to an adjacent position and still remains in equilibrium it is said to be *neutral*; a sphere is an example; however it is moved, the C. of G. is always vertically above the point of support.

Centre of Gyration, that point in a rotating body at which the total mass of the body may be supposed to be concentrated. Gyration is rotation about a fixed line, called the axis of gyration, and the inertia of the body acts as a resistance to any change in the angular velocity of the body with regard to the axis of gyration. The resistance depends upon the distribution of the mass, and it is possible to conceive of the whole mass being located at a single point so that the resistance is unaltered.

Centre of Oscillation, that point in a suspended body at which the whole mass of the body may be looked upon as concentrated in order that the time of oscillation

may be the same. A simple pendulum consists of a heavy particle suspended by a fine thread from a fixed point, about which it oscillates. Such a pendulum does not exist in practice, and it is usually convenient to use a rigid rod terminated by a heavy mass. The different points in this system will strive to complete their oscillations in different times, owing to their varying distances from the point of suspension. They must, however, all oscillate together; and it follows that the motion of particles near the point of suspension will be retarded, while that of the more distant particles will be accelerated. Between these points it will be possible to fix upon a point where the motion is neither accelerated nor retarded, and the distance of this C. of O. from the point of suspension is the length of the pendulum. It has been found that the point of suspension and the C. of O. are mutually convertible, so that the C. of O. may be found experimentally as that point at which the pendulum must be suspended in order to produce the same time of oscillation as when the pendulum was suspended at its first point of suspension.

Centre of Percussion, that point in a body moving round a fixed axis at which it may be struck without producing any shock at the axis. If a body free to move be struck instantaneously in a direction which does not pass through the centre of mass, it is made to rotate about some other point in the body, whether that point is fixed or not. That is to say, that point is neither carried forward in a direction parallel to that of the blow, nor has it a reaction in the opposite direction. The two points, the C. of P. and the centre of rotation, are mutually convertible, and in fact stand in the same relation as the centre of oscillation and the point of suspension of the body considered as a pendulum. A cricket bat swung to meet a ball at its C. of P. does not communicate any shock to the axis by reason of the impact, but a shock is felt if the obstacle is met at a greater or smaller distance.

Centre of Pressure, that point in a surface pressed by a fluid at which the whole pressure exerted by the fluid may be counteracted by a single force equal to the whole pressure. If a plane surface is immersed horizontally, the C. of P. corresponds with the centre of gravity, but not if it is immersed in any other direction. If a rectangle be immersed vertically with one side in the surface, the C. of P. is at a distance of two-thirds of the vertical side below the surface. The term is used with reference to plane surfaces only, since it is not always possible to represent the pressures on a curved surface by a single force.

Centrifugal and Centripetal Forces are those called into play when a body is constrained to move with uniform velocity in a circular path. According to Newton's law a body will continue to move with a constant velocity in a straight line unless acted upon by external forces. If we wish the body to take up a circular path, a force must be applied perpendicular to the direction of motion and

equal in magnitude to the product of the mass into the square of the velocity divided by the radius of the circle. The direction of the force is towards the centre of the circle and considered in this light is a centripetal force. If we consider that the body tends to move away from the centre, the force with which it does so is called the centrifugal force. The two terms are really two names of the same thing considered in different aspects. The motion of the body when the force is removed will be along the tangent to the circle at the point where the body leaves it. The centrifugal force is an important quantity, and has many applications. Thus in the case of an engine governor there are two balls hung on rods fixed to a vertical rotating shaft, which rods can move up and down in a vertical plane, being hinged at the top end. Then when the shaft rotates the knobs tend to get away from the shaft and so are lifted up. This lifts up a valve-cap and allows steam to escape when the rotation is too rapid. The outlet of steam decreases the rotation of the shaft, lowers the balls, and closes the valve so that the pressure of steam and rotation of the shaft are kept fairly constant. Centrifugal drying machines act on the principle that the moisture clinging to the material is apparently forced out by virtue of the centrifugal force acting upon it when set in rapid motion, but, more strictly speaking, this moisture tends to go in the direction of its own motion, and so leaves the fixed material behind. Similarly in separators for various operations. The centrifugal force on a body is proportional to its mass, so that dense bodies will tend to move to the outer radius of a cylindrical vessel rotating about its axis, and lighter substances tend to move in towards the axis. In the design of fly-wheels, and all rapidly rotating wheels, the centrifugal force is an important consideration. With heavy rims moving at big velocities the force becomes enormous, and if the tensile strength of the metal does not exceed the tension caused by the force, disastrous results are caused by the wheel flying to pieces.

Centring, or Centering. When arches are being made it is necessary to support them in order that they shall not come to pieces before the mortar is set and equilibrium obtained. This is done by making a framework of wood called a centre of the required curve along its upper edge, upon which the brick or stone can rest and be built up. In the case of arches of small rise, such as those above the reveals of a window, the centre can be shaped from a single board or two boards, which are held in position by means of supports nailed into the jambs of the opening. This can only be done if the soffit is of small thickness; for larger ones a semi-circular frame is made with strips crossing the top. For larger arches with a big rise a complicated structure of wooden pieces must be built up to the required shape and of such a form that stresses in the members are of safe values when the load is applied. Thus the ribs, as they are called, should be kept in compression if possible, and for

extra large arches this compression must not be large enough to cause bonding and thus displacement of the arch. The removal of the centre is done gradually so as to let the arch take up its proper form.

Centrisous, name given by Cuvier to the typical genus *Macrorhamphosus* of the family Macrorhamphosidae. *C.* (or *M.*) *scolopax*, the trumpeter, bellows-fish or sea snipe is common to the Mediterranean, and is sometimes taken on Brit. coasts.

Centroid is analogous to centre of gravity, but in its determination we leave out consideration of mass and consider distance only, so that the C. of the body of uniform density will coincide with its centre of gravity. Thus in a system of points (separate or forming an area) the C. is situated at a distance from three co-ordinate planes equal to the average distance from those places of all the points in the system.

Centrolophus, genus of deep-sea fishes of the family Stromateidae and suborder Percoformes. *C. niger*, the black fish, and *C. britannicus* have occasionally been found on Brit. coasts.

Centronotus, or **Pholis**, genus of spiny-rayed fishes of the Blenniidæ, or blenny family. The species are littoral, and *C. gunellus*, the butter-fish, is Brit.

Centropomus, genus of perch-like fish of the Serranidae, or sea bass family. *C. undecimalis*, the sea-pike, which tenants the mouths of great rivers of S. America, weighs about 25 lb., and is used largely for food.

Centropristis, genus of spiny-rayed fish of the Serranidae, or sea-bass family, of which sev. species appear on the coasts and in the rivers of America. *C. nigricans*, the black perch or black bass, is abundant in N. Amer. rivers, and is much esteemed for the table.

Centumviri, court of plebeian judges in ant. Rome, the number of which varied from 100 to 180. Sometimes the court sat as a whole body under the presidency of a prætor, but on occasions it sat in sections (*consilia*). Their power of jurisdiction extended in the first place to matters of status and quiritian ownership, but latterly it was confined mostly to questions of succession. The special sign of quiritian ownership was a spear, and therefore one was always erected in front of their court.

Centunculus, small and insignificant genus of Primulaceæ which flourishes in temperate and sub-tropical countries. In Britain it has one native species, *C. minimus*, the bastard pimpernel, a small plant with pink flowers.

Centurio, Rom. officer on foot. The three prin. divs. of the regiment or legion were the Principes, the Hastati, and the Triarii, and they each elected twenty Cæ., two of whom were appointed to each of the thirty companies of foot into which the legion was divided. The first C. chosen was always a member of the council of war.

Centuripa, **Centuripe**, or **Centorbe**, tn. in the prov. of Catania, Sicily. The tn. is situated at the foot of Mt. Etna between the Simeto and the Salso, and is

about 30 m. N.W. of Catania. In ancient times the Ln. was one of the most important possessions of the Siculi (see Cicero, *Verr* (2nd oration), iii., iv., and v., *passim*, and Plin. iii. c. 8). The Emperor Frederick II. sacked the fn. in 1233. There are sulphur mines in the vicinity. In the Second World War the church of the Immacolata suffered damage in the Sicilian campaign. Pop. 12,200.

Ceorl, A.-S. word used to denote a freeman who held the position above a serf, but below the noble or thegn. The position of the C. was precarious; occasionally by signal service he was promoted to the rank of thegn, but more often through stress of circumstances he became identified with the serf. After the coming of William the Conqueror and the estab. of Norman feudalism in England, the C. disappeared as a unit of a definite class, and a corresponding position was occupied by the newer order of villeins.

Ceos, now called **Zea**, an is. in the Aegean Sea. It is one of the Cyclades, and noted principally for its lovely climate and its fertility. The length is 13 m. by 8 m., and it covers an area of about 40 sq. m. The bp. of the poet Simonides. Pop. 5000.

Cephaelis, now sometimes included in the genus *Urgeae*, belongs to the family Rubiaceae and flourishes in S. America. C. (or U.) *ipecauanha*, which grows in damp, shaded parts of Brazilian forests, is a herb from the roots of which the drug *ipecauanha* is obtained.

Cephalanthera, genus of N. Orchidaceae, of which three species (helleborines) are Brit. C. *mandiflora*, C. *rubra*, and C. *ensifolia* are all leafy plants with rhizomes, a rudimentary rostellum, and an unspurred labellum.

Cephalanthus, genus of Rubiaceae common to Asia, Africa, and America. C. *occidentalis*, the button-wood, is a shrub which grows to a height of 6 to 15 ft., and has a light spongy wood. The root contains an agreeable butter used as a remedy for coughs.

Cephalaspis, curious genus of fossil ostracoderm fish found in the Old Red Sandstone of Scotland and the Upper and Lower Devonian of Canada and Britain. The species had elongated bodies, large heads covered with a bony shield, a median spine, a single dorsal fin, and the anal fin was heterocerical like that of a shark. They had no jaws, and the skeleton is thought to have been cartilaginous as it has not been preserved. C. *Lyellii* and C. *Lloydii* are Brit. species, and C. *magnifica*, the largest Cephalaspid, occurs in the Cuthliss Flagstones.

Cephalæmatoma, term used in medicine to denote a tumour or swelling due to the extravasation of blood beneath the pericranium. It is only observed in newborn infants, and is produced by pressure during labour, which causes a tearing of the periosteal tissues. There is no need in most cases to do anything with a swelling of this kind, as absorption generally occurs and the C. disappears.

Cephalochordata, group of vertebrates, or primitive representatives of the verte-

brates, which is classed immediately below Pisces, or fishes. It consists of only about ten species comprised in the single genus *Amphioxus* (q.v.). There is no actual backbone, but a notochord is present, around which the backbone is constructed in the true vertebrates. The notochord extends forwards to the extreme anterior end ('head'), whence the name C. is derived.

Cephalodiscus, curious animal about the classification of which there has been some disputation among zoologists. It was first discovered in 1876, when the members of the *Challenger* expedition were dredging in the strait of Magellan, but later it was found in sev. other seas. It was originally believed to be related to the Polyzoa, but is now generally classed with *Balanoglossus*, and *Rhabdopleura* has been placed with it among these worm-like creatures which bear signs of approximating to vertebrate structure. The C. is colonial, and lives with other individuals in a branching, weed-like investment which may measure as much as 9 in. by 6. The body, like that of *Balanoglossus*, is divided into a proboscis, collar, and trunk; two gill-slits are present and a notochord is represented by a diverticulum of the alimentary canal. All these animals comprise the *Hermichordata*, allied to the *Cephalochordata* (q.v.).

Cephalonia, or **Kephallenia**, place mentioned in the *Odyssey* under the name of Samos (Samos). It is the name given to the largest of the seven Ionian Isles lying to the W. of Greece and opposite the entrance to the gulf of Lepanto. The length is 32 m. by a breadth from 5 m. to 12 m., and has an area of 300 sq. m. The coastline is very broken, and the surface is mountainous. The highest point is Elato, or Monte Negro (anc. Gk. *Ávros*, Lat. *Ænos*) (5215 ft.). The vine and currant are grown extensively, and wheat, oil, and fruit are the chief exports. The chief fn. is Argostoli. Pop. 67,000.

Cephalopoda (Gk. *κεφαλή*, head, *πους*, foot), to which belong the octopods, cuttlefishes, and squids, are the most highly specialised molluscs, and are characterised by the well-marked head, round which are arranged symmetrically 'arms' bearing suckers or tentacles, formed from the foot, as is the funnel through which water is squirted. The mantle-cavity contains four ctenidia (gills) in the Tetrabranchiata, two in the Dibranchiata, and in both orders the median anus, ink-sac, paired kidneys, and genital duct open into it. The anct. forms had external shells, and though these may be seen fossil as belemnites and ammonites, they have persisted in only one living genus, the *Nautilus*. The eyes are very large, those of one species measuring 15 in. across; the mouth has a parrot-like beak and on the tongue there is a rasping ribbon; the sense of touch is highly specialised in the arms. The cephalopods are all marine, voracious animals which feed on animal matter, especially on Crustacea; they can swim in a horizontal position or creep by means

of their arms, and they project themselves backward swiftly by a contraction of the mantle. The ink-sac is a gland which opens into the rectum, and contains a dark brown fluid in which is sepia; when alarmed the creature can expel this fluid and darken the surrounding water so as to cover its disappearance by a kind of 'smoke screen.' Among the *C.* the sexes are always distinct, a characteristic not common among molluscs, and the female is usually larger than the male. The eggs are large and are attached in masses, called sea-grapes, to bodies in the sea, and immediately on hatching they present the appearance of a diminutive adult. The *C.* are divided into two orders, the *Tetrabranchiata* and *Dibranchiata*, according to the number of their gills. In

CEPHALOPODA: COMMON OCTOPUS

the former order there are four, and the species are characterised by having no ink-sac, a well-developed external shell, a funnel composed of two unfused lobes, four kidneys and auricles, and numerous arms without suckers. *Nautilus* is the single living genus of this order, but several are found fossil, the commonest being *Ammonites*. The *Dibranchiata* have two gills, and the species are usually furnished with an ink-sac; there is no external shell, the lobes of the funnel are fused, the kidneys and auricles are two in number, and there are either eight or ten sucker-bearing arms. When there are eight arms and two tentacular arms these molluscs are known as *Decapoda*, and have an internal shell, e.g. fossil *Belemnites*, or the living *Sepia*, the cuttle-fish (of which the internal shell, or cuttle-fish 'bone' is sometimes suspended in parrot cages); when there are only eight arms, the creatures are *Octopoda* and have no shell, e.g. *Octopus*, the poulpe or octopus, and *Argonauta*, the paper-nautilus. The reproduction of *C.* is remarkable in that one of the arms of the male becomes charged with sperm and is used as a copulatory organ; in some species (e.g. the *Argonaut*) this arm is much modified ('hectocotylised') and is left behind in the

body of the female, where it was described by Cuvier as a parasite. Some deep-sea species of *C.*, such as those observed by Beebe in his bathysphere, are enormous in size, being amongst the largest of known animals.

Cephalotaceae, smallest possible family of dicotyledons, as it contains a single genus consisting of a solitary species, *Cephalotus foliolaris*. This plant, popularly known as New Holland pitcher plant, grows in the marshes of W. Australia, and is very closely related to plants of the order *Saxifragaceae*; it has a pitcher which closely resembles that of *Nepenthes* in structure and in the function of insect-catching. The flowers are hermaphrodite, apetalous, perigynous, with six perianth leaves, stamens in two whorls of six, a gynaeceum, consisting of six free apocarpous carpels each with a single basal ovule. The fruit is a one-seeded follicle. The family differs from the *Saxifragaceae* only in the free, apocarpous carpels and basal ovules. The upper leaves of the plant are flat and green, while the lower leaves are those which bear the pitchers and have lids.

Cepheus, king of Ethiopia, son of Belus, husband of Cassiopeia and father of Andromeda. He was one of the heroes in the voyage of the Argonauts, and was changed into a constellation after his death. (See Ovid, *Met.* iv. 669, and v. 12.)

Cepheus, in astronomy, a constellation of the N. hemisphere, surrounded by Cassiopeia, Ursa Major, Draco, and Cygnus. It is mentioned by numerous ancient authors, including Eudoxus and Aratus, but considerable diversity appears as to the number of stars it contains. Tycho naming eleven, Ptolemy thirteen, and Hevelius fifty-one. The prin. star, Alderamin, is of the third magnitude, while Delta Cephei is an interesting double star.

Cephisus (Cephius) (Gk. Κηφισός); 1. One of the largest rivers of Attica (Podoniphthi or Sarantaporos), flowing S. through the olive-grove W. of Athens into the bay of Phaleron (near Eleusis), E. of Piræus. It rises on the slopes of Mts. Pentelicon and Parnes, and is constantly fed by their springs. 2. Also a riv. flowing through Phocis and Boeotia towards the bed of the anct. Lake Copais (Topolias). Now called Mavronero, it empties into the channel of Eubœa. Its waters are drawn off in drainage canals.

Cepheu, see KHAFFA.

Cephus, genus of hymenopterous insects of the family *Cephidæ* (stem sawflies), which have no waist and live on plants. The females lay their eggs in stems or twigs and the white larvae eat their way through and thus frequently are very destructive. *C. integer* is an Amer. species which feeds on willow, and *C. pygmaeus* a European species which lives on corn.

Cepola, typical genus of perch-like fishes of the *Cepolidae*, or bandfish family. The species are all marine and inhabit European seas; *C. rubescens*, the red bandfish or red snakefish, is a Brit. species which grows to an average length of 12 in.

Ceram, Zeram, Serang, or Ceiram, is. of the Moluccas, Dutch E. Indies. It is situated to the N.E. of Amboyna, and is divided by the isthmus of Taruno into Great and Little C. Very little is known of the interior of the is.; a chain of mts. crosses it, the chief being Nusa Keli (11,000 ft.). The land is fertile, and sago is largely grown. The exports are timber, iron, dried fish, edible nests, and birds of paradise. Area about 6605 sq. m. Pop. 98,000.

Cerambycidae, or Longicorns, family of coleopterous insects which have elongated bodies, long antennae with their insertion much embraced by the eyes, five segmented tarsi and no rostrum. The species live on trees and herbaceous plants, and the larvæ are soft, whitish grubs, usually without legs. More than 12,000 species are known, and many of them greatly damage trees, e.g. *Saperda populnea*, which attacks the aspen, and *Elaphidion villosum*, the oak.

Ceramics, technical name for the study of the art of pottery in its widest sense, though pottery nowadays tends to designate only the coarser articles manuf. from clay, and porcelain is used to denote the finer articles. See POTTERY.

Ceramium, genus of marine algae belonging to the order Ceramnaceae. It consists of delicate filamentous seaweeds, with the tips of the filaments incurved and a cortical band at the nodes. *C. rubrum* is a common species.

Ceramius, genus of the hymenopterous family Masariidae, is related to the true wasps of the family Vespidae. The forewings of the species are flat, their antennae clubbed, and their homes are usually underground cells.

Ceram Laut Islands, group of little is. belonging to the Malay Archipelago, and one of the Molucca group. These is. are situated S.E. of Ceram, the chief one being mountainous.

Cerapus, genus of amphipodous crustaceans, is shrimp-like in general figure, but the first pair of limbs are small, and the second constitute strong pincers; the antennae are strongly developed. *C. tubularis* lives in a small cylindrical tube and exposes only the anterior part of its body. The species occur in abundance in N. America.

Cerargyrite, otherwise called **Chlorargyrite**, or **Horn-silver**, mineral found in S. America and Australia. It is a form of silver chloride, containing 75 per cent silver and 25 per cent chlorine. It is remarkable for malleability and sectility, and is blackened by light.

Cerasin, solid tasteless insoluble body obtained from cherry-tree gum. The soluble part of the arabin (constituting the chief part of gum-arabic) is dissolved out by digesting with water and C. remains. When C. is heated with nitric acid it yields mucic and oxalic acids.

Cerastes, genus of vipers found in W. Asia and N. Africa. The males, and sometimes the females, have a horn-like process over the eyes, and this feature is responsible for the name of the species *C. cornutus*, the horned viper. The other

species, *C. ripera*, has no horns and is said to have been the asp of Cleopatra.

Cerastium, genus of Caryophyllaceae, the representatives of which are called mouse-ear chickweed in Britain. The species contain no valuable properties and are quite un-ornamental.

Cerasus, name which Tournefort gave to a genus now usually included in *Prunus*, which belongs to the Rosaceae. It was used to distinguish cherries from such fruit as plums, and it was divided into the true cherries, bird-cherries, and cherry-laurels. *C. vulgaris*, the common cherry, is identical with *P. Cerasus*; *C. Padus*, the common bird cherry, with *P. Avium*; *C. laurocerasus*, the broad-leaved cherry laurel, with *P. laurocerasus*; *C. Lusitanica*, the Portugal laurel, with *P. Lusitanica*. See PRUNUS.

Cerasus, colony on the S. shore of the Black Sea. The colony gave the name to the cherry, a fruit which grew abundantly in the region. The colony was originally founded from Sinope.

Ceratina, genus of solitary bees which belongs to the group Scopulipidinae of the family Apidae, or Anthophila. Unlike most bees, the Ceratina has very little hair on its body, and like the carpenter-bee of the same group it bores in wood for its home. *C. cerulea* is not uncommon in Britain.

Ceratites, genus of fossil mollusc of the order Ammonoida. *C. nodosus* is a good example.

Ceratodus (Gk. *κερας*, horn; *ὄδον*, tooth), name given to a genus of diploid fishes only a few of which are still in existence; many species, however, have been found fossil. The body is long, compressed, covered with large, thin scales, there are two teeth in one jaw and the species have only one lung. They are found in the Trias and less seldom in the Jurassic and living examples occur in the mud-fish of Queensland rivers. *C. forsteri* is commonly called the barramunda.

Ceratonía Siliqua, sole species of its genus in the Leguminosae, and is known by the name of carob-tree. It is found wild in the countries skirting the Mediterranean, especially in the Levant, and is almost the only tree of Malta. The pods, called algaroba, or St. John's bread, contain a sweet nutritious pulp and are used for consumption by human beings and domestic animals. They are said to be the tree which yielded the honey eaten by St. John the Baptist, and the seeds are supposed to have been the original of the carat weight.

Ceratophyllaceae, small and obscure order of dicotyledonous, aquatic plants, comprehends the single genus *Ceratophyllum*, comprising three species. The flowers are dichous, the males consisting of about six to twelve stamens and as many perianth leaves, and the females of sev. perianth leaves and a single free carpel; there is one ovule and the fruit is an achene.

Ceratophyllum, sole genus of Ceratophyllaceae (q.v.) is represented in Britain by *C. demersum*, and *C. submersum*, the hornworts. They are found submerged

in ponds and ditches as rootless plants with much-divided leaves, the old leaves being horny and giving them their popular name.

Cerbera, genus of Apocynaceæ, flourishes in S. India, Ceylon, and Madagascar. *C. tanghin* has a fruit from which the tanghin poison is procured; it was formerly used in trials of persons convicted of crime, their guilt being estab. if it took effect, their innocence if they survived.

Cerberus (Gk. Κερβερος), name of the dog who guarded the infernal regions in Gk. mythology. Described in the poets as many-headed (Hesiod, *Theog.* 311; Homer, *Virgil*), he is usually represented with three or two heads, and a tail or mane of serpents. He only attacked those who tried to escape from Hades. It was the twelfth labour of Hercules to bring C. up from the lower world. Hevelius gave the name also to a N. constellation.

Cerberus, genus of Colubridæ, belongs to the sub-family Homalopsine, and consists of viviparous, aquatic snakes common to the rivers and estuaries of the E. Indies from Bengal to N. Australia. *C. rhynchops* has large ventral scales, and none of the species is fatal to man.

Cercamon (fl. 1100) famous Provencal troubadour, *b.* in Gascony. A *tenso* and three of his amorous lyrics survive, but the *pastorelas*, of which mention is made by his old biographer, is lost. Marcarun, a poet of great originality of thought and style and whose historical poems date from 1135 to 1148, was a pupil of C. See F. Diez, *Die Poesie der Troubadours*, 1827, and *Leben u. Werke der Troubadours*, 1829 (later eds. by Bartsch, 1883 and 1882 respectively).

Cercaria, scientific name applied to many young Trematodes in the genus *Distomum*, or liver-fluke. They bear considerable resemblance to the adult form, but possess a long, motile tail, frequently have eyes, and the generative organs are only rudimentary. When the eggs of a *Distomum* hatch, the larvæ search for a host, *e.g.*, water-snail, and when the C. stage is reached in the host's body they wriggle out of it, swim to another host or foreign body, lose their tails, and encyst. In this form they may be eaten by a vertebrate, *e.g.* sheep, when they become mature and the larvæ once more continue the cycle.

Cercis, genus of leguminous plants, flourishes in Europe, Asia, and America. *C. Siliquastrum*, the Judas tree, so called from the tradition that the false disciple hanged himself upon one, flowers in the open air in Britain. In colour they are a bright pale red, and in the spring they burst out before a leaf appears.

Cercopitheciidæ, one of the two families of Catarrhine Apes, is to be found only in the Old World. The dentition is the same as that of the Simiide, the inter-nasal septum is parrow, the tail is never prehensile, cheek pouches may or may not be present, and ischial callosities are to be seen. The genera are divided amongst the two sub-families Cercopitheciinæ, *e.g.* macaques, mandrill, green monkey, and

Senmopitheciinæ, *e.g.* guerezas, langurs, or holy apes, and proboscis monkey.

Cercopithecius, or **Guernons**, is a genus of Old World monkeys, which have long tails, ischial callosities, cheek pouches, and are often brightly coloured, *e.g.* *C. callitrichus*, the green monkey. *C. diana*, the Diana monkey, has a white beard.

Cercyon, son of Poseidon, or Hephestus, and the king of Eleusis. He was a cruel tyrant, put to death his daughter, Alope, and killed all strangers whom he overcame in wrestling. He was ultimately conquered and slain by Theseus.

Cerdu, Juan Luis de (1560-1643). Sp. author and theologian, *b.* and educated at Toledo, where he spent the greater part of his life. He entered a Jesuit order and was made prof. of theology and belles-lettres. He is principally famous for his able commentaries on Virgil's *Bucolics* and *Georgics* in 1608 and on the *Æneid* in 1612. He also ed. the works of Tertullian in 1624.

Cerdagne, W. part of the prov. of Roussillon in France during the fourteenth and fifteenth centuries. The name is now applied to the land on the N. and S. of the Pyrenees, partly in Spain (Catalonia) and partly in France (dept. of the Pyrénées-Orientales). From its broad valley the R. T6v flows to France, and the R. Segre to Spain.

Cerdic (d. 534?), was king of the W. Saxons and the ancestor of all the kings of England except Canute, Hardicanute, two Harolds, and William the Conqueror. It is said that he was the ninth descendant from Woden, and he landed probably in Hampshire in the year 495. He allied himself with Æse and Ella and defeated the Britons on many occasions. In 519, with Cynric, he founded the kingdom of the W. Saxons. In 530 he conquered the Isle of Wight.

Cereals, **Cereal Grasses**, or **Cerealia**, form a group of graminaceous plants which are cultivated for their edible seeds: the name is derived from Ceres, the corn-goddess of classical mythology. Botanically speaking the term has no definite limits, for the species of some genera are often cultivated for their grain, while their near allies are of no importance as food. The plants have been grown from the earliest times, and frequently the wild form from which they have sprung is unknown, as in the wheat and barley. The C. which are best known to the human race are wheat or *Triticum*, barley or *Hordeum*, rye or *Secale*, oats or *Avena*, Indian corn (maize) or *Zea*, millet or *Panicum* (also *Sorghum*, *Setaria*, *Pennisetum*), and rice or *Oryza*.

Cerebral Softening, see under **BRAIN**, *Diseases of the Brain*.

Cerebration, **Unconscious**. It is certain that all conscious mental processes are accompanied by molecular changes in the cerebrum (see *Function of the Brain*, under **BRAIN**). Sir W. Hamilton and Dr. Carpenter believe that these changes in the brain may go on without accompanying conscious action. As an example of this, we may take the ordinary experience of suddenly recalling a name or an

incident while in the midst of some entirely different line of thought, after having been unable to recall it while thinking definitely of it. According to Dr. Carpenter, the cerebrum, after being put in action by the consciousness, goes on working automatically. This may perhaps be regarded as the physiological interpretation of the psychological statement that the mind may undergo modification without being conscious of the processes involved. See Sir W. Hamilton, *Lectures on Metaphysics and Logic*, vol. 1., 1859-60, 1874; W. B. Carpenter, *Principles of Mental Physiology*, 1874.

Cerebro-spinal Fluid, lies between the coverings of the brain and spinal cord. The outer covering is termed the dura mater, while the inner one which follows the contours of the brain is termed the pia mater. Between these two there is a third, the arachnoid, formed of loose connecting tissue. The C. F. is contained partly between the dura mater and the arachnoid, but mainly between the pia mater and the arachnoid. It passes over all the brain and spinal cord, and acts as a carrier of waste products and as a guard against shock to either the brain or the spinal cord. It further maintains an equal pressure on the skull, being variable in quantity. It is clear, practically colourless, liquid, and very similar to lymph. It is abundant in old people, for as the brain atrophies the amount of fluid increases.

Cerebro-spinal fever, see under MENINGITIS.

Cerebrum, see BRAIN.

Ceremonies, Master of the, title incumbent of the 'Governor of the Feast' of the N.T. In the present day it is usually applied to a person who assumes control of affairs at any social function.

Cereopsis, genus of anseriform birds of the family Anatidae, is one of the least natural of its kind. *C. Nova Hollandiae*, the New Holland or Cape Barren goose, is a handsome bird of grey-brown plumage.

Ceres—1. Nt. in Fife-shire, Scotland, 3 m. S. E. of Cupar. Pop. 1145. 2. Dist. and tn. in Cape of Good Hope, near the Hex R. valley and 7.5 m. from Cape Town. It has a good water supply and is a health resort. Pop. of dist. 7000 of the tn. 1300.

Ceres, Rom. name of the Gk. goddess Demeter (*q.v.*).

Ceres, name given to the first discovered of the asteroids. It was first seen by Piazzi at Palermo, Sicily, on Jan. 1, 1801, and observed by him till Feb. 13. There was some danger of its being lost again, as by the time the news of its discovery reached other astronomers in March, observations were impossible owing to its proximity to the sun. The difficulty was overcome by the invention of a new method of planetary orbit computation by Gauss. It is not visible to the naked eye, being of the seventh or eighth magnitude.

Céret, tn. in the dept. of Pyrénées-Orientales, France, near Perpignan, with tale quarries, cork and shoe-making industries. Pop. 5000.

Cereus, or Torch-thistle, large genus of Cactaceae common to tropical America and the W. Indies. Most of the species are erect, the stem is elongated, angular, seldom branched, and the fruit is often edible. Some of the members of the genus bloom in the night-time, and are sweetly scented, e.g. *C. triangularis* and *C. grandiflorus*. *C. senilis*, old-man cactus, is covered with silky white hairs, and *C. giganteus* is the tallest cactus in existence, reaching a height of over 70 ft. *C. flagelliformis*, the creeping C., has thin sinuous branches, and *C. speciosissimus* is noted for its beautiful purple and red flowers.

Ceria, genus of dipterous insects, belongs to the Syrphidae, or hover-fly family. The body is elongated and somewhat ovate in form, black and yellow in colour, the general appearance is wasp-like. *C. conopsoides* is a species rarely found in Britain.

Cerignola, tn and episcopal see in the prov. of Foggia, Italy. It was near here that the Spaniards under Gonsalvo da Cordova defeated the Fr. under the duc de Nemours in 1503. Taken by the Eighth Army (*q.v.*) in Sept. 1943 in their advance to the Foggia plain. Pop. 40,000.

Cerigo (anct. Cythera), most southerly of the Ionian Isles. It is very mountainous, and covers an area of 116 sq. m. The chief tn. is Caspali which lies at the S. end. Wheat, vines, olives, and cotton are grown, and the pasture land is excellent. Sheep and goats are exported to Greece in great numbers. The is. was colonised by the Phœnicians, and was celebrated for the worship of Venus, who was said to have come up out of the sea near this spot. Pop. 16,000.

Cerinthus (c. A.D. 100), early Christian heretic, who was a contemporary with the last years of St. John the Apostle. Early accounts all seem to agree that the prov. of Asia was the scene of his work, and Hippolytus states that he had his training in Egypt. The teaching of C. was that the world had been made by angels, and the only part of the N.T. he accepted was extracted from St. Matthew's gospel.

Cerithium, gastropod mollusc, is to be found in marine, but more often in brackish, water. Like others of the family Cerithiidae, it has a long, many-whorled turreted shell, a short branchial siphon, and a horny operculum. It occurs fossilised in great abundance.

Cerium, one of the 'rare earth' metals, chemical symbol Ce. Atomic weight 140; sp. gr. 7.0; melting point 645°. It resembles iron in appearance. It is malleable and ductile and a poor conductor of electricity. Burns in air, and in the form of wire its flame is brighter than that of magnesium. The metal is prepared by the electrolysis of its fused chlorides, with the addition of a small percentage of sodium or potassium chloride with iron cathode and graphite anode. Sev. mixtures are used for making lighters. C. occurs in a number of rare minerals, one of the commonest

being monazite sand; and thorium and other rare metals contain up to 30 per cent of the oxide; much rarer, but containing some 60 per cent of the oxide, is cerite.

Cernusci (Cernuschi), Enrico (1821-96), lt. economist, b. at Milan; fought as a Republican (1848-49), and in 1850 settled as a banker in Paris. In 1871, having incurred the hostility of the Communards, he left France and travelled in Egypt, China, Japan, England, and America. He was an advocate of bimetalism, and his works, mainly on money questions, include *Mécanique de l'échange* (1865); *Illusion des sociétés coopératives* (1866); *Silver Vindicated* (1876); *Le Bimétallisme à quinze et demi* (1881).

Cernusco sul Naviglio, community situated 6 m. from Milan in Italy. Pop. 6800.

Cerocoma, genus of coleopterous insects of the family Cantharidae, is noted for the extraordinary antennae of the males. The Brit. species appear on flowers in great numbers during the summer months, but the larva of *C. Schnaefferi* has been found preying on the food stored in a wasp's nest.

Ceroxylon, genus containing five Amer. palms, is remarkable chiefly for *C. andicola*, the wax palm of the Andes. The plant grows to a height of about 180 ft. among the most rugged precipices of the wild region it inhabits, avoiding tropical plains; its leaves are 18 to 20 ft. long, and the trunk is covered with a thick incrustation of wax which is made into excellent candles.

Cerreto, tn. and an episcopal see in the prov. of Campania, Italy, 16 m. from Benevento. It has a very fine cathedral. In the fighting of 1943 the Gers. blew up the campanile of the Madonna del Carmine Church. Pop. 5000.

Cerro de Pasco, mining tn. and cap. of dept. of Junin, 120 m. from Callao, in the highlands of Peru. It has silver and copper mines which are extraordinarily rich, and there are therefore large smelting works. Coal and salt are also found near by. There is a railroad connection with Lima via Oroya. It stands at an altitude of 14,270 ft. Pop. 15,000.

Cerro Gordo, pass between the mts. in Mexico on the road from Mexico City to Vera Cruz and about 60 m. from the latter. The Amers. under Gen. Scott defeated the Mexicans here in 1847.

Cerro Largo, dept in N.E. of Uruguay. It has the Rio Negro on the N.W., and Brazil on the E. Large herds of cattle are pastured on the grass-covered downs. Its area is 5753 sq. m. Pop. 96,000.

Certaldo, vil. in the prov. of Tuscany, Italy, 20 m. from Florence. It is the place where Boccaccio lived and d. (1313-1375). The tn. was heavily shelled in the Second World War. Boccaccio's house was badly damaged, and minor damage was done to the church of SS. Michele e Jacopo. Pop. (com.) 12,000.

Certhia, genus of passeriform birds, consists of sev. species with moderately long curved bills, short wings, and stiff tail-feathers, which have large feet and

strong claws well adapted for climbing about trees and rocks. The food consists of insects and their larvae. *C. familiaris*, the tree-creeper, is an active little creature common in England, with a monotonous and often-repeated note.

Certhiidae, family of passeriform birds known popularly as creepers. The species have a long, slightly curved beak and there is a sharp claw on the hind toe; many utter shrill cries, e.g. *Tichodroma muraria*, the wall-creeper, but others are songsters, e.g. *Certhia familiaris*, tree or common creeper.

Certhilauda, genus of the Alaudidae, or lark family, of which the members dwell in arid plains and deserts. The plumage is dull-coloured, and the beak long and curved.

Certificate, in law, may comprise either (1) documents officially prepared by a court for the purpose of notifying another court, or any one whom it may thereafter concern, of anything directed or ordered in the certifying court; or (2) signed and written statements by various persons admissible as evidence of the facts certified therein. Instances of the first kind are a bankrupt's C. of discharge, a C. of conviction or acquittal on a criminal charge tried before a court of record, a C. of dismissal on a charge before a court of summary jurisdiction, and a judge's C. of costs. Instances of the second class are a public analyst's C., a C. of the registration of a Brit. ship, an alien's C. of naturalisation, an architect's C. as to the due performance of a building contract, a C. of shares in a joint-stock company constituting the document of title to the shares, and a C. of deposit given by a banker for the purpose of certifying that the person named therein has placed a certain sum on deposit account.

Certification, in law of Scotland, means the express or implied notice to the defender (defendant in Eng. law) that unless he complies with the order in a summons, or shows a reason why he is not bound to do so, certain penalties will be inflicted by the judge. The defender may by custom obtain a special C. against the pursuer (plaintiff) if the latter fails to prosecute an action after having commenced it.

Certiorari, writ issuing from one of the superior courts, directing the judges or officers of an inferior court to transmit or cause to be certified (*certiorari facias*) records or other proceedings. The object of the removal is either that the judgment of the inferior tribunal may be reviewed by the superior court, or that the decision and the proceedings leading to it may take place before the higher tribunal. The Crown office rules provide that indictments and proceedings from inferior courts in criminal matters may not be removed by writ of C. unless it is clear that a fair trial cannot be had in the inferior court, or that some question of law of unusual difficulty may arise, or that a view of the premises or a special jury in respect of which the indictment is preferred may be required for a satisfactory trial. The Central Criminal Court (q.v.) has a trans-

ferred jurisdiction by writ of C. from the various sessional courts within its jurisdiction. A writ of C. is demandable as of right by the Crown, but a private prosecutor must apply for leave to obtain such a writ.

Certosa di Pavia, Carthusian monastery in Italy about 5 m. N. of Pavia. This monastery was inaugurated in 1396 by Giovanni Galeazzo Visconti, duke of Milan. The front exterior of the church is very elaborately decorated, and is considered one of the finest specimens of Renaissance work in Italy. In the interior of the church are many beautiful pieces of sculpture, among which are the tombs of the founder, of Lodovico Moro and his wife Beatrice d'Este. There are also paintings by Borgognone, Solari, Luini, and others. The monks manufactured a special liqueur. The monastery was dissolved in 1866, but it was made a national lt. monument in the year 1891. It is close to this spot that Francis I. of France was taken prisoner by the imperialists in 1525.

Cerumen, commonly known as ear-wax, is yellow waxy matter, and is secreted by certain glands which lie in the passage leading from the outer ear to the tympanum or drum. Its purpose is to catch particles of dust and other substances, and so prevent them from damaging the drum, and it further serves to lubricate the passage. Sometimes C. is formed in excess, and it then causes deafness. Oiling and syringing have in these cases to be resorted to so as to remove the wax which has become hard.

Ceruse, see WHITE LEAD.

Cervantes Saavedra, Miguel de (1547-1616), playwright, poet, and novelist, *b.* at Alcalá de Henares. His parents were fairly well to do, but were not of noble lineage. His father, an apothecary surgeon, seems to have moved about the country during the early years of C.'s life, and it is, of course, highly probable that C. went with him. From 1566 onward the family lived in Madrid. In 1569 C. contributed some poems to a memoir of Isabel de Valois, the wife of Philip II. In 1569 also we have indisputable evidence that C. was in Rome. Many theories have been put forward as to the manner of his arrival there, but the probability is that he served as a soldier in Italy and there entered the service of Acquiliva, recently raised to the cardinalate. In 1570 he became a soldier in the regular service, and in 1571 he took part in the battle of Lepanto, serving on board the *Marquesa*. He was ill of a fever at the time of the battle, but insisted upon fighting, and was thrice wounded. During the following years he saw active service at Navarino and Tunis, and served in the garrison at Naples and Palermo. In 1575 he received leave to return to Spain, and armed with letters of recommendation from those in authority he set out for home. He sailed in a ship called the *Sol*, which was taken on the voyage by Barbary pirates, and C. and his brother, together with many other Spaniards, were taken to Algiers and there sold as slaves.

C. became the slave of a man called Dal Marni and, since he was supposed to be a man of considerable importance, was somewhat closely guarded. In 1576 he tried to escape but failed, in 1577 his brother was ransomed, but the amount sent was not sufficient to pay his ransom also, and in the same year he made another attempt to escape. He was captured and brought before Hassan Pasha, the viceroy of Algiers, by whom he was bought, and who seems to have regarded the 'manned Spaniard' as a kind of mascot. C. still had many plans for escape, and his parents were indefatigable in their attempts to ransom him, and

CERVANTES

After an engraving by D. F. Selma

finally, after much difficulty, he was released and returned to Spain in Oct. 1580, reaching Madrid in the Dec. of the same year. During the years immediately following he seems to have visited Algiers and Portugal, and may possibly have been in the Azores. Between the years 1583 and 1587 he produced many plays for the stage, very few of which remain in existence at the present time. In 1584 he produced *Palat*, and in the Dec. of the same year he married. He found, however, that he could not earn sufficient with his pen, although in the matter of dramatic plays it had been exceedingly busy, and so in 1587 we find him engaged in gathering stores for the Invincible Armada. Between this date and the end of the century his fortune sank lower and lower. The work which he was doing was unconsensual, the pay was often in arrears, he was unfortunate in the men he employed, was in constant financial difficulties, and his unbusiness-like methods cost him even the pittance which he was earning. He was at least twice imprisoned during this period, and by 1600 his condition was that of extreme

poverty. He had still contributed little to literature and between 1585 and 1603 his contributions may be regarded as a negligible quantity. In 1604, however, permission was granted C. to publish *Don Quijote de la Mancha*. His work may have been read in MS. previous to this date, but it was first definitely pub. at the beginning of 1605. *Don Quijote* sprang into universal popularity almost at once. The breadth of the humanity of the book and its general philosophy did not at first strike the public mind; but its essentially natural character, its broad survey of the types of the time, and its comedy appealed at once, and the book became a huge success. Eds. of it were pirated; it was printed at Madrid, at Lisbon, at Valencia. Within six months of its pub. *Don Quijote* and *Sancho Panza* were regarded as proverbial types of character. His main object, as C. himself said, was to ridicule the romances of chivalry; the greater world-wide view of the book came only slowly and was not appreciated, because it was not seen by the greater number of his contemporaries. Even after the pub. of his great book C. would seem to have remained poor. He had also at this time a number of domestic troubles, and in 1608 we find him living in very poor circumstances indeed. In 1609 he became a member of one of the Franciscan orders, and in 1613 he pub. and sold his *Novelas Ejemplares*, a book which would itself entitle him to rank as one of the greatest of Sp. writers. It consisted of twelve short stories written in his own inimitable style. Between this date and 1614 he pub. some plays and some interludes. The plays are acknowledged by himself not to be good, but in most cases the prose is good. In 1614 also appeared his most famous poem, the *Yngie del Parnaso*. In 1614 was pub. a second part to *Don Quijote*, this time, however, from the pen of one Avellaneda, who in his preface taunted C. with his poverty and ill fortune, and openly acknowledged that whilst he knew that he (the author) would not stand any chance from a literary point of view in competition with C., he was determined to be the first in the market. The second part from the pen of C. was pub. in 1615, and was received with as much acclamation as had been the first. His last work, *Los Trabajos de Persius y Sigmunda*, the author did not live to see pub.; he breathed his last in April 1616, the greatest of all Sp. novelists. Before his death his *Don Quijote* had been trans. into many languages, of which the Eng. by Shelton was the first. It was destined to become one of the most popular of all books of all languages. Fielding's *History of the Adventures of Joseph Andrews* (1742) was written 'in imitation of the manner of Cervantes.' Complete works (trans.) ed. by J. Fitzmaurice-Kelly, 1901-6. Trans. of *Don Quijote* by T. Shelton, 1612, 1620; P. A. Mottaux, 1712; C. Jervas, 1742; T. Smollett, 1755; J. Ormsby, 1885. Lives by J. Fitzmaurice-Kelly, 1892 (rev. ed. 1913); A. F. Culvert, 1905. See also J. Fitzmaurice-Kelly,

Cervantes in England, 1905, and *Cervantes and Shakespeare*, 1916; S. de Madariaga, *Essay on Don Quijote*, 1935; L. B. Walton, *Cervantes*, 1948, and introduction to *Don Quijote* in Everyman's Library.

Cervera y Topete, Pascual (1839-1909), Sp. admiral and commander-in-chief during the Sp.-Amer. war of 1898. He was b. at Jerez in the prov. of Cadiz. When the war broke out, he sailed for Cuba with secret orders to defend Sp. interests. He reached Santiago on May 19, and was there blockaded by Adm. Sampson, commanding the Amer. fleet. The Amers. tried to block the harbour by sinking the *Merrimac*, but failed to do so, and on July 3 the Sp. fleet endeavoured to escape. This was done in response to public opinion, but against C.'s judgment. The result was that the Amers. captured or sunk every Sp. ship, killed a third of their crews, and C. was made a prisoner. When the war ended he returned to Spain, where he was tried by court-martial, but honourably acquitted.

Cervetri, or Cervetere, vil. 20 m. W.N.W. of Rome. It is built in a corner on the inner side of the ancient Etruscan walls of the city Caere. The old city carried on an extensive trade and was very prosperous down to the thirteenth century. It is noted for the famous Etruscan graves, some of which are cut out of the solid rock.

Cervia, com. in the prov. of and 15 m. from the tn. of Ravenna, Italy, situated on the Adriatic. It has a beautiful cathedral. Pop. 10,159.

Cervidae, deer family, of the ruminant div. *Pecora*, is divided into the sub-families Cervinae and Moschinae, the latter consisting of the single genus *Moschus*, the musk-deer of Asia; sev. extinct genera are found fossil. The members of the family are distinguished by their antlers, features possessed by no other ruminants, which are present in all male deer but *Moschus* and *Hydropotes*, and in the females also of *Rangifer*, the reindeer. In the genus *Elaphodus* the antlers are devoid of any branching, but in *Cervus* there are sev. branches and there may be as many as forty-eight points. A gall-bladder is present only in *Moschus*, and in the family Bovidae (*a.o.*) only one genus lacks this organ; all deer have two orifices to the lachrymal duct, and only one genus of antelope has this feature; and in sev. minor points the C. may be shown to differ from the Bovidae. The sixty or so species of deer are spread over Europe, Asia, America, and part of Africa, and are totally lacking in Australia.

Cervin, Mont. see MATTERHORN.
Cervole, Arnaud de (d. 1366), also known as Archpriest. He was b. at Périgord and was a leader of the Fr. mercenary troops. He entered the service of John II. of France in 1352 and fought against the Eng., especially distinguishing himself at the battle of Poitiers in 1356. In 1357 he invaded and looted Provence and compelled Pope Innocent VI. of Avignon to pay a large sum of money. Charles V. of France made use of him in

1359 to disperse other bands, the Tard-Venus. In 1365 he gathered all his troops together on the Alsation frontier with a view of quelling the Turks, but his men were so riotous and disorderly that Charles IV. of Germany would not consent to their passing through his country. C. was murdered the following year by one of his lieutenants on the occasion of a new expedition against the Turks.

Cervus, see DEER.

Cesalpino, see CAESALPINUS, ANDREAS.

Cesari, Giuseppe (1568-1640), called Il Cavaliere d'Arpino. He was a painter in Rome of very high repute, and was the rival of Carracci and Caravaggio. His work, however, is not accurate, nor is the perspective good, but it is considered very pleasing by some. His best works were a Rom. battle picture and 'The Death of Cicero.'

Cesarini, Giuliano (1389-1444), also known as Cardinal Giuliano. He was an It. diplomatist. He learnt law at Padua, and won the favour and patronage of Pope Martin V., who conferred the title of cardinal upon him in 1426. In 1430 he was sent to Germany as papal legate to get ready a crusade against John Huss and his followers. He was present at the battle of Taus in 1431. He became president of the Council of Basle in 1431, but as his propositions were not agreeable to the council he resigned in 1438. The king of Poland, Ladislaus III., had conquered the Turks and made a treaty with them, when C. approached him as papal legate and persuaded him to go back on his word. The result was disaster. In 1444 they fought the Turks at Varna, and both C. and the king were killed.

Cesarotti, Melchiorre (1730-1808), It. writer, b. in Padua of noble but poor family. He became a prof. of Gk. and Heb. at the univ. in his native tn. in 1768, and held that position all his life. When Italy was invaded by the Fr., he wrote in defence of their cause, and Napoleon I. made him a knight of the Iron Crown, and gave him a pension. By way of expressing his gratitude he penned a very fulsome poem to Napoleon called *Prouva*. His most important original work was *Saggio sulla Filosofia delle Lingue*, which he wrote in 1785. In this he advocated a free development of language as opposed to the teaching of the Della Cruscan Academy at Florence. He also wrote a book called *Filosofia del Gusto*. His great work of translation was Macpherson's *Ossian*, done in 1763, but he produced a complete ed. in 1772. This was thought much of in Italy, and it exercised a great influence in that country and elsewhere. His introductory preface was trans. into Eng. and ed. with notes by J. McArthur in 1806. He also attempted, by way of translation, a prose version of the *Iliad*, which he followed with a long verse paraphrase running into 10 vols., entitled *La Morte d'Elleore*. In 1772 he trans. some of Voltaire's plays and Gray's *Elegy*.

Cesarewitch, see TSAR.

Cesena (anc. *Cassena*), tn. and episcopal see in the prov. of Forlì, Italy, 17 m. from

Rimini. It has a splendid Malatesta library and also a cathedral and a citadel. The people spin silk and mine sulphur, and the tn. is noted for its wine and hemp. The Fr. defeated the Austrians here in 1815. Dante alludes to its hist. in his *Inferno*. In spite of fighting in this area in the course of the Second World War there was no serious damage to any of the city's monumental buildings. The church of San Domenico had its roof damaged and the Palazzo Comunale (tn. hall) also sustained some damage. The Palazzo delle Scuole, which housed the above-mentioned library, founded in 1452 and containing some 400 valuable MSS. and incunabula, as well as the picture galleries, was unharmed. Pop. 16,000.

Cesenatico, com. and seaport on the Adriatic in the prov. of Forlì in Italy, 14 m. from Rimini. Brit. ships bombarded it in 1800. Pop. 10,000.

Cesky-Brod (Ger. *Böhmisch-Brod*), old tn. in Czechoslovakia, 20 m. E. of Prague. Pop. 4,500.

Cesky Krumlov (Ger. *Krumau*), tn. of Czechoslovakia, on an is. in the Moldau, 14 m. S.S.W. of Budjovice. Manus. include linen, cloth, paper, celluloid, hemp. There is graphite mining also. It has a fine old castle. Pop. (1921) 8,200.

Cesme, Asiatic Turkey, see CHESME.

Cesnola, Luigi Palma di, Count (1832-1904), explorer, b. at Rivarolo, near Turin. He fought in the war with Austria in 1848. In the Crimean war, and in the Civil war in America he had a command with the U. S. army. In 1865 he was made Amer. consul at Cyprus, and while in that position he began his excavations at Dali, Curium, and Larnaca. The Museum of Art in New York bought nearly all his collection, and he was appointed its director in 1878. He brought out a book entitled *Cyprus: its Ancient Cities, Tombs, and Temples* (1877).

Cessio Bonorum, in Scots law, a system which enabled any person who was in prison for civil debt, or against whom such a writ of imprisonment had been issued, to present a petition setting forth his inability to meet his liabilities and his willingness to convey the whole of his property to a trustee for the benefit of his creditors. C. B., like the old insolvency system in England, was characterised by this important difference from mercantile bankruptcy, that the person who obtained the privilege was not discharged from his debts, but only from proceedings against his person. Since the Debtors Act, 1880, which virtually abolished imprisonment for debt, the process of C. B. is applied to sequestration (in Eng. law, 'adjudication') in minor bankruptcies, for the purpose of reducing expenses.

Cession (Lat. *cedere*, to yield), name given in international law to the formal transfer of ter. from one state to another. This may be the result of a gift, an exchange or a sale, but is more usually due to the fortune of war, most Cs. having been exacted as the price of peace between warring nations. The consent of the people of the ceded ter. is not essential, but deference is often paid to

their wishes, except by modern totalitarian states. Their civil and political rights should be and generally have been determined by the treaty under which the C. is made. Apart from special stipulations, the citizens transfer their allegiance from one sovereignty to the other, obtaining their share in the rights of the new state, though, in recent instances of 'cession', as, e.g., in the case of Czechoslovakia and Poland, the Ger. and Russian Govs. first set up puppet govts. and then accorded the inhab. only such rights as were convenient to Ger. and Russian interests respectively. But, according to international jurists, the position is that old laws continue valid until altered by the new sovereign. Titles to property and personal relations remain unchanged. If the citizens should suffer loss of property by the C., the ceding state is not bound to indemnify them. Usually a clause in the C. treaty deals with the question of debts. As the object of C. is sovereignty over the ceded ter., all such individuals domiciled therein as are subjects of the ceding state become *ipso facto* by the C. subjects of the acquiring state. The hardship involved in the fact that in all cases of C. the inhab. of the ter. who remain lose their old citizenship and are handed over to a new sovereign whether they like it or not, revived after the First World War a movement in favour of the claim that no C. should be valid until the inhab. had by plebiscite given their consent to the C. Moreover sev. treaties of C. concluded during the nineteenth century stipulated that the C. should only be valid provided the inhab. consented to it through a plebiscite. But it seemed doubtful whether the law of nations would ever make it a condition of every C. that it must be ratified by a plebiscite. By the treaties of peace after the First World War the method of a plebiscite was adopted in a number of cases. In any case the hardship of the inhab. being handed over to a new sovereign against their will can be lessened by a stipulation in the treaty of C. binding the acquiring state to give the inhab. of the ceded ter. the option of retaining their old citizenship on making an express declaration. But it must be emphasised that, failing a stipulation expressly forbidding it, the acquiring state may expel those inhab. who have made use of the option and retained their old citizenship, since otherwise the whole pop. of the ceded ter. might actually consist of aliens and endanger the safety of the acquiring state. In many cases an option of neutrality was accorded in the treaties of peace following the First World War to the inhab. of ters. ceded under them. The terms of the option varied in each particular case; but the general principle applied was that persons habitually resident in ceded ter. acquired *ipso facto* the nationality of the state to which the ter. had been transferred, and lost the nationality of the ceding state. Nevertheless such persons, if over eighteen years of age, might opt for their old

nationality, and if they exercised that option their choice covered a wife and any children under eighteen years of age. They must, however, in that case remove themselves to the ter. of their old state (L. F. L. Oppenheim, *International Law*). See T. J. Lawrence, *Principles of International Law*, 1910; W. E. Hall (ed. Higgins), *Treatise on International Law*, 1917; J. L. Brierly, *The Law of Nations*, 1928.

Cessnock, tn., New S. Wales, 130 m. W. of Sydney. Pop. 7000.

Cestoda, or **Cestoid Worms**, form an order of Platyhelminthes, or flat worms, and from their elongated shape are known as tapeworms. They are all parasitic and only one genus reaches the adult stage outside the alimentary canal of vertebrates. The tapeworm consists of a head, or *scolex*, which attaches itself to the lining of the canal by suckers or hooks, and most of the species then show a long chain of segments, or *proglottides*, each of which, when separated from the others, lives as an independent animal. A few species, however, have no external segmentation, and do not break off in this way. In no species are there sense-organs, vascular system, mouth, or alimentary canal, food being absorbed by the body from the host, but there are a nervous and a well-developed excretory system. The life hist. is curious. The detached proglottides pass out of the host, and the eggs are scattered. These are swallowed by a new host in its food or drinking-water and the embryos eventually bore into the blood-vessels and are carried to the various organs. Thereupon they change into a *cystic* or *bladder-worm*, and develop a scolex, and if the animal in which they live is eaten by another the scolex passes into this final host, enters the alimentary canal, and matures. Among the vertebrates attacked by the C. are man, dog, sheep, ox, horse, hare, rabbit, squirrel, fox, pig, rat, mouse, frog, and sev. birds. *Diphyllobothrium latum* (*Bothriocephalus latus*), the largest species preying on man, may attain a length of 30 ft.; *Cenurus cerebralis* destroys many sheep, causing the disease of staggers; and various members of the genus *Tænia* are dangerous to human beings who are not vegetarian in habit. *T. saginata* is the beef tapeworm, still common in many countries; *T. solium*, the pork tapeworm, is now very rare. The bladder-worm stage of *T. echinococcus* sets up hydatid cysts in various internal organs; this species becomes adult in dogs and consequently it occurs chiefly in people, e.g. Eskimoes, closely associated with these animals.

Cestracion, typical genus of Cestraciontidae, the bull-shark family; occurs in the Pacific and E. Indies. *C. philippi* is known popularly as the Port Jackson shark.

Cestus: 1. Thongs of leather which the Gk. and Rom. boxers wore on their hands. They were not used, as are modern boxing-gloves, to soften the blow, but to make it harder, as those thongs were often weighted with iron and lead.

2. Name given to the magic belt of Aphrodite (Venus) which made everybody who beheld her fall in love with her.

Cestus Veneris, or **Venus's Girdle**, is a species of *Ctenophora* found in the Mediterranean and Atlantic. The body of this ctenulate is much compressed, and becomes ribbon-like in shape; it often exceeds one yard in length. *C. pectenalis* resembles it in appearance, but has a patch of orange at each end of its body.

head of the animals is always very large, the nostrils are seen as a single or double blowhole placed generally far back on the skull, the bones are spongy and full of oil, teeth are few or absent, there is no collar-bone, the eyes are tiny when compared with the bulk of their owner, and there is no external ear. The females usually bring forth one at a birth; their two mammae are inguinal in position and are adapted to the function of feeding the

Ceteacea, large order of mammals, consisting of whales, dolphins, and porpoises, but the purely aquatic habit of its members has often led them to be classed vulgarly and erroneously with fishes. They are fishlike in form, having a tapering tail expanded into horizontal flukes which aid the creatures in their powerful locomotion, there are no posterior limbs, and the anterior limbs are converted into paddles which are unprovided with external digits. They are unlike fish in nearly all important characteristics, such as that they possess warm blood and breathe air; in connection with this feature it may here be mentioned that in spouting whales do not blow sea-water, and any water that can be seen is the condensed vapour of their breath. Among the *C.* a hairy covering is always absent, but it is represented usually by a very few bristly hairs about the mouth easily counted; the warmth of which they would be deprived by the absence of the covering is amply replaced by a thick layer of blubber under the skin. The

young in the water; the mother proves most devoted to her offspring. Whales are very widely distributed throughout the seas of the world, and a few are to be found in rivs. of Asia and S. America. On land they are helpless, and after being for a short time out of their native element they die, probably crushed by their own weight. In diet all cetaceans are carnivorous, their chief food being cuttlefish, crustaceans, jelly-fish, and true fishes; some even devour seals and smaller whales; the whalebone whales are said to feed on the minute animals of the surface waters (plankton). In disposition they seem gentle and docile. The minimum size of one of these animals is about 3 ft., and the maximum is the enormous length of 85 ft. Fossil *C.* have been found in the Eocene, Miocene, and Pliocene, and the sub-order Archaeoceti comprises a single genus, that of the extinct Zeuglodon. The two sub-orders of living *C.* are the Mysticoceti or whalebone whales and the Odontoceti or toothed whales. In the former div. are to be found the species

known as right whales, porquals, the grey whale, the blue whale, and the hump-back whale; in the latter occur the sperm whales, bottlenose, dolphins, porpoises, the narwhal, white whale or beluga, the killer, and the pilot whale. See separate articles for products and species. See also WHALE.

Cetatea Alba (formerly Akkerman), fort, tn. in Bessarabia (Rumania), near the mouth of the Dniester, and about 30 m. S.W. of Odessa. The chief industry is the raising of fruit, especially grapes, but fish and salt from the neighbouring lakes are also exported. Pop. 40,000.

Cethegus, name of a patrician Rom. family of the Cornelian clan.

Marcus Cornelius Cethegus was twice censor, n. 209 B.C. and 204 B.C. respectively. He was noted for his rhetoric and correct manner of speaking. He d. in 196 B.C.

Gaius Cornelius Cethegus was one of Catiline's companions in his conspiracy of 63 B.C. He stayed in Rome intending to murder the chief senators, but Cicero arrested him and had him put to death. Is said to have been a worthless and violent man.

Cetin ($C_{32}H_{64}O_2$), fatty crystalline substance, insoluble in water, but soluble in alcohol and ether. It melts at $19^{\circ}C$. and volatilises at $360^{\circ}C$. It is the chief constituent of spermaceti, a wax found in the body of the sperm whale and other cetacean. C. is employed as an emollient, and for the manu. of candles, etc.

Cefiosaurus, genus of large fossil Dinosaurs in the order Sauropoda. This reptile was four-footed and herbivorous; its remains occur in the Middle Jura of England, but both skull and cervical vertebrae are unknown.

Cotonia, genus of coleopterous insects of the family Scarabaeidae, inhabits warm lands. *C. aurata*, the rose-chaffer, is a beautiful bright green beetle. Both larva and imago feed on vegetable substances, but *C. floricola* is said to live in ants' nests in the larval state and to eat the young.

Cetotolithes (Gk *κίτος* whale, *λίθος*, ear, *λίθος*, stone), parts of the ear-bone of a whale found fossil in great abundance in the Upper Tertiary on account of their hardness. They have been used in the manu. of superphosphate of potash for artificial manure.

Cetraria Islandica, or Iceland Moss, fruticose or shrub-like lichen procured mostly from Norway and Iceland, but also a native of the higher mts of N. Britain. When dry, it is almost odourless and the taste is bitter and unpleasant, but when the bitter principle is removed it becomes a wholesome and palatable food. It must first be boiled in water, upon which it becomes a mucilaginous fluid; unless steeped it is offensively bitter, and its purgative properties have given it the name of *Lichen catharticus*.

Cette (anc. *Seton*), seaport in Hérault, France, and situated 17 m. S.W. of Montpellier at the entrance to the Than lagoon, and a few miles E. of the meeting of the Canal du Midi with the Mediter-

anean. It has an excellent harbour, and its sea-bathing and mineral springs form a great attraction to visitors. There is an extensive fishing industry and the prin. trade is done in liqueurs, beer, wines, and brandy, all made in the tn. The tn. is of Gk. foundation. Pop. 36,000.

Cettinje (**Cetynje**), formerly the cap. of Montenegro; but, nestling as it does on a bare plateau 6000 yds. long by 1000 wide beneath the Black Mt., it was much too close to the guns of Cattaro for safety when Austrian military power began to draw southward in the First World War. Its sole building of any size is the New Palace, which was built by King Nicholas. The old palace, the Bihardit, in appearance like a fortress, was a military school during the First World War. The walls of the tn. were dismantled just before the war. For the rest C. is a tn. of cottages and a few residences of foreigners. Repeatedly, since its foundation in 1484 C. has fallen to the Turks, but at last, in 1715, with the aid of Russian mercenaries, the Montenegrins succeeded in driving out the Turks for ever. After the battle of Mt. Lovchen in 1916 its fall was certain. After that event, the Montenegrin authorities proposed to transfer the seat of gov. to Nikshich, but the whole country was ultimately absorbed in Yugoslavia. Pop. 6000. In 1918 it was announced that the war-damaged town of Podgorica was being rebuilt as the future cap. of Montenegro, under the name of Titograd.

Cetus, The Sea Monster, is a constellation situated below Pisces and Aries, and was supposed to represent the sea monster about to devour Andromeda. Although it covers a large expanse of sky, no star in it is of a brighter magnitude than the third. *Mira Ceti* is a long-period variable. In about 332 days it increases in brightness from below the ninth magnitude (when it is only visible with a telescope) to about the second magnitude, and then declines. Its period varies from 320 to 370 days, and its maximum and minimum luminosity is not invariable. It is historically interesting as being the first recorded variable, its fluctuations being noticed in the first instance by David Fabricius in 1596. C. contains many of the so-called 'white' nebulae, one of the most important being discovered by Caroline Herschel in 1781. It was at first thought to be elliptical in form, but its true shape has now been shown by Dr. Roberts to be spiral.

Cetyl Alcohol, see ETHAL.

Cetywayo, phonetically spelt **Ketsiwayo** (c. 1836-84), son of the Zulu king Panda, whom he deposed in 1856. He defeated his brother Umbulazi and then his right to the throne was acknowledged by Natal on the conditions that he dispersed his troops and gave up his barbarous mode of governing. It was owing to the Transvaal being annexed in 1877 that England had to enforce these measures, and in 1879 C. was made a prisoner by Maj. Maitland and lodged in Cape Town.

He was brought to England in 1882, but through pressure of public opinion he was restored as king of the Zulus again in 1883. However, very soon after he returned to his native land he was attacked and beaten up by one of his old enemies named Ushépu, and had to seek an asylum in the native reserve on Brit. ter. *D.* at Eshowe Feb. 8.

Ceulen, or Keulen, Van, see VAN CULEN.

Ceuta, fort and seaport belonging to Spain and situated on the E. of the Moroccan peninsula, which juts out N. towards Gibraltar. It is supposed to be the auct. tn. Abyla, one of the mythical Pillars of Hercules. It consists of an old tn. right on the tongue of the peninsula, and a new tn. running up the hills at the back. It is a bishop's see, and has a fine fifteenth-century cathedral. C. was a very busy tn. once and did a great trade under both Rom. and Arab rule. It was conquered by King John I. of Portugal in 1415, but passed into the hands of Spain in 1580. Pop. 40,000.

Ceutorhynchus, genus of coleopterous insects of the family Curculionidae, is a small weevil with many species, which frequent various plants.

Cevadilla, Sebadilla, and Sabadilla, are various Sp.-Mexican names applied to liliaceous plants containing veratrine. *Schomocaulon officinale* is one of these plants and the alkaloid is derived from its dried fruits. *Helonias officinale* is another species, a native of N. America; *Veratrum album*, often known as white hellebore root, and *V. sabadilla* are gathered for the veratrine-yielding rhizomes. These hellebore alkaloids, of unknown constitution, but of considerable physiological activity, have not found much use in medicine. The alkaloid *jervine* forms crystalline salts. *Protoveratrine* is very poisonous and causes violent sweating. The other alkaloids, *protoveratridine* and *veratridine* are of little importance. See also VERATRINE, VERATRUM.

Cevadine, alkaloidal substance found in hellebore and sabadilla. It occurs in white crystals, soluble in water, alcohol, and ether. In medicine it has been used to expel worms, but it is very poisonous.

Cévennes (from Celtic root, cf. Welsh *cefn*, ridge), important mt. range in S.E. France, extending (in its widest application) from Canal du Midi (N. of Carcassonne) to the S. of the Côte d'Or. This range is some 330 m. long, forms the S.E. border of the central plateau and the watershed between the Rhône and Garonne. Sometimes the name is confined to the S. ranges only, ending at the gorge of the Chassezac. N. of Montagne de Lozère. In its narrowest significance it means only those mts. E. of the plateaux of the Causses, beginning with Lozère plateau and ending with those round Aigoual at the head of the Gard valley. The large group is divided into two divs.: N., with Monts du Charolais, Beaujolais, Lyonnais, Vivarais (Mt. Mézenc), and S. with Montagnes Noires, Cévennes proper, Garrigues, Monts

de l'Épinouse and Lozère (Lozère, Pic de Pinet, Mt. Aigoual). The Loire, Allier, Tarn, Aveyron, Gard, and other rivers, rise in the C. In the N.E. a railway from Nîmes crosses the range by Alais to the valley of Allier and Clermont. The central mass lies in the depts. of Ardèche, Lozère, Haute-Loire. The rocks are chiefly metamorphic and granitic, volcanic in parts. The C. have been the scene of much religious warfare. The revolt of the Camisards occurred here, where many Protestant families found refuge after the revocation of the Edict of Nantes (1685). Also an old dist. of France, cap. Mende. See R. L. Stevenson, *Travels with a Donkey in the Cévennes*, 1879; Porcher, *Le Pays de Camisards*, 1894; Ribard, *L'Histoire cévenole d'après des documents*, 1898.

Ceylon (Sanskrit *Sinhala*), is, in the Indian Ocean, until 1948 crown colony of Great Britain, when it became a self-governing dominion. It is separated from India by the gulf of Manaar and Palk Strait, but virtually joined to the mainland by the submerged coral reefs and sandbanks known as Adam's Bridge, and by Rameswaram Is. It lies between 5° 55' and 9° 50' N. lat., and 79° 40' and 80° 53' E. long. Length from Dondra Head to Palmyra Point about 256 m., width varies from 32 to 140 m. Area over 25,000 sq. m. The ls. is mountainous in the S., expanding into a wide plain towards the N., still partly impenetrable jungle. The loftiest peak is Pidurutalagala (Pedurutallagalla), over 8000 ft., the best known is Adam's Peak, over 7000 ft. There are nine provs. for administrative purposes provided over by gov. agents. The longest riv. is Mahavelli Ganga, flowing into the sea by Trincomalee Bay. There are no lakes. The S.W. is damp, but N.E. and S.E. require irrigation, and remains of vast reservoir basins for this purpose are found in the N. The climate is tropical, but the heat is tempered by the surrounding sea; unhealthy in the coast dists., it is not so in the interior hilly parts. Newara Elia, where there is a sanatorium, has a mean temp. of 58°. Colombo one of 80°. Among C.'s chief tns. are Colombo (its cap. and chief seaport), Jaffna, Kandy, Kalutara, Peradeniya and Point de Galle. In the N. are the ruins of Anuradhapura. There are sev. short railway lines, the longest being between Colombo and Kandy. The total railway mileage is a little over 910 (807 being 5 ft. 6 in. gauge, the rest 2 ft. 6 in.). The soil is mostly fertile, and vegetation very luxuriant. The time of greatest heat is between the two monsoons, from Feb. to May. Forests abound, and also plantations of coco, areca, tea, and coffee. Since the blight of 1870 (*Hemileia vastatrix*) the cultivation of coffee has been replaced by that of tea. Other products are rice, coco-nut, cinnamon, cardamoms, and tobacco. The stiff fibres of the palmyra palm are prepared as a substitute for bristles, and the palmyra is also used for food. C. provides Europe with its largest supply of cinchona, and is third among the

tea-producing countries of the world. Rice is the prin. form of indigenous agriculture, and more profitably grown in the wet regions than in the dry, though in the jungle and forest tracts a sparse pop. lives on patches of rice and dry grain.

Of its mineral resources plumbago (graphite) and talc are of most commercial value; others are gold, iron, and precious stones, notably rubies and sapphires. In Oct. 1942 it was announced that the presence of vanadium had been discovered in large quantities in the is. Among native animals are tuskless elephants,

the is. was ceded to Britain under the treaty of Amiens (Mar. 25, 1802), and C. was then formed into a separate crown colony, the Kandyan kings finally disappearing voluntarily, 1815. The is. of C. was known to the Gks. and Roms. under the name of Taprobane (copper leaf) and in later times Serendib, Sirlindul, and Zeylan were used to designate it by writers of the W. and E. worlds. The pop. is approximately 5,314,000, the dominant race being the Sinhalese, 3,500,000. These are descendants of colonists from the Ganges valley who

E.N.A

TEA PLANTATION DISTRICT IN CEYLON: ON THE LEFT, ADAM'S PEAK

bears, panthers, various kinds of deer, and monkeys, leopards, and buffaloes. There are countless kinds of ferns and flowers, innumerable species of birds, and many reptiles, including crocodiles. C. has been called the 'pearl garden' of the earth, and the pearl-oyster fisheries on the coast have sometimes yielded a fair profit. For further details see Herdman, *Report on the Pearl-Oyster Fisheries* (1903-4). C.'s chief imports are rice, cotton manufs., sugar, coal, manures, and spirits. The leading exports in order of total value are tea, rubber, copra, coco-nut oil, cinnamon, cacao, citronella oil, cardamoms, coir and areca nuts, plumbago, and unmanufactured tobacco. The value of the imports into the United Kingdom (in 1939) was £10,743,000, and of the exports of Brit. goods to C. about £2,000,000 (1942 and 1943). The Portuguese reached C. 1505, and estab. commercial settlements. They were driven away by the Dutch, 1656. In 1785 C. passed into Eng. possession, being first annexed to Madras; six years later

settled in C. in the sixth century B.C. and estab. the Sinhalese dynasty. Sinhalese kings ruled from 543 B.C. to A.D. 1815.

Sinhalese, the most widely spoken language, is an Indo-Aryan language, derived immediately from Sanscrit. Many words spring from Pali, which is studied by the learned as the sacred language of Buddhism and is largely used for literary purposes. Tamil, a Dravidian dialect, is spoken in the N. The Sinhalese are Buddhists, the introduction of Buddhism into C. dating from the third century B.C., when Mahinda came from India and estab. it under King Tissa (a contemporary of Asoka). As a result of many generations of war the N. regions were occupied by Tamils, a Dravidic people from S. India, and the pop. of these dists. is almost wholly Tamil, numbering to-day 1,100,000, and mainly Hindu in religion. The remainder of the pop. are mostly Muslims or Moormen, thought to be of Arabic descent, and numbering about 300,000; they are the most energetic and intelligent. There are also about

35,000 burghers—descendants of Dutch settlers—and Eurasians, 15,000 Malays, and 12,000 Europeans. There are fewer than 500,000 Christians, and the Muslims number about 300,000. Apart from differences of race and religion, caste is a recognised feature of the Sinhalese and Tamil social systems. Inter-marriage between the racial groups or between the higher and lower castes in the groups are comparatively few. The pop. is densest in the wet regions of the S.W. and N., with an ann. rainfall of 200–250 in. and producing most of the exportable wealth. The rainfall of the dryer N.W. and S.E. being only 20–25 in., production there is far less profitable; while in the jungle tracts production is so meagre that poverty and disease are almost unmanageable problems. Europeans own most of the tea plantations. Much of the work is done by Indian Tamils, the great majority of whom are immigrant labourers from S. India who belong to the humblest castes and have a standard of living and culture inferior to that of the peasantry in C. These Indian Tamils are a separate racial group, and number 600,000, and as they usually return to India after a few years, they present a problem in the development of representative gov., but there has been a strong movement to reduce their number in order to give work to the Sinhalese. Though the Sinhalese predominate, they are not absorbing the other races. They are mainly engaged on the soil. The burghers find their occupations chiefly as gov. servants and in the tns. The more important industries are gold, silver, brass, ivory, and tortoiseshell articles, pottery, weaving, and metal and lacquer work, basket- and mat-making. There are cigarette, match, and soap factories. Factories have also been recently estab. for acetic acid, ceramics, coir, glass, quinine, plywood, paper, leather, hats, and steel plates; caffeine and shark-liver oil plants—mostly estab. by the dept. of commerce and industries. The manuf. of salt is a gov. monopoly. The Europeans are mainly employed as gov. servants in all parts, on the tea and rubber estates, and in European business in the large tns. The tn. pop. is growing, and in Colombo particularly, with its cosmopolitan pop. of 285,000, problems typical of tn. life have already emerged. Eighty-five per cent of the people live outside the tns. Over half the pop. can neither read nor write. This fact was prejudicial to the great extension of the franchise which was proposed under the Donoughmore constitution. In 1913 there were over 2100 gov. (Sinhalese and Tamil) schools, with about 142,000 boys and 98,000 girls, and 1820 aided schools (125,000 boys and 200,000 girls), where education is free. Fees are charged in the 400 Eng. and bilingual schools (54,000 boys, 20,000 girls). There is a Royal College, a gov. training college, and a technical college in Colombo. On July 21, 1942, the Univ. College of Colombo, founded in 1921, was inaugurated as the univ. of C.

Constitutional Developments.—A reformed Legislative Council came into existence in 1912. But the only new features were the introduction of the elective principle and the representation of the Sinhalese and Tamil middle class. The official majority was maintained by the addition of two official members. On the whole the reforms inaugurated by Sir Henry McCallum helped to perpetuate the divs. In society, the special interests of which the Brit. system of administration for over a century had tended to obliterate. The constitutional reforms initiated by Sir Wm. Manning (governor from 1918 to 1925) and Sir Graeme Thomson (1931–33) were the most important political events of the period subsequent to the rule of McCallum. After McCallum's time the middle class grew in strength with the extension of plantations and trade, the expansion of gov. services, and the growth of the professions, and by 1917 it began to ask once more for a reform of the constitution. The agitation for reform received an impetus from various new factors. In 1915, during the First World War, riots occurred in the is., which were, probably erroneously, supposed to be a manifestation of hostility to Brit. rule. The agitation for reform began in 1917 with the formation of the C. Reform League and of the C. National Congress in 1919. Broadly speaking, the agitators demanded a constitution similar to that recommended by Lord Willingdon for the presidency of Bombay. They wanted parl. institutions for C.; full representative gov. and an executive partially responsible to the legislature. In response to these demands the secretary of state for the colonies in consultation with Governor Sir Wm. Manning issued an Order in Council in Aug. 1920 which introduced a constitution somewhat resembling that which was granted to the Indian provs. by the Morley-Minto reforms in 1909. (See INDIA, *History*.) These reforms introduced the principle of representative gov., but in reality gave no power to the Sinhalese. The Order in Council gave further extraordinary powers to the governor: he had the right to stop the discussion of any Bill or resolution, to limit the time of any discussion, and to suspend unofficial members. There was further agitation by the C. National Congress, followed by new recommendations by Manning, but the secretary of state refused to make any fundamental change. He agreed with Manning that for an indefinite period representation must be communal, on the ground that it would take many years for the mass of the electorate to develop a political instinct strong enough to rise above racial and religious divs. The importance of C. in view of its strategic position in relation to India and Brit. communications with the E. was fully realised at this time as a result of the First World War, and this, conceivably, deterred the consideration of any proposal to start C. on the road to self-gov. Sir Hugh Clifford (1925–27), who succeeded Manning, reported to the

secretary of state that the new constitution did not work satisfactorily, and a commission under the chairmanship of the late earl of Donoughmore was appointed to visit C. to report on the working of the existing constitution and to consider proposals for its revision. Their famous report was submitted in June 1928, or about seven months after they had first arrived in C.

The most remarkable feature of the pre-Donoughmore constitution was the divorce of power from responsibility, the governor's power but not his responsibility having been transferred in part to the unofficial members of the legislative council. He could only make laws or levy taxes with the advice and consent of the legislature, and yet he was the complete autocrat so long as all his legislators were officials on whose votes he could rely. It was this anomaly that focused the attention of the Donoughmore commission. C. had reached that stage in the development of crown colony gov. when the official majority in the council had become converted into a permanent minority, this being largely due to the introduction, in 1921, of territorial representation by election. It was generally agreed that this constitution had only produced a political atmosphere of barren controversy, entirely unfavourable to the solution of the is's political and economic problems, especially at a time when much depression prevailed through the world demand for its products being much below the supply. A kind of administrative impasse had been reached, for the gov., in effect a European gov., was at once independent for its existence, but yet largely dependent for its effectiveness, upon a predominantly 'Ceylonese' council ('Ceylonese' meaning in this context those who have made the is, their permanent home). This antithesis provoked a perpetual challenge to Brit. predominance in the affairs of the colony. Moreover, another cause for discontent among the native elements was the fact that (in 1928) something like 62 per cent of the total exportable wealth of the is, belonged to the Europeans, while no less than £100,000,000 worth of European capital, chiefly Brit., was invested in the agriculture and trade of the colony. The theory of the old constitution that the gov. should be a partnership had therefore broken down, or, at all events, had become a mockery of the party system, because the gov. could not claim to represent any one racial group in the council, whereas the unofficial block, externally united only in attacking the gov., were divided upon every other positive matter. The Donoughmore commission made political re-education the main requirement of the situation, and proposed universal suffrage subject to those of the Tamils who were otherwise qualified making a declaration of permanent settlement in C. The commission suggested a novel expedient for the solution of C.'s constitutional problem. They did not consider a parl. form of gov. suitable for C., as there was

no party system and divs. were possible only on communal lines. They proposed therefore the estab. for the gov. of C. of a system which had hitherto worked satisfactorily in the sphere of local gov. They recommended the estab. of a State Council which would give both responsibility and power to its members. It was to possess legislative powers as a general body. It was also to exercise its powers. The depts. of gov. were to be divided into ten groups. Three of them were to be in charge of officers of state, the chief secretary, the financial secretary, and the attorney-general (date

L.N.A.

THE OLD DUTCH GATE AT GALLE

legal secretary), who were to be members of the State Council but without the right to vote. The remaining seven groups were to be controlled by the elected members of the State Council, who were to be divided into seven executive committees of home affairs, agriculture and lands, local administration, health, labour, industry, and commerce, education, and communications and works. These committees were to elect their chairmen, and these chairmen, together with the officers of state, were to form the board of ministers. The State Council was to consist of sixty-five territorially elected members, in addition to the twelve nominated members. Officials, of course, had no place in such a council, where there was no question of commanding a majority. Sir Herbert Stanley (1927-31), who succeeded Clifford, considered that some of the conclusions of the commissioners were too sweeping in their condemnation of the Manning constitution of 1924, but he supported their main proposals and defended them

against the objections raised by the Legislative Council. The Legislative Council, whose representation was based on communal lines, naturally opposed the abolition of communal representation. The Sinhalese supported the commissioners as its abolition coincided with their interests. The Tamils objected to the estab. of electorates based on numbers which would prejudice their influence; the Muslims and burghers, however, supported communal representation as it was their one safeguard against political extinction. Stanley sympathised with the fears of the Tamils, the Muslims, and the burghers, but agreed with the commission that any advance towards self-gov. should be accompanied by the abolition of communal representation. The other features in the Donoughmore report which were strongly opposed were the system of executive committees and the wide powers given to the governor. The executive committee system was condemned 'either as unworkable or as derogatory to the status and proper functions of a minister . . . or as an impediment to further constitutional evolution towards the desired goal.' Stanley considered the executive committee system fundamental to the whole scheme of gov. proposed in the report, and he objected also to any reduction of the powers recommended to be given to the governor in view of the important changes proposed and the wide powers that were to be given to the State Council. The secretary of state agreed on the whole with Stanley, but contrary to Stanley's views he agreed to the proposal of the Legislative Council to have a State Council of fifty territorially elected members and eight nominated members, of whom four were to be Europeans. The proposals of the secretary of state were finally accepted in the council by the unofficial members by nineteen votes to seventeen. The Donoughmore constitution was estab. by Sir Graeme Thomson in 1931. A board of ministers consisting of seven Ceylonese ministers, three of whom belonged to the minority communities, replaced the executive council which came into existence with the estab. of the crown colony system of gov. in 1802. Sir Baron Jayatilaka, who had played an important part in the movement for reform, became the leader of the House and the vice-chairman of the board of ministers. The Donoughmore constitution did not satisfy all sections of opinion and requests for changes were made from 1932, but the secretary of state refused to consider any radical alteration of the constitution before it was given a fair trial. The Donoughmore constitution, however, was always regarded as a preliminary step to responsible gov., and in 1937 Sir Andrew Caldecott was asked by the secretary of state to examine the position and submit recommendations. He objected to the proposals to restrict the franchise (to those who had an abiding interest in C. or who might be regarded as permanently settled in the is.) or to curtail

the powers of the gov. He agreed with the objections that had been raised against the executive committee system, and suggested its abolition as 'there was no determining, co-ordinating, controlling, or designing force behind the administrative machine and everything depended upon bargaining and compromise.' He was for the estab. of a cabinet system of gov. by the exclusion of the officers of state and the appointment of two other ministers to be entrusted with their work. These proposals led to no general agreement and the Colonial Office felt that the whole position should, in view of the approach of war, be postponed for fuller consideration. The war had the effect of making the Brit. once more emphasise their ideals of freedom and democracy and offer dominion status to India. In 1942 the State Council of C. asked for dominion status for C., and in the result they largely attained their ambition.

After the war a new commission under the chairmanship of Lord Soulbury visited C. and in their report they recommended a form of constitution largely akin to the Brit. constitution. The commissioners thought that the then existing system of universal suffrage should be retained and they recommended the setting up of a Senate of thirty members and a House of Representatives of ninety-five elected members plus six members nominated by the governor-general. Instead of the 'board of ministers' there would be a Cabinet responsible to the legislature. The governor-general would be empowered to legislate on external affairs and defence. Currency Bills and any Bill likely to involve 'oppression or serious injustice' to any racial or religious community would be treated as 'reserved' Bills. The Soulbury commission did not believe that there was any serious body of opinion in the is. that questioned the need for its dependence upon the United Kingdom for some time to come in matters of defence and external affairs; hence the commission did not recommend dominion status immediately — apart from the effect immediate dominion status might have on the minorities. The Brit. Gov. (Oct. 1945) accepted the Soulbury committee's report, having come to the conclusion that a constitution on the general lines proposed by the commission conformed in broad outline, save as regarded the second chamber, with the constitutional scheme put forward by the C. ministers themselves (see Cmd. 6690, 1945, Statement of Policy on Constitutional Reform). When the Soulbury report was under discussion considerable apprehension was expressed about the effect of its proposals upon the position of the minority communities in general and the Tamils in particular. The Tamils had long pressed for such a weight in the legislature as would enable them to deal on terms of something like equality with the Sinhalese majority, from whom they are distinguished by religion and customs as well as by race. But their contentions were not

accepted either by the commission or by the gov. When the new constitution was debated in the State Council the eagerness for self-gov., which their representatives shared with the majority community, resulted in the overwhelming majority for acceptance that led up to the new Order in Council embodying the constitution (pub. May 15, 1916). In the new constitution the State Council is replaced by a Parliament consisting of His Majesty, represented by the governor, and two Chambers to be known respectively as the Senate and the House of Representatives. The C. Parliament will

power to legislate by Order in Council for defence and external affairs and to amend or revoke the constitution. As regards prov. gov., the offices of the gov. agents are the prov. treasuries. The gov. agents are, generally, assisted by assistant gov. agents, who are in charge of revenue dists. The officer immediately subordinate to the gov. agent is the chief headman, who is variously styled Mudaliyar in the maritime Sinhalese dists., Ratemahatmaya in the Kandyan dists., Maniagar, Adigar, and Vanniya in the Tamil dists.

Ceylon in the Second World War.—There were Jap. air attacks on Colombo, April 5, 1942. Some seventy-five Jap. planes, operating from carriers, made dive-bombing attacks on the harbour and in the Rotnamada area. Twenty-seven Jap. planes were destroyed and at least twenty-five more seriously damaged. Brit. losses were slight, and casualties were about fifty. A large Jap. bomber force with fighter escort attacked the Trincomalee naval base, April 9, 1942, causing damage to the harbour and aerodrome and some casualties among dockyard workers and naval personnel. At least twenty-one enemy planes were destroyed and a few Brit. planes were lost.

Ceylon attains Dominion Status.—C. became a self-governing dominion of the Brit. Commonwealth on Feb. 4, 1948, with the putting into force of the Independence Act, which was passed by the Brit. Parliament in Dec. 1947. The first session of the new Parliament of C. was opened on Feb. 10, 1948, by the duke of Gloucester under special commission from the king. The Order in Council giving effect to the Independence Act replaced the governor by a governor-general appointed on the advice of the Prime Minister of C. and representing the king. The Gov. of the United Kingdom is now represented by a high commissioner as in the case of the other dominions. Agreements, concluded in Nov. 1947 between the United Kingdom Gov. and the Gov. of C. as a prelude to this constitutional development, making provision for defence and external affairs, became operative with the inauguration of the Soulbury constitution in 1948. Under these agreements Britain and C. will give each other such military assistance for the security of their ters., for defence against external aggression, and for the protection of essential communications as it may be in their mutual interest to provide. The United Kingdom Gov. may base such naval and air forces and maintain such land forces in C. as may be required for these purposes as may be mutually agreed. The United Kingdom Gov. will also furnish the Gov. of C. with such military assistance as may from time to time be required towards the training and development of Ceylonese armed forces. The agreement relative to external affairs declares the readiness of C. to adopt and follow the resolutions of past Imperial conferences (q.v.); makes arrangements for the interchange of information, consultation, and diplomatic representation; and pledges United King-

John Li Stone

THE TEMPLE OF THE TOOTH, KANDY

have full power to make laws for the peace, order, and good gov. of the is., but it may not make laws which discriminate against any community or religion, or interfere with freedom of worship, or with the constitutions of religious bodies without their concurrence. There is a Cabinet of ministers (one of whom will be Prime Minister) who are charged with the general direction and control of the gov. of the is. and will be collectively responsible to the C. Parliament. The governor is required to reserve for His Majesty's assent a few classes of Bills only. These include Bills relating to defence and external affairs and Bills which, in the governor's opinion, have evoked serious opposition by any religious or racial community and are likely to involve oppression or serious injustice to any such community. Bills relating solely to certain specified subjects, such as franchise and immigration, are excluded from the classes of Bills to be reserved. His Majesty's Gov. retain the

dom support for any application by C. for membership of the United Nations or any specialised international agency. Brit. tutelage of C. lasted a century and a half. The devolution of power and responsibility by the Brit. Gov. to the elected representatives of C. was effected so smoothly and sympathetically that the newly won freedom of the Ceylonese people served rather to underline the achievements of the Brit. period in economic prosperity, in educational development, in the estab. of law and order, in the growth of a sound judicial system, in public health, and, not least, in a respect for those values which make democratic gov. possible in a community comprising sev. minorities of different race and religion.

Cézanne, Paul (1839-1906), celebrated Fr. painter and founder of the Post-Impressionist school, b. at Aix, Provence, Jan. 10, son of a banker. At first destined for a banking career, but early forsook his father's business house to study at the art school in Paris. Was influenced to some extent by the adherents of Manet, but was

more revolutionary than others of that group. He seems to have taken part in the Commune, while in Paris, but thereafter returned to Aix, where he spent the remainder of an uneventful life painting landscape studies and portrait studies. He was a contemporary of the Impressionists, and used their colour palette with the addition of brown, a colour peculiar to the sun-scorched S. of France. When C. left Paris and returned to Aix, he set himself the task, as he said, 'to make of Impressionism something solid and enduring like the art of the Old Masters.' His early rather flashy style of painting gave way to a method of absolute sincerity. No brush-stroke was

Druid

CÉZANNE'S 'WOMAN WITH ROSARY'

placed upon the canvas that was not realised, and it is this honesty of purpose rather than a facility in drawing that has made C. an acknowledged world master. His 'Dabbas' and his 'House of the Hanged Man' estab. him as a great painter of still life, as also the 'Card Players,' which is notable for apparent defects of drawing which have been imitated by followers who did not understand the principles of his workmanship; for with faults or apparent faults in drawing went also subtlety and skill in developing form through colour. Contrasted with Manet and Monet, C. did not see things in masses of smooth colour or bathed in colour-light, but rather 'as giving back colours which had their own given qualities and values, due to their own grave vibrations, just as notes in music have their own sound vibrations'; and indeed he spent a long life in trying to grasp and fix the laws of the vibrations of colour, and in this work he strongly influenced the later generation, particularly Van Gogh and Gauguin. See E. Bernard, *Souvenirs sur Paul Cézanne*,

1924; A. Volland, *Paul Cézanne, his Life and Art* (Eng. translation, 1924; E. Faure, *Paul Cézanne*, 1926; Roger Fry, *Cézanne*, 1927; J. Meier-Graef, *Cézanne*, 1927; J. Gasquet, *Cézanne: what he said to me*, 1931; G. Mack, *Paul Cézanne*, 1935).

Cezimbra, tn. on the coast of Portugal, 20 m. S. of Lisbon. Fishing extensive. Pop. 12,000.

Chabas, François Joseph (1817-82), Fr. Egyptologist, b. near Briançon. In 1873 he was offered the chair of Egyptian language and archaeology in the Collège de France, but he refused it. He wrote *Histoire de la XIX^e Dynastie* (1873), and *Études sur l'antiquité historique d'après les sources égyptiennes* (1874). He was also the editor of *L'Égyptologie*, an archaeological paper, between the years 1873 and 1877. Maspero wrote his biography, which was attached to an ed. of his *Œuvres diverses*, in 1899.

Chabert, Philippe (1737-1814), Fr. veterinary surgeon, b. at Lyons; studied in the veterinary school there, and in 1766 obtained an important post at Alfort, finally becoming director of the school there. In 1780 he succeeded Bourgelat as director and inspector of veterinary schools throughout the country. He was a member of the Institute of France and numerous other learned societies, and wrote sev. valuable works on veterinary practice.

Chabeuil, Fr. tn. in the dept. of Drôme. It stands on the Véouze, S.E. of Valence. It is supposed to be the ant. city of Cerebellaca. Pop. 2600.

Chablais, former prov. of Savoy (old div. of Annecy), bordering on Lake Geneva. Now included in the Fr. dept. of Haute-Savoie, arrond. of Thonon. In the Middle Ages it had counts and dukes as rulers.

Chablis, Fr. tn., dept. of Yonne, about 9 m. from Auxerre, on R. Seine. Noted for famous white wine (Chablis) produced near by. Pop. 1900.

Chabot, Charles (1815-82), Eng. lithographer and calligraphic expert. He was b. at Battersea and d. at Clapham. His skill as a calligraphist was much in demand at the law courts; he gave evidence in the celebrated Roupell and Tichborne cases. He identified Sir Philip Francis as being the author of the *Letters of Junius*.

Chabot, François (1759-94), Fr. revolutionist. Originally a Capuchin monk, but became an atheist of corrupt and vicious character. In 1790 he became a member of the Constituent Assembly, and gained great power as an extreme and fanatical democrat, instigating many of the worst excesses committed by the party, and being noted for his daring, blasphemy, and disgusting immorality. He was finally guillotined by order of Robespierre.

Chabot, Philippe de (1480-1543), Fr. soldier and count of Charny and Buzançois. Known as L'Amiral de Brion. In 1524 he saved Marsellos from the Imperialists, and in 1535 was made a prisoner at Pavia. He was made governor of Burgundy and admiral of France in

1526, after which he conquered the greater part of Piedmont. He later on fell into disgrace and was imprisoned for two years.

Chabrias, famous Athenian general, commander of an army as early as 392 B.C. In 390 he took part in the Thracian expedition of Thrasybulus. In 388, on his way to Cyprus to help Evagoras against the Persians, he defeated the Spartans at Ægina. In 378 C. commanded against the Spartans and drove Agesilanus from Boeotia, inventing the famous manœuvre of receiving a charge on the left knee, with shields resting on the ground and spears levelled at the foe. In 376 he won the naval victory at Naxos; 373 went with Iphicrates to Coreyra; 369 fought against Thebans in Peloponnesus, repulsing Epaminondas before Corinth; 367-366 was accused of treason over the Theban capture of Oropus, but was acquitted. In the Social war (357) he joined Chares in command of the Athenian fleet, and was killed as triarch at the siege of Chios. See Cornelius Nepos, *Chabrias*; Xenophon, *Hellenica*, v.; Rohdant, *Die Iphicrates, Chabrias et Timothee*, 1845.

Chabrier, Alexis Emmanuel (1842-91), Fr. musical composer. He was b. at Ambert in the dept. of Puy-de-Dôme. In 1877 he wrote *L'Étoile* (an operetta) and in 1883 *Les Fées pittoresques* for the piano. He was chorus-master at the Château d'Eau theatre in 1884-85, where he played at concerts. While there he assisted Lamoureux (q.v.) to produce two acts of *Tristan and Isolde*. He also brought out *La Salamite* in 1885, and also selections from his opera *Gwendoline*, which was done as a whole in Brussels in 1886. His orchestral rhapsody, *España*, was a triumph, but the Paris Opera, while accepting his opera *Le Roi Malade* (unrejected), rejected his *Gwendoline*. Wagnerian. For his harmonic and orchestral experiments he may be regarded as a forerunner of Debussy and Ravel. When he d. he left his opera *Brusis* unfinished.

Chabron, Marie Etienne Emmanuel Bertrand de (1806-89), Fr. general and politician, b. at Retournac (Haute-Loire). He served with distinction in the Crimean war, the It. war, in which he fought at the battle of Palestro, and the Franco-Ger. war of 1870-71, being made a general of div. by Gambetta for the relief of Belfort. At the close of the war he was elected deputy for Haute-Loire, and later became a senator.

Chacatos, see CHOCOTAWS.

Chachapoyas, or San Juan de la Frontera, tn. in Peru, cap. of Amazonas, situated 80 m. N.E. of Cayamarca. Pop. 4000.

Chacma, or *Cynocephalus* (or *Papio*) *porcarius*, largest species of baboon (q.v.), belonging to the family Cercopithecidae (q.v.), and nearly allied to the mandrill. It is a native of S. Africa, and in habit it is gregarious. Although largely vegetarian in diet, it is omnivorous at times and is fond of insects.

Chaco, ter. in the Argentine Republic, which is part of the Gran Chaco, S. of the

Hermelo R. Timber-felling is the chief industry, but cattle-grazing and agriculture are also carried on. The cap. is Resistencia, which is also the governing centre, and is 400 m. N. of Buenos Aires. The area covers 52,471 sq. m. Pop. 58,000.

Chaco War, fought from July 1932 to Jan. 1936, between Bolivia and Paraguay. The dispute over the boundaries of the Gran Chaco was of over fifty years' standing. The first military incidents in the war occurred early in 1927, and by the middle of 1933 hostilities had developed into extensive trench warfare, with aeroplanes and armoured cars. In 1933 the League of Nations Council, on the suggestion of the belligerents, invited Argentina, Chile, and Peru to intervene, it being their opinion that this offered a better chance of solution than mediation by a League commission. But the S. Amer. countries refused the invitation, and hostilities dragged on until Oct. 1935, when a peace treaty was negotiated by which Paraguay granted to Bolivia a free zone at Puerto Casado, on the Paraguay R., other points being settled in the ensuing year.

Chaconne (Fr.), dance, probably of Sp. origin. It was once extremely popular, but now it is utterly forgotten and neglected, possibly because the movements thereof were slow and stately. The music was generally a number of variations on a ground bass of eight bars. Bach, Handel, and Porpora all wrote C music, of which the C. of Bach (the last movement of the D minor Suite or '2nd Partita') for solo violin is the most famous.

Chad, name given to the young of a fish—the common sea bream—by the fishermen of Devon and Cornwall.

Chad, St. or Ceadda (d. 672), was b. in Northumbria and was a follower of St. Aidan. He became bishop of the E. Saxons in the year 664, bishop of York in 666, and then bishop of Mercia in 669. He was a holy and very austere man.

Chad, Tohad, or Tsad, Lake, or rather two large but shallow lakes, surrounded by swamps, in W. Africa, situated between Bornu, Bagirmi, Kanem, and Wadai. The total length from N. to S. is from 120 to 150 m., while from E. to W. it is estimated at from 60 to 130 m. The lake is studded with is., and the depth is from 8 to 15 ft. The area varies according to the season; if it is wet it covers about 20,000 sq. m., and if dry 10,000. Lake Chad gets most of its water from the Shari, but it also gets the waters of the Waube or Yo (otherwise the Komaduga Yohe). There are many fish to be found there, and it is also frequented by wild fowl, hippopotami, and alligators. The convention of 1898 gave France the right to the E. shore. There are two groups of is., the Kuri archipelago in the S. and the Buduma in the N. They are inhabited by the Buduma and Kuri tribes.

Chad Colony, in the Fr. Congo. A ter. with an area of 461,200 sq. n. and a pop. of 1,433,000 natives and about 600 Europeans. It was formerly a dependency of the Ubangi-Shari colony, but by decree

on March 17, 1920, it was made a separate colony. It extends from Lake Chad across the E. Sudan and includes Wadai to the E. of Kanem, which has an area of 170,000 sq. m. and which accepted the Fr. protectorate in 1903. Great numbers of cattle, sheep, camels, horses, and asses are raised in the colony. Kanem state to the N.E. of Lake Chad, which came under Fr. control in 1903, is also now a part of the colony of Chad with Mada as its cap. Copper, zinc, and lead are among the minerals found. The Fr. owe the conquest of this region to the activities of Savorgnan de Brazza, who in 1885 led an expedition through Ubangi to Sangha; to Lieut. Gentil, who founded Fort Archambault; to Commandant Lamy, from whom is named the cap., Fort Lamy; and above all to Lieut. Binger, from whom is named Bingeruville. It is noteworthy that the colony of Chad was the first Fr. overseas ter. openly to support de Gaulle (q.v.) and the Fighting Fr. against the Fascist powers in the Second World War.

Chadderton, par. and tn. of Lancashire, England, suburb of Oldham. Has important cotton and chemical manufs., and coal mines near. Pop. about 28,730.

Chaderton, Laurence (c. 1536–1640), Eng. theologian, b. in Lancashire; studied theology at Cambridge, in opposition to his father, who wished him to enter the law; and in 1584 was chosen by Sir Walter Mildmay as master of the newly refounded Emmanuel College. He assisted in the A.V. of the Bible.

Chaderton, William (c. 1540–1608), Eng. divine. After holding sev. important positions at Cambridge, he became bishop of Chester in 1579, being also appointed a commissioner for the discovery and conviction of popish recusants. In 1595 he was appointed bishop of Lincoln, where his efforts were still directed towards conformity.

Chads, Sir Henry Ducie (c. 1788–1868), Brit. naval commander, son of a naval captain. In 1810 he took part in the operations off Mauritius, being one of the party that seized the Ile de la Passe (see W. James, *Naval History*, 1866). First lieutenant of the *Jara* under Capt. Lambert when captured by U.S.A. frigate *Constitution*, 1812. Tried by court-martial for loss of this ship, 1813, but honourably acquitted. Commanded the *Alligator*, 1825, throughout the first Burmese war (1826). In 1845–54 captain of gunnery-ship *Excellent* at Portsmouth. Admiral, 1863. His son (1819–1906) was also an admiral. See W. R. O'Byrne, *Naval Biographical Dictionary*, 1849; *Memoirs by an Old Follower* (Montagu Burrows), 1869; T. Roosevelt, *Naval War of 1812*, 1882.

Chadwell St. Mary, par. of England, in Essex, on R. Thames, 10½ m. from Romford, 1½ m. from Tilbury Dock station. Contains the E. and W. India deep-water docks. Pop. 10,000.

Chadwick, Sir Edwin (1800–90), Eng. social reformer and statistician. He came from Manchester to London, studying at the Inner Temple, called to the Bar, 1830. He early studied social, sanitary,

and political science, and devoted his life to reforms, and prevention of pauperism and disease. In 1828 his article 'On Life Assurance' in the *Westminster Review* appeared; 1829 a paper 'On Preventive Police' in the *London Review*. These won him the notice and friendship of Jeremy Bentham. In 1834-47 he was secretary to the Poor Law commission. From evidence collected for this commission, C. wrote *Report on the Sanitary Condition of the Labouring Population of Great Britain* (1842). An earlier report of 1833 laid the foundations of later systems of gov. inspection. A public health Act was passed in 1848, and a general Board of Health appointed. C. was a member from 1848 to 1854. He was one of the founders of the Social Science Association, 1878. K.C.B., 1889. The society called Friends in Council (including Rowland Hill, John Stuart Mill, and others) was formed by C. to discuss political economy questions (c. 1844). C. advocated competitive examinations for gov. offices. See Sir B. W. Richardson, *The Health of Nations: a Review of the Works of Chadwick*, 1887; T. Mackay, *History of the English Poor Law*, 1899.

Chadwick, Sir James, b. 1891, Brit. physicist, now master of Gonville and Caius College, Cambridge. He was studying in Berlin when the First World War broke out and was interned, but allowed to continue with his work. Later he worked under Rutherford at Cambridge and took a prominent part in the researches that led to the modern ideas of atomic structure. In 1932 he demonstrated that what had appeared to be a penetrating radiation, produced by bombarding certain light atoms with α -particles, was in fact a stream of particles, of mass similar to that of the hydrogen atom nucleus, but uncharged with electricity. This discovery of the neutron was of immense importance for the understanding of atomic structure, since it soon became apparent that neutrons formed part of the central core or nucleus of all atoms. C. also shared in the discovery of the disintegration of the deuteron by β -rays, and of the creation of a pair of electrons (one positively and the other negatively charged) by β -rays. In 1932 he received the Hughes Medal of the Royal Society; in 1935 he received the Nobel Prize for physics and became prof. of physics at Liverpool. At the outbreak of the Second World War he began to study the chain reactions arising during the fission of uranium nuclei, and played a prominent part in the researches that led to the production of the atomic bomb.

Chærea, Caius Cassius, Rom. tribune of the pretorian cohort in Caligula's reign. He formed a conspiracy and assassinated that emperor. A.D. 41. Shortly afterwards he was executed by Claudius. See Tacitus, *Annals*.

Chæroneia, anc.^t Gk. city Chæroneia, Boeotia, famed for the victory of Philip II. and Alexander of Macedon over Athenians and Thebans, 338 B.C. (see succeeding article), also for Sulla's defeat of the army

of Mithridates, 86 B.C. This city was Plutarch's bp., whence his sobriquet, the Chæronean Sage. Its ruins are near the present vil. of Kapræna, consisting of a temple, an aqueduct, and one of the most perfect remaining Gk. theatres. A colossal lion over the sepulchre of the Boeotians who fell in 338 B.C., mentioned by Pausanias, ix., was found much mutilated. It was restored and re-erected, 1905. See Murray's *Handbook for Greece*, 1884; Thucydides, iv.; Plutarch, *Alexander and Sulla in his Lives*; J. Krommayer, *Antike Schlachtfelder in Griechenland*, 1903-12.

THE LION OF CHÆRONEIA

E.N.A.

Chæroneia (Chæroneia), Battle of (338 B.C.). The details of this battle are not so well known to us as those of many less decisive conflicts in Gk. hist. In the Confederate host the Thebans held the right wing, the Athenians the left, while the Corinthians held the centre. In the Macedonian army the king faced the Athenians, and his son Alexander—a youth of eighteen who now saw his first battle—was opposed to the Thebans. Philip had decided to throw his greatest force against the enemy's right, for he dreaded the famous Boeotian phalanx. While he fought cautiously with the Athenians and even gave ground, Alexander delivered numerous furious onslaughts on the Thebans. The short spears of the Boeotians could not prevail against the long pikes of the Macedonian phalanx, and their cavalry was outnumbered and driven from the field. Theagenes, the Theban general, was

killed, the entire 300 chosen hoplites of the 'Sacred Band' fell to a man, and, finally, the Boeotians were routed by Alexander's cavalry. This was followed by the collapse of the Corinthians, who fled the field. The Athenians were now almost surrounded, so that flight was their only hope, and 2000 were captured and 1000 slain. The losses of the Thebans were even greater. Thus ended this famous battle, and 'once more the narrow spirit of local ambition had proved the evil genius of Greece,' and Philip, with Athens and Greece at his feet, had achieved his life's ambition (Oman).

Chærophyllum, genus of Umbelliferae, flourishes in N. lands of temperate climate. *C. temulum*, closely allied to the celery, parsnip, and carrot, is the chervil which is sometimes used as a pot-herb. *C. temulum* is the wild chervil, the garden species being *C. Sativum*. See also CHERVIL.

Chætoderma, genus of gastropod molluscs, forms by itself one of the two families in the div. Aplacophora. The species, of which there are three found in the Atlantic, Arctic, and Pacific Oceans, are cylindrical, covered with bristly spicules, and the sexes are separate.

Chætodon, genus of spiny-rayed fishes of the family Chætodontidae or Squamipennae. The body is laterally compressed and elevated, the snout is fairly long, the mouth is furnished with closely set rows of long, slender, bristle-like teeth, and there is one dorsal fin. The species are often remarkable for their beauty of colour, the commonest tints being black, yellow, and brilliant metallic blues and greens. Their food consists of small animals, and they are very adroit fly-catchers. The numerous species often frequent coral reefs, and are most often found in the Indian and Amer. seas, the Atlantic and Pacific Oceans.

Chæstognatha, very small div. of marine animals, consisting of the three genera, *Spadella*, *Khorolla*, and *Sagitta*, the arrow-worm. The species are elongated, have caudal and lateral fins, are completely transparent, extremely numerous, and in habit they are carnivorous. The largest of these creatures is about 2½ in.

Chætopoda, class of Annelida, or segmented worms, in which the setae, or bristles, are very noticeable. The chætopods are divided into two orders, the Polychæta and the Oligochæta, according as the setae are borne on special processes called parapodia, or spring directly from the body. In the first order all the species are marine, with extremely few exceptions, and in most of them the sexes are distinct, while the second order is composed of hermaphrodite creatures which generally inhabit fresh water or live underground. Among the former may be mentioned the genera *Arenicola*, the lob-worm; *Aphrodite*, the sea-mouse; and *Chæloperus*; among the latter occur all the earthworms, e.g. *Lumbricus* and *Megascolides*.

Chælopterul, genus of annelid which is noted for its green phosphorescent glow. It is a curiously shaped worm which

inhabits a long tube. *C. variopeatus* is found on Brit. coasts and in all European seas.

Chaffer, name applied popularly to beetles of the family Scarabaeidae, which consists of about 13,000 species. The males have horns, and many of the perfect beetles and larvae are destructive to vegetable life. The term is usually compounded with another, e.g. cock-chaffer, barkchaffer, rosechaffer.

Chaffinch, or *Fringilla caelebs*, pretty, active little bird of the family Fringillidae, and is related to the sparrow, canary, and buntings. The cock-bird is a favourite songster, and from his note the Gers. call him *finck*, from which we derive the word finch; his specific name is obtained from the habit of the sexes of living apart in winter, the females migrating and leaving the celibate males behind.

Chagai, dist. of Baluchistan, N.W. of the Kharan State. Formerly an administrative div. of Brit. Baluchistan.

Chagall, Marc (b. 1887), Russian painter, b. at Liosno, Vitebsk. Studied painting under Bakst in St. Petersburg and (1910-1914) in Paris. Migrated to the U.S.A. in 1941. An artist of the Impressionist and Cubist schools, as may be seen from his 'Adam and Eve,' 'Parisian Self-Portrait,' and 'Paris through a Window.' His scenes of Russian folk-life are well known, as also his water-colours illustrating La Fontaine's Fables. See studies by T. Däubler, 1922, and A. Salmon, 1928.

Chagny, tn. of France, in the dept. Saône-et-Loire, 10 m. from Châlon-sur-Saône, 9 m. from Beaune. Has trade in wine, railway workshops, and quarries. Pop. 4800.

Chagos Archipelago, scattered group of coral reefs and islets in the Indian Ocean, S. of the Laccadive and Maldivé groups. They lie in circular form round the Chagos bank, in 5° 30' to 6° 30' N. and 71° 30' to 72° 30' E., separated from the Maldivé Is. by a deep channel 300 m. wide. Area about 150 sq. m. A dependency of the Brit. colony of Mauritius. The most important cluster is the Oil Is., with Grand C., or Diego Garcia, in the S.E. This is. has a good harbour, is a coaling-station, and exports much coco-nut oil. It is on the route of Australian and Red Sea steamers. Other is. are Danger, Egmont, Eagle, and Three Brothers Is. Various other is. S. and E. of the bank have disappeared. Pop. about 800 (400 in Diego Garcia).

Chagres River, in S. America (Colombia), flows W., then N. through isthmus of Panama, rising in San Blas Mts., about 30 m. from Panama, flowing into Caribbean Sea. Navigation is hindered by its falls and extreme swiftness, which also presented one of the main difficulties in constructing the Panama Canal. The Panama railway follows a part of its course.

Chahar, prov. of Inner Mongolia, China. Area 107,700 sq. m. Cap. Changchiakow. Pop. 2,034,000.

Chahats, see CHOCTAWS.

Chaillé-Long, Charles (1842-1917), African explorer of Fr. parentage, b. at

Baltimore, graduated at Washington Academy, 1880; studied law at Columbia, becoming barrister, 1880; served in the Confederate army, 1862-65; went to Egypt and was made lieutenant-colonel by the khedive, 1870. In 1874 he became chief of Gordon's staff, and went on a mission to King M'tesa of Uganda. Obligated owing to plots to return to Gordon at Gondokoro, he managed to explore Lake Victoria and the country round, the course of the Somerset Nile, and Makaraka and Nyam-Nyam countries. He was decorated with many medals and honours for services as explorer and soldier. Among his works are *Les Combattants français*; *Les Sources du Nil*; *L'Égypte et ses provinces perdues*; *Central Africa: Naked Truths of the Naked People* (1876); *The Three Prophets* (1886); *My Life in Four Continents* (1912).

Chailletaceæ, obscure natural order of Dicotyledons flourishing in the tropics. The inflorescence is cymose, the flowers are hermaphrodite or unisexual, the calyx, corolla, and andræcium are in parts of five, the gynæceum consists of two or three united carpels, and the fruit is a drupe.

Chaillot, formerly a vil. in the immediate neighbourhood of Paris on the R. Seine. In 1859 it was called the suburb of 'la Conférence,' because the peace of the Pyrenees was decided upon after conferences there. Before the revolution there were two monasteries at C. In 1786 it became part of the precincts of Paris. The Trocadero Palace on the heights of Passy was rebuilt for the Paris Exhibition of 1937 under the name of the palace of C. The popular expression 'ahuri de Chaillot' (of unknown origin) meant a fool, a simpleton; 'envoyer à Chaillot,' 'envoyer promener.'

Chaillu, Paul du, see DU CHAILLU.

Chain, or **Gunter's Chain**, measuring-line in land surveying, of 100 links (iron or steel rods, 7.92 in. long). Hence a lineal measure of 22 yds. Ten square chains make 1 acre (4840 sq. yds.). A surveyor's chain now is more commonly 100 ft. long (Ramsden's chain).

Chain, Chain Cables (Lat. *catena*), series of links of metal, or other material, so connected as to form a flexible band. Cs. are of very ant. origin, but the number of different uses to which they can be put has been largely increased in modern times. Some of the oldest uses are as ornament (collar, bracelet, cf. modern watch chain), as a symbol of office (cf. modern knight, mayor), and as fetters for prisoners or slaves, hence any kind of shackle or bond, or figuratively a restraining force. Cordage was used for many purposes now served by Cs. They are employed to confine, bind, fasten, or connect together various objects, to lift weights, to transmit a mechanical power. These last are known as pitch-Cs. In some Cs. the links are composed of a single piece of metal (oval-link hoisting-C.). In others the links are made up of sev. separate pieces (bicycle-C.). These pieces are connected by bolts, rivets, or stud-screws, so formed as to engage with the teeth of a sprocket wheel.

They are partly machine- and partly hand-made. Cs. differ greatly in structure according to the shape of the links (stud Cs., open-link Cs., twisted-link Cs.), the mode of uniting them, and the purpose for which they are intended. They are sometimes loosely divided into hand-made and machine-made C. Ornamental Cs. may have a large variety of links, but those for useful purposes are mainly of two types: (1) stud Cs., in which a transverse stud or brace is inserted in each link to keep the sides from collapsing under strain; (2) open-link Cs. with no stud. The first are much stronger, increasing the load a C. can bear by about 50 per cent. Small Cs. are often made by machinery, but larger ones are usually made by a smith and entirely hand-wrought. Crane Cs. and ships' cables, etc., are generally hand-made from rolled bar-iron. The weld is commonly at the end of the link, but for large cables presses may be used to bend the link, or power hammers for welding, the weld sometimes being at the side. Weldless Cs. are machine-made ones, manufactured from cruciform steel bars pressed while hot into links with no join (Strathern's process). They are mostly made in small sizes for cow-ties, dog Cs., or fence Cs. Strong Cs. can withstand a breaking strain of many tons. C. cables have to undergo severe tests before passed by the Brit. Admiralty for use on board ship. Cs. for railways, cranes, dredges, etc. have similar tests. Size is defined by the diameter of the bar from which the links are made. A 2-in. stud C. cable must withstand a test-load of 72 tons. For full 'test requirements' see *Cent, Mechanical Engineer's Pocket Book*. As a nautical term C. means the contrivance to extend the basis of the lower shrouds of a mast, consisting of dead-eyes, C.-plates, and C.-wale ('channel').

Chained Books. The custom of chaining books to stands or reading-desks was very common in various parts of Europe in the fifteenth and sixteenth centuries. A library, fitted with reading-desks made with an iron rod along the top to which the books were fastened by a chain was founded at Zutphen, 1561, and is still to be seen. Later, as the number of books increased, upright book-shelves were set up (very much as in modern libraries) and the books so arranged in them as to show the fore-edges on which the titles were written. Sloping desks were placed in front of the shelves, and chains were fastened to the books long enough to allow of their being placed and consulted on the corresponding desks. All Saints' Church, Hereford, still possesses a library of this kind dating from 1715. Its cathedral library is an earlier example of the same system. In the reigns of the Tudor kings Henry VIII. and Edward VI., orders were given for Bibles and copies of the Paraphrases of Erasmus to be chained in the parish churches. These books, together with Foxe's *Book of Martyrs* and works of Jewell (d. 1571), may still be found in old churches with their chains attached

to them. The practice was discontinued early in the eighteenth century. It was doubtless first introduced because the scarcity of books made them very valuable. See W. Blades, *Books in Chains, and other Bibliographical Papers*, 1892; J. W. Clark, *The Care of Books*, 1901.

Chain-mail, flexible defensive body-armour of hammered metal links, much used in Europe in the twelfth and thirteenth centuries, and still in India and the interior of Asia. The links or rings were interlaced and connected by riveted links, so that each embraced four others, and wrought into the form of a garment. Though more convenient to the wearer than plate-armour, it was less adapted to withstand a lance's thrust.

Chain-plates, in shipbuilding, strong plates or bands of iron fastened to the ship's side under the chainwale, to which are attached the dead-eyes or (more recently) rigging-screws, to which the standing rigging and shrouds are fastened. In architecture, a series of connected plates built into walls to give greater strength.

Chain-shot, obsolete form of projectile, invented by Adm. de Witt in 1666, consisting of two balls connected by a chain or bar, and used to destroy the enemy's rigging.

Chairman, presiding officer at the meeting of any assembly, association, or company, whether convened for public purposes or for the transaction of the private business of the members. When a meeting is assembled the first thing to be done is for the chair to be taken. Some person present may have a statutory right to preside, and in the case of many public meetings, the name of the C. is previously announced in the notice convening the meeting. In the absence of the foregoing, or where the C. selected by the convenors of the meeting is challenged, the meeting should put the call to the chair to vote. The president or C. of the House of Commons is elected at the beginning of every new Parliament, and is called the Speaker. The principal function of a C. is the maintenance of order, and on taking the chair a C. is consequently invested with authority to control and regulate the proceedings of the meeting. Generally speaking the duties of a C. are to decide points of order, put motions to the vote, call upon speakers to address the meeting, regulate the discussions, call upon the stewards or managers (if any), or the members themselves to eject interrupters without unnecessary violence, sign and secure the proper framing of the minutes, and adjourn the meeting. The Speaker of the House of Commons gives rulings as to procedure, names members guilty of disorder, reprimands members and other persons, if necessary, and signs warrants of commitment for contempt. Speakers at a meeting must always address the chair. Unless previously selected to speak, when he will be called upon to do so by the C., a member desiring to speak must rise at the end of another member's speech. If two or more rise simul-

taneously, the one that 'catches the C.'s eye' should be called upon; but the C. may call upon whom he will. The office of C. may not be an easy one to fill. The ideal qualities in a C. are urbanity, the most unimpeachable impartiality, and a clear perception of the fundamental rules of debate. In calling speakers to order his function is to keep a discussion within legitimate or relevant bounds. In the case of meetings of public bodies it is obvious that public time can only be saved by confining speeches to the questions on the agenda. The C. is the sole judge as to whether any speech, resolution, or amendment is in order. When any resolution or amendment is proposed and seconded the C. is bound to put the resolution or amendment to the vote. Where the voting is equal the C. may have a second or casting vote.

Chairman of Committees, the officer who takes the chair in the House of Commons when the House is in Committee and the speaker vacates the chair. He holds office during the whole parliament. To the C. of C. belongs the duty of superintending all matters relating to private Bills. The salary of the C. of C. is £2500 a year. When the Speaker of the House of Commons is absent from parliament the C. of C. takes his place and the House of Commons also has a deputy-chairman.

Chaise, originally 'a chair' from the Fr., whence sedan-chair; then by transference a light, wheeled vehicle. Sometimes loosely used for any kind of pleasure-carriage. Usually a two-wheeled carriage for two people, with a calash top and the body hung on straps, drawn by one horse (*cf.* hansom). The post-chaise of the eighteenth and nineteenth centuries was a closed, four-wheeled vehicle, with two or four horses.

Chaitanya, Indian mystic (*d.* c. 1486-1570). Founder of the Vaishnava sect of Bengal. Regarded by his adherents as Krishna incarnate.

Chalabre, tn. of France, situated in the dept. of Aude, arron. Limoux. It stands on the R. Lers, and lies S.W. of Carcassonne. Pop. 1600.

Chalaza, term in botany used in describing the internal structure of the ovule. The C. is the base of the nucellus, a mass of parenchymatous tissue from which the integuments arise.

Chalcedon, properly Calchedon (now Kadiköy), anct. Gk. city of Bithynia on the Bosphorus, opposite Byzantium, S. of Scutari. It was a Megarian colony, founded 685 B.C. For long it vacillated between Athenian and Lacedæmonian interests. Attalus III. of Pergamus bequeathed it to the Romans, 133 B.C. Partly destroyed by Mithridates, it was recovered under the empire. C. was frequently ravaged by barbarian hordes, such as the Goths (A.D. 256) and Persians under Chosroes (A.D. 616-28). In A.D. 451 the fourth general council was held here to determine the eccles. jurisdiction of the sees of Rome and Byzantium. It was destroyed by the Turks after 1075.

Chalcedony, or **Calcedony**, precious stone of the commoner sort, deriving its name from Chalcedon, a city of Bithynia in Asia Minor. The anct. mineral, however, appears to have been a green-stone, whereas modern C. is a milky-white or yellowish stone consisting of silica. It differs from quartz in not being definitely crystalline, but occurs in concretionary, mammillary, or stalactitic forms with a fibrous structure. Its hardness is 6.5 and sp. gr. 2.6. It occurs in cavities in volcanic rocks, where it has been deposited out of solution in water, as in the basalt of N. Ireland, Iceland, the Faroe Isles, etc. Occasionally specimens are found with a drop of water in the interior, and these are much prized as ornaments. C. has been worked by jewellers from early times, and variegated forms are differentiated as agate, onyx, jasper, bloodstone, carnelian, etc.

Chalcedonyz is a specially marked variety of chalcedony, a mineral composed of quartz of a milk-white colour caused by the presence of opal. It usually has greyish markings, which give it, when polished, an ornamental value, it being used for making brooches and vases.

Chalchicomula (San Andrés), tn. of Mexico, state of Puebla, 25 m. from Orizaba, near the foot of Orizaba peak. Pop. 7000.

Chalchihuitl (Chalchulte), Mexican name for a kind of green, fine-grained stone, quarried near Santa Fé, much prized by the anct. Mexicans. Probably it was a green variety of turquoise, or else a kind of jade. It was valued above gold, carved into rude figures and polished, or made into beads and ornaments. Figures were found in tombs, and the brooch fastening Montezuma's robe was of chalchihuitl.

Chalcides, name of a large genus of lizards in the family Scincidae. The species are pleurodont lizards with bony plates on the head and body, a scaly and feebly nicked tongue, elongated and sometimes serpentine body, the limbs wanting or little developed, and the lower eyelid has a transparent disk. They inhabit S.W. Asia and the Mediterranean. *Ch. ocellatus* attains a length of about 10 in.

Chalcidæum, in architecture, vestibule or portico of a public building; annex to a larger building (a basilica, or a modern church); a columned hall or covered portico in front of the chief entrance of certain buildings. In Gk. houses it was the part destined for guests or receptions. In Rom. basilicas they were side-annexes on each side of the tribunal. So called from Chalcis in Eubœa, which apparently first had such structures. The basilicas of Eumastria at Pompeii, and of Constantine at Rome, had a C. placed at one end.

Chalcids, typical genus of the curious family of hymenopterous insects, Chalcididae. The family contains numerous species of tiny parasites which prey on the larvae of galls, on caterpillars, on bees and beetles, but also on many destructive insects and they are thus of considerable

value to man. *C. flavescens* is a species which is native to tropical America, and certain hymenopterous insects of the allied genera *Blatophaga* and *Sychophaga* assist in caprification or the fertilisation of the cultivated fig.

Chaldis (Negropont), anct. seaport of Greece, cap. of Eubœa, on the Euripus at its narrowest part 17 m. from Thebes, 35 m. from Athens, to which it was subject in fifth and fourth centuries B.C. In early times it was a flourishing seat of commerce and manufs. (metal-work, purple, pottery), and a great colonising centre. The three-pronged peninsula of Chalcidice, projecting from Macedonia into the Aegean Sea and divided into Pallene, Sithonia, and Acte (with Mt. Athos), took its name from colonists in the eighth century B.C. from C., and its tns., Olynthus and Potidea, were famous in Gk. hist. Cumæ and Naxos were also colonised from there. In the seventh century it defeated Eretria in the Lelantine war, becoming chief city of Eubœa. Both Antiochus III. (192 B.C.) and Mithridates VI. (88 B.C.) used C. as a base for invading Greece. Aristotle d. here. C. was important in the Middle Ages; called Egribo by the Gks., Negroponte by the Its. It has medieval walls and towers, buildings of Venetian construction, and mosques mostly converted into Christian churches. In 1894 an earthquake did much damage. Since 1904 a railway connects C. with Athens and Piræus. Pop. about 11,000.

Chalcondylas (Chalcondyles), Demetrius (c. 1424-1510), learned Gk. grammarian of Athens. On Lorenzo de' Medici's invitation he went to Florence and taught there, his pupils including that prince's sons, Grocyen, Linacre, and Latimer (1480-92). Prof. of Gk. also in Perugia, Rome, and Milan. The first printed ed. of Homer was ed. by C. (1488). His Gk. grammar, *Erotemata*, appeared about 1493. He also ed. Isocrates (1493) and Suidas (1499). See P. Giovio, *Elogia virorum bellica virtute illustrium*, 1551; J. A. Symonds, *Renaissance in Italy*, 1875-86.

Chalcondylas (Chalcondyles), Laonicus or Nicolaus (d. 1464), also Byzantine historian of the fifteenth century, son of an Athenian noble, relative (perhaps brother) of Demetrius C. (q.v.). During the siege of Constantinople (1446) Laonicus was ambassador from John VII., Palæologus, to Sultan Murad II. He wrote *History of the Turks and of the Byzantine Empire, from 1298 to 1463* (*De Origine et Rebus Gestis Turcorum*), ed. by Bekker, 1843. See J. A. Fabricius, *Bibliotheca Græca*, 1790-1809; J. von Hammer-Purgstall, *Geschichte des Osmanischen Reiches* (new ed. 1840; Eng. trans. 1854).

Chaldæa, **Chaldæans** (perhaps from Assyrian *kasdu*, to conquer), strictly a prov. of Babylonia, bounded by the lower course of the Euphrates, the head of the Persian Gulf and the Arabian desert. Its cap. was Bit-Yakin, chief seat of Merodach-baladan, who harassed Sargon and Sennacherib. In O.T. C., or Kas-

dim, is used in a wider sense to mean the whole empire of Babylonia (Gen. ii., Jer. i. 51). Ezekiel (xxiii.) includes certain foreign nations as well. Another name is Mat Tamti (Sea-land). The C. were probably a Semitic people from N. Arabia or the Kurdish uplands, and were the ruling class at Babylon as early as the eighth century B.C. Nabopolassar, or Nabuapaluzur (c. 626-604), and his successors made Babylonia a world power. From this time onwards the terms Babylonians and C. became more and more interchangeable, till finally they were considered synonymous as in the Hebrew writers. Labashi Marduk was the last Chaldean king (556);

Chaldir-gol, lake in Transcaucasia, 35 m. from Kars. Length, 12 m.; maximum breadth, 10 m.; area about 33 sq. m.; maximum depth, 140 ft. It abounds in fish (carp, trout, etc.), and is frequented by water-fowl.

Chaldrón (another form of cauldron), Eng. dry measure; in London 36 heaped bushels, or its equivalent weight, nearly twice as much at Newcastle. Now only used for coal and coke (formerly only 32 bushels), now about 25½ cwt. In U.S.A. a C. is about 2940 lb., in New York, 2500. See Pepys's *Diary* iii.; Steele, *Taller*, No. 73.

Chalet (dimin. of O.F. *chastel*, Mod. Fr., *château*), Swiss word, said to have been

SWISS CHALETS AT ZUM-SEE, NEAR ZERMATT

1 optical

the Babylonian Nabunaid succeeded him (555-538). According to some, the C. were a mixed race of Babylonians and Kassites or Cosseans. Besides being used as a race-name for Babylonians, C. in the book of Daniel (second century) meant astronomers, astrologers, mathematicians, and even magicians. This sense also appears in Herodotus, Diodorus, and Strabo. Xenophon's 'Chaldeans' (*Anab.* vii.) were an entirely different people from the Euxine. The Chaldean language seems to have been more like the Babylonian than like the Arabic or Aramaic. Daniel, however, speaks of Aramaic as 'the language of the C.' Hence, when the Babylonian tongue was superseded by Aramaic, Jerome wrongly called the latter 'Chaldee,' and this name was kept till quite recently. For recent archaeological research and bibliography, see under BABYLONIA; UR.

Chalder, old Scottish dry measure of 16 bolls or 64 firloths of corn (96 bushels). For lime or coal it varied from 32 to 64 Imperial bushels. Still used in computing the stipends of Scottish ministers (*cf.* CHALDRON).

introduced into France by Rousseau. Originally a wooden hut or cabin in the Swiss mts., where cattle are lodged in summer, and cheese is made. Extended to a Swiss peasant's small cottage, a herdsman's hut or wooden house. Applied now to any picturesque villa built in imitation of that style.

Chaleurs Bay (Baie des Chaleurs), sheltered inlet of the gulf of St. Lawrence, Canada, between Gaspé Peninsula and New Brunswick. Quebec is on the N., New Brunswick on the S. The bay is about 90 m. from E. to W., maximum breadth 25 m. There are good mackerel fisheries. Shippegan and Miscou Is. are near the entrance. Discovered by Cartier in 1535, it was named from the intense heat of the season.

Chalfont St. Giles, par. of Buckinghamshire, England, Wycombe div.; 3 m. from Chalfont Road station and Amersham, 10 m. from Windsor. Penn. is buried in the Friends' cemetery near. Milton lived there during the plague (1665-66), finished *Paradise Lost*, and wrote part of *Paradise Regained*. His cottage is still preserved and shown. Pop. 2000.

Chalford, eccles. dist. and vil. of Gloucestershire, England, 4 m. from Stroud, 1½ m. from E. Brinscombe station. Has dyeworks and broadcloth manufs. Pop. 3000.

Chalgrove (A.-S. *cealc-græf*, chalk-pit), par. and vil. of Oxfordshire, England, about 7 m. from Oxford, and 4 m. from Watlington station, Henley div. In 1643 the Parliamentarians were crushed here by the Royalists under Prince Rupert, Hampden being mortally wounded. Pop. 400.

Challapin, Feodor Ivanovitch (1873-1938), Russian basso, b. in Kazan, Russia. He was at different times, shoemaker's apprentice, railway clerk, railway out-porter, and stevedore on Volga steamboats. Trained in the choir of the archbishop of Kazan. At 17 joined a little Russian travelling company as singer and dancer. Ussatov, a singer of repute, volunteered to teach him, and later procured him an engagement at the Tiflis opera house; and he then made his operatic debut there in *A Life for the Tsar*. Later, he sang at St. Petersburg, taking the part of Ivan the Terrible in Rimsky-Korsakov's *Maid of Pskov*. His most valuable experience was, however, in Mamontov's company, in 1894-95, when he took Mephistopheles in *Faust*, the miller in Dargomizsky's *Russalka*, and Salleri in Rimsky-Korsakov's *Mozart and Salieri*. In 1896 at the Private Opera in Moscow, he became famous. He appeared in Moscow, in 1899, at the Imperial Opera and, in the same year, earned fresh laurels at Petrograd in the title-role in *The Demon* of Rubinstein and as Holofernes in Serof's *Judith*. Two of his best and favourite parts were Don Basilio in *The Barber of Seville* and Leporello in *Don Giovanni*. In 1908 he visited America, and in 1913 Sir Thomas Beecham brought him to London, where he appeared in *Boris Godunov* and *Khovanshchina*. He was again in London in 1921, and in America 1922-23. In 1928 and 1929 he appeared at Covent Garden in Boito's *Mefistofele*, Gounod's *Faust*, and Rossini's *The Barber of Seville*. In 1932 he was in the film, *Don Quixote*. Pub. *Pages from my Life* (1927); *Man and Mask* (1935).

Chalibaus, see CHALYBAEUS.

Chalice (Lat. *calix*), originally any drinking-cup, goblet, or bowl, but in this sense now only used in poetical language. Applied especially to the cup used in celebrations of the Holy Communion. Formerly it could be made of any material (the 'Luck of Edenhill' preserved in the family of Musgrave, near Penrith, is of glass), but must now be of gold, silver, or silver-gilt, and consecrated by a bishop in accordance with a prescribed form. It must be touched only by those in holy orders. The paten served as a chalice-cover and also to carry the wafer or bread. The C. is the emblem of St. John the Evangelist. The use of the 'mixed C.' (water mixed with wine in the Eucharist) in Rom. Catholic and Oriental churches dates from very early times. See Justin Martyr, *Apologia*, i.

Chalcotherium, genus of fossil pachydermatous animals, belongs to the extinct Ancylopoda, and has been discovered in the Miocene of Eppelsheim, near Mainz. Its limbs are tridactylate, and in dentition it lacks incisors, and has no canine teeth in the upper jaw.

* **Chalil**, El, see HEBRON.

Chalina, genus of Porifera, received its name from the naturalist Grant. The sponge is represented in Britain by *C. oculata*, the mermaid's glove.

Chalk, soft, white variety of limestone. As found in the S. and E. of England, it is white or yellowish-white in colour and easily broken, though it varies considerably in compactness. Flints of various sizes are found embedded in the C. usually in fairly definite layers; otherwise it consists of calcium carbonate, with some admixture of silica, alumina, and magnesia. C. consists of the shells of minute animals called foraminifera. Different forms of these animals exist in all parts of the ocean, and are capable of developing shells for themselves from the calcium compounds found in the seawater. When the animals die, the shells combine with other debris to form an ooze in the ocean bed. At various periods in the earth's history, such masses of ooze, hardened by superincumbent pressure into rock, have risen above sea level, and thus we find that underneath the most recent formations a vast mass of C. exists throughout a great part of England and in those European coasts separated from England by the sea. The C. formation extends from the wolds of Yorkshire, with characteristic rounded hills and white sea-cliffs, to the N. and S. Downs in Kent, running westward until they merge in Salisbury Plain. Owing to its soft nature, the C. provides gently undulating scenery, a fine thin soil in which abundant grass grows suitable for sheep pasture, while the solution of the carbonate leaves behind numerous flints. Water in such localities is generally hard, owing to the amount of calcium carbonate in solution. The C. is used for building purposes when found hard enough, and the flints are used for building and road-making. When subjected to a bright heat, C. loses its carbon dioxide, and calcium oxide, or

quicklime, is formed. When mixed with water, the hydrate, or slaked lime, is produced, and this, mixed with three times its bulk of sand, forms the mortar used to cement bricks together. Lime is also much used as a manure, as it hastens the decomposition of organic constituents of the soil. C. burnt with certain proportions of clay provides different forms of cement, which harden with more or less rapidly according to the proportions of their constituents. C. is treated with acids to produce the carbonic acid gas required in the preparation of aerated waters, etc. When the C. is triturated with water, and the fine particles allowed to fall in a fairly homogeneous mass, the resulting product is whiting, used as a pigment and a polishing medium. An artificial C. is prepared by adding sodium carbonate to a solution of calcium chloride, when a fine precipitate forms. This product, known as precipitated C., is used in medicine as an antacid and astringent, and serves as a tooth-powder and as a pigment. Substances somewhat similar in consistency to the carbonate are known as C's. *Black C.* is a soft schist containing carbon; *red C.* consists of iron ore and clay; *French C.* is a variety of steatite, or soapstone.

Chalkeley, Thomas (1675-1741), Quaker. After a varied and adventurous youth, he began preaching at Quaker meetings, and in 1697-98 visited the Puritan Amer. colonies. In 1700 he returned to America; in 1701 took a preaching tour to the Barbados, and between then and 1710 visited Ireland, Scotland, England, Holland, and Germany. The rest of his life was mainly spent in preaching and organisation in America, where he had great influence. His collected works appeared in 1751 and 1790.

Chalking the Door, mode of giving tenants notice of removal (especially among the poorer classes), long known and still in use in Scotland. The chalk-mark is made by a burgh officer in the presence of witnesses on 'the most patent door,' on the proprietor's verbal order. This is done forty days 'before Whit Sunday,' or the date on which the tenants are expected to leave. When this has been done, and a declaration of 'chalking' been written out and signed by the officer and two witnesses, he may demand the ejection of the tenants six days after the expiry of the forty days.

Challemeil-Lacour, Paul Amand (1827-1890), Fr. publicist and statesman; prof. of philosophy at Pau and Limoges. In 1868 he estab. the *Revue Politique*, with Brisson and Gambetta, who made him prefect of Lyons, 1871; deputy, 1872; senator, 1876; ambas. to Switzerland, 1879; to England, 1880-82. In 1883 under Ferry, he was minister of foreign affairs, in 1890 becoming vice-president, and in 1893 president of the Senate. C. founded the *République Française* with Gambetta, becoming editor-in-chief. Member of Fr. Academy, 1893. He wrote philosophical works: *La Philosophie individualiste* (1864);

trans. of Ritter's *Geschichte der Philosophie* (1861). He also ed. Mme d'Épinay's *Works* (1869). His *Œuvres oratoires* appeared in 1897.

Challenge, see **JURY**.

Challenger Expedition, scientific exploring expedition sent out by the Brit. Gov. (1872-76) for experiments in deep-sea soundings and the investigation of the conditions of life in the Atlantic, Pacific, and Antarctic Oceans. The cruise of H.M.S. *Challenger* followed that of the *Lightning* in 1868, and of the *Porcupine*, 1869-70. Capt. Nares was naval commander of the vessel, the scientific staff being under Prof. Wyville Thomson. Every kind of scientific appliance was supplied for sounding the depths, mapping the basins, and determining the physical and biological conditions of the oceans. H.M.S. *Challenger* reached Santa Cruz in Feb. 1873. Investigations were made at 362 stations. Among numerous places on the route were Madeira, Canaries, W. Indies, Nova Scotia, Cape Verde, Fernando Noronha, Cape of Good Hope, Melbourne, Hong Kong, Japan, Valparaiso, Magellan Straits, Portsmouth. The deepest sounding was between Admiralty Is. and Japan, 4575 fathoms. See *Official Reports on the Scientific Results of the Voyage of H.M.S. Challenger*, ed. by Wyville Thomson and John Murray, 50 vols. (Zoology, Botany, Deep-sea Deposits, Physics, and Chemistry, etc.), 1880-95. The narrative occupies 2 vols. (1882-85). Consult also H. N. Moseley, *Notes by a Naturalist on the Challenger*, 1872-76, 1879; W. J. J. Spry, *Cruise of H.M.S. Challenger*, 1876; and works of W. Thomson, J. Murray, Lord George G. Campbell, and J. J. Wild.

Challis, James (1803-82), Eng. astronomer and physicist, educated at Trinity College, Cambridge. Senior wrangler, first Smith prizeman, 1825; ordained 1830. In 1836 Plumian prof. of astronomy and experimental philosophy, and till 1861 director of the observatory of Cambridge Univ. His labours were largely directed to determining the positions of the sun, moon, and planets, so as to increase tabular accuracy. Among his valuable improvements were the collimating eye-piece (1850), the transit-reducer, and the meteoroscope. He contributed largely to scientific publications, and also produced independent works on astronomy, physics, and mathematics, among them being *Astronomical Observations*, 1838-45 (1829-50); 1846-51 (1854-56); an *Essay on the Mathematical Principles of Physics* (1873). See Adams, James Challis.

Challoner, Richard (1691-1731), Eng. Rom. Catholic divine, educated at the Eng. college at Douay, 1704; prof. of philosophy there, 1713-20; vice-president and prof. of divinity, 1720-30. C. returned to London, becoming coadjutor to Petre, titular bishop of London, 1741, succeeding him in 1758 as vicar-apostolic. He was bishop of Debra in Libya, 1741. During the Gordon riots he took refuge in Highgate. He pub. theological and polemical works, among them *Church*

History; Grounds of the Old Religion; The Garden of the Soul (1740); *The Rheims New Testament and the Douay Bible, with Annotations* (1749-50). His version of the Douay Bible is substantially that since used by Eng.-speaking Catholics. C. also trans. *The Imitation of Christ* (1706). See Barnard's life (1784).

Chalmers, Alexander (1759-1834), Scottish biographer and editor, educated in Aberdeen. He ed. sev. newspapers in London (*Morning Herald*), contributed to periodicals, but chiefly wrote prefaces for new eds. of Eng. classics (Shakespeare, Johnson, Fielding, Warton, Gibbon, Burns, Pope, Bolingbroke, and others). His *Glossary to Shakespeare* appeared in 1797. His *British Essayists*, in 45 vols., 1817, is still useful. His fame chiefly rests on his *General Biographical Dictionary* in 32 vols. (1812-17).

Chalmers, George (1742-1825), Scottish antiquarian and historian, educated in Aberdeen and Edinburgh. Emigrated to America, 1763, practising law in Baltimore till the revolution. From 1787 was chief clerk of the Board of Trade in London. His chief work is *Caledonia; or, an Account of North Britain* (1807-24). Other works were biographies of Defoe (1785), Thomas Paine (1791), Mary Queen of Scots (1818), also a *Collection of Treaties* (1790), and works on the colonies.

Chalmers, George Paul (1833-78), Scottish painter. In early life a surgeon's errand-boy, then apprentice to a ship-chandler. He determined to become an artist, coming to Edinburgh, 1853, and studying under Scott Lauder. Orchardson, Graham, Pettie, and others were among his fellow students. Among his first works were small figure pieces in oil, 'The Student,' and 'The Smoker.' His 'Favourite Air' won notice, 1854. His colouring is rich and powerful, his portraits very good. His beautiful landscapes mostly appeared in his later years, including 'The End of the Harvest' (1873); 'Running Water' (1875). Other works are 'The Legend' (Edinburgh National Gallery); 'Prayer' (1871), both etched by Rajon; 'Threescore Years and Ten' (R.A., London, 1875); 'Knitting' (1876); 'The Love Song'; 'The Potato Harvest.' See *Memoir*, 1879; *Art Journal*, April 1873.

Chalmers, James (1841-1901), Scottish missionary, served in Glasgow City Mission, passed through Cheshunt College, and was appointed by the London Missionary Society (1866) to work in Raratonga Is. in the S. Pacific. He worked there for ten years, especially training native evangelists, and called by the natives Tamate. Then he was transferred to New Guinea. Besides zealous missionary work, C. and Lawes (his colleague) did much as explorers to open up the land, and helped in establishing the Brit. protectorate. C. and Tomkins (another missionary) were murdered by cannibals at Goaribar. Is. See R. L. Stevenson, *Letters*, II. 212, 220; J. Chalmers: *Autobiography and Letters*, ed. by R. Lovett, 1902.

Chalmers, Thomas (1786-1847), Scottish

theologian and economist, one of the most eminent figures and influential preachers of the nineteenth century. His powers of oratory were so great that Jeffrey ranked him with Demosthenes, Cicero, Burke, and Sheridan. Educated at St. Andrews Univ., he began preaching at nineteen. From 1803 to 1815 was minister of Kilmarnock, Fife. He then gave much time to studying mathematics, political economy, and natural philosophy, but after reading Wilberforce's *View of Practical Religion*, and writing at his request the article on Christianity for Brewster's *Edinburgh Encyclopædia*, 1810, his spiritual nature was aroused, and he became an enthusiastic pastor. In 1815-20, as minister of Tron par., Glasgow, he tried to remedy the ignorance and vice of his par., making experiments in parochial organisation which may be said almost to have suggested modern methods of dealing with the dependent classes, as seen in charity organisation societies and in settlement work. See N. Masterman, *Chalmers on Charity*, 1900. C. divided the par. into twenty-five dists., and estab. two week-day and numerous Sunday schools. His *Astronomical Discourses* appeared in 1817, and were very popular. His visit to London was enthusiastically received. His *Christian and Civic Economy of Large Towns* appeared from 1821 to 1826. These energetic labours told on his health. In 1823 he became prof. of moral philosophy at St. Andrews; 1828 of theology at Edinburgh. In 1827 appeared the *Use and Abuse of Literary and Ecclesiastical Endowments*; in 1834 his Bridgewater treatise, *Adaptation of External Nature to the Moral and Intellectual Constitution of Man*, which won him great distinctions from Edinburgh, France, and England (I.C.L., Oxford). In 1829 C. delivered a speech on Catholic emancipation. He was elected moderator of the General Assembly of the Scottish Church, and convener of the church-extension committee (1834). Cases of conflict between the church and civil authority arose in Auchterarder, Dunkeld, and Marnoch. In 1843, owing to these internal troubles, 470 clergymen, headed by C., left the church and founded the Free Church, claiming for it spiritual independence. C. was made prin. of the Free Church College. He devoted much time to the attempt to abolish pauperism round about Edinburgh. His last work was *Institutes of Theology*. Other works are: *An Enquiry into the Extent and Stability of National Resources* (1808); *Commercial Discourses* (1817); *Political Economy* (1832); *Defence of Church Establishments* (1838). His works were collected by W. Hanna 1836 40. and posthumously 1847-49. See R. Buchanan, *The Ten Years' Conflict*, 1849; W. Hanna, *Memoirs*, 1849-52; Taylor Innos, *Law of Creeds in Scotland*, 1867; Mrs. T. C. Oliphant, *Thomas Chalmers*, 1898; W. G. Blaikie, *Life*, 1897.

Chaloner, Sir Thomas (c. 1520-65), Eng. statesman and writer, educated at Oxford, sent by Henry VIII. as ambas. to Charles V., whom he accompanied in

his disastrous expedition against Algiers, 1541. Recalled to England as chief clerk of the Privy Council; knighted for his services at Musselburgh, 1547. As a Protestant he was driven from office in Mary's reign. Elizabeth sent him as ambas. to the Emperor Ferdinand I. of Germany, 1558, to Philip II. at Courtray, and as minister at the Sp. court, 1561. Among his works are *Office of Servants* (trans. from Cognatus, 1543); trans. into Eng. of St. John Chrysostom's homilies (1544); *De Republica Anglorum Instauranda* (1544); *Miscellaneous* (Lat.) *Poems* (1559); *Carmen Panegyricum* (1560); and trans. of Erasmus's *Praise of Folly* (1549).

Chaloner, Sir Thomas (c. 1561-1615), Eng. naturalist, son of the statesman, father of Edward, James, and Thomas the regicide (d. 1662). A favourite of James I., he came with him to England after a visit to Scotland, and in 1603 was appointed director of the education and household of Prince Henry. He founded a grammar school at St. Bees, 1608, where two C. scholarships still exist. He opened the first Eng. alum-mines at Belman Bank, Gulsborough, about 1600. C. wrote *A Short Discourse of the most rare Vertue of Nitre* (1584).

Châlons-sur-Loire, tn. in the dept. of Maine-et-Loire, France, 12 m. S.W. of Angers. The chief trade is in wines, grain, and limestone. There are mineral springs in the neighbourhood. C. possesses the ruins of a twelfth-century château. Pop. 3400.

Châlons-sur-Marne, cap. of the dept. of Marne, France, 107 m. E. of Paris by rail, situated on the r. b. of the R. Marne. C. is a garrison tn., surrounded by old walls. Many of its houses are old and built of timber, and the cathedral of Saint-Étienne, famed for its altar, dates back to the thirteenth century. C. has some handsome public buildings—the hôtel-de-ville, communal college, museum, and library, etc.—and a fine park, the Promenade du Jard. It has trade in woollens, leather, grains, oil, and champagne, but the manu. of 'shalloon,' a kind of worsted cloth, mentioned by Chaucer, had fallen into disuse before 1939. C. was known to the Romans, as Catalaunum; it was the site of the defeat of the Huns by the combined forces of Romans and Goths in 451; it suffered at the hands of the Eng. (1430-34) and of the Prussians (1814), and in 1870 was taken by the Gers. during the Franco-Prussian war, when MacMahon withdrew from the famous camp of C., formed by Napoleon III. in 1856. And again in the First World War, when Marshal Joffre withdrew his left wing during the Ger. offensive of Aug. 1914, he pivoted the movement on Verdun, hoping to hold the enemy on the R. Alsne. But this he could not do owing to their overwhelming numbers, and the Gers. pressed southward towards the Marne. Here also they could not be held, and C. was abandoned to them on Aug. 28-29. The enemy was, however, brought to a standstill on line just S. of the Marne. Joffre had

already entrusted the formation of a new army to Gen. (later Marshal) Foch, and it was Foch's Ninth Fr. Army that opposed the Gers. opposite C. and followed hard on their heels into the tn. when they retreated northwards during Sept., 1914. C. was not again visited by the enemy during the war. In the Second World War C. fell to the Gers. early in June 1940, in their headlong rush to the Seine. Gen. Patton's (q.v.) troops crossed the upper Marne near Vitry-le-François on Aug. 29, 1944; on the next day the 4th Armoured Div. of 12th Corps moved on to Saint-Dizier, while to the N. the 80th Infantry Div. captured C. and advanced rapidly northward. Pop. 31,100.

Châlons-sur-Saône (anct. Cabillonum), the cap. of an arron. in the dept. Saône-et-Loire, France, situated on the r. b. of the R. Saône at its junction with the Canal du Centre. There are fine quays along the river-side, and the tn. has a prosperous trade with the Atlantic and Mediterranean. Its chief manu., before the Second World War were glass, pottery, paper, hosiery, umbrellas, and jewellery; there are also copper and iron foundries and shipbuilding works. Pop. 32,600.

Chalus (Castrum Lucii), tn. of France in Haute-Vienne, on R. Tardoire, 17 m. from Limoges. The upper tn. contains ruins of the castle where Richard I. was mortally wounded, 1199. Near by is the ruined fortress of Monbrun. Pop. 2700.

Chalybeus (Chalybæus), Heinrich Moritz (1796-1862); Ger. philosophical writer, taught for some years; 1839-52, prof. of philosophy at Kiel Univ. where, with the exception of one brief interval, he remained till his death. In 1836 he pub. *Historische Entwicklung der speculativen Philosophie* (Kant to Hegel). But his chief works are *Entwurf eines Systems der Wissenschaftslehre*, 1846, and *System der speculativen Ethik*, 2 vols., 1850. His general principle, 'ideal-realism,' rejects both the extreme realism of Herbart and what he regards as the one-sided idealism of Hegel; and he tries to find a mean between the two. He defines the 'world ether' as the infinite in time and space and which in his view must be postulated as necessarily coexisting with the Infinite Spirit or God.

Chalybeate Springs are natural mineral waters in which iron predominates, as at Harrogate and Leamington Spa, England. The iron is generally combined with carbonic acid, in the form of protoxide or proto-carbonate, or with sulphuric acid, in the form of sulphate of iron, and the springs, therefore, can be subdivided into carbonated chalybeate and sulphated chalybeate.

Chalybes (Gk. χάλυβες, from χάλυψ, steel), Asiatic people who lived in Pontus, Asia Minor, S.E. of Black Sea. Famed as ironworkers, whence our word 'chalybeate.' Also a people near the headwaters of R. Euphrates in anct. times.

Chalybite, see SIDERITE.

Cham (Heb. for Ham, son of Noah) (1819-84), pseudonym of the brilliant caricaturist, Amédée Charles Henri, Vicomte de Noé. He studied under

Delaroche and Charlet, and won fame for depicting the humorous side of contemporary Parisian life, his first album, *Calebours, bêtises, jeux de mots tirés par les cheveux*, appearing 1842. In 1843 he first became connected with *Charivari*, and in this and the *Journal des Pèlerinages* his drawings continued to appear till his death. His masterpieces are chiefly social, but he also did political cartoons. Among his skits are *Proudhomana*, *Baigneurs et buveurs d'eau*, *L'Exposition de Londres*. For collections of his comic sketches see *Douze Années comiques* (1880); *Les Folies parisiennes* (1883). There are also examples in G. A. Sala's *Paris Herself Again in 1878-79*, 1882. See F. Ribeyre, *Cham, sa vie et son œuvre*, 1884.

Chamæleon, small S. constellation near the S. pole between Hydrus and Argo, announced by Bayer in 1603.

Chamerops, genus of palm-trees, consists of only two species, both Mediterranean plants, and *C. humilis* having the peculiarity of being the only European palm. In Britain it is frequently cultivated in hothouses, where it grows to a height of 15 ft., but in Spain it grows in the open to about 4 or 5 ft. only, and in Italy it is smaller still. The trunk is 5 or 6 in. in diameter, and the fan-like leaves grow in a tuft at the top.

Chamalhari, or **Shumalari**, peak of the Himalaya Mts., over 23,930 ft. high, between Tibet and Bhutan, E. of Sikkim, 140 m. from Mt. Everest, rising above the main route from India to Gyantse.

Chamba, or **Chumba**, native tribal state of India, also chief tn. of this state on the Ravi, at the foot of the Himalayas, 120 m. from Lahore. Bounded N.E. by Kashmir, Kāngra and Gurdaspur on the S. Produces wheat, millet, rice, Indian corn, hops, wax, nuts, honey, and timber. Iron ore and slate quarries abound. A favourite resort of sportsmen, it contains the Brit. sanatorium of Dalhousie. Area, 3180 sq. m. Pop. 170,000.

Chambal, or **Chumbal**, riv. in Central India, trib. of the Jumna R., rises in the Vindhya Range (2019 ft.) and flows 650 m. in a N.E. direction to its junction with the Jumna, 90 m. S.E. of Agra.

Chamber of Commerce, association of merchants, bankers, and others associated with trade for the purpose of promoting trade interests directly and by appeals and representations to the gov. Such associations also furnish statistics with reference to the dists. to which they belong, and comparative statistics of trade generally. A C. of C. may also be called upon to decide issues in mercantile questions. Thus, e.g., the London C. of C. and the Corporation of the City of London estab. in 1892 a joint board of twenty-four members (twelve from each body) who appoint arbitrators to adjudicate on commercial disputes that may be submitted to them. Important provincial Cs. of C. which perform this service include those of Manchester and Dublin. The oldest C. of C. is said to be that of Marseilles, which was founded in the fourteenth century and acted as a court

of arbitration in mercantile affairs. At the beginning of the eighteenth century chambers were organised at Lyons, Rouen, Toulouse, Bordeaux, etc., but were abolished at the close of the century. At the beginning of the nineteenth century these Cs. of C. in France were re-instituted. The objects of the Fr. chambers are to mediate with the gov. for the purpose of promoting trade, and to advise with regard to public works whose construction or alteration affect the progress of trade. The members of these associations are elected by the chief merchants of the dist. selected for that purpose by the prefect. The Fr. Cs. of C. are of a quasi-official character, and, in that respect, unlike the Brit. Cs. of C. An illustration of the wide powers vested in them is provided by the fact that, during the First World War, they issued paper money and token coinage to meet the lack of small change then existing. This issue, which was also made by the municipalities, was liquidated only ten years after the cessation of hostilities. The oldest Brit. chamber is that of Jersey, which was founded in 1768. The chamber of Glasgow was instituted in 1753, Dublin chamber was founded in 1785, Edinburgh in 1786, Manchester in 1794, Belfast in 1796, Birmingham in 1813, Newcastle-upon-Tyne in 1818, and Liverpool in 1851. The London chamber, though most important to-day, was only instituted in 1881; it has a large direct and indirect membership. The chamber is divided into numerous depts. The largest section of the London C. of C. consists, as is the case generally, of merchants, these numbering about 3500, while manufacturers number approximately 3000. The balance is made up of banking, insurance, and transport interests, together with certain brokers and agents. The activities of this chamber, which is situated at 69 Cannon Street, E.C.4, are multifarious, there being as many as seventy sections. Not the least important of those activities is that concerned with the supply of suitable labour for its members' businesses, the larger part naturally being clerks. The teaching of book-keeping, modern languages, and other commercial subjects is encouraged by grant of certificates of efficiency, after examinations, for which many thousands of students sit. Each dept. has a chairman and committee. The general council approves the measures adopted by the depts. The Edinburgh C. of C. was largely responsible for the repeal of the Corn Laws and the adoption of Free Trade; it petitioned for the construction of the Suez Canal, and advocated the control of the telegraph system by the post office. The Manchester chamber was energetic in the cause of Free Trade. Throughout Great Britain there are now similar bodies in all the important mercantile centres. An association of Cs. of C. of the United Kingdom was instituted in 1860, and membership is entirely voluntary. The general association meets in London in March of each year, and the decisions of this assembly have great

weight in Parliament. When this national body was founded it was constituted by sixteen chambers, but to-day practically every important chamber in the country is affiliated. There is also a body called the Federation of Cs. of C. of the Brit. Empire. This was founded in 1911, under the name of the Brit. Imperial Council of Commerce. It holds congresses every three years and its membership consists of nearly 200 chambers or associations of chambers. The Association of Brit. Cs. of C. is naturally a constituent of the international association of Cs. of C. There are also independent Brit. Cs. of C. in foreign countries, which play an important part in promoting trade. Those in Paris, and other European caps. (after the Russian Revolution the C. of C. of St. Petersburg, or Leningrad, disappeared and that in Berlin was dissolved by the Second World War), are especially influential in this connection, while those in great S. Amer. cities have a high standing. These bodies, like those in Great Britain, are entirely voluntary and enjoy no gov. subvention. In the Brit. colonies there are also important Cs. of C. in the important mercantile centres. The oldest colonial chamber was that founded in New York City in 1768 before the Amer. colonies broke away from the motherland. This chamber, incidentally, may be said to have been the model for future Amer. Cs. of C., or Boards of Trade as they are sometimes called. A chamber was founded next at Cape Town, S. Africa, in 1804, a few in India between 1830 and 1840, while the first C. of C. in Australia and Canada were estab. respectively in 1840 and 1845. In the dominions these chambers are now federated and both Canada and Australia now have their own C. of C. in London. Congresses of colonial and Brit. delegates have been held from time to time, and thereby afford an opportunity to the colonial boards to appeal to the home chambers. In 1916 was founded in Great Britain the Federation of Brit. Industries (*q.v.*), a federation of trade associations, chiefly manufacturing, which to some extent supplements and in some cases supersedes the work of the Association of Brit. Cs. of C. The Cs. of C. in the U.S.A. often partake of the characteristics of both the Brit. Cs. of C. and the Federation of Brit. Industries, *i.e.* they are associations of merchants and of trade associations. The first Amer. C. of C. to be estab. abroad was one at Liverpool in 1801. There is also one in London and one in Paris. France also maintains Cs. of C. in London and Liverpool.

Chamber of Shipping of the United Kingdom includes most of the ship-owners' associations of the United Kingdom. It communicates with the chief gov. depts. on all matters affecting the interests of Brit. merchant shipping. In 1929 the chamber passed resolutions in favour of an international load-line agreement, and a uniform standard for safety of life at sea. Its affairs are managed by an executive council to which each affiliated association elects one or more

members. Its offices are at 3 Bury Street, London, E.C.3.

Chamberlain, officer attached to the court of a monarch, appointed by a king, nobleman, or corporation to perform domestic and ceremonial duties. In Great Britain this office dates from very early times. The C. was one of the chief officers of state from the thirteenth century; 1406 Parliament declared that he must be a member of the council *ex officio*. Hence he had originally considerable share in the responsibilities of gov., and though this is no longer the case, he remains an officer of very high standing in the royal household. The Lord C. has control over all officers, servants (except those of the bed-chamber), physicians, musicians, comedians, and tradesmen connected with the royal household. In 1782 he became the provider of state robes for the royal family, household, and officers of state. Cards of admission to royal functions (levees, drawing-rooms, balls) must be obtained from him. He endorses the king's answer on petitions, and often communicates His Majesty's pleasure to Parliament and the council. Theatres in tns. containing a royal palace have to be licensed by the Lord C.; no new play can be performed without his sanction. Much discussion has been raised on this point (*see CENSORSHIP OF THE DRAMA*). The examiner of plays is a leading member of his staff. His salary is £2000 a year, tenure of office depending on that of his political party. A vice-C. as deputy and assistant has existed from the time of Richard II. Other state officials are the Lord Great C., and City C. (of various corporations). *See Anson, Law and Customs of the Constitution*, 1896.

Chamberlain, Arthur Neville (1869-1940), Eng. statesman, *b.* at Birmingham, youngest son of Joseph C., and only son of his mother, Florence Kenrick, second wife of Joseph C. Educated at Rugby and at Mason College, Birmingham (later known as Birmingham Univ.). He managed an estate in the Bahamas, 1890-97; returned to be a manufacturer in Birmingham; entered Birmingham City Council, 1911, and became chairman of the town planning committee and an alderman, 1914. During the First World War he was member of the Central Control Board (Liquor Traffic) 1915, and director-general of national service, 1916-17—he resigned this office on account of objection to his schemes, which were deemed to amount to industrial compulsion. C. was also lord mayor of Birmingham, 1915-16, and took a leading part in the estab. of the municipal bank, which began as a war-time expedient. In Dec. 1918 he was elected Conservative M.P. for the Ladywood div. of Birmingham; Privy Councillor and postmaster-general in the Bonar Law ministry, in 1922; paymaster-general, 1923. When Baldwin replaced Bonar Law as Prime Minister, C. entered the Cabinet as minister of health. Only a few months later he became chancellor of the exchequer. This series of meteoric promotions,

remarkable in the case of a man who had not entered public life till he was past forty, was in a measure justified by the general recognition of his notable gifts for parl. debate. It was by his persuasion that Baldwin dissolved Parliament in Oct. 1923 on a tariff reform appeal, and though the resulting defeat postponed tariff reform, it reunited the Conservative party, which soon returned with a solid majority. C. was naturally asked to resume the chancellorship of the exchequer, but he preferred to be minister of health and he made of that ministry

Elvott & Fry

NEVILLE CHAMBERLAIN

a leading dept. of state. Indeed nearly all the chief measures of the Baldwin Gov. in the domestic sphere were prompted or executed by C. He became chancellor of the exchequer again in the National Gov., 1931, in succession to Snowden, and his first policy was to carry protection. In all C. introduced six budgets, and his policy was to refuse large state expenditure on public works and to restore confidence by economy, by raising wholesale prices, and by fostering easy credit and low rates of interest. He differed from the old *laissez-faire* school in that he desired large state expenditure on social reform, but only if private enterprise created the requisite wealth. At the Lausanne conference on war debts he argued unsuccessfully for 'cancellation all round' and later that year took a leading part in negotiating the Ottawa Economic Conference agreements with the dominions. His hopes for a great programme of social reform were now, however, dashed by the menace of inter-

national security and the need to think of rearmament. It was on his advice that the gov. capitulated to Mussolini on the question of sanctions over the war with Abyssinia, but he was probably justified in throwing the blame on the League of Nations. In Feb. 1937 he announced the gov.'s decision to spend £1,500,000 on rearmament. On May 28, 1937, he succeeded Baldwin as Premier. Early in 1938 he came into conflict with his foreign secretary, Mr. Eden, over his decision to negotiate an agreement with Italy, Mr. Eden insisting that Italy must first withdraw her invading armies from Spain. C. carried his Cabinet with him and Mr. Eden resigned. Mr. Eden's justification lay in the fact that C. had to promise Parliament precisely what Mr. Eden had demanded, and the Anglo-It. Agreement made by C. therefore remained a dead letter. The gov. also sacrificed principle by recognising the It. annexation of Abyssinia. This was in fact the beginning of the 'appeasement policy' with which the memory of C. must ever be associated. Himself comparatively a novice in foreign affairs, he had an instinctive distrust of the Foreign Office experts and was largely his own foreign secretary. After the Ger. annexation of Austria and when Czechoslovakia was by implication threatened with a like fate, C. refused to follow Russia and France in giving guarantees to Czechoslovakia, but shortly afterwards, when Hitler concentrated his forces against that country he took a firm line and Hitler held off. But towards Italy C. remained lenient, and when Mussolini resumed his attacks on Brit. shipping and sent more divs. to Spain he did nothing. Meanwhile the pace of rearmament and the organisation of A.R.P. (q.v.) was slow in the extreme, but C. thought that by patient activity in peace-making he could exorcise the demon of international armed conflict. Having scored one arguable success, the agreement with do Valera to call off the economic war and surrender Brit. control of the Irish naval bases, he sent Lord Runciman to Prague to mediate between the Czechs and the Sudeten Gers. (see further under CZECHOSLOVAKIA). War seemed inevitable and C. then took the unprecedented step of going, together with Sir Horace Wilson (the gov.'s industrial adviser), by plane to Berchtesgaden to see Hitler. As he was now sixty-nine and had never flown before, the world saw an element of the heroic in this personal dash for peace. C. acceded to Hitler's damaging demands and carried both the Brit. and Fr. Cabinets with him. At a second meeting with Hitler at Godesberg Hitler naturally raised his price and even C. shrank from compliance. War seemed imminent but, on the intervention of Mussolini, C. and Hitler were once again brought together—this time at the notorious Munich four-power meeting (see MUNICH PACT) which in effect threw the Czechs overboard. C. deluded himself by bringing back a worthless signature to a treaty of permanent friendship between Germany and

Britain. He announced that he had 'brought back peace with honour' and he believed that it was 'peace for our time'; and he compared his home-coming to that of Beaconsfield from Berlin in 1878. He was acclaimed everywhere, and though disillusionment soon followed with the increasingly bellicose tone of Ger. political utterances, C. continued to point to his various international agreements as vindications of his policy of appeasement. On Feb. 28, 1939, he announced in the Commons the unconditional recognition of Franco—a logical sequel to his gov.'s policy in withholding arms from the republicans—and repeated his conviction that Germany had no aggressive intention. On Mar. 10 he gave out a statement that the international outlook was fair; but five days later Hitler dropped the mask and invaded Czechoslovakia. C. at length turned, rebuked Hitler for his perfidy, gave a guarantee to Poland and, still later, guarantees to Rumania and Greece. It is no doubt true to say that C.'s part in the Munich Pact gave Britain a year in which to make good her defences; but C.'s rearmament did not even keep pace with that of Germany, and on Sept. 1, 1939, Germany's lead in air strength was much greater than at the time of Munich. It was only in May that C. at last consented to waive his prejudice against the formation of a Ministry of Supply. Himself a quick and businesslike administrator, he neither filled ministerial posts with able ministers nor had the power to drive others. Indeed, he felt so confident that the country had made good its shortcomings that he manifested his complacency in an address to his party adherents on April 4, when he told the world that Hitler, by not attacking, had 'missed the bus'—in which piece of optimism, however, he was but re-echoing a very similar utterance previously made by Gen. Ironside, then chief of staff. C.'s Gov. did not long survive the opening of the war. The fiasco in Norway infuriated the whole country, and in the debate in the Commons of May 6-8 his vote of confidence was passed by only 251 to 200, a great many gov. supporters abstaining. C. then tried to meet the rising storm by reshuffling his Cabinet, but Labour refused to join any gov. under him and he resigned on May 10, the day when the Gers. invaded the Low countries. As lord president of the council in the Churchill Gov. he wholeheartedly supported the new Prime Minister's resolve to continue the war come what might. At the end of July he underwent an operation, but hopes of recovery were not fulfilled. He resigned on Oct. 3, 1940, and d. Oct. 9. See D. Keith Shaw, *Prime Minister Neville Chamberlain*, 1939; K. Feiling, *The Life of Neville Chamberlain*, 1940.

Chamberlain, Lord Great, an hereditary sinecure office, historically descended from the anct. Chamberlain of the Exchequer dept. of the Norman period. The office was formerly of the highest dignity, and was held in grand serjeanty. The L. G. C. is now the sixth great officer

of state, and the duties of the office are mainly concerned with coronation ceremonies. To the office also appertain the care of the king's palace at Westminster, authority over the buildings, of the two Houses of Parliament during recesses, and the duty of attending on peer at their creation, and bishops when they perform their homage. The element of 'serjeanty', or personal service, is preserved by the L. G. C.'s theoretical right to dress the king on coronation day and to serve the king with water before and after the banquet. The office, which became hereditary on the grant by Henry I. to the family of De Vere, earls of Oxford has been the subject of two legal contests within the last 150 years. Towards the end of the nineteenth century it was still held conjointly by the families of Cholmondeley and Willoughby d'Eresby, in right of their mothers, who were sisters and co-heirs of the fourth duke of Ancaster, but later it was in the joint tenure of the marquess of Cholmondeley, the earl of Ancaster, and the marquess of Lincolnshire. On the coronation of Edward VII. the honorary functions of the office were by mutual agreement committed to the care of the marquess of Cholmondeley. The present holder of the office is the earl of Ancaster.

Chamberlain, Basil Hall (1850-1935), Eng. scholar in Jap. language and writing, b. at Southsea, Hampshire. Educated in France and by a private tutor in England. Held the appointment of prof. of Japanese and philology at the univ. of Tokyo. Among his pub. are *The Classical Poetry of the Japanese* (1880); *A Romanised Japanese Reader* (1886); *The Language, Mythology, and Geographical Nomenclature of Japan viewed in the Light of Aino Studies* (1887); *Practical Introduction to the Study of Japanese Writing* (2nd ed.) (1905); *Things Japanese* (5th ed.) (1905); *Handbook of Colloquial Japanese* (1907); *Murray's Japan* (3rd and subsequent eds. in collaboration with W. B. Mason); *Japanese Poetry*, 1910; *Iluit Siècles de poésie française*, 1927.

Chamberlain, Houston Stewart (1855-1927), Anglo-Ger. author, b. at Southsea, Hampshire, son of Rear-Adm. Wm. Charles Chamberlain. Became lecturer on philosophy at the Vienna Univ. The results of his study of modern thought and civilisation are embodied in his remarkable book *Die Grundlagen des neunzehnten Jahrhunderts* (1899), trans. into Eng. in 1910. In 1896 he pub. a most appreciative biography of Wagner, whose daughter he married, and for whom he again showed his admiration in *Das Drama R. Wagners* (1892). Among his other works are *Die ersten 20 Jahre der Bayreuther Bühnenfestspiele* (1896); *H. von Stein und seine Weltanschauung* (1903); *Immanuel Kant* (1905); *Goethe* (1912); *Rasse und Nation* (1918); *Mensch und Gott* (1921). He espoused the cause of Germany in the First World War, and in 1916 was naturalised a Ger., incurring thereby considerable odium in the Brit. press. C. was a strong anti-Semite and

probably Hitler derived his Aryan theory and policy partly from C. as well as from Gobineau, Lapouge, and others. He d. at Bayreuth. See A. Rosenberg, *Houston Stewart Chamberlain als Begründer einer deutschen Zukunft*, 1927.

Chamberlain, Joseph (1836-1914), Brit. statesman, was b. in London. He was the eldest son of Joseph C., a well-to-do business man, who was a Unitarian by religion and a man of advanced political ideas. Joseph C. was educated at Canonbury and at the Univ. College school (London). On leaving school he spent a short time in his father's office in tn., and then left for Birmingham, where he joined his cousin, Joseph Nettlefold, in the screw business. His keen business methods and his undoubted ability ensured the progress of the firm. New methods were introduced into the business, and competition was successfully cut down by means of a series of amalgamations. The result of this keen business ability was that at a very early stage C. was able to retire from business and take an active interest in public life. During his stay in Birmingham he had taken more and more interest in local politics, and when he retired from business in 1874 he was able to devote most of his time to these. He had married in 1861 Harriet Kenrick, who d. in 1863, and later, in 1869, he married again Florence Kenrick, a first cousin of his first wife. He was already recognised as one of the leaders of liberal ideas in Birmingham, and had been instrumental in establishing a Liberal Association in the tn. He also took a prominent part in the educational movements of the time. In 1870 he became a member of the Birmingham school board, and three years later the chairman. His politics at this time were usually given the name of republican, not because they actually advocated the principles of republicanism, but because they were so advanced and so radical that they easily outdistanced even the most liberal ideas of the formal Liberal party. He took a prominent part also in the municipal affairs of Birmingham, and in 1873 he became mayor of Birmingham, an office he occupied for the succeeding three years. Birmingham dates a great deal of her importance back to the days of his mayoralty. Great municipal reforms were carried out during his period of office. A magnificent library and an art gallery were built, public recreation grounds were opened, slums were pulled down, and spacious and well-paved streets took their places. The prosperity of Birmingham rose very rapidly indeed. The rise of C. as a leading reformer in municipal matters had not passed unnoticed throughout the rest of England. Already he was marked as a coming man, the fame of his reforms was spread about, his utterances were taken up by the press, and in addition to his popularity as mayor of Birmingham he was also well known throughout England. In 1874 he contested a parl. seat in Sheffield, but without success. However, two years later, C. became the

colleague of Bright in the representation of Birmingham. Hitherto his work had been confined to Birmingham, now he rapidly advanced towards the front ranks of the Liberal party. Almost simultaneously with his entrance into public politics, his ability and worth were recognised. He showed his organising ability by the manner in which he organised the Liberal Association throughout the country, an organisation for which both he and the Liberal party were recompensed in the general election of 1880, when the Liberals were returned with a clear majority over both the Conservatives and the Nationalists. In the Liberal Gov. of 1880, C. was given the position of the president of the Board of Trade, with Cabinet rank, and Sir Charles Dilke, another leader of the radical section, became under-secretary for foreign affairs. In 1883 he carried his Bankruptcy Act, and throughout the whole of his tenure of office he supported democratic ideas. In 1885 he put forward what was called the 'unauthorised programme,' that is, a programme which went far beyond the conception of the Liberal party. He had up to this time supported the Liberal party on questions of foreign policy, and more especially Irish policy. He advocated also free education and small holdings, the famous phrase 'three acres and a cow' exemplifying the latter policy. In 1885 Gladstone's ministry was defeated. At the elections which followed the number of Liberal members was decreased, and it became necessary to depend on the Irish vote for a majority. C. was returned for W. Birmingham, and in Jan. 1886 Lord Salisbury's Gov. was defeated. Already it was known that Gladstone was going to introduce a Home Rule Bill, but C. accepted office as president of the Local Gov. Board. In March he resigned, giving as his reason that he was unable to accept the measure which Gladstone had laid before the Cabinet, that he still supported a large extension of local gov. for Ireland, but could not go to the lengths proposed. There was, however, not yet any definite break with the party; constant efforts were made to get Gladstone to amend his Bill, but finally, when it became obvious that the measure would come up for its second reading in practically its original form, serious steps were taken by Lord Hartington and C. At a meeting of the followers of Hartington and C. it was agreed that the dissentient Liberals must vote with the Tories against the Bill, and this was done. The Bill was rejected by a majority of thirty, ninety-four Liberal-Unionists, as they now began to be called, voting with the majority. Even yet reconciliation with the Liberals was not impossible. A round-table conference was held, the idea being put forward by C., but it came to nothing; a working basis could not be found, and the split in the party became more definite. The feeling of the Liberals, not unnaturally, was deep and bitter against C., and one member at least did not refrain from calling him Judas. The Liberal-Unionists

rapidly became more and more separated from the Gladstonian Liberals, and they adopted a definite policy for themselves. They decided that it was necessary under every consideration to keep Gladstone out of office, and they supported the Tories with that end in view. They did not, however, yet take office with the Tories, and their influence was rather widening in Tory policy. The Tory Gov. passed measures which up to this time had been regarded solely as part of the Liberal programme, and many of them were more progressive than similar measures previously adopted by the Liberals. In 1887 C. became one of the Brit. plenipotentiaries to the U.S.A. for the purpose of discussing various fishing disputes which had arisen. He returned to England in 1888 and was given the freedom of Birmingham. In the same year he married his third wife (Mary Endicott). In the general election of 1892 he was again returned for his old constituency, but the Liberal-Unionists and Tories were in a minority and Gladstone again became Prime Minister. In 1893 C. took the most prominent part in opposing the Home Rule measure introduced by Gladstone; a measure which passed the House of Commons but was rejected by the Lords. In 1895 the Rosebery Gov. was defeated, and the gov. which was formed by Lord Salisbury included a number of Liberal-Unionists. This was the first great definite step towards the union of the parties. C. became colonial secretary.

The period 1895-1900 was one of great difficulty, especially in the matter of colonial affairs, and more especially in S. Africa. The Jameson Raid did not help the strained feelings which existed between the Brit. Gov. and the Boers, and the whole difficulty was often attributed by his political opponents to C. and his desire for personal aggrandisement. Every step in the negotiations of 1899 was attributed to personal feeling on the part of the colonial secretary. War broke out in 1899, and in 1900 C. received vindication in the result of the election which followed. During this period of office he had also passed the Australian Commonwealth Act (1900). During the years of office C. had advocated the policy called Imperialism. He had never subscribed to the narrow limits of the Gladstonian foreign policy, and his tenure of office as minister for the colonies had taken his ideals from the purely national point of view and widened them to the imperial point of view. During the war he was the hero of his party, and by his firm policy and his unswerving support of the war did much to enhance his reputation. In 1902 Arthur Balfour became Prime Minister, and C. continued to serve under him. He visited S. Africa in the same year, and did much to smooth over the bad feeling which still existed. But he had become essentially a colonial minister, and he regarded from the broader point of view all issues. During the war a corn tax had been levied, and had caused some considerable perturbation at the time, but since it was regarded only as a war tax it

had been supported by the party. Ritchie now proposed to take the corn tax off. Sev. of the members of the Unionist party were in favour of its permanent retention. C. advocated the remitting of the tax in the case of the colonies, but its retention as far as foreign corn was concerned. The tax was remitted, but it became obvious that there were serious differences within the party on the question of Free Trade. No open split took place until the following year, when C. put forward the main ideas of tariff reform at Birmingham. He held that it was impossible to inaugurate a system whereby we could help our colonies without a revision of our present tariff system. The movement found support and opposition. Some political economists issued manifestoes in favour of it, more issued manifestoes against it. The party itself was divided, and on Sept. 15, C., pleading for a free hand, resigned. Ritchie and Lord George Hamilton, the stauncher free traders, also resigned at the same time. C. resigned merely to become the pioneer of the movement which he advocated, and not from any sense of hostility towards his 'friend and leader' Balfour. Balfour's attitude on the question was more or less philosophic, and he was claimed by both sections of his party. He, however, made it clear that he was in favour of a measure of tariff reform for purely retaliatory purposes. C. spent the years 1903-6 in travelling throughout the country advocating his system of tariff reform. He was attacked on every side, and his party to all intents and purposes, if not openly, was divided seriously on the question. The withdrawal of C. from the Cabinet, and the advocacy of these new measures, contributed to the downfall of the gov., which resigned in Dec. 1905. The election which followed was to a very great extent the result of the differences in the party. C. insisted on the adoption of his principles, and the Unionist party was overwhelmed at the elections. Balfour after the elections pledged himself to tariff reform, which after that became the prin. plank of the Unionist platform. In the middle of 1908, after he had received an overwhelming ovation from his fellow citizens on his seventieth birthday, C. was taken ill, and although at first it was hoped that he would recover sufficiently to return to Parliament, the hope was in vain. He retained his seat for W. Birmingham, but did not take a prominent part in the deliberations of the party after his illness. Like all strong men C. was the object of intense admiration and dislike, and probably no Eng. politician of his time aroused such strong political passions. He d. at Birmingham, July 2. A memorial museum was opened at Highbury—his home in Birmingham—by Sir Austen Chamberlain in 1934. See J. L. Garvin, *The Life of Joseph Chamberlain*, 1932.

Chamberlain, Sir Joseph Austen (1863-1937), Eng. statesman, eldest son of Joseph C. Educated at Rugby and Cambridge. In 1882 he entered Parliament as Liberal-Unionist member for E

Worcestershire, for which constituency he sat till 1914. From that year he represented Birmingham W.; and has been called 'the last reminiscence of Victorian correctness'—in allusion to his adherence (almost alone) to the old habit of wearing a hat inside the House of Commons. During Lord Salisbury's third administration (1895-1900), C. was civil lord of the Admiralty, being promoted as financial secretary to the Treasury on the formation of Salisbury's fourth Gov. (1900-2). As financial secretary he represented the postmaster-general, Lord Londonderry, in the House of Commons. He became postmaster-general in Balfour's first Gov., July 1902. C. was appointed chancellor of the exchequer on the reconstruction of Balfour's Cabinet, 1903-6. He married in 1906. In 1913 he was chairman of the royal commission on Indian finance and currency. In the Coalition Gov. formed during the First World War he was secretary of state for India 1915-17—resigning because the dept. over which he presided was culpable in regard to the Mesopotamian campaign. He became a member of the War Cabinet, without office, in 1918. He was chancellor of the exchequer 1919-21; Lord Privy Seal and leader of the House of Commons 1921-22. Later, in the Conservative Gov., he was secretary of state for foreign affairs 1924-29; but in the autumn of 1928 he was obliged to take a long sea-voyage for his health. Though he signed the Locarno Treaty Oct. 16, 1925, and the Kellogg Pact Aug. 27, 1928, he was, in the estimation of peace enthusiasts, but a lukewarm supporter of the League of Nations. He made an extremely creditable recantation concerning the vote he had given against the grant of representative gov. to S. Africa. He missed his chance of leadership of his party twice—in 1911 and in 1922. He was lord rector of Glasgow Univ. 1925-28. He received the Nobel Peace prize, 1926. Re-elected at general election by a narrow majority, 1929, and by a larger majority in 1931 and again in 1935. Wrote his autobiography in 1935. See Sir C. Petrie, *The Life and Letters of Sir Austen Chamberlain*, 1939, 1940.

Chamberlain, Sir Neville Bowles (1820-1902), Brit. field marshal, b. at Rio de Janeiro, Brazil. He entered the Indian Army in 1837 and took part in the Afghan war (1839-42) at Ghazni, Kandahar, and Kabul, and was wounded on six occasions. He fought at Maharajpur in the Gwalior campaign of 1843 and in the Punjab campaign of 1848, after which he was made commandant of the Punjab military police. In the Indian Mutiny (1857) he distinguished himself at Delhi, where he was severely wounded. He was in command of the Umberia campaign (1863), and from 1876 to 1881 was commander-in-chief of the Madras Army. He retired in 1886, and was made a field marshal in 1900. See life by G. W. Forrest, 1909.

Chamberlin, Thomas Chrowder (1843-1928), Amer. geologist, b. at Mattoon, Illinois. In 1869 he was appointed prof.

of natural science at the State Normal School of Whitewater, Wisconsin. In 1892 he was appointed prof. and head of the dept. of geology and director of the Walker Museum of the Univ. of Chicago. In 1894 he accompanied the Peary Arctic Relief Expedition as geologist. He was also from 1902 to 1909 investigator of fundamental geological problems in the Carnegie Institution.

His theories on the glacial deposits of the N. states, together with his work on the planetesimal hypothesis with Moulton, won for Prof. C. a world-wide reputation. For nearly forty years he ed. the *Journal of Geology*, and his publications include *The Geology of Wisconsin* (1877-1883); *Contribution to the Theory of Glacial Motion* (1904); *General Treatise on Geology* (with R. D. Salisbury) (1907-9); *The Origin of the Earth* (1916); *The Two Solar Families: the Sun's Children* (1928).

Chamber Music, name for music suitable for performance in small rooms as opposed to church or theatre music, and especially at the present day to concert music. According to the authority Dr. Percy Scholes, the modern conception of C. M. dates only from Haydn and the mid-eighteenth century, for in the preceding century and a half in the harpsichord era such a conception was impossible. Haydn, Mozart, Beethoven, and Schubert are the greatest creators of C. M. up to the end of the first quarter of the nineteenth century. The term was first used in the seventeenth century, when instrumental music, then in its infancy, was limited to dances, *locadas*, etc., in four parts; and at the time it connoted, almost exclusively, vocal music, such as the chamber cantata or chamber duet. When the later forms of instrumental music came into existence—chamber, concerto, symphony, suite, sonata, etc.—these forms and all music that was not essentially church or theatre music became known as C. M. To-day only works performed by a few solo instruments are included in the term: such are trios, quartets, quintets, etc., up to octets and sonets for strings, or strings and wind, with or without pianoforte, sonatas for pianoforte and one-stringed or one-wind instrument, solo compositions for one instrument, and also songs, duets, and trios for voices, with accompaniment of one or a few instruments. Concert music, orchestral and choral, is now generally understood as being the true opposed term to C. M. C. M. may be properly said to have a chamber style because the lack of fullness of sound and of variety of instrumentation has to be compensated by fine shading and detailed execution; and C. M. composition in which the parts are treated orchestrally is faulty. (See also CANTATA, SONATA, etc.). In France, Saint-Saëns, Gabriel Fauré, and César Franck were pioneers of modern Fr. C. M., and the real creators of the Fr. school of C. M. Debussy's influence is also considerable and the day his string quartet was first played is a landmark in the hist. of Fr. music.

Belgian C. M. is cultivated with a very

special partiality and it is in this domain that the Belgian composers of the early twentieth century have composed their most significant works, notably Joseph Jongen and Victor Vreuls. The chief names in Ger. C. M. are Johannes Brahms, who produced a great number of piano-forte trios, quintets, violin sonatas, and clarinet sonatas; Hans Pfitzner and the Neo-Romanticists of the Munich school; Thulle, Reuss, Kaspar, and others; and musicians who, like Herzogenberg and Arnold Mendelssohn, fill the classical forms of Brahms with more or less romantic subject-matter. Mention should also be made of Mendelssohn (F.) who wrote a string octet, two quintets, seven quartets, etc.; and Robert Schumann who also left much C. M. Max Reger and his disciples are later exponents of the style which makes a departure from Brahms. Among moderns the chief are Schönberg (*q.v.*), Busoni (*q.v.*), Schnabel, Bruckner (*q.v.*), Hindemith (*q.v.*), and others who, like contemporary composers of C. M. in Russia, England, and France, cultivate abstraction and expressionism. N. Rimsky-Korsakov, C. Franck, K. Goldmark, C. Saint-Saëns, H. Huber, E. Elgar, Ethel Smyth, A. Arensky, C. Koechlin, B. Bartók, D. Tovey, S. Coleridge-Taylor, B. Smetana, A. Dvořák, C. Sinding, F. Jellus, C. Debussy, A. Glazunov, R. Vaughan Williams, M. Ravel, V. Tommasini, I. Stravinsky, A. Berg, A. Hliss, E. Goossens, and W. Walton are among the many, more modern, composers who have written C. M. for string quartets, quintets, or sextets, or sonatas for piano and violin.

Chambers, Charles Haddon (1860-1921), playwright, *b.* at Stammore, Sydney, New S. Wales, Australia; son of John Ritchie C., a native of Ulster. Educated in New S. Wales. Entered civil service, 1875. Two years later became a stock-rider in the Bush. Visited England and Ireland; returned to and settled in England, 1882, and became journalist, story-writer, and finally dramatic author. His plays include *Captain Swift* (produced 1888); *The Idler* (1891); *The Honourable Herbert and the Old Lady* (1892); *John-a-Dreams* (1894); *The Tyranny of Tears*, his best work (1899); *Passers-By* (1911). Part author of *The Fatal Card*, *Boys Together*, and *The Days of the Duke*.

Chambers (or Chalmers), David, Lord Ormond (c. 1530-92), Scottish judge and historian, educated at Aberdeen, then studied theology and law in France and Italy. Parson of Suddy, chancellor of Ross, lord of session (1565). A partisan of Mary Queen of Scots, said to have been privy to Darnley's murder, 1567. Attainted by Parliament after the battle of Langside, he fled to Spain and France. Pub. *Abregé des Histoires*, reprinted with additions, 1579 (a chronological summary of European hist.). C. returned to Scotland, becoming again lord of session, 1586. See G. Mackenzie, *Lives of the most eminent writers of the Scots Nation*, iii., 1708-22; F. Michel, *Les Écossais en France, Les Français en Écosse*, ii., 1562.

Chambers, Sir Edmund Kirkeover, distinguished Eng. Shakespearean scholar, *b.* in Berkshire March 16, 1866, son of Rev. Wm. C., Fellow of Worcester College, Oxford. Educated at Oxford Univ. His great works are *The Medieval Stage* (1903), and *The Elizabethan Stage* (1923). In these he shows the connection between the political and social hist. of England and the growth and flowering of the drama. The latter book unfolds in minute detail the story of each stage company, and sums up all the knowledge in existence on the subject. Other publications include *Tudor Revels* (1906); *Shakespeare: A Survey* (1925); *William Shakespeare* (1930); *Arthur of Britain* (1928), a brief but penetrating discussion of Nennius's sources; *Oxford Book of Sixteenth Century Verse* (1932); *S. T. Coleridge* (1938); *A Sheaf of Studies* (1942).

Chambers, Ephraim (1680-1740), Eng. encyclopedist, *b.* at Kendal. As a young man he was apprenticed to a map- and globe-maker in London. In 1728 he pub. by subscription his *Cyclopaedia, or an Universal Dictionary of Arts and Sciences* in competition with Harris's *Lexicon Technicum*, 1704. C.'s work reached its fourth ed. a year after his death, and gave rise to the *Encyclopédie* of Diderot and d'Alembert.

Chambers, George (c. 1803-40), marine painter, *b.* at Whitby, Yorkshire. He was the son of a fisherman, and in early life was apprenticed to the master of a trading brig. He soon showed a talent for painting, and his little sketches of shipping scenes found a market in Whitby. His ambition, however, drew him to London, where he received employment as a scene-painter at the Pavilion Theatre. He also worked on the panorama of London at the Colosseum. His work received the attention of Lord Mark Kerr, through whose kindness C. received the appointment of marine painter to William IV. and Queen Adelaide. He was a member of the Society of Painters in Water Colours, and exhibited from 1827 to 1840. Two of his pictures of naval battles are in Greenwich Hospital, viz. 'The Capture of Portobello,' and 'The Bombardment of Algiers in 1836.'

Chambers, Robert (1802-71), Scottish publisher and author, *b.* at Peebles and educated at the local school. In 1818 he started business as a bookstall keeper in Leith Walk, Edinburgh. Eventually he joined his brother Wm. (*q.v.*), who started a similar business, and the two founded the publishing firm of W. & R. Chambers. In 1825 he pub. *Traditions of Edinburgh*, which won him the friendship of Scott and led to further writings of the same description, *Notes of the Most Remarkable Fires in Edinburgh from 1386 to 1824* (1824); and *Walks in Edinburgh* (1825). Robert was at first only a contributor to the *Journal* started by his brother in 1832. Later he became joint editor, and his essays and wisdom in selection of such materials in literature, hist., art, and science as would best suit the popular taste were large factors in the success of the paper. He wrote or

contributed to *A Biographical Dictionary of Eminent Scotsmen* (1832-35); the *Cyclopædia of English Literature* (1844); containing selected extracts from the best authors in each period 'set in a biographical and critical history of the literature itself'; the *Life and Works of Robert Burns* (1851), for which he gathered many hitherto unpublished details from the poet's sister, Mrs. Begg; *Ancient Sea-Margins* (1848); *Domestic Annals of Scotland from the Reformation to the Revolution* (1859-61). He also contributed 'Histories of the Scottish Rebellions' to Constable's *Miscellany*, 1828-29. Robert C. was an ardent scientist, and visited Scandinavia and Canada for purposes of geological exploration, the results of which are contained in *Tracings of the North of Europe* (1850), and *Tracings in Iceland and the Farøe Islands* (1856). In 1844 he pub. anonymously, to avoid bringing an accusation of heterodoxy upon his firm *Vestiges of the Natural History of Creation*, which anticipated the theories of Darwin's *Origin of Species*. The authorship was acknowledged in Alexander Ireland's preface to the twelfth ed. (1884). In 1869 the univ. of St. Andrews conferred upon him the degree of Doctor of Laws, and he was elected a member of the Athenæum Club in London. His labours in compiling his last publication, *The Book of Days* (1862-64), ruined his health and probably hastened his death. Besides the works already mentioned Robert C. wrote *The Popular Rhymes of Scotland* (1826, 1842), a valuable addition to Scottish folklore; *Scottish Ballads and Songs* (1829); *Romantic Scotch Ballads with original Airs* (1844); *Songs of Scotland prior to Burns* (1862); and *Life of Sir Walter Scott* (1835). See W. Chambers, *Memoir of Robert Chambers with Autobiographic Reminiscences of William Chambers*, 1872, 1884, and *Story of a Long and Busy Life*, 1884; J. Payn, *Some Literary Recollections*, 1884.

Chambers, Sir William (1726-96), Eng. architect, b. at Stockholm. As a boy he went to sea, but in 1744 began to study architecture in Italy and Paris. He remodelled Somerset House (1776), designed the pagoda and other buildings in Kew Gardens (1762), and was first treasurer of the Royal Academy (1768). His *Treatise on Civil Architecture* (1759) is a standard text-book. His absurdly extravagant *Dissertation on Oriental Gardening* (1772) called forth the satire *An Heroic Epistle to Sir William Chambers*, in which Wm. Mason and Horace Walpole took part. Life by T. Hardwick, 1825.

Chambers, William (1800-83), Scottish publisher, b. at Peebles. In 1813, owing to family misfortunes, he was apprenticed to a bookseller in Edinburgh. Five years later he started business for himself, afterwards adding printing to the bookselling, and was soon joined by his brother Robert. In 1825-30 he wrote the *Book of Scotland*, and collaborated with Robert in a *Gazetteer of Scotland*. His fortnightly jour. called *The Kaleidoscope* ran only

from Oct. 6 (1821) to Jan. 13 (1822). In 1832 he issued the first number of *Chambers's Edinburgh Journal*, the pioneer of the cheap popular periodical. After the issue of the fourteenth number Robert became co-editor, and the prosperity of the jour. rapidly increased. This led to the founding of the firm of W. & R. Chambers, and the issue of a series of works designed for popular instruction which met with immediate popularity. *Chambers's Information for the People* was pub. in 1833; in 1835 appeared the *Educational Course*, including the *Cyclopædia of English Literature* (2 vols.); *Miscellany of Useful and Entertaining Tracts* (20 vols.); *Papers for the People* (12 vols.), and *Chambers's Encyclopædia* (10 vols.), first pub. in 1859-68. In 1849 Wm. bought the estate of Glenormiston, Peeblesshire, and in 1859 endowed the Peebles Institution, which includes a library, museum, and art gallery. He was twice lord provost of Edinburgh, during which he promoted sev. improvements in the city and restored, at his own cost, the cathedral of St. Giles. He was offered a baronetcy, but d. before the title could be conferred. Besides his contributions to the *Journal* and the *Educational Course*, Wm. C. wrote: *Tour in Holland and the Rhine Countries* (1839); *Things as they are in America* (1854); *History of Peeblesshire* (1864); *France: its History and Revolutions* (1871); *Ailie Gilroy* (1872); *Stories of Old Families and Remarkable Persons* (1878); and *Historical Sketch of St. Giles's Cathedral* (1879). See also CHAMBERS, ROBERT.

Chambersburg, tn., cap. of Franklin co., Pennsylvania, U.S.A., 50 m. S.W. of Harrisburg. The tn. has many fine buildings, among which is the Willson College for girls. The trade of the tn. is extensive, and among its chief manufacturing industries are leather, cotton, and woollen goods, iron utensils, paper, and furniture; it has also large locomotive works. In 1864 a portion of the tn. was destroyed by the Confederates. Pop. 14,800.

Chambertin, rare red Burgundy produced from the vineyard of Chambertin in the dept. of Côte-d'Or, France, about 6 m. S. of Dijon.

Chambéry, cap. of the dept. of Savoie, France, situated, amid beautiful scenery, in a valley 6 m. S. of Lake Bourget. The tn. contains some interesting old churches and a fifteenth-century cathedral. The castle of the dukes of Savoy was destroyed by fire, but was restored at the beginning of the last century and is now used for administrative purposes. The industries include the manuf. of silks, lace, clocks, and soap. Pop. 25,400.

Chambon-Feugerolles, Le, steel-manufacturing tn. in the dept. of Loire, France, situated in the vicinity of St. Etienne. Pop. 15,000.

Chambord, famous château of the Renaissance period, situated in the dept. of Loir-et-Cher, France, 13 m. E. of Blois. The building of the castle was commenced by Francis I. in 1526, and was completed by his successors of the Houses of Valois

and Bourbon. It is a huge pile, capped by many turrets and gables, and stands in a walled park of 13,000 ac. It has been the residence of the Fr. kings down to Louis XV., and of Marshal Saxe, Diane de Poitiers, Stanislaus Leszczyński, king of Poland, and Marshal Berthier, who had it conferred upon him by Napoleon in 1809. After the death of Berthier it passed into the hands of the comte de Chambord, who left it to the house of Bourbon-Parma. Molière gave his first performance of the *Bourgeois Gentilhomme* in the castle in 1670. See A. Arnaud, *La Question de Chambord*, 1887; and H. Debraye, *Touraine and its Châteaux*, 1926.

Chambord, Henri Charles Dieudonné, Comte de and Duc de Bordeaux (1920-83), posthumous son of the duc de Berry and grandson of Charles X. of France, was b. in Paris. Charles X. abdicated in favour of his grandson in July 1830, but the machinations of the people to put Louis Philippe on the throne caused Charles and his grandson to flee to England for safety. C. subsequently went to Gorz, where he came under the influence of the duc de Damas, and became imbued with uncompromising ideas on predestination and the divine right of kings. His movements and plans were marked with great indecision, and his readiness to comply with the plans of the vacillating nobles who espoused his cause dissipated his chances of attaining to the throne. It was thus in 1818 his claim was lost, and again in 1870 at the close of the Franco-Ger. war. At the fall of Thiers in 1873 his cause was finally ruined. He d. at Frohsdorf, Austria, without an heir, the nearest claimant being the comte de Paris.

Chambre Ardente (Fr. flaming chamber), court organised in 1535 by Francis I. of France for the suppression of Protestant heresy, and the examination of cases of poisoning. The courts were draped with black and lit, even in the day-time, by torches. The most famous was that which was summoned to try the Brinvilliers poison case of the reign of Louis XIV.

Chambre Introuvable (Fr. for 'the matchless chamber'), name popularly given to the unprecedented Chamber of Deputies which was first convened in July 1815, after the second recall of Louis XVIII. It was bestowed by the king out of gratitude, although some say in irony; for this Parliament roused indignation and alarm throughout France for its thoroughgoing royalist policy. The term has since been ironically applied to any ultra-monarchical assembly.

Chamdo, or **Chiamdo**, tu. in Tibet, situated on the Lantsang; it has sev. monasteries, and is much frequented by Lamaist pilgrims.

Chamoleon, name of a large and distinct order of lizards in the family Chamaleontidae which inhabit Asia and Africa, but especially Madagascar. Many of their characteristics are very peculiar, e.g. the long, prehensile tail used in steadying the animal by being coiled round a branch; the long sticky, club-shaped tongue which

can project about the length of its body; the eyes covered with a thick granular lid capable of moving independently and squinting; the five digits in bundles of twos and threes; the triangular head, flattened body with a toothed crest; and the habit of changing colour which can be performed at will. They are all insectivorous, are rather quarrelsome and inactive, difficult to keep in captivity, and when angry they will distend their capacious lungs and puff out their bodies to a great extent. At night they sleep on a twig, and in winter hibernate after taking in large supplies of food and water.

CHAMELEON

Nearly all are oviparous, and the female lays her thirty to forty eggs in a hole in the ground. The commonest species is *Chamaleon vulgaris*, which never exceeds 1 ft. in length, and *Ch. parsoni* is the largest species, sometimes measuring 2 ft. from head to tail.

Chamfer, term in masonry and carpentry signifying to groove, bevel, or furrow.

Chamfort, Nicolas Sebastian Roch (de) (1741-94), noted Fr. cynic and author, b. at Clermont in Auvergne, France. His writings and brilliant conversation attracted a wide circle of admirers of every class. Louis XVI. and Marie Antoinette favoured his literary efforts, but he was keenly opposed to the Royalist party during the revolutionary agitation. He, however, defeated his own purpose by directing his cynicism against his own party. His irate associates conspired against him, and to escape he was obliged to commit suicide. His works, mainly of apophthegms and anecdotal, were ed. by Auguis and pub. in five vols., 1824-25. A selection of his works, called *The Cynic's Breiary*, is trans. by Hutchinson.

Chamidae, family of molluscs nearly related to the cockles, belongs to the order Eulamellibranchiata. The members of the family are confined to the warmer seas, and fossils are abundant from the Jurassic.

Two of the chief genera are *Chama* and *Diceras*.

Chamier, Frederick (1796-1870), naval historian and novelist, entered the navy at the age of thirteen, and served in the Walcheren expedition, and on the Mediterranean and W. Indian stations. He devoted his leisure to authorship. His most valuable work was a continuation of W. James's *Naval History of Great Britain* (1837).

Chaminade, Cecile, Louise Stephanie (1861-1944), Fr. musical composer, b. at Paris. She began to compose at the age of eight, and her works became well known in France and England, where she toured widely. Works: *Les Amazones* (dramatic symphony); *Callirhoë* (symphonic ballet); *Trios*, for piano, violin, and cello; sev. vols. of melodies and numerous piano pieces.

Chamisso, Adalbert von (Louis Charles Adelaide de Chamisso de Boncourt) (1781-1838), celebrated Ger. poet and naturalist. He was b. at the château of Boncourt in Champagne, but spent his childhood in Prussia, where his family took refuge during the Fr. Revolution. In 1798 he entered the Prussian Army, but in 1806, when war broke out, his patriotism led him to return to his native country. In Paris he became the friend of Mme de Staël at Coppet, where he met Schlegel. At this time he began the study of botany, which he afterwards continued at Berlin, being appointed curator of the botanic gardens in 1819. He ed. the *Musenalmannach* (1804-6), and became a member of the Berlin Academy in 1835. C.'s fame rests on his romantic ballads, which are by turns fantastic and lurid. *Peter Schlemihls wundersame Geschichte* (1814), a prose tale, already known to folklore, of the man who sold his shadow to the devil, has been trans. into almost every European tongue. C. made many verse translations from poems in other languages, the most notable being the *Song of Thyrm*. He wrote also sev. works on natural hist. His collected works were pub. at Leipzig in 1864, with a biography by E. Hitzig and his letters of 1836-39. See K. Fulda, *Chamisso und seine Zeit*, 1881; E. du Bois-Reymond, *Chamisso als Naturforscher*, 1889; and K. Leutner, *Chamisso: a Sketch of his Life and Works*, 1893.

Chamois, goat-like antelope (*Rupicapra tragus*) inhabiting the mts. of Central and S. Europe (especially the Alps) and of W. Asia. Noted for great speed, agility, and delicate power of scent. The flesh is highly prized as venison, the skin furnishes true chamois-leather (sheepskin is often sold as such). The hunting of C. is a favourite but dangerous pastime in Switzerland and the Tyrol. In the Caucasus, Taurus, and Carpathians over 100 are often seen in a flock. The C. has short horns, and is grey-brown in colour.

Chamonix - Mont - Blanc, Chamounix, Chamouni, beautifully situated vil. on the Arve in the dept. of Haute-Savoie, France. The vil. is about 40 m. distant from Geneva. It is situated in a narrow ravine to the N. of the Mont Blanc range.

Seven glaciers are in its near vicinity. C. is the best approach to Mont Blanc, and is therefore thronged with tourists. The air at this spot is very bracing, and at all seasons valetudinarians here seek health and strength. De Saussure, who had the honour in 1786 of first ascending Mont Blanc, made his ascent from this point, and a statue of him in the vil. memorialises the event. The altitude of the vil. is 3425 ft., and the pop. 4400. See E. Whymper, *Chamonix and the Range of Mont Blanc*, 1896.

Champac, or Michelia Champaca, is an Asiatic species of Magnoliaceae which is cultivated in China for its beautiful and scented flowers, handsome appearance, medicinal bark, and useful timber. It is a sacred tree of the Buddhists and Brahmans.

Champagne (Fr., flat country, from Lat. *campus*, a field), dist. and former prov. of France, comprising the depts. of Marne, Haute-Marne, Aube, and Ardennes, and part of Seine-et-Marne, Aisne, and Yonne. The prov. was about 180 m. long by 150 m. broad. The land is fertile in the W. region, and its vineyards produce the famous champagne wine. The prov. was ruled at one time by the Franks, and later by native princes, the vassals of the Fr. kings. In 1284 it passed to the Fr. crown by the marriage of Philip IV. with Jeanne de Navarre.

Champagne, Campaign in (First World War). The geographical position of C. renders it an obvious battlefield for an attack on France from the E. or N.E. During the First World War it was the scene of great endeavours by both sides throughout the whole campaign. Towards the end of Aug. 1914, von Moltke, chief of the Ger. General Staff, ordered Prince Rupprecht to penetrate the Fr. frontier at Nancy. The Fr. here were under the command of de Castelnau, and after a battle lasting six days the Gers. were repulsed with heavy loss. This was the first battle in C. Further N., however, the Gers. overran C. in their great sweep towards Paris, and Rheims, Châlons-sur-Marne, Epervay, and Château-Thierry all fell to them early in Sept. 1914. By Sept. 9 the Brit. Army under Sir John French was recrossing the R. Marne at Château-Thierry and taking the offensive against von Kluck, and with this movement the battle of the Marne commenced. By Oct. 14 the Gers. had been forced back from just N. of Verdun—N. of Rheims—and N. of Soissons, and that part of C. S. of that line was not again invaded by the enemy during the war, except on the left, where it was again pierced by the Gers. in July 1918. From the middle of Oct. to middle of Nov. 1914 the Gers. kept a heavy pressure on the Fr. in the Rheims-Soissons sector, and gained some ground about Moussy. At the beginning of the new year another action took place which resulted in the Gers. gaining ground at Crouy. Taking advantage of the disorganisation of the Fr. supplies occasioned by the sweeping away of all the bridges at Villeneuve and Soissons, the Gers.

again attacked, and maintained pressure for two days, and in the end the Fr. were forced to withdraw to the S. of the Aisne at Soissons. A few days later the Fr. lost more positions on the Chemin-des-Dames (q.v.). After this a period of trench warfare set in, the lines occupied being chiefly dictated by the Ger. desire to maintain a strong line on the Verdun-Rheims sector. For strategical reasons (viz. to prevent further Ger. divs. being sent to the E. front against the Russians) Marshal Joffre decided upon a Fr. offensive in C., with a view to clearing the enemy N. of the Aisne. The advance commenced on Feb. 16, and after nearly a month's hard fighting little progress had been made, and at great sacrifice. Still the Fr. maintained pressure against the Gers. in this sector for the first three weeks of March 1916, gaining a little ground here and there. Except for one or two actions, operations were practically suspended for the summer. With the object of breaking through the Ger. line E. of Rheims, an offensive was planned for the autumn. If this were successful it was hoped that it would so threaten the hostile flanks in this region as to compel their withdrawal. No attempt was made to keep the Fr. plan secret, and the Gers. fully prepared to meet the offensive. The preliminary bombardment opened on Sept. 22, and was maintained for three days continuously. Operations went on fiercely until Sept. 29, but again little impression was made on the Ger. positions. Matters remained thus until 1917. The economic situation in France soon produced a general state of mind favourable to offensive action, and Marshal Joffre made plans accordingly. Attacks were to take place in sev. sectors, and on the C. front another effort was to be made about Rheims. Joffre resigned the post of commander-in-chief in Nov. 1916 and was succeeded by Gen. Nivelle, who had to meet difficulties both within and without the army. A change of gov. had brought in ministers unfavourable to the proposed offensive, and these consulted army commanders on the subject behind Nivelle's back. There was much coming and going between parties, but in the end, chiefly owing to support by the Brit. higher command, Nivelle was given a free hand. The offensive in C. commenced on April 16, and, although the Ger. resistance was stubborn, important gains were made in ground and prisoners, etc. The ministers again became hostile to Nivelle, which made things difficult for him. Eventually he was relieved, and Gen. Pétain succeeded him, with Foch as chief of the general staff. One of the chief successes which fell to the Fr. in this region during 1917 was their victory over the Gers. on the Chemin-des-Dames. During Oct. they had taken Fort Malmaison, and this placed them in a favourable position for attacking the Chemin-des-Dames, of which they made full use, the Gers. being compelled to evacuate the position early in Nov. The area to the E. of Rheims was the main scene of the Ger. offensive in May 1918.

Here they succeeded in making a great bulge in the Fr. line towards Paris, with Rheims and Soissons at the E. and W. ends, respectively, of the curve. The Chemin-des-Dames fell to the invader very early, and the Aisne was soon crossed, as was also the Vesle further S. Gradually Fr. resistance about Soissons was felt, then the Amers. brought the Gers. to a halt at Château-Thierry, and within a few days the Ger. offensive had shot its bolt. A further Ger. attack was attempted in the middle of July, but this melted away within two days. It was now the turn of the Allies to take the offensive, and the large salient created by the Gers. in May was an obvious point of attack.

In this area Gen. Mangin was in command of the Fr. Army, to whom great credit is due for the conception and execution of the plan for driving the Gers. out of this region. After a series of minor operations the general offensive commenced on July 18. An enormous number of tanks participated in the assault, and contributed largely to its success. In Aug. the offensive was resumed and maintained until the Gers. were gradually forced back out of C. and eventually out of France.

Champagne, or Champaigne, Philippe de (1602-74), Flemish portrait painter, b. in Brussels. He first studied under Poussin at Antwerp, but in 1621 went to Paris, where he became the queen's painter. In this capacity he painted decorations in the Luxembourg for Maria de' Medici. He was appointed rector of the Académie de Peinture et de Sculpture, and received frequent commissions from Cardinal Richelieu. In his later years he became associated with the Port Royalists and the Jansenists. His best-known pictures are 'The Last Supper,' 'The Dead Christ,' and a portrait of Cardinal Richelieu in the Louvre, and a triple portrait of Cardinal Richelieu in the National Gallery.

Champagne Wines are produced in the old prov. of Champagne (q.v.). The Champagne vine country, which was delimited by a Fr. law in 1911, produces 80 per cent of blue grapes (N. of the R. Marne) and 20 per cent of white grapes (S. of the riv.). Sparkling wines made outside this delimited area are not entitled to the appellation C. and are called *vins mousseux*. The produce of the vineyards on the banks of the Marne is the choicest in flavour. In colour C. W. are white, pale amber, pink, or red, and in character are still, creamy, and sparkling (or *non-mousseux*, *crémant*, and *mousseux*), of which the last is the choicest. The C. W. are sent all over the world, but especially to Great Britain and the dominions, to N. and S. America, and to the countries of W. Europe. The red wines are mainly consumed in Belgium. The vine in the Champagne country is grown on chalk, and is most carefully cultivated. C., like other light wines (e.g. Moselles, Hooks, and Burgundies), is produced by bottling before complete fermentation. The secondary fermentation taking place in a closed

container (the bottle) the carbon dioxide cannot escape, is dissolved into the wine, and so develops the effervescence. The grapes are carried from the vineyards to the press in baskets shielded from the sun's rays. They are disturbed as little as possible while being placed on the press. The must is kept in vats for half a day to allow the dregs to settle. When fermentation sets in the rich amber-coloured liquid is placed in hogheads of about forty-four gallons in capacity. At Rheims the tuns hold 12,000 litres.

J. Pommery & G. G. Reno

**A STORAGE GALLERY IN CHAMPAGNE
CAVES AT RHEIMS**

The process of bottling takes place from April to June after the various growths have been carefully blended according to their affinities. A good C. should combine flavour, delicacy, elegance, body, and vinosity, and as the product of one vineyard never possesses all these qualities, blending is a necessity. The bottles are filled and the corks are secured by means of an iron adjustment called an *agrafe*. This appliance clasps the neck of the bottle at the rim, and can be adjusted and readjusted at will. The bottles are then laid out horizontally, and fermentation goes on briskly for about three weeks. During this process there is considerable loss owing to the bursting of bottles. About four years after the bottling, the sediment of dead yeast developed by the second fermentation has to be removed by a careful treatment called disgorging. The bottles are fixed neck downwards on

a rack, and as the position is slightly altered day by day the sediment gradually collects on the cork. Then the bottles are immersed in the *dégorgoir* into a brine at 13° F. below zero, the neck of the bottles only bathing in the refrigerating liquid, and after a quarter of an hour there is a small lump of frozen wine formed in the neck of the bottles securing the sediment on the corks. The clamp is then removed, and as the cork shoots out under the pressure of the carbon dioxide, so does the ice and sediment. Very little wine is lost in the process of disgorgement. The space thus left is filled up either with C. of the same vintage if the quality of *brut* is desired, or with an addition of liqueur (which consists of cane sugar dissolved in a good C. wine) in more or less quantity according to the quality to be obtained: 2 per cent for the Extra-Sec, 4 per cent for the Sec, 8 per cent for the Demi-Sec. The Russians prefer a powerful and sweet wine, the Eng. a dry and lively wine, while the Fr. select a light, sweet wine. Inferior quality is most easily detected in the dry species. The bottles are stored for a long time, as the wine mellow with age. C. wine is at its best from eight to twelve years. After twenty years it can quickly deteriorate. The best C. to be drunk in 1949 was 1930, but it would not gain then by being kept any longer. The ordinary qualities are stored for about five years.

Champagnole, Fr. tn. situated in the dept. of Jura. It stands on the R. Ain, a trib. of the Rhône. Pop. 4500.

Champaign, prosperous industrial city in C. co., Illinois, U.S.A. It has many fine buildings, the most notable of which is Illinois Univ. Pop. 22,000.

Champaran, dist. of Bengal, India, situated in the Patna div. of N.W. Behar. Its area is 3531 sq. m., and its pop. 1,941,000.

Champ de Mars, large open space in Paris over half a mile long, and from 200 to 500 yds. wide, stretching from the Eiffel Tower to the Ecole Militaire. Since 1914 laid out as a park with avenues and flower-beds in the Fr. style. Once it was the scene of military reviews, and of the international exhibitions of 1867, 1878, 1889, 1900, and 1925. It possesses an historical interest by reason of the many scenes it has witnessed. During the revolution it was the field of the fête held on the first anniversary of the fall of the Bastille, when a vast assembly acclaimed the federation and vowed eternal devotion to their country. It was laid out as a parade-ground in 1770. In 1791 a regrettable massacre occurred, and in 1804 Napoleon distributed the imperial standards in the square.

Champel-sur-Arve, suburb of Geneva, and fashionable health resort. It has a fine hydropathic and sev. large hotels.

Champerico, important harbour of Central America, situated on the Pacific coast of Guatemala. C. is also the terminus of the San Felipe railway. Pop. 2000.

Champerty, or **Champarty** (Lat. *campum*

partiri, to divide the land), in criminal law is a species of maintenance or officious intermeddling in a law suit which in no way concerns one. The crime consists in making a bargain with a plaintiff or defendant that, in consideration of the champertor carrying on the action at his own expense, the land or other subject matter of the action shall in the event of success be divided between them. C. is a misdemeanor punishable by fine or imprisonment, or both. It has been held to be a champertous agreement to offer to exercise influence in procuring evidence to support a claim for money upon condition of receiving a portion of the sum recovered. See also MAINTENANCE.

Champfleury, Jules Husson (1821-89), Fr. author, *b.* at Laon. His true name was Jules Fleury-Husson or Husson. He joined the Bohemian circle of Baudelaire and Henri Murger, and was an acknowledged leader of the realistic school. His *Bibliographie céramique* (1882), written after he was appointed director of the Sèvres potteries in 1872, is of some value. Among his novels are *Chien-Caillou* (1847), which won the praise of Victor Hugo; *Les Souffrances du professeur Delleil* (1853) (trans. into Eng. under the title of *Naughty Boys, or the Sufferings of Mr. Delleil*); *Les Bourgeois de Molinchart* (1855), a satirical tale of prov. life among the middle classes; *Les Amoureux de Sainte Perine* (1859); *Le Violon de Faïence* (1862), generally considered his masterpiece; *Monsieur Tringle* (1866); and *Fanny Minore* (1882). His biographical works include *Honoré de Balzac* (1852). His *Les Chats* (1868) has been trans. into Eng. under the title *The Cat, Past and Present* (1885).

Champligny-sur-Marne, tn. in France, dept. Seine, and 6 m. E.S.E. of Paris. It has manufs. of piano keys and embroideries. There is an early Renaissance chapel, and C. was the scene of two battles during the siege of Paris, 1870. Pop. 27,500.

Champion (Late Lat. *campio*, from *campus*, a field or open space) in the judicial combats of the Middle Ages the hired combatant who took the place of women, children, aged persons, or any incapable of fighting their own battles. These Cs. were of the lowest class, and were regarded as disreputable persons. Later, in the age of chivalry, the name acquired a higher meaning and was applied to a knight who challenged or defended on behalf of an injured lady or child. The office of crown C. is peculiar to England. The 'King's C. in full armour and mounted on horseback rode into Westminster Hall at the coronation banquet and challenged to single combat any who should deny the sovereign's right to reign.' The challenge was never accepted, but the picturesque ceremonial was performed up to the coronation of George IV. The office is hereditary and is held by the family of Dymoke.

Championnet, Jean Antoine Étienne (1762-1800), Fr. general, *b.* at Valence in Drôme. He enlisted in the army at a very early age and took part in the siege

of Gibraltar. When the revolution broke out he took a prominent part; suppressed the Girondist movement in the Jura (1793) without bloodshed; was brigadier-commander in the Rhine campaign and by his stubborn resistance at Fleurus (1794) greatly contributed to Jourdan's victory. In 1798 he was appointed commander-in-chief of 'the army of Rome,' defended Rome against the Neapolitans and the Brit. fleet, and finally captured Naples (1798), setting up the Parthenopean republic there. His intolerance of opposition was the cause of his recall from Italy in disgrace. In the following year he was appointed commander-in-chief of the 'army of the Alps,' but was defeated at Gendia (1799) by the Austrian and Russian troops, and retired to Nice. He *d.* at Antibes in the following year.

Champlain, lake in the N.E. of the U.S.A., lying between Vermont and New York. It is long and narrow, its N. end stretching for nearly 5 m. into Canada. It is drained to the N. by the Richelieu into the St. Lawrence, and is connected by a canal with the Hudson. It has an elevation of about 95 ft. above the sea, and an area of about 750 sq. m., being approximately 110 m. long by from 1 to 15 m. broad. To the E. lies the Green Mt. range to the W. the Adirondacks. The lake was discovered in 1609 by Samuel de C., who gave it his name. It was the scene of many skirmishes during the Fr. and Indian wars, and during the Amer. Revolution. In 1814 the Brit. fleet was defeated by the Amers. in the naval war of 1812-15.

Champlain, Samuel de (1567-1635), Fr. explorer, founder of Quebec and first governor of Fr. Canada, *b.* at Brouage (Saintonge). His youth was spent in the army of Henry IV., and in an expedition to the W. Indies of which he wrote an account in *Bref Discours des Choses plus remarquables que S. Champlain a reconnues aux Indes Occidentales* (first pub., 1870). In 1603 he made his first voyage to Canada. On his third voyage (1608) he founded Quebec, estab. friendly relations with the Indians, and founded a prosperous fur trade. In 1612 he was made lieutenant of Canada. In 1629 Quebec fell into the hands of the Eng., and C. was taken to England as a prisoner. At the treaty of St. Germain (1632), which restored Canada to France, C. returned to Quebec as governor. When C. came to the St. Lawrence furs were already being brought to the riv. from great distances, and C. found himself involved in the intense rivalry for the trade. In his trade and explorations C. had followed a policy of making alliances with Indian tribes, especially with tribes N. of the riv. where lay the best fur country. In 1609, soon after Quebec was founded, C. was already beginning to ally himself with the N. Indians. In that year he made an exploration up the Richelieu R. and into the lake which still bears his name. C. was often hindered in making explorations himself by the cares of the settlement at Quebec; but he sent younger men to live with the Indians and learn their ways and

languages. It was through one of these young men, Vignau, that C. was led to make his second important expedition, a voyage, in 1613, up the Ottawa as far as Allumette Lake. Two years later C. undertook his greatest exploration. This was to the Huron country with Etienne Brulé, a Quebec youth, in an attack on the Iroquois. C. made the long trip up the Ottawa, across the Mattawa R. to Lake Nipissing and down the Fr. R. to Georgian Bay and thence to a Huron vill. near Lake Simcoe—in the fighting there C. was wounded and his party retired defeated; and in the following year, C. went home. Brulé carried on the work of exploration subsequently. At C.'s death large parts of the great lakes were still unexplored; but C. was the pioneer in the remarkable voyages which first put the great lakes on the map. His men had pointed the way to the Mississippi and found the St. Mary's R. and Mackinaw Strait, which were subsequently to be the cross-roads of the great fur-trading routes of the N. and W. Great as he was as an explorer, C.'s fame rests solidly on his writings. To-day these are printed, with an Eng. trans., in six large vols. and by a society which bears his name. They are no doubt his best memorials, a valuable and convincing record of the beginnings of Fr. settlement and exploration, besides being an attractive character-study of the man himself. See *Œuvres de Champlain* (6 vols.), 1870, and *Voyages* (3 vols.), 1878-82; also life by Dionne, 1891; and in *Makers of Canada Series, Champlain*, by Dionne, 1905.

Champlain Epoch or Period, name given by Prof. Dana to the period succeeding the Glacial in N. Amer. geology, equivalent to the post-Glacial period of Brit. geologists. The chief traces left by the C. E. are the deposits, including marine shells, round Lake Champlain and elsewhere in N. America, the raised beaches around the great lakes, and old lake basins, now dried up, in their neighbourhood and near the E. coast. The small bitter lakes, the most important of which is the Great Salt Lake of Utah, are the remains of a great system in the W.

Champollion, Jean François, le Jeune (1790-1832), Fr. Egyptologist, b. at Figeac, in the dept. of Lot, France. He was a great student of Coptic, and, indeed of all Oriental languages. In 1816 he was appointed to the professorship of hist. at the Lyceum of Grenoble, which he was afterwards obliged to vacate on account of his Bonapartist sympathies. By comparing anc. MSS. and monuments, C. was led to believe that the three systems of Egyptian writing were identical and inferred that the hieroglyphics represented ideas or letters. By degrees he discovered the twenty-five letters. He was sent on scientific expeditions to Italy, 1824-26, and to Egypt, 1828-30; appointed conservator of the Egyptian collections, 1829; member of the Académie des Inscriptions, 1830; and prof. of Egyptology in the Collège de France, 1830. His works include *L'Égypte sous*

les Pharaons (1811-14), *Sur l'écriture hiéroglyphique des anciens Égyptiens* (1821), *Lettre à M. Dacier* (1822), *Précis du système hiéroglyphique* (1824), *Pantheon égyptien* (1823); and, posthumously, *Grammaire égyptienne* (1836-41), *Monuments de l'Égypte et de la Nubie* (1844), etc. See H. Hartleben, *Champollion, sein Leben und sein Werk*, 1905.

Champollion-Figeac, Aimé Louis (1812-1894), Fr. author, b. at Grenoble, and son of Jacques Joseph O.-F. He was assistant librarian to his father at the Royal Library; also pub. sev. works on Fr. hist., art, and palaeography, and ed. a number of memoirs.

Champollion-Figeac, Jacques Joseph (1778-1867), Fr. archaeologist, elder brother of the more famous Jean François Champollion, b. at Figeac. He became prof. of Gk. at Grenoble, and in 1828 was appointed conservator of MSS. in the Royal Library at Paris. He lost this position through Carnot on account of the Feb. revolution, but afterwards was made keeper of MSS. at the Bibliothèque Nationale in Paris, also prof. of palaeography in the Ecole des Chartes. In 1849 he was appointed librarian of the palace at Fontainebleau. He wrote sev. works on historical and philological subjects, and was ed. of some of his brother's works.

Chamusea, tn. of Portugal, in the prov. of Estremadura. It is situated on the R. Tagus, 12 m. from Santarem. Wine is largely produced. Pop. 3500.

Chanak, tn. of the sanjak of Bigha, Asiatic Turkey, on the Dardanelles. The allied fleet attacked it in 1915, but without success. In 1922 it was occupied by Brit. forces in order to arrest the advance of Kemal's army. This nearly resulted in war with Turkey—or the resumption of war, for as yet peace had not been officially concluded—but the contretemps was avoided by the tact of Sir Charles Harrington, the Brit. commander-in-chief in the Black Sea area.

Chanar, old fortress and tn. of India, situated in the dist. of Mirzapur, on the r. b. of the R. Ganges. Warren Hastings lived here. There is a state prison in the neighbourhood. Pop. 6960.

Chañaral de las Animas, tn. of Chile, S. America, situated on the coast, in the prov. of Atacama, 75 m. N.N.W. of Copiapó, and 48 m. from Caldera. It is, next to the latter, the most important port. There are copper mines in the dist. The water supply is obtained by condensation from salt water. Pop. 2000.

Chance, see PROBABILITY.

Chance-, or **Chaud-medley** (**Chaud-mellé**) (O.F. *chaude mellee*, 'heated affray'), originally meant any casual affray accompanied with violence but without deliberation or preconceived malice. The expression, though seldom used, now means the killing of another in self-defence upon a sudden and unpremeditated encounter. C.-M. is to be distinguished from manslaughter, for the latter is a crime, but the former an excusable act. The general distinction is

that, if both parties are actually fighting, he who gives the mortal blow is guilty of manslaughter, but if one of them at first refuses to fight and retreats until, at last, to avoid his own destruction, he kills his antagonist, that is excusable homicide, or, as it is inaccurately termed, C.-M.

Chancel (Late Lat. *cancellus*, a screen), the E. part of a church, usually separated from the nave by an open-work screen or rail. In some mediæval churches the screen is very high, so that the congregation is completely shut off. The choir stalls and the rector's pew are in the C.,

THE CHANCEL OR CHOIR OF MANCHESTER CATHEDRAL, AS IT APPEARED IN 1884

and the communion table on a raised platform at the far end. The term C. is often used as synonymous with choir; in small churches the space behind the screen is frequently called the sanctuary. According to Eng. law the rector has special rights over the C., is entitled to the chief pew, and is liable for all necessary repairs. Parishioners are allowed beyond the screen for the celebration of holy communion and for marriage services.

Chancellor (Lat. *cancellarius*). Primary meaning of *cancellarius* is one who is stationed at the lattice-work of a window or doorway, to introduce visitors, etc. In another sense, *cancellarius* was a kind of legal scribe, so called also from his position at the cancelli of the courts of law. The *cancellarius*, under the later emperors and in the court of Constantinople, was a chief scribe or secretary who was ultimately invested with judicial powers and a general superintendence over the rest

of the officers of the emperor. All the modern nations of Europe have or have had Cs., though the powers and duties seem to have varied in each. In England the C. was originally the king's chief secretary to whom petitions were referred, by whom patents and grants from the crown were approved and completed and by whom reports upon such matters were, if necessary, made to the king; hence in Saxon times he was sometimes styled *referendarius*. The name C. is said first to occur in Eng. hist. in the time of Edward the Elder, A.D. 920. In early times, as the C. was usually an ecclesiastic head chaplain and father confessor to the king, he became keeper of the king's conscience, examiner of his patents, the officer by whom prerogative writs were prepared, and keeper of the great seal. The last ecclesiastic who exercised the office was John Williams, archbishop of York, from 1621 to 1625.

The interference of the king, the source of justice, was frequently sought against the decisions of the courts of law; and also in matters which were not cognisable in the ordinary courts, or in which, from the maintenance of protection afforded to his adversary, the petitioner was unable to obtain redress. The Eng. C.'s jurisdiction sprang from this royal discretionary authority (see also CHANCERY, EQUITY). It may be observed that although the Eng. C.'s powers were so closely interwoven with the development of equity he nevertheless possessed at one time a political pre-eminence not only far greater than he enjoys at the present day, but second to none in the state; for on the decline of the office of chief justiciar, the C. succeeded him as the chief minister. The earl of Suffolk in the reign of Richard II., for example, exercised authority not only over revenue matters, but also over foreign policy. Like the justiciar, however, the office of C. always tended to become a purely legal one. The style of the C. in England is lord high C. of Great Britain. He takes rank above all dukes not of the royal blood and, next to the archbishop of Canterbury, is the chief judge in England, and has a seat in the Cabinet. He is appointed by delivery of the great seal, sits on the woolsack, presides at debates in the House of Lords, and goes out with the gov. A Rom. Catholic may not be lord high C. of England. The salary of the lord C. is £10,000 a year, and an ex-lord C. receives a pension of £4000 a year, but on going out of office he usually conducts a great deal of judicial work, presiding in the House of Lords, sitting as the ultimate court of appeal, and hearing appeals to the Privy Council. In the House of Lords he presides as Speaker. He is the guardian of infants and their property, and has jurisdiction over idiots and lunatics by special delegation from the Crown. He is qualified to sit in the court of appeal, and presides when he sits there, and is the titular head of the chancery div. He appoints the judges of the court of appeal and the high court and the county courts, and may

remove county court judges if necessary. He also appoints county justices of the peace on the recommendation of the lieutenant, borough magistrates, and commissioners for oaths. At the opening of a new Parliament he signifies the Crown approval of the appointment of the Speaker of the Commons, and reads the king's speech in the absence of the latter. He has the presentation of various canonries and livings, dispenses a wide patronage in addition to that already noted, exercises a concurrent jurisdiction with the other judges of the superior courts with respect to writs of *habeas corpus* (*q.v.*), and is, *ex officio*, visitor of all hospitals and colleges founded by the Crown. There was also, before the estab. of the Irish Free State in 1922, a Lord C. of Ireland, whose authority within his own jurisdiction was in most respects the same as that of the lord high C. of Great Britain. His salary was £8000 a year.

In Scotland, as in England, the C. was always a high officer of the Crown and had great authority in the king's councils; and similarly, that authority at length extended beyond its original limits and affected the whole judicial power in the kingdom. But while in England the C. for the most part only carved out for himself a jurisdiction in equity, in Scotland he reached the head of the administration in justice, and sat in a court which dispensed both equity and common law and the course of proceeding in which all the other judicatures were bound to follow. The office of C. of Scotland expired in 1707 when, by the treaty of Union with England, it was provided that there should in future be but one great seal for the United Kingdom. The C. of a bishop is vicar-general to the bishop, and presides over the bishop's consistory court. He must be a barrister of at least seven years' standing. The C. of the duchy of Lancaster is an officer who presides in the duchy chamber of Lancaster, adjudicating on equity matters connected with the Crown lands of the duchy. He is one of the titular heads of the Ministry of Agriculture. The C. of a cathedral is one of the four chief dignitaries of cathedrals of anct. foundation. The C. of the Exchequer is the prin. finance minister of the Crown. The office is sometimes held by the Prime Minister when he is a member of the House of Commons. His legal functions are now merely formal, such as presiding at the ceremony of nominating sheriffs. Constitutionally he is the under-treasurer, the office of lord high treasurer being now executed by the Lords Commissioners of the Treasury. His voice, however, may be all-powerful in connection with the Exchequer, the degree of his political eminence varying with the qualities of the individual who holds the Exchequer seat (see under EXCHEQUER, CHANCELLOR OF). The Ch. of the univ. of Oxford and Cambridge are the titular heads of the univ., and are elected by the respective corporate bodies of which

they are the heads. Their duties are mainly discharged by a vice-C. The C. of the order of the Garter and other orders of knighthood, seals and authenticates the formal instruments of the chapter and keeps the register of the order.

Chancellor, Richard (d. 1556). Eng. navigator; appointed in 1553 as captain and pilot-general of the *Bonaventure*, in the expedition of Sir Hugh Willoughby's to search for a N.E. passage to India. The ships were separated in a storm off the Lofoten Is., and C. reached Vardohuus, the meeting-place that had been agreed upon, and after waiting seven days in vain for the rest of the company, he went on alone into the White Sea, from whence he travelled to the court at Moscow, being well received there, and concluding a treaty that gave freedom of trade to Eng. ships. On a second voyage he was lost in a shipwreck off the coast of Aberdeen.

Chancellorsville, vil. of Virginia, U.S.A., situated in Spottsylvania co., between Richmond and Washington. It was the scene of one of the greatest battles of the Civil war in 1863, when Gen. 'Stonewall' Jackson received his death wound and Gen. Hooker was defeated.

Chancery (Lat. *cancellarius*, chancellor). Before the fusion of common law (*q.v.*) and equity (*q.v.*) by the Judicature Act, 1873, the Court of C. was the name given to the court which had the sole administration of equity. Since 1873, when the Supreme Court of Judicature was estab. to exercise the consolidated jurisdictions of the old courts of C., king's bench (*q.v.*), common pleas (*q.v.*), exchequer (*q.v.*), and admiralty (*q.v.*), probate, divorce, and matrimonial causes courts, the administration of equity became competent to all courts of law, and the C. div. now means that side of the high court of justice to which is assigned the trials of certain special causes. As a fact practically all matters falling within its old jurisdiction are still heard in the C. courts. The prin. matters assigned to the C. div. relate to the estates of deceased persons, partnerships, trusts, partition or sale of real estates, specific performance of contracts for the sale of land or other property, the redemption or foreclosure of mortgages, care of infants' estates, cancellation or rectification of deeds or other written instruments, and the construction of wills. It consists at the present day of five puisne judges, with the lord chancellor as titular head.

History.—The whole course of the gradual evolution of the court of C. is intimately connected with the development of equitable principles; principles which, borrowed partly from the civil and canon law, and partly from the dictates of natural justice, were designed to redress grievances for which there existed no available remedy at common law. The king as the fountain-head of justice, enjoyed the prerogative of dispensing justice personally in his royal council (*curia regis*). Later the judicial side of the royal council became specialised in the *concilium ordinarium* acting as a court of

appeal and equity, and the chancellor, as the keeper of the king's conscience and the chief legal officer of the council, presided over it in the king's absence. The old court of C. is generally believed to have been estab. in 1348 by an ordinance which vested in the chancellor plenary authority in 'matters of grace and favour.' But whether after 1348 the so-called court of C. was or was not merely the royal council, sitting in a place called 'the chancery' to hear petitions of 'grace and favour' in cases which the common law could not reach, the chancellor gradually usurped the judicial functions of the council and sat as a judge alone. The power of the court of C. after it ceased to follow the king in 1348 was developed mainly through the chancellor's delegated authority to invent new writs to meet cases for which the common law judges were unable to give redress either because of some defect of principle in the law itself, or because such remedies as it did provide could not avail against the oppression or local influence of one of the parties. During and after the end of the fourteenth century the judicial power of the court of C. increased enormously in spite of remonstrances from the common law judges and the Commons. At the time of Coke it exercised an *ordinary* or common law (*secundum legem et consuetudinem*) jurisdiction and an *extraordinary* (*secundum equum et bonum*) jurisdiction, in the former giving auxiliary remedies such as discovery of documents in cases otherwise decided on common law principles, in the latter proceeding entirely on grounds of equity. The characteristic features of its proceedings were the summons by subpoena to *appear* and *answer* without any *original writ* to the sheriff, by which means it could reach powerful personages, who defied the common law courts, and the *injunction*, by the instrumentality of which it removed causes from the common law judges or reversed their decisions, and committed a plaintiff for contempt who persisted in going on in the common law courts against conscience, and in defiance of the order of the C. court.

The constant struggles between the common law judges and the C. court culminated in the historic contest between Coke and Ellesmere in 1616, when the king pronounced in favour of the chancellor. From that time the court of C. became the dominating power in the judiciary, and the rules of equity were made to prevail over those of common law. Down to the middle of the nineteenth century the business of the court of C. was exercised by the lord chancellor, three vice-chancellors, and the master of the rolls, each occupying a separate court. There were also various officials who exercised certain parts of the equitable jurisdiction of the court, who derived their authority from special delegation of one of the C. judges. These were principally the masters in ordinary and the accountant-general. Proceedings in the old court of C. were conducted by *Bill* and *Answer*. The Bill set out the facts as

alleged by the plaintiff, prayed for relief, and concluded with a request for a subpoena to compel the appearance of the defendant for examination. The defendant's answer usually contained a demurrer (*q.v.*) to the Bill, various pleas in reply, and a denial of the truth of the allegations, with his own version of the case. Scientific precision indeed was completely subordinated to conscience, but the true spirit of equity was in a measure violated by the gradual tendency of the procedure to as complete a technicality as that of the common law. The partial fusion of administration of equitable remedies effected by the Judicature Acts has to a great extent modified the excessive technicality of the C. court, or its modern representative the C. div. It may be noted that in most of our colonies there are courts of C. based more or less on the model of the Eng. courts. In Amer. law it also indicates a court of general equity jurisdiction. Separate courts of C. or equity exist in a few of the states; in others the courts of law sit also as courts of equity; in others equitable relief is administered under the forms of the common law; and in yet others, the distinction between law and equity has never existed or has been formally abolished. The Federal courts exercise an equity jurisdiction as understood in the Eng. courts about 1689. See also BILL in EQUITY.

Chanetonbury Ring, hill on the S. Downs, in Sussex, England, near Steyning. Its tree-capped summit (814 ft.) is occupied by prehistoric earthworks and a dewpond. The oval rampart which defended it is 500 ft. by 400 ft., and its outworks measure nearly 400 ft. Rom. coins and other remains were found in 1909.

Chanda, tn. of India, in the Nagpur div. of the Central Provs. Until 1751 it was the cap. of the Gond kingdom of C. There are manufs. of silk and cotton goods and bamboo articles. A yearly fair is held which lasts three weeks. Pop. 25,000.

Chandausi, tn. of Pakistan, situated in the Moradabad dist. of the N.W. Provs., 30 m. S. of Moradabad. It exports cotton and sugar. Pop. 25,000.

Chanderi, tn. of central India, in the state of Gwalior. The old tn. is deserted and hidden in thick jungle, having ruins of tenth-century temples. The modern tn., 8 m. S., is famous for its silks and gold brocades.

Chandernagore, or properly **Chandarnagar** (city of sandalwood), Fr. settlement in the prov. of Bengal, India, 20 m. N. of Fort William, Calcutta, on the r. b. of the R. Hugli. It is the seat of a Fr. sub-governor. The settlement was founded by the Fr. in 1673. Pop. 41,000.

Chandler, Ellen Louise, *see* MOULTON, Mrs.

Chandler, Richard (1738-1810), Eng. classical archaeologist, b. at Elson, Hampshire. He was educated at Winchester and at Queen's and Magdalen, Oxford. In 1763 he pub. a detailed description of the Oxford marbles in his *Marmora*

Oroniensta, which was printed at the expense of the univ. In the following year the Society of Dilettanti sent him out with Revett and Parn to study the antiquities of Greece and Asia Minor. On his return C. pub. his discoveries in *Ionian Antiquities* (1768-97); *Inscriptions Antiquae* (1774); *Travels in Asia Minor* (1775), and *Travels in Greece* (1776). He was given the title D.D. in 1773. See an 'Account of the Author,' prefixed to R. Churton's ed. of the *Travels*, 1825.

Chandler, Samuel (1693-1766), Eng. nonconformist divine, b. at Hungerford, Berkshire, where his father was minister. He was educated at Gloucester, where he met his lifelong friend, Bishop Butler. He became fellow of the Royal and Antiquarian Societies, and was made D.D. of Edinburgh and Glasgow. From 1716 to 1726 he was minister at Peckham, from then preaching at the Old Jewry until his death. His writings were numerous, and he took a prominent part in the deist controversies of the time.

Chandor, tn. of India, in the presidency of Bombay, 130 m. N.E. of Bombay city. It is strongly fortified, the fort being on the summit of a high hill, and it thus commands an important pass on the route from Bombay to Khandesh. It was taken over by the Brit. Gov. in 1804. Pop. 5000.

Chandos, great Eng. family, descended from a follower of William the Conqueror, of Norman times:

Sir John Chandos (d. 1429) was the last representative in direct male line.

Sir John Brydges, descendant in the female line, was lieutenant of the Tower under Queen Mary, and was created Baron C. in 1554.

James Brydges, eighth Lord C., was created duke in 1719. The C. residence, once at Canons, near Edgware, is now destroyed.

Chandpur, tn. of India, situated in the dist. of Bijnaur, 70 m. N.E. of Delhi. Pop. 12,000.

Chandragupta, or *Sandrocottus* (reigned 316-292 B.C.), founder of the Maurya empire, and first emperor of India. He was son of a king of Magadha, his mother being of humble birth. When a youth he was forced into exile by his kinsfolk, and during this period he gathered round him a great company of warriors, then attacked the Macedonians, and conquered the Punjab. He next attacked Magadha, slew the king, and estab. himself on the throne, and in due time his kingdom extended from the Hindu-Kush to the bay of Bengal.

Chandrakona, tn. of India, situated in the dist. of Midnapore, Bengal, 59 m. W. of Calcutta. Pop. 21,000.

Chang, name given to the Tibetan plateau which breaks up about the meridian of 92° E. Scientific investigations have not been systematically carried out in this region as yet, but it is known that the Himalayan tribes of the Brahmaputra derive their sources from the Tibetan plateau.

Chang Bhakar, or **Chang Bhuker**, native

state in Chota-Nagpur, India, with an area of 900 sq. m. The cap. is Janakpore, which is merely a small vil., and the state is principally jungle. Pop. 9000.

Changchiawan, small tn. in Chihli, China. It is situated about 6½ m. from Tungchou. Here a battle was fought in Sept. 1860 by the Fr. and Brit., where the Chinese treacherously captured sev. Eng. officers under a flag of truce.

Chang-Chih-tung (1837-1909), Chinese scholar and statesman, b. in the prov. of Chih-li. From 1889 to 1907 he was viceroy of Hukwang. In character he was a great dreamer and enthusiast, and very unpractical. He had great literary powers, and his knowledge of the Chinese classics was unrivalled. He is said to have been one of the most able men in modern times, and his powerful personality and true patriotism won for him a high position in the regard and trust of his fellow countrymen.

Changchow, two cities in China. The first is situated in the prov. of Fukien, about 28 m. W. of Amoy. It has manufactures of bricks and sugar, and a great silk trade. The second belongs to the prov. of Kiangsu.

Chang kia kow, see **KALGAN**.

Changkufeng, hill on the Russo-Manchurian border notable as the scene of a savage conflict between Soviet forces and the Jap. In 1938. Between the frontier of Jap.-controlled Korea and the Soviet area S. of Vladivostok was a sort of no man's land whose precise limits had never been clearly determined. In June 1938 the Jap. learned that the Russians were planning to estab. a new submarine and air base on Possiet Bay, at the extreme S. limit of Soviet ter. Hence they seized a hill called C., situated in the no man's land about 20 m. from the sea, which gave artillery control over Possiet Bay. The Russian frontier guard expelled the Jap. patrol which had seized C. The Jap. returned in strength and annihilated the Russian frontier guard. The Russians countered in turn, and within ten days two large armies each of 80,000 men, with planes, tanks, and heavy guns were fighting for possession of the narrow ridge of C. The battle was won by Soviet dive-bombers whose pilots had learned the methods of *blitzkrieg* in the Sp. Civil war, and by Russian infantry, who drove the Japs. into the valley below. Although the battle attracted but little attention from the rest of the world, it was an important conflict in its implications. Each antagonist evidently thought that the other was bluffing, but when the fight had developed from a mere frontier skirmish into a savage battle, both sides seem to have realised that the bluff had gone far enough and an 'amicable' settlement was reached, by which, however, the Jap., for the first time in Russo-Jap. hist., abandoned a field of battle. They recognised that the ridge of C. was Russian ter. and withdrew discomfited to the valley 5 m. to the S.W. This episode throws some negative light on subsequent Russo-Jap. relations, besides giving the Kremlin the welcome

assurance that the Red Army in Siberia was neither impotent nor demoralised at a time when the peak of misunderstanding between Soviet Russia and the rest of the world was attained. The following year the Jap. tried again, on the even more vague border-line between Inner Mongolia, which they controlled, and Outer Mongolia, controlled by the Soviet, at a place called Nomanhan. In this struggle the brunt was borne by native levies, although regular Jap. and Russian troops, with planes, tanks, and artillery, were engaged. In a 'war' which lasted six weeks, the Jap. were again defeated and again withdrew from the field. The C. affair confirmed Stalin's belief that the Soviet had been strengthened by the notorious army purge of 1936-38. He now knew, despite foreign prejudices, that his long-drawn internal struggle in Russia had been won and his Red Army in the E. could deal with the Jap. The sequel was the pact of friendship and non-aggression between Russia and Japan in 1941. There was no real friendship on either side, but actually a salient example of two countries following a policy dictated solely by their own interests. The pact was scrupulously observed for some years and led to the settlement of such vexed questions as the frontiers between Man. Lukuo-Korea and of the border between Inner and Outer Mongolia, which had never previously been determined. See W. Duranty, *U.S.S.R.: the Story of Soviet Russia*, 1944.

Changpaishan, Laoling, or Shanalin Mountains, mt. range in the prov. of Manchuria, China. It stretches in a N.E. direction between Kirin and Korea, the altitude being 8000 ft. Two rvs. have their source in the mts., the Sungari on the N. side, and the Yalu on the S.

Changsha, cap. of the Chinese prov. of Hunan, was opened as a treaty port in 1903. It exports coal. The famed anti-mony works of the Huachang Company, which has branch offices in the Woolworth Building, New York city, are here. There is a temple to a celebrated scholar, Yo-lo, who d. at C. in 165 B.C. In the gardens of another temple is a high school for girls, the principal of which is Miss Tseng, B.Sc. (London). There is a fine hospital erected by a graduate of Yale. C. was successfully defended against the Taiping rebels in 1852 in spite of a siege of ninety days. Pop. 535,800.

Changtsefu, two cities in China. The first is in the prov. of Honan; and the second in the prov. of Hunan, situated on the R. Yuan, which is the chief means of communication from the neighbouring prov. of Kweichow.

Chang Tso-lin (1870-1928). Chinese marshal and leader of one of the Chinese factions. Born of humble parentage and a native of Fengtien prov., Manchuria. Joined the Jap. cause in the Russo-Jap. war, 1904-5; became ruler of Manchuria in 1915. He was probably the most powerful man in China, although his insignificant and mild appearance belied his true character, for he could, it is said, exhibit the fury of a tiger. He had the

power of life and death, and used it ruthlessly. Despite this he was considered an enlightened and progressive ruler, and Manchuria was the best-governed prov. of all China. He employed many European and Amer. advisers. He hated Bolshevism, and towards the end of his regime he became cool towards his former allies, the Jap. It has been alleged that this change of front led to his elimination. He made great efforts to establish a stable gov. at Peking, but failed. In 1921 he was driven back by Wu Pei-fu to Manchuria, which he then declared independent. In 1923 he defeated Wu Pei-fu and set up a gov. in Peking in 1927. In 1928 he withdrew with the intention of going to Mukden, but the train in which he was travelling was bombed and his injuries led to his death on June 3.

Changarnier, Nicolas Anne Théodule (1793-1877), Fr. general, b. at Autun. He was for many years governor-general in Algeria, and served in the Sp. war, 1823. He later on obtained a military post in Paris, where he subdued the Communist struggles of 1849. He was arrested in 1851 for opposing Napoleon III., and exiled from France, to which he only returned eight years later, after the settlement of 1859. He joined with Bazaine in the war of 1870, and when the tn. of Metz was captured he was taken prisoner and sent to Germany.

Change (derived from Low Lat. *campium*, exchange), meeting-place for merchants. The name has been thought to be an abbreviated form of exchange and is written thus—change, but this is incorrect.

Changeling. According to fairy lore, a C. is a fairy infant substituted for a human one immediately after its birth. In olden days a child that was especially peevish was regarded as a C. Great precautions were taken in the guarding of the mortal infant, and often some charm was left in the cradle. It was supposed the exchange could only take place before the christening, and that afterwards the mortal infant was safe.

Channel, The English, see ENGLISH CHANNEL.

Channel Islands, group of Brit. is. in the Eng. Channel, W. of the Cotentin Peninsula, N.W. France. The largest is. are Jersey and Guernsey; the lesser inhabited is. are Alderney and Sark. Herm, Jethou, and Bréhou have, from time to time, a few inhab. Outlying rocky islets or reefs include Burhou, the Casquets, the Dirouilles, the Errehou, Lihou, the Minquiers, and the Paternosters. **Chausey**, an extensive rocky reef, with a few inhab., lies S.W. of Jersey but belongs to France. Navigation around the coasts is difficult owing to rocks, tides, and currents. The area of the four main is. is about 75 sq. m. The total pop. is about 100,000, all except about 2000 being in Jersey and Guernsey. The is. formed part of the duchy of Normandy at the time of William the Conqueror's invasion of England in 1066. They were not included in the Eng. continental possessions lost to France in 1204 in the

reign of King John, and remained attached to the Brit. Crown, of which they are the oldest possession. The is. remained, however, in the diocese of Coutances (Normandy) until 1568, when they were brought into the diocese of Winchester. Their strategic importance in the past and their effectiveness as privateering bases brought attacks by the Fr., the last in 1781, when a landing force under de Rullecourt was routed by the Eng. garrison and the local militia in the battle of Jersey, commemorated in a painting by Copley, hung at the

cation between the is. and the home secretary. The bailiff in each bailiwick is also appointed by the Crown and combines the functions of chief magistrate and president of the legislature. Each of the four is. has its own legislature and courts. The laws and customs and political institutions vary in each is., but are all based on those of medieval Normandy, though modified in many respects by local legislation. The is. have shown great attachment to their traditional laws and forms of gov., both sustained in the past by the common

THE CHANNEL ISLANDS: PORTELET BAY IN JERSEY

E.N.A.

Tate Gallery, London. Under conditions of modern warfare the is. are untenable against a powerful enemy in occupation of the mainland of France, and shortly after the collapse of France in June 1940, they were declared by the Brit. Gov. to be open towns, and were occupied by Ger. forces. They were heavily garrisoned and fortified by the Gers., but were of little positive value to them during the war. They were peacefully liberated in May 1945. The is. have long enjoyed full self-gov., subject only to the king-in-council; they are not represented in the Parliament at Westminster and are not subject to it. The is. are divided into two bailiwicks: one for Jersey and one for Guernsey, Alderney, and Sark, the latter two is. having also their own high degree of gov. within the bailiwick, but with direct appeal to the king-in-council on some matters. A lieutenant-governor represents the king in each bailiwick and is the formal channel for communi-

cation between the is. and the home secretary. The bailiff in each bailiwick is also appointed by the Crown and combines the functions of chief magistrate and president of the legislature. Each of the four is. has its own legislature and courts. The laws and customs and political institutions vary in each is., but are all based on those of medieval Normandy, though modified in many respects by local legislation. The is. have shown great attachment to their traditional laws and forms of gov., both sustained in the past by the common

use of the Norman language, still spoken with variants in vocabulary and accent in each is. Until recent times Fr. was used exclusively in the legislatures and courts, but Eng. is now in general use. In 1946 a committee of the Privy Council visited Jersey and Guernsey and approved substantial changes, already proposed by the islanders, in the composition of the legislatures in Jersey and Guernsey, and also approved the setting up of an appeal court for both bailiwicks. The reforms in Jersey have now (1948) been constitutionally adopted, but in Guernsey they have been rejected. Reforms in Alderney are pending. The C. I. enjoy a mild climate, with moderate range and with record sunshine periods during the summer; ann. rainfall varies from 34 in. to 38 in. They have developed an intensive agriculture and a flourishing holiday traffic from England, the latter activity centred mainly in Jersey, which received 200,000 visitors in 1947. The is. attract

as residents many *rentiers* and Eng. folk living in retirement from service overseas. Glasshouse culture has developed extensively in Guernsey, because the ls. slopes northwards and is therefore less favoured than Jersey, which slopes southwards, and where outdoor intensive cultivation prevails on small holdings seldom exceeding 20 ac. The ls. enjoy long-standing privileges of exporting their crops—potatoes, tomatoes, fruit, and flowers—to the United Kingdom free from import taxes. Jersey, Guernsey, and Alderney also export considerable quantities of granite. The ls. are the homes of the well-known breeds of cattle that bear their names. The herds are strictly controlled and are virtually free from disease. The large proportion of local production exported from Jersey and Guernsey gives rise to large imports from the U.K. of food, coal, motor vehicles, feeding stuffs, fertilisers, packing materials, horticult. requisites, hardware, and general goods. Jersey and Guernsey are served by regular steamer from Southampton and Weymouth and air services from the U.K. Sark and Alderney have regular trade and communications only with Guernsey. Trade between France and the ls. is insignificant and there is a steamer service only from Jersey. Eng. currency of all denominations is used, and the 'big five' Eng. banks are estab. Jersey and Guernsey make token issues of their own copper coinage. During the Ger. occupation (1940-45) they issued their own currency notes and postage stamps. A large part of the administration of the ls. is carried out on a voluntary basis, which, with the frugal character of the islanders, accounts for the comparatively low taxation and relatively small public debt, in each ls. Taxation is, however, tending to rise to meet social legislation of various kinds. The ls. have a rich flora and offer much of geological and archaeological interest, Jersey having a remarkable megalithic tomb, La Houque Bic, and a cave, La Cotte de St. Brelade, which has revealed evidence of Neanderthal man. See B. B. Elliott, *Jersey, an Isle of Romance*, 1923; E. Koord, *The Channel Islands*, 1924; T. D. Kendrick, *The Archaeology of the Channel Islands*, 1928; A. C. Saunders, *Jersey in the 18th and 19th Centuries*, 1930; B. de Guerin, *The Norman Isles*, 1948.

Channel Ports. Ger. designs on the C. P. became obvious in the early months of the First World War. Possession of them would have given Germany bases for submarines, besides offering favourable conditions for cutting Brit. communications with France. Hence the Ger. plan was to capture Dunkirk, Calais, and Boulogne and also the Belgian ports, Zeebrugge and Ostend. The menace was increased after the fall of Antwerp on Oct. 9, 1914, when the Gers. concentrated three armies, under the duke of Württemberg, Gen. von Bülow, and the crown prince of Bavaria, for a general offensive towards the straits of Dover. Ostend and Zeebrugge were evacuated and the Belgian Army retreated to the Yser. As

a fast fresh allied troops had been landed at both these ports before Oct. 9, but this had no effect on the fate of Antwerp or in protecting the retreat of the Belgians. (Consult 1914 by F.-M. Viscount French of Ypres, who expresses strong adverse opinions on the policy of directing from London the operations for the relief of Antwerp. Instead of leaving all dispositions to him and to Gen. Joffre.) In the last days of Oct. the three Ger. Armies delivered a formidable and almost simultaneous attack on the allied front extending from the Yser It., through the Ypres sector and La Bassée, to Arras. This was the inception of the first battle of Ypres, and upon its issue hung the fate of the C. P. The moment of greatest danger was during Oct. 31, when Haig, leading the 1st Corps, issued an order that the line Frezenberg-Westhoek-Klein Zillebeke was 'to be held at all costs.' Gen. French, hearing that the 1st Corps had been forced back 'after a glorious stand,' and with 'no shadow of blame upon them or their commander,' thought that the only hope of saving the C. P. was to make a stand on the Ypres-Messines line, but he doubted whether even that was possible, and viewed the situation 'with the utmost gravity.' Yet the Gers. were checked by this fateful battle. At the beginning the sorely tried Belgian Army bore the brunt of the attack, stubbornly resisting Württemberg's troops behind the Yser until such time as the Brit. warships were in position to fire on the Gers., and so compel them to withdraw. Between Nieuport and Ypres, further inland, the advance was thwarted by the desperate expedient of opening the dikes and so flooding the surrounding country. The sole gain to the Gers. in this quarter was the capture of Dixmude. Southward, the second Ger. Army, that under the Bavarian crown prince, after sev. days of fierce fighting, succeeded in advancing its positions a few miles, from La Bassée to Neuve-Chapelle; but this proved the limit of its advance to the C. P. The Third Ger. Army, under von Bülow, operating still further S., could make no headway against the Fr. in front of Arras. The fiercest fighting in the whole battle was near Ypres, the attacks on the Brit. forces being repeated and long-drawn; but though the Brit. line was driven back some little way, it was never pierced. The historic effort of the Gers. to take the C. P. had thus definitely failed. A further effort was made in 1918 in the course of the final Ger. offensive, but the attack was launched from motives of despair. When they were held before Amiens (q.v.), the Gers. delivered a great assault against the Brit. line between Arras and the region N. of Ypres, the plan being to separate Plumer's Second Army from Horne's First Army, the attempt to drive a wedge between the Fr. and Brit. having failed. Success would have jeopardised Calais, for an advance in any way comparable to that already made in the Amiens sector would have involved first Hazebrouck and then Ypres. But though

the Brit. line sustained a terrific battering at Passchendaele Ridge, and lost many important positions, they still dominated the strategic railway lines from and to Amiens, Arras, and Ypres, and the Gers, despite prodigious losses in men, were no nearer the C. P. At the same time, too, they had lost the Belgian ports as effective bases for U-boat operations, owing to the Brit. Navy sinking ships in the harbours of Ostend and Zeebrugge (see also VINDICTIVE; ZEEBRUGGE).

Second World War.—In the Second World War all the C. P. were taken by the Gers. in the course of the campaign on the W. front in 1940, and on May 21 the R.A.F. were attacking some of the ports which were then in Ger. hands. Boulogne was taken by the enemy on May 24. Ostend fell on May 29, and on 30th the Brit. expeditionary force was evacuated from the Dunkirk beaches. See further under WESTERN FRONT IN SECOND WORLD WAR.

Channel Tunnel. The project, known as the C. T. scheme, to connect England and France, is now over one hundred years old and has had a chequered career. It is not due to any engineering difficulty that it still remains merely a project, for the best engineers of both countries are convinced of its feasibility, but to political and economic factors, which, in Great Britain at any rate, have led the responsible chiefs of all parties to refer the scheme to committees. M. Mathieu, a Frenchman by birth, was the first to propose submarine communication with England. He laid the suggestion before Napoleon I that a roadway should be built under the Eng. Channel, and that locomotion should be carried on by means of horses. After railways had come into vogue, it was suggested by some Eng. and Fr. engineers that a tube should be laid along the bed of the sea. Wm. Low, in the year 1867, thought that two single-line tunnels, with numerous passages to connect them, could be engineered. At the Paris Exhibition of that same year a model of a tunnel was shown by Thome de Gamond, and in 1872 the Eng. C. T. Company was formed. The scheme was set on foot, and operations begun at Samzatte, near Calais, and Shakespeare's Cliff, near Dover, headways having been bored for 2600 yds. under the sea at each end. But the plan was not allowed to proceed, for the Eng. military authorities refused to sanction it, saying it would greatly increase the necessity for defensive precautions, and Parliament also strongly opposed the scheme. During the experimental proceedings coal was discovered near Dover. In May 1904 the Paris chamber of commerce passed a resolution strongly advocating the scheme, and the C. T. Company, an offshoot of the original company known as the Submarine Continental Railway Company, founded in 1881 (this company is still in existence, there being one surviving (1940) shareholder), in recent years showed intention of once more approaching Parliament on the subject. It will be seen from the foregoing that the safety of the country

was the determining factor in the refusal of successive Brit. Govs. to sanction the scheme. The military authorities were loath to permit of any project that would deprive Great Britain of the advantages due to her insular situation. But in the twentieth century new factors came into the consideration of the problem even from a strictly military standpoint. First there was the invention of the aeroplane, which caused people to say, especially after M. Blériot had first flown over the Eng. Channel in 1909, that England was no longer an island. Next came the First World War with the submarine warfare of Germany on Brit. shipping, which greatly hampered the forwarding of supplies to the Brit. Army and its allies. After the war the allied generalissimo, Marshal Foch, is reported to have stated that had the C. T. been in existence in 1914 the war might have been shortened by one-half, and that such a tunnel 'would make war in W. Europe impossible.' The Brit. generals, Lord French, Lord Kitchener, and Sir Henry Wilson, declared, on the contrary, that the tunnel would have been a handicap in the war. Finally, since the inception of the *entente cordiale* in 1903 France, the 'historic enemy' of England, 'has become an ally in war and peace. Among economic factors that led after the war to a revival of the agitation in Great Britain in favour of a C. T. was the idea that the undertaking of so large a scheme would assist trade and employment and that it would encourage tourists, fearful of sea-sickness, to visit England. For this reason the great London drapers advocated the scheme, and some London newspapers lent their support. The rival scheme of a channel train ferry, which became an actuality during the last year of the First World War, is an economic factor adverse to the tunnel, and the increasing air transport has led to further economic doubts. A committee appointed by the Labour administration reported in 1930 that there were certain economic advantages in the scheme, but on June 30 of that year the House of Commons, taking its cue from the Premier, Mr. MacDonald, rejected the project by the narrow margin of 179 votes to 172. The Fr. Gov. still attaches great importance to the scheme, as was indicated by the fact that the Chamber has passed a favourable vote on it, which was strongly supported by the foreign affairs committee. The fact, too, that Gen. Weygand joined the board of the C. T. Company is further proof of Fr. military interest in its strategic value. It remains to be added that the Brit. scheme was for a tunnel 30 m. long (of which 20 would be under the sea), costing about £30,000,000 and taking five or six years to build. M. Dautry, chairman of the Fr. C. T. Committee, suggested much the same length and cost, the depth of the lowest portion of the tunnel in his scheme being about 300 ft. below sea level, and he quoted a Franco-Brit. expert agreement to the effect that the receipts for the first year would be

about 557,000,000 francs and that the tunnel would be financially self-supporting. Just before the Second World War, M. André Boisdévant aroused interest by his detailed plans for a 30-m. road tunnel with a road width of 22 ft. and a height from road level to roof of 18 ft., the deepest point being 450 ft. below sea level, and the route being from Marquise, under Cap Gris Nez, to near Folkestone, the estimated cost being £12,000,000. There appears to be no insuperable difficulty (apart from the glacial moraine which is said to exist in the centre of the channel), from the engineering standpoint, in the construction of a C. T., the chalk substratum of the channel bed being eminently favourable to boring operations. According to the C. T. Company, the appropriate plan would be to bore two traffic tunnels, 18 ft. in diameter, with a pilot tunnel of about 12 ft. diameter. It is estimated that the yearly gross revenue from the tunnel, based on the average present ocean passage rates, would be about £4,000,000 and the net profit, £3,000,000.

Channing of Wellingborough, Sir Francis Allston, first Baron (1811-1926), Eng. politician, was b. in U.S.A., son of the Rev. Wm. Henry C. He was educated at Exeter College, Oxford, and was tutor and lecturer in philosophy at Univ. College in the same univ. Married in 1869 Elizabeth Bryant of Boston, U.S.A. He took an active part in promoting agric., educational, and labour reforms. He was a member of the Royal Commission on Agric. Depression, 1893-96, and chairman of the Central and Associated Chambers of Agriculture in 1891. He wrote *Instinct, The Greek Orators as Historical Authorities; The Second Ballot; The Truth about Agricultural Depression* (1897); *Memories of Midland Politics* (1917), etc. He was made a baronet in 1906, and a peer in 1912.

Channing, William Ellery (1780-1842), eminent Amer. Unitarian preacher and writer, b. at Newport, Rhode Is. He graduated at Harvard in 1798, and in 1803 became minister of the Federal Street Congregational Church, Boston, where he acquired a great reputation for eloquent preaching. C. became involved in a controversy in which he was called the 'apostle of Unitarianism,' although he himself objected to the term in the sense it is commonly used. C. had a gentle, pious nature, and shrank from eccles. quarrels, and had little sympathy with those who preached dogma, of whatever kind. He preached and wrote vehemently against intemperance, war, slavery, and oppression. While on a visit to Europe he met many Eng. authors, notably Wordsworth and Coleridge. His works include *Remarks on National Literature* (1823); *On the Character and Writings of John Milton* (1826); *On the Character and Writings of Fénelon* (1829); an essay on *Negro Slavery* (1835); and *Self-culture and the Elevation of the Masses* (1838). His complete works were pub. in five vols. in 1841, and in 1875 were reprinted in one vol. His sermons were collected and pub.

in 1872. See life by his nephew, Wm. Henry C., 1818, and that of J. W. Chadwick, 1903.

Chansons de Geste (Lat. *gesta*), name given to long narrative poems written by the *trouvères* of N. France from the eleventh to the fifteenth century, in number about 110 according to Gautier. Probably as early as the ninth century epic poems began to be known, as chanted by the minstrels, or *jongleurs* as they were called. The earliest known chanson in existence, the *Chanson de Roland*, is by far the most famous and noblest of them all, which appears to have been written between the years 1066 and 1095. Most of the C. are divided into three cycles, that of Charlemagne, of Doon de Mayence, and Garin de Montglane; there are also lesser cycles, such as Garin de Lorraine, and all are connected one with another. Probably the most important cycle was that one which gave an account of the doings of Charlemagne, and was known as the *Geste du Roi*. It described the life of the mother of Charlemagne, as well as that of the emperor himself. Another interesting cycle is that of *La Geste de Guillaume*, which tells of the brave men of the S. who render faithful service to the throne. There are a great number of poems belonging to this cycle, and are some of the earliest now extant. The subjects of these *chansons de geste* are nearly all taken from Fr. hist., and written in verses of ten or twelve syllables. Their general character is inclined to hardness and coarseness, want of art and very little grace, but there is great energy; they are full of Gallic strength and force. Their literary value and historical interest are very considerable; the customs and ideas of the times in which they were written are faithfully reproduced, and their popularity spread into England, Italy, Spain and even Iceland. Very many of the surviving poems were never pub.

Chant, in church music a species of melody used in cathedrals and other churches between an air and a recitative, to which the psalms of the day and canticles, etc., are sung. In the Church of England the psalms are usually chanted, while in some nonconformist churches certain passages of Scripture are also chanted. The earliest form, the Ambrosian C., introduced by St. Ambrose, of Milan, was superseded by the Gregorian C. or plain-song system of antiphonal psalmody as devised by Pope Gregory I. In this system eight groups of chants correspond to the eight modes or tones (represented on the piano by the white notes). The C. begins with an intoning note and then a reciting note, followed by the mediation marking the half of the C., a reciting note and the termination. In the Anglican C. the main principle is that of the traditional Gregorian tones. See also PLAIN SONG, PLAIN CHANT, or GREGORIAN CHANT.

Chant, Mrs. Laura Ormiston, née Dibdin (1848-1923), Eng. social and political reformer. She was b. at Chepstow, and prior to her marriage had been assistant

managers in an asylum and also a school-teacher. She lectured in different parts of the world on woman's suffrage, temperance, liberalism in politics, and many other subjects. In 1895 she began to attack the London music-halls on the ground of social purity. She was a writer of songs and of pamphlets on social questions.

Chantabun, prin. tn. of the prov. of C., on the E. side of the gulf of Siam. It has been a stronghold of the Rom. Catholic missionaries since the seventeenth century, and is considered to possess a stronger Christian element than any other place in Siam (Thailand). There is considerable export trade in rosewood, dyewoods, timber, ivory, hides, gum, and horns, and there are mines of precious stones in the vicinity. Pop. 5000.

Chantada, tn. of N.W. Spain in the prov. of Lugo. It is situated on the l. b. of the Rio de Chantada, and on the main road from Orense to Lugo. There is considerable trade in hemp, flax, grain, and dairy produce. Pop. 15,000.

Chantarelle, see CHANTERELLE.

Chantelaue, François Régis (1821-88). Fr. historian. b. at Montbrison, Loire. He brought out many works, the majority of which deal with the seventeenth century. His most important writings are *Le Cardinal de Retz et l'affaire du chapeau* (1878); then in 1879, *Le Cardinal du Retz et ses missions diplomatiques à Rome*. He had previously pub. (1876) *Marie Stuart: son procès et son exécution*. All these books were crowned by the Fr. Academy. He also brought out others over which there was much controversy.

Chantenay, until 1908, a tn. of France in the dept. of Loire-Inférieure, situated on the R. Loire, 2 m. W. of Nantes of which it now forms part. There are large brandy distilleries, iron foundries, forges, shipbuilding works, etc.

Chanterelle, Chantarelle, and **Chanterella**, popular renderings of the name *Cantharellus cibarius*, an edible mushroom which resembles *Agaricus*. In colour it is a bright orange, the cap is irregularly shaped, the gills are thick and wrinkled, and the whole plant has a pleasant fruity smell.

Chantilly, com. in the dept. of Oise with a celebrated chateau. Rebuilt between 1527 and 1532 and restored by the duc d'Anjou in 1876-82. In 1886 the duke presented it, and the invaluable collections housed in it, to the Institute of France. There is a famous racecourse in the grounds of the chateau. Pop. 6000.

Chantry, Sir Francis Legatt (1781-1841). Eng. sculptor. b. at Norton, Derbyshire. He began life in humble circumstances, his father being a carpenter. He was left an orphan at the age of twelve, but was befriended by a wealthy lady in the neighbourhood, and in 1797 was apprenticed to a wood-carver, frame-maker, and gilder in Sheffield. Here he began modelling in clay and drawing pencil sketches, which attracted the attention of John Raphael Smith, the mezzotint engraver, who gave him some lessons in portrait painting. In 1803 he came to

London and studied at the Royal Academy, where his first work, a 'Portrait of D. Wale, Esq.', was exhibited in 1804. His work was well received, so that in 1809 he received a commission to execute colossal busts of Brit. admirals—Howe, Vincent, Duncan, and Nelson—for the Greenwich Hospital. In 1808 he received an order for a statue of George III. to be placed in the Guildhall. His reputation for portraiture was estab., and he executed busts or statues of most of the prominent men of his time. His busts include those of Sir Walter Scott (two, 1820 and 1828), James Watt (Westminster Abbey), and Wordsworth; his chief statues are Sir Joseph Banks (1827), Washington (in Boston), the duke of Wellington (in front of the Royal Exchange, London), George IV., Canning, and Roscoe (Glasgow). His statue-group of the 'Sleeping Children' in Lichfield Cathedral is well known. C. bequeathed his fortune to the Royal Academy, to be partly expended on the purchase of works of art executed in Great Britain. See J. Holland, *Memorials of Chantry*, 1851; G. Jones, *Sir Francis Chantry*; and D. S. MacColl, *The Administration of the Chantry Bequest*, 1901.

Chantry Fund. This fund was estab. by the bequest of Sir Francis Chantry, B.A., under which £105,000 was invested in consols, the available income being then about £3000. The first purchases out of the fund were made in 1877, and the collection, which now comprises over 437 works, has since 1898 been permanently housed in the Tate Gallery. In 1903 complaints with regard to the Chantry bequest were raised on the ground that the committee was too exclusive in its choice of artists, and since then various changes have been made in the composition of the selection committee. At present it consists of two joint committees for painting and sculpture, each composed of three members of the Academy and two of the Tate Board; proposals for purchase come before the Academy Council, who retain the power of approval or rejection.

Chantry (O.F. *chanterie*, Lat. *cantare*, to sing), term applied to a chapel or altar where masses may be sung for the repose of a soul. C. chapels are often built off the aisle or nave of a church, and have the tomb of the founder placed in the centre. The word C. is also applied to the endowment for the upkeep of such a chapel. See G. H. Cook, *Medieval Chantries and Chantry Chapels*, 1941.

Chanute, city of Neosho co., Kansas, U.S.A. It is in the Kansas Oklahoma oil and gas field, is the centre of a splendid farming region, and much dairy produce is obtained. C. was incorporated as a city in 1873. In 1899 natural gas and oil were discovered. Pop. 10,000.

Chanzy, Antoine Eugène Alfred (1823-1883). Fr. general. b. at Nottul, Ardennes. He was present at Magenta and Solferino in 1859. He had about thirty years' service in Africa, on his return from which he commanded the second army of the Loire in the Franco-Prussian war in 1870. He was ambas. to Russia, 1879-81, and

was nominated as president of the republic in 1879.

Chaochow, city of China, in Kwangtung prov., situated on the It. Hankiang, near where it flows into the China Sea.

Chaoking, city of China, in Kwangtung prov. It is situated on the West It.

Chaones, people who lived in Epirus in the N. of Greece; thus Epirus is occasionally called Chaonia.

Chaos, term given by the Gks. to the space and void which existed before the universe was made. Literally means 'a yawning.' C. is said to be the mother of Erebus and Nox (Darkness and Night).

Chapala, lake in Mexico, with an area of 1300 sq. m., situated between Guadalajara and Michoacan. There are numerous is., and the Rio Grande flows through it.

Chaparral, tn. in Colombia, 115 m. from Bogotá. It is rich in copper, iron, coal, and petroleum. It stands at an altitude of 2740 ft. Near by are the painted rocks of Alpe and a peculiar grotto. Pop. 7000.

Chapbooks, or **Broadsides**, term believed to have come into use in the reign of George IV., and applied to small pamphlets which at that time were the chief form of literature that the poor people enjoyed, not only in England but on the Continent. In Germany they were called *Volksbücher*, first printed in France for the populace after the invention of the printing press. The beginning of the seventeenth century is said to be about the time of their advent into England. Early in the sixteenth century some of these books were devoted to the interpretation of dreams, palmistry, astrology, etc., while others were such tales as *Jack the Giant Killer*, *Patient Grizel*, *Reynard the Fox*, etc. In Scotland a number of more or less religious books were in vogue, especially the 'prophecies' of Peden. Then humorous books were always favourites, among them being *The Merry Exploits of George Buchanan*. Thackeray describes the Irish C. in his *Irish Sketch Book*, chaps. xv., xvi.

Chapel (printing house), see FATHER OF THE CHAPEL.

Chapel (O.F. *capelle*, from Lat. *capella*, a sanctuary), building that is used for worship. Cs. were attached to cathedrals, churches, and abbeys as early as the tenth century, and were dedicated to some saint. An altar and relics of the saint were placed in the C., so that private devotions or special services might be held there. The central C. was often called the lady C. because it was dedicated to the Virgin Mary. Cs. might also be erected to hold the tombs of private individuals, as Henry VII.'s C., added in 1502-20 to the E. end of Westminster Abbey. Cs. were also built by private families on their own estate, and by colleges and guilds. Modern colleges and schools frequently have Cs., in imitation of those at Oxford and Cambridge. The term C. is also applied to places of worship built by nonconformists, as distinct from those consecrated according to the laws of the Church of England.

Chapel Royal, of England, the date of whose foundation is not certain. It is

known, however, that it was in existence at the time of Edward IV. It is composed of a dean, sub-dean, and fifty-eight clergymen, ten of whom are called priests in ordinary. Like the Ger. *Kapelle*, it is to be understood not as a building but as a body of clergy and musicians. Its purpose was to attend on the sovereign, wherever he or she might be. In former years it existed in the chapel at Whitehall, but now it never holds a service anywhere but in the chapel known as the C. R. at St. James's Palace, London. 'The Chapel Royal, as an institution, has been of the greatest value in fostering English musicianship and in promoting the development of English music' (Scholes).

John H. Stone

CHAPEL ROYAL, ST. JAMES'S PALACE

There were thirteen minstrels and eight choir-boys in the C. R. of Edward IV., and in the fifteenth century began the custom of the musical members performing 'interludes' before royalty. The C. R. under Elizabeth was especially distinguished, for its church music was not inferior to that of the musicians of the Sistine Chapel. In the late seventeenth century Purcell was 'composer in ordinary' to the chapel. If the brightest days of the C. R. in developing Eng. music had passed in the late eighteenth century, there were still accomplished organists whose names are familiar to every student of Eng. musical hist.

The C. R. of Scotland was founded by Alexander I. at Stirling Castle, but Mary had it removed to Holyrood. The chapel now consists of the dean, appointed by the sovereign, and six chaplains in ordinary who attend on the king when he is at Balmoral Castle. Any money that belongs to the chapel is given for salaries for chairs of divinity in connection with a univ. The name used to be given to Holyrood Abbey Church, which is now in ruins.

Chapelain, Jean (1595-1674), Fr. literary critic who first came into notice

through his preface to the *Adone* of Marino in the year 1623. He was considered quite the chief of Fr. poets, and every one thought that his *Pucelle*, which was one of the pseudo-epics of that time, would equal the *Hiad* or *Æneid*. The popularity of this work, however, did not endure, and after the praise bestowed on the issue of the first twelve cantos in 1636 had subsided, his fame gradually dwindled, and he was laughed at by the younger poets such as Boileau. Under the patronage of Richelieu, however, he was prominent in founding the Académie, and it is to him that the rules of the 'three unities' were formally estab. in Fr. drama. The last twelve cantos of *La Pucelle* were not pub. until 1882. His most important work is *Séductions de l'Académie sur le Cid*, which he brought out in 1637.

Chapel-en-le-Frith, tn. and par. in High Peak div. of Derbyshire, England, 4½ m. N. of Huxton. Pop. 3000.

Chapelhall, vil. in Lanarkshire, Scotland. There are collieries and ironworks in the neighbourhood.

Chapelle Ardente, chamber, catafalque, or bier for the lying in state of exalted persons, lit with candles. In Westminster Abbey, at the Crossing, dead kings lay in effigy under elaborate canopies or 'hearses,' supporting a multitude of candles. The effigies, carried at the funerals, represented the actual corpse. Henry VII. provided by his will that at his funeral a hearse should be set up, with 100 tapers and four great candles in the lantern space, until the king's great chapel was finished (see under WESTMINSTER ABBEY). The hearse of Edmund Crouchback (earl of Lancaster) had no fewer than 559 candles, an odd number which suggests that there was a single one at the apex. This custom is first recorded as occurring at the obsequies of the Frankish king, Dagobert I., in the seventh century. See W. R. Lethaby, *Westminster Abbey Re-examined*, 1925.

Chapelle St.-Denis, anct. com. of Seine, France. It was united to Paris by an imperial decree of 1860, and now forms part of the eighteenth arron.

Chapeltown, eccles. par in the W. Riding of Yorkshire, England, 6 m. N. of Sheffield. There are collieries and iron foundries, and bricks, tiles, etc., are manufactured. Pop. 9000.

Chaperon (Fr. hood) has a variety of meanings: (1) It is the name often given to the plumes seen on horses' heads in funeral or other processions. (2) Also applied to the cap, which is worn by members of the Eng. Order of the Garter. (3) It is the name given to the academic hood worn by all people who have taken a degree of any kind, such as Doctor of Music, Bachelor of Arts, etc. (4) Most commonly known as the term applied to a married lady who is acting as 'guardian' to an unmarried woman when appearing in public. This custom arose in the reign of Queen Anne. Prior to this no unmarried girl or woman could appear in public except under the guardianship of a near relation.

Chaplain, term employed for a clergyman serving in some official capacity. Thus, in civil life, there are Cs. of the Chapel Royal, of prisons and workhouses, and, in an almost obsolete sense, of the households of noblemen. But the word is most commonly used in connection with the armed forces. In the Brit. Army there are regimental Cs., i.e. clergymen specially commissioned for military service, and having the status of a non-combatant officer. The service is under a military dept. of the War Office, and is governed by a C.-general, with the rank of a major-general, who has jurisdiction over the Anglican Cs., who form the majority. Rom. Catholic and Presbyterian Cs., who are commissioned for regiments where most of the men are of one of these faiths, are under the authority of the secretary of the War Office. Cs. are of four ranks, corresponding to colonels, lieutenant-colonels, majors, and captains. Their duties are to accompany the troops on active service, and in times of peace to hold divine service, officiate at funerals, etc., visit the men, and generally act as par. priests to the military stations to which they are allotted. Every large ship in the navy has an Anglican C., who must not be over thirty-five years of age on entering the service, and who retires at sixty. Cs. who also act as naval instructors receive special allowances. The head of the service, the C. of the Fleet, is paid £1358, the same as that of the C.-general. Naval Cs. are members of the gun-room or wardroom mess, and their duties include the holding of services on board, visitation of the sick, and assistance in the maintenance of moral discipline among the men. During the First World War a great expansion of the Cs. Dept. took place as a result of the numerous new units brought into existence, the estab. of hospitals both in the field and at home, and of the casualties among Cs. themselves. By 1915 the nonconformist churches and churches of the Jewish religion had Cs. on the regular estab. of the army, and before the end of the war the Salvation Army was similarly represented. Most of the Cs. were in France and Flanders, but wherever there were Brit. troops Cs. accompanied them. They shared in the dangers in Italy, Macedonia, E. Africa, Egypt, Palestine, Iraq, and on hospital ships. Besides looking after the spiritual welfare of the army, Cs. rendered a great service by arranging concerts and performing many other social services. The fine services of the Brit. Army Cs. Dept. was marked by His Majesty King George V. in 1919 by granting the title of 'Royal' to the dept., which then became the Royal Army Cs. Dept. During 1930 a C.-commandant was appointed to the dept. and a new badge approved. In the Second World War there was a similar expansion of the Cs. Dept. and Cs. accompanied the troops to N.W. Europe, N. Africa, Italy, and Burma.

Chaplain, Jules Clément (1839-1900), sculptor of medals and busts, deserves honour because he restored to its earlier

dignity the fallen art of engraving on medals. Thus he executed a series for various societies and functions, including one for the Universal Exhibition of 1867, another in commemoration of the resistance of Paris, a third for the Salons, and a fourth to be given as a recognition for acts of heroism. Among his medallion portraits are those of Meissonier, Renan, and Gambetta. *D.* at St. Germain-des-Prés.

Chaplin, Charles (1825-91), Fr. painter, *b.* at Andelys (Eure) of Eng. parents. He soon found that his real vocation lay in painting portraits of women in the Watteau and Boucher style. He managed to catch the piquant charm of Parisian women in his pictures. In 1860 he painted the apartments of the Empress Eugénie at the Louvre, and afterwards the bathroom at the Élysée. His best works are 'Les Bulles de Savon,' 'The Birth of Venus,' 'The Bath,' and 'Rising in the Morning.' He was also an excellent engraver, and made engravings of many of Decamp's and Watteau's pictures, and also of some of his own.

Chaplin, Charles Spencer ('Charlie Chaplin'), cinematograph actor and producer, *b.* April 16, 1889--in France, according to some—son of Charles C., a variety comedian. His boyhood's home was in the Kensington neighbourhood, S. London. He went on the stage at the age of seven, and in 1899 appeared in music-halls all over the United Kingdom as one of 'Eight Lancashire Lads.' He appeared at the opening of the London Hippodrome, Jan. 15, 1900, in *Giddy Osend*. He then entered the company touring with Wm. Gillette's version of *Sherlock Holmes*, as Billy. He appeared in London at the Duke of York's Theatre, Dec. 27, 1904, as one of the wolves in the first production of *Peter Pan*. On Oct. 3, 1905, he acted Billy in the *Painful Predicament of Sherlock Holmes*, with Wm. Gillette and Irene Vanbrugh. He first appeared in the U.S.A. in 1910 with Fred Karno's company; and his connection with the films began through Joseph M. Schenck, who engaged him for the Keystone Company at Hollywood. Until recently he always kept to the same get-up. His little round hat, smudge moustache, slack trousers, and long-toed boots, his flat-footed gait and imperturbable impassivity, gradually became so famous that, at the beginning of the First World War, no personality was more familiar to the Eng.-speaking world. He had his own producing organisation and studios at Hollywood. Some of his films are *Shoulder Arms*; *The Kid*; *Idle Class*; *Pay Day*; *The Pilgrim*; *The Gold Rush*; *The Circus*; *City Lights*. He staged, but did not appear in, a serious film, *A Woman of Paris*. His film *Modern Times* was shown in London in 1936; *The Great Dictator* in 1940; and *Monsieur Verdoux* in 1947.

Chaplin, Henry, first Viscount (1810-1923), Eng. statesman, *b.* Dec. 22, 1840, second son of the Rev. Henry C. of Blankney, Lincolnshire, and was educated at Harrow and Christ Church, Oxford.

He first went into Parliament in 1868, as Conservative member for Mid-Lincolnshire. There he remained till 1906, when he was defeated; but he re-entered again in 1907 in a by-election, member for Wimbledon. He was a well-known figure on the racecourse, and his horse *Hermit* won the Derby in a snowstorm in 1867. He took a great interest in agric. questions, and was a typical specimen of an 'Eng. country gentleman.' In 1889 he became president of the new Board of Agriculture, with a seat in the Cabinet, and he kept this position till 1892. He was always an advocate of Protection; and when Joseph Chamberlain began his Tariff Reform campaign, C. was one of its most ardent supporters. He was President of the Local Government Board 1895-1900, and was responsible for the Agric. Rating Act. In 1916 he was raised to the peerage. See *Marchioness of Londonderry*, *Henry Chaplin*, 1948.

Chapman, small itinerant tradesman. In the eighteenth century he sold chap-books, needles, laces, linen, and all sort of things, and bought up old brass, old clothes, and sometimes human hair.

Chapman, George (1559-1634), Eng. dramatic poet and translator of the *Iliad* and the *Odyssey* of Homer. *b.* at Hitchin, Hertfordshire. (Anthony Wood is responsible for the very dubious connection with Kent.) A fine classical scholar, he was educated at Trinity College Oxford, which he left for London about 1576. Here he settled at once to a literary career, was patronised by Sir Thomas Walsingham, Henry, Prince of Wales, and Carr, earl of Somerset, and became friendly with Shakespeare (C. has been plausibly identified with Shakespeare's rival poet of the *Sonnets*), Spenser, Daniel Marlowe, Jonson, and Inigo Jones, the architect, who after his death designed a monument for him in St. Giles-in-the-Fields. His trans. of Homer, the earliest in Eng., appeared in various parts, the *Iliad*, 1598-1611, and the *Odyssey* in 1614-15. These trans. occupied his leisure through much of his lifetime. His version of Homer is one of the most faithful to the original we possess in verse, but his *Iliad* loses much of the fire and spirit of Homer by reason of his metre, which is the fourteen-syllabled rhyming line of Drayton's *Polyolbion*. It was warmly praised by Dryden, Pope, and Coleridge. His version of the *Odyssey* is in ten-syllabled heroic couplets and is hardly less deserving of the same high praise. His first play was a comedy, *The Blind Beggar of Alexandria* (1596), which, like its successor, *A Humorous Day's Mirth* (1599), is poor. But his *All Fools* (1605) is entertaining comedy, with ingenious situations, sprightly characters, and a well-constructed plot. *The Gentleman Usher* (1606) and *Monsieur d'Olive* (1606) have some good features, but are defective in construction. *The Widdowes Teares* (1612) is also among his better comedies. The comedy, *Eastward Hoe* (1605), regarded as his best, was written in conjunction with Jonson and Marston and was the inspiration of Hogarth's

'Idle Apprentice.' Many of his tragedies deal in a spirit of tolerance with contemporary Fr. affairs, and are melodramas of bloodshed, with many horrors, no little rant and fustian, and with but deficient skill in characterisation. Among his tragedies are *Bussy d'Ambois* (1607); *The Conspiracie, and Tragedie of Charles Duke of Byron* (1608); *The Revenge of Bussy d'Ambois* (1613); and *The Warres of Pompey and Cæsar* (pub. 1631 but probably written much earlier). He also pub. sev. other trans. and various poetical works, including the euphuistic *Ovid's Banquet of Sense* (1595), the conclusion of Marlowe's *Hero and Leander* (1598), *The Tears of Peace* (1609), a dignified funeral song in memory of Prince Henry (1612), and a masque performed by the societies of Lincoln's Inn and the Middle Temple to celebrate the betrothal of the Palgrave and the Princess Elizabeth in 1613. See T. M. Parrott, *Plays and Poems*, 3 vols., 1910-14; R. L. Hine, *Hitchin Worthies*, 1932; H. Ellis, *George Chapman*, 1931; P. Brooks Bartlett, *Poems*, 1942.

Chapman, John (1801-54), Eng. political writer, b. at Loughborough in Leicestershire. He failed in business, which was that of a lace manufacturer, in 1834, and went to London and became ed. of the *Mechanics' Magazine*. He invented improvements in the 'four-wheeler', which eventually led to the hansom cab. He wrote *The Cotton and Commerce of India* in 1851.

Chapman, Sir Sydney John (b. 1871), Eng. economist, b. at Wells, Norfolk. Educated at Manchester Grammar School and Cambridge Univ. Prof. of Political Economy, Owens College, Manchester, 1901-17. Permanent under-secretary Board of Trade, 1920-27; chief economic adviser to the Brit. Gov., 1927-32. Chairman of the Imperial Economic Committee, 1931-32. Pub. *Outlines of Political Economy* (1911).

Chapman, Walter, see CHEPMAN.

Chapone, Hester, *née* Mulso (1727-1801), Eng. essay writer, and an ardent admirer of Richardson the novelist. She wrote *Letters on the Improvement of the Mind* in 1772, and this was very popular in girls' educational circles. This essay was very often found bound up with Dr Gregory's *Advice to a Daughter*. Her complete writings may be found in vol. xviii. of Chalmers's *British Essayists*, 1856-57.

Chappe, Claude (1763-1805), Fr. mechanician, b. at Brûlon, Normandy, the nephew of Abbé Chappe d'Auteroche, the astronomer. He was the inventor of a form of telegraphic communication founded on the theory of Robert Hooke (q.v.) (1684) as modified and practically demonstrated by Guillaume Amontons (q.v.), which he presented to the National Assembly in 1792. It was successfully tried between Paris and Lille, and soon came into general use.

Chappell, William (1582-1649), bishop of Cork and Ross. He was b. at Laxton in Nottinghamshire. Archbishop Laud favoured him, and through his influence

he was made dean of Cashel in 1633. Afterwards he was provost of Trinity College, Dublin, from 1637 to 1640, and then bishop of Cork and Ross in 1638. After Strafford's fall, he was put into prison for a short time in Dublin in 1641 and at Tenby in 1642.

Chappell, William (1809-88), Eng. musical antiquary. He managed his father's business (a firm of piano-makers). He pub. *A Collection of National English Airs, consisting of Ancient Song, Ballad, and Dance Tunes*, in two vols., between 1838 and 1840, which he afterwards extended and reissued under the name of *Popular Music of the Olden Time* (1855-1859). In 1841 he founded the Musical Antiquarian Society, as well as the Percy Society. For this latter society he ed. Dowland's songs, and assisted in the preparation of the *Percy Folio* in 1868. He also produced (1871-75) in three vols. his notes on the *Roxburghe Ballads*, of which only one vol. was pub., which contain a vast amount of archæological information. He also projected a *History of Music*, of which only one vol. was pub. in 1874.

Chapra, or Chupra, chief tn. in Sarau dist. in Bengal, India, 32 m. from Patna. It has lost its commercial importance, but still has many banking houses. Pop. 45,000.

Chaptal, Jean Antoine, Comte de Chanteloup (1756-1832), Fr. chemist and statesman, b. at Nojaret, Lozère; graduated in medicine at Montpellier in 1777, and settled to scientific study in Paris. In 1781 he became prof. of chem. at Montpellier, and made many discoveries of considerable commercial value. Though in the main a supporter of the revolution, he was imprisoned by the popular party in 1793, but was soon released to become director of the salt-petro works at Grenelle. In 1796 he became a member of the Institute, in 1800 a councillor of state, in 1801 minister of the interior, and in 1805 grand officer of the Legion of Honour, and a senator. Author of sev. works on chem.

Chapter, originally an assembly of monks or canons, now the body of ecclesiastics, known as canons, attached to a cathedral or collegiate church. They are presided over by a dean, and are considered as the council of the bishop. The term is used in both the Anglican and Rom. Catholic churches.

Chapter-house, building in which the chapter (q.v.) of canons of a monastic estab., cathedral, or collegiate church meets for the discussion of its affairs. They are often elaborately designed and ornamented, and usually polygonal, or octagonal, as at Lichfield and York, in shape. Benedictine Cs. are usually square, as at Canterbury, but Westminster has an octagonal C. and Worcester a circular. The C. at Lincoln is a decagon. York C. is remarkable for still preserving the beautiful original stained-glass windows, while the original frescoes are still to be seen on the walls at Westminster. At Ripon the usual central shaft is replaced by two central pillars supporting the

ceiling, and there is an apsidal end. In position the C. usually lies to the W. of the transepts of the church, from which it opens either directly or by a passage. Crypts are occasionally found beneath the floor.

THE NORMAN CHAPTER-HOUSE OF
BRISTOL CATHEDRAL

An engraving of a drawing by R. Garland, 1538

Chapu, Henri Michel Antoine (1833-91), celebrated Fr. sculptor. He was b. at Mée (Seine-et-Marne), and was a pupil of both Fradier and Duret. He became a member of the École des Beaux Arts in Paris in the year 1849 and won the Grand Prix, and in 1855 the medal. His first work shown in the Salon was 'Mercury inventing the Caduceus,' and it is now in the Luxembourg at Paris. His strong point in sculpture was his extremely able portrayal of tenderness and charm in woman. His most typical pieces of work are 'Princess Hélène at the Tomb of the duc d'Orléans,' now at Dreux; and 'Youth' in memory of Henri Regnault. His 'Joan of Arc at Domremy' in the Luxembourg is not his best work.

Chapultepec, tn. 1½ m. from Mexico, with 1200 inhab. where the anc. Aztec kings resided. The residence itself has been replaced by a castle, which serves as a military school. Here the Mexicans were finally defeated by the Amers. in 1847. In consequence Texas, New Mexico, and California were ceded to the U.S.A.

Char, see **CHARR**

Char, or **Charra**, tn. of Kenya, E. Africa. It is situated on the R. Tana, 4 m. from its mouth.

Char-a-banc was originally a large four-wheeled vehicle in the form of a wagonette with benched seats from side to side and facing driver. There was an alley-way in the middle. It was drawn by two or four

horses according to size and used principally for picnic parties. It has in the motor age developed into the motor coach and the use of the older name has fallen into disuse.

Characeæ, order of the green Algae of which the species inhabit fresh and brackish water of pools and slow streams. They emit a nauseous offensive odour, and near Rome they are pestilential. They are interesting on account of the facility with which they exhibit the circulation of their fluids.

Characteristic (of a logarithm), see **LOGARITHMS**.

Charade, kind of riddle, consisting of the subdivision of a complete word, which forms the answer, into its component syllables or letters. A certain amount of information is given of each syllable or letter, and also of the reunited whole, which then has to be guessed. Cs. may be either written or acted. In the latter, which form a favourite drawing-room amusement, the scenes—one for each syllable of the word, and one for the word itself—are arranged to introduce plainly, though not obtrusively, the syllable or word in question. Cs. are usually extemporised, half the company retreating and concocting scenes which they return and act to the remaining half, who attempt to guess the word. Written Cs. for acting may also be bought. In dumb Cs. the acting is entirely in dumb show.

Charadriiformes, plover-like birds, form the eleventh tribe in Gadow's classification, and comprise sev. hundreds of species of various habits. The group is subdivided into the *Limicola*, birds which wade and fly, e.g. the oyster-catcher, the various plovers, sandpiper, and snipe; the *Lari*, which swim and fly, e.g. the gull; the *Pterocles*, which are desert birds, e.g. sand-grouse; the *Columba*, good fliers, e.g. dove; and sometimes a fifth group is added, *Alce*, marine birds, e.g. the auk.

Charms, genus of moths of the owlet-moth family or Noctuidæ, is represented in Britain by sev. species. The larvae feed upon roots, and pupate underground. *C. graminis* is common in Sweden, where the caterpillar frequently proves destructive to the pastures.

Charala, tn. of Colombia. in the dept. of Santander, 120 m. N.E. of Bogotá. Pop. 11,000.

Charcoal, blackish residue consisting of impure carbon, obtained by removing the volatile constituents of animal and vegetable substances. It is a porous solid, burning without flame or smoke, obtained by the imperfect combustion of organic matter. Various kinds are produced from wood, sugar, bone, and coal (giving coke and gas carbons). Wood charcoal results from strongly heating wood. If for fuel, it is best prepared by partial combustion of wood in heaps; for gunpowder the wood is charred in externally heated cylinders to avoid the introduction of grit. Brown C., used in preparing 'cocoa' powder, is prepared at a lower temp. Wood charcoal is used as a fuel, a filter, and an absorbent of gases and aqueous vapours; also, as a non-conductor

of heat, for packing round cold storage-rooms or refrigerators.

Animal charcoal, or bone black, is produced by dry distillation of bones and ivory. It contains mainly calcium and magnesium phosphates, and is often manufactured from residues obtained in glue and gelatin industries. Its decolorizing power was applied in 1812 to the clarification of syrups obtained in sugar refining, but other reagents have now replaced it for this purpose. It is also used as a deodorant and for crayons. *See also* CARBON.

Charcot, Jean Baptiste Etienne Auguste (1867-1936), Fr. doctor and Antarctic explorer, *b.* at Neuilly-sur-Seine, the son of Jean Martin C. He commanded the Fr. Antarctic expedition of 1903-5 and also that of 1908-10. The latter expedition sailed in Aug. 1908 from Havre in a vessel called the *Pourquoi Pas?* It was one of the best fitted out and up-to-date vessels that ever put out on such a quest. The expedition brought back much very valuable information, as the whole affair had been carried through most scientifically. A new coastline in 70° S. was mapped, as also were Graham Land, Adelaide Is., Alexander Land, and Deception Isle. Much hydrographic work was done, such as soundings, surface and deep-sea temps., deep-sea dredging and fishing with tow and vertical nets. The expedition came back to Rouen in June 1910. Dr. C. pub. an account of his explorations in *Le Français au Pôle Sud* in 1905, and *Le Pourquoi Pas? dans l'Antarctique* in 1910 (C. Land in Antarctica is named after him); *Rapports des croisières scientifiques de 1912 à 1914 et de 1919 à 1930*, and *Autour du Pôle Sud* (1912). He died at sea.

Charcot, Jean Martin (1825-93), Fr. physician, *b.* in Paris. He graduated as M.D. of Paris Univ. in 1853, and three years later he became physician of the Central Hospital Bureau. In 1860 he was appointed prof. of pathological anatomy in the medical world of Paris, and in 1862 he began his connection with the Salpêtrière which lasted all his life. He was elected to the Academy of Medicine in 1873, and in 1883 was made a member of the Institute. He was a good linguist and had an excellent knowledge of the literature of other countries as well as his own. He was a great clinical observer and pathologist. He spent much of his time in studying obscure morbid conditions such as hysteria in relation to hypnotism. His work at the Salpêtrière was chiefly in the study of nervous diseases, but besides his labours in the field of nerves he also pub. many able works on the subjects of liver and kidney diseases, gout, etc. His complete works came out in nine vols. between 1886 and 1890. He was extraordinarily successful as a teacher, and his many followers were most enthusiastic in their work. Dr. S. Freud was among his pupils. He d. very suddenly at Morvan while on a holiday.

Chard, municipal bor. and mkt. tn. of Somersetshire, England, situated within a mile of the Devonshire border, on high

ground, between the Bristol and Eng. Channels. It is of great historic interest, being the scene of a victory gained by the parl. forces during the Civil war. Judge Jeffreys held here in 1681 one of his 'bloody assizes.' There are manufs. of linen collars, lace, and iron and brass goods. Pop. 4,500.

Chard, John Rouse Merriott (1847-97), Eng. engineer officer who defended Rorke's Drift successfully with Lt. Bromhead and 110 men against 3,000 Zulus. He thus saved Greytown and Helpmakaar, and made sure the retreat of Chelmsford's forces. This was fought on the night of the Isandhlwana disaster, Jan. 22, 1879.

Chardin, Jean Baptiste Siméon (1699-1779), Fr. painter, *b.* in Paris. He was a pupil of Coppel, whom he copied in details of nature. His early work was in still life pictures, and they were often believed to be by Flemish artists. He was the first notable Fr. artist to depict middle-class life, which he did with truth and refinement. As a *genre* painter, his pictures were in sharp contrast to the work of his contemporaries, who always depicted the *fêtes galantes* of their time. Among his best paintings are 'Le Bénédicité,' 'L'Enfant au Toton' ('Child with Teetotum'), 'Le Buffet,' 'Le Jeune Violoniste,' 'La Toilette du Matin,' and 'Les Tours de Carte' ('Card Tricks'). Most of his pictures are in the Louvre, but the National Gallery, London, has one of them; there are others in other Brit. galleries and in Glasgow Univ., and Dublin has his 'Card Trick.' *See* lives by E. and J. de Goncourt, 1861; E. Pilon, 1909; and G. Wildenstein, 1933.

Chardin, Sir John (1643-1713), E. traveller, *b.* in Paris, the son of a jeweller. During 1661-70 he visited India and Persia, spending some years at Ispahân, where he acquired much useful knowledge, and was employed as a royal agent for the purchase of jewels. After revisiting Paris, he returned to Persia in 1671, remaining there till 1677. In 1681 he settled in London, where he was knighted by Charles II., elected a fellow of the Royal Society, and employed on diplomatic mission. His *Travels in Persia and the East Indies* (3 vols.) appeared 1686-1711.

Chardonnet Silk, *see under* ARTIFICIAL SILK.

Chardzhou, *tn.* in Uzbekistan, in the C. Region of the Turkmén S.S.R., near S. bank of the Amu Darya and 70 m. S.W. of Bokhara on the Trans-Caspian railway. It has trade in raw cotton. Pop. 10,000.

Charente, dept. of France, formed out of the old prov. of Angoumois, with portions of Saintonge, Poitou, Marche, Limousin, and Périgord. Area 2,306 sq. m., divided into the three arrons. of Angoulême, Cognac, and Confolens. Watered by the Charente, Vienne, and Dronne, the last forming the S. boundary. The greater part of the surface is undulating, with a light warm soil resting upon calcareous or chalky rocks. A small dist. in the N.E. is hilly, with numerous lakes, and has a clay soil on a granite or schist foundation. Granite, limestone,

iron, and gypsum are found. There is extensive forest land, and grain, potatoes, vines, beets, hemp, flax, and truffles are grown. Chief manufs.: paper, felt, and woollen and cotton goods. Cap. Angoulême. Pop. 311,000.

Charente-Maritime, dept. of S.W. France, formed out of most of the old provs. of Aunis, and parts of Saintonge, Poitou, and Angoumois, and including the is. of Ré and Oléron. Area 2790 sq. m., divided into the arrons. of La Rochelle, Jonzac, Rochefort-sur-Mer, and Saintes. Watered by the Charente, Boutonne, Sèvre-Niortaise, Touvre, and Gironde. Surface level, with very fertile soil. Grain, vines, potatoes, pulse, hemp, flax, beets, and fruit are grown, and much livestock reared. The chief industries are agriculture, the distillation of Cognac brandy, the working of the salt-marshes on the coast, and the pilchard and oyster fisheries. Cap., La Rochelle. Pop. 116,100.

Charente, River, riv. of France, rising in Haute-Vienne, 14 m. N.W. of Chalus, and flowing W. through Charente and Charente-Maritime into the Atlantic opposite the is. of Oléron. Length 200 m. Tribs., Boutonne on the r. b., and Touvre and Né on the l. b.

Charenton-le-Pont, tn. of Seine, France, at confluence of Seine and Marne, 1 m. S.E. of Paris. Has ports on the Seine and Marne, a celebrated lunatic asylum (actually at St. Maurice), and many country houses. Pop. 21,000.

Chares, Athenian general of fourth century B.C. In 366 he was sent to assist the Philistines against the Arkives, Arcadians, and Thebans; in 361 defeated the democratic party at Coreyra; in 358 compelled the execution of the Convention of Athenodorus in Thrace, and in 357 took over the command of the Social war. His successes seem to have been largely due to party influence and corruption.

Chares of Lindus, in Rhodes, Gk. sculptor of about the fourth century B.C., a pupil of Lysippos. He is the traditional designer of the Colossus at Rhodes, one of the seven wonders of the world. This, which was a bronze statue of Apollo, was destroyed by earthquake in 224 B.C. See COLLOSSUS.

Chares of Mytilene, master of ceremonies at the court of Alexander the Great. He appears to have held sev. military commands, but in this connection there is confusion with Chares the Athenian general. Small portions of his book of anecdotes about Alexander are still extant.

Charette de la Contrie, François Athanase (1763-96), was the leader of the Vendean rebellion against the Fr. Revolution. He was b. at Coulé, near Oudon (Loire-Inférieure). He was made chief of the Lower Vendée in 1793, and as he had many successful encounters with the revolutionists he was ordered to assist the Royalist Army against Nantes (June 1793). C. was then unsuccessful, but he began a harassing guerrilla warfare. An armistice was made between C. and the Convention early in 1795, but it did not last long. After the defeat at Quiberon

(June 27, 1795) Hoche pursued him relentlessly, and defeated him again and again. At last Hoche took him prisoner and had him executed at Nantes on March 26.

Charge, in law, in a wide sense denotes a duty or obligation imposed upon some person in a will, or deed, or contract, or in some transaction collateral thereto. More strictly C. denotes a mortgage, lien, hypothecation, or pledge over a specific thing by virtue of which a creditor may in certain events be entitled to satisfy his claim out of the thing itself or proceeds thereof.

Chargé d'Affaires, diplomatic agent, ranking next below a resident minister, in connection with the ministers for foreign affairs, from the head of which dept. he holds his credentials. He may either act as a representative at a minor court or be empowered to take the place of an ambas. in his absence.

Charging Current: 1. Of an accumulator battery, the current at which electricity should be made to flow into the battery in order to bring it into that chemical condition which makes it a potential source of electrical energy. The C. C. depends on the capacity of the accumulator, and the quantity of electricity put into it is known as the *charge*, being usually measured in ampere-hours. 2. Of a condenser, the rate of flow of electricity into a condenser resulting from the potential differences across its terminals.

Charing Cross, dist. of London, England, at the W. end of the Strand and on the S.E. side of Trafalgar Square, within the city of Westminster. It takes its name from the stone cross which was erected by Edward I. to mark the last resting-place of the coffin of his queen, Eleanor, before her interment in Westminster Abbey. A fine modern cross stands in the courtyard of the former S. Railway station in the Strand. The origin of the name 'Charing' is doubtful, although popular tradition derived it from 'chère reine' in reference to Edward's 'dear queen.' Another derivation is suggested from 'O.E. *cierring*, "turning, turn" - referring to the bend in the Thames near the place or possibly to a bend of the Roman road that ran near by' (*Concise Oxford Dictionary of English Place-names*).

Charing Cross Bridge Scheme. This is a plan for adding to the amenities of London by giving greater traffic facilities, at the same time improving on the alleged shortcomings of the Londoner of Victorian days in the matter of architectural beauty. The bridge over the Thames at Charing Cross is for railway traffic, with a footway beside the metals. It stands on the site of the old Hungerford suspension bridge; and the red-brick pier in the riv., near the Surrey side, forming part of the old bridge, has been incorporated in the present structure, which is of steel with round steel caissons, or pillars, the whole being painted a dull red. While adequate for the purpose for which it was built, namely to carry the Southern Region line into Charing Cross station, and admirable from the point of view of traffic on the riv.,

affording as it does an uninterrupted view, it has been denounced by the æsthetic-minded as an eyesore. This impression was heightened by the fact that Rennie's Waterloo Bridge (now demolished), the next bridge down-stream, had very considerable architectural merits, although difficult to negotiate by river traffic—a series of canal arches, it was called by Mr. Bernard Shaw. There is also a feeling that the foreshore on the Surrey side of the riv. between Westminster and Waterloo bridges has a drab and shabby appearance unworthy of the capacity of an empire. This is borne in on the

was the finest of its kind in the world. The road it carried was quite level, but it was very narrow, for apart from the footpaths there was little more space than would suffice for the two streams of traffic, north- and south-bound. The subsidence was doubtless caused by the bigger wash made by the passage of larger vessels up-stream than were in use when Rennie built the bridge, for among other craft, colliers, carrying about 2000 tons of coal, now pass up the riv. to Vauxhall and Wandsworth. The subsidence made the question of a new, or repaired, Waterloo Bridge urgent and the Gov. of Mr.

John H.

CHARING CROSS BRIDGE, FROM COUNTY HALL ON THE SURREY SIDE

observer when he regards County Hall and the short embankment in front of it and then contrasts this improvement with the somewhat anct. wharves and the old brewery that neighbour it. Added to these æsthetic considerations are the practical ones that a road bridge at Charing Cross would greatly relieve the congested traffic in the Strand and that the existence of a tube railway running under the Thames connecting Charing Cross with Waterloo has to some extent obviated the necessity to have the terminus of the Southern railway on the Middlesex side of the riv. What finally brought the question to a head was the serious subsidence of two of the central arches of Waterloo Bridge. Of the fourteen road bridges over the Thames in the co. of London, Waterloo Bridge was the oldest standing, for John Rennie's masterpiece was opened in 1817. This bridge had as many as nine arches and it

Baldwin appointed a royal commission presided over by Lord Leo of Farnham to consider the whole question of the Thames bridges in London. This commission produced a report dealing, *inter alia*, with the Charing Cross scheme, and on March 16, 1927, the Gov. announced that it would find 50 to 75 per cent of the money needed for new bridges and riverside improvements in connection with them, being prepared to spend £1,000,000 a year for a number of years. On July 30, 1929, the London County Council and the shareholders of the Southern railway approved the agreement reached between the leaders of these two bodies to build a new bridge from Charing Cross to the Surrey side, the scheme involving the placing of the terminus of the S.E. section of the Southern railway on the site of the Lion brewery. This approval having been given, a Bill was promoted in Parliament in 1930 to obtain the necessary

sanction to proceed with this work. It was, however, rejected by the House of Commons, which was not satisfied with the site of the terminus and the effect it would have on the amenities of the Surrey bank. Two years later further preparation of the scheme lapsed for reasons of economy, the estimated cost being about £12,000,000.

In the elaborate County of London Plan prepared for the London County Council by J. H. Forshaw and Sir Patrick Abercrombie in 1943, the erection of new bridges at Charing Cross and the Temple are regarded, not in the light of an ambitious scheme, but merely as prerequisites of a proper development of the S. bank of the riv. It is suggested in this plan that the proposal for new bridges at Charing Cross and the Temple would be more than compensated for by the removal of three railway bridges and the substitution of tunnels. For the new bridges would be so designed, with large arches and few piers, that riv. traffic was interfered with as little as possible. The suggestions made in this plan envisage the reconstruction at a more convenient level of Charing Cross station and its overhead approaches—and similarly with a number of other stations, including London Bridge and Blackfriars. On the N. bank of the riv. the plan proposes that the riverside stations at Charing Cross, Cannon Street, and Blackfriars might be replaced by underground stations below their present sites and the three connected on an underground system to continue from Charing Cross to Victoria station and thence under the riv. to Battersea. The N. bank loop would be supplemented by a deep-level link from Charing Cross to London Bridge via Waterloo junction. By means of two underground loops it is hoped, by this plan, to dispense with the need for the existing high-level approaches to head-on terminals at Charing Cross and Cannon Street, as well as for the existing high-level stations at London Bridge and Waterloo junction and for their viaduct connections. All stations concerned would be replaced by underground 'through' stations on each loop. See J. H. Forshaw and Patrick Abercrombie, *County of London Plan*, 1943.

Chariot, kind of two-wheeled carriage, used both in peace and war in anct. times by the E. nations, Egyptians, Assyrians, Babylonians, Gks., Romans, anct. Britons, etc. Various forms of Cs. for different purposes are depicted in monuments, etc. The most familiar type is the war C., usually drawn by two horses. That of the Homeric heroes is partly formed of open rail work, the Rom. pattern is rather heavier, and that of E. nations still more solid. Some E. peoples had scythes attached to the wheel-axles of war-Cs. The quadriga, or racing C., was drawn by four horses harnessed abreast, as was also the Rom. *currus triumphalis*, on which generals made triumphant entries into Rome. This was round in shape, and unlike most Cs., closed behind. **Charisius** Aurelius Arcadius, Rom.

jurist of about the fourth century A.D. His works are quoted in the *Digest*, and from internal evidence he is supposed to be the last jurist of the classical period of Rom. jurisprudence. The three books of which portions remain are *Liber singularis de Testibus*; *Liber singularis de Muneribus civilibus*; and *Liber singularis de Officio Præfecti pratorio*.

Charité, La, or La Charité-sur-Loire, tn. of Nièvre, France, 14 m. N.W. of Nevers. Manufs. iron ware and trades in wine. Has magnificent twelfth-century church and the ruins of a priory founded 1052, to which the tn. owes its origin. Pop. 5000.

Charites (Lat. name Gratiae), Graces, were the daughters of Jupiter and the goddesses of beauty and grace. They were three in number, Aglaia (Brilliance), Euphrosyne (Mirth), and Thalia (Bloom), and were generally in attendance on Aphrodite. They presided over physical exercises, dancing, and festivals, and were the patrons of poetry and art, through which they were closely allied to the Muses. They are generally represented as young, beautiful, nude girls, holding each other by the hand.

Charities (Charitable Trusts and Uses, Superstitious Uses). The term charity popularly connotes the relief of poverty. No such restricted meaning attaches to the term C. in law, indeed one judicial decision defines 'charity' as a gift to a general public purpose, which extends as well to the rich as to the poor, but although not really susceptible of any precise definition, a sufficiently accurate conception of its signification is to be inferred from the purposes which the law has interpreted as 'charitable' in the construction of testamentary bequests to charity, or for charitable purposes. In law C. and charitable uses or trusts are interchangeable terms and the decision of the question whether a purpose is or is not charitable depends upon a long line of judicial precedents more or less remotely based upon the enumeration of a varied list of C. in the preamble of a statute passed in the forty-third years of the reign of Elizabeth. The objects of C. therein enumerated comprise the relief of aged, impotent, and poor people; the maintenance of sick and maimed soldiers and mariners; schools of learning and free schools of univs.; the repair of bridges, ports, havens, causeways, churches, sea banks, and highways; the education and preferment of orphans; the relief or maintenance of houses of correction; marriages of poor maids; supportation aid and help of young tradesmen, handicraftsmen and persons decayed; the relief or redemption of prisoners or captives and the aid or ease of any poor inhab. concerning payment of taxes. A number of these objects savour of medieval ideas, and apart from the fact that the enumeration has never been held to be exhaustive, it is not easy to discern any common defined principle underlying them. In the eye of the law only those trusts are charitable whose object is at least intended to be for the public benefit, whether, if carried out, it would actually benefit the

community or not; e.g. a trust of funds to further the movement for the suppression of vivisection is a valid charitable trust, although both the court and many lay minds might be of the opinion that such suppression was contrary to public interests.

A generally accepted modern definition of C. or charitable trusts is that of Lord Macnaghten in a decision given in 1891, to the effect that such trusts are 'trusts for the relief of poverty, trusts for the advancement of education, trusts for the advancement of religion, and trusts for other purposes beneficial to the community, not falling under any of the preceding heads.' A trust for the benefit of particular individuals named by the donor is not a charitable trust, and would therefore fail if and in so far as it contravened the rule against perpetuities (*q.v.*), a trust or use for charitable purposes being the only class of gift which by the Eng. law is permitted to infringe that rule—the purpose of which is to prevent the tying up of property beyond the power of alienation. Unlike a trust for public purposes, there need be no great degree of certainty as to the objects intended to be benefited by a charitable trust, provided only the donor evinces a general intention of charity. Hence in a case where a testator left a legacy in trust for 'charitable or philanthropic purposes' the court decided that as philanthropic purposes were not necessarily charitable, and the testator had in no way apportioned the fund between the objects indicated by him, the whole trust failed. Assuming the donor manifests a general intention of charity, the mere fact that the particular charitable purpose expressed by him cannot be carried out (e.g. where the institution proposed to be benefited is not yet in existence) will not involve the complete failure of the trust; for the court will remedy the difficulty by carrying out the purpose *cy-près*, i.e. as nearly as possible to effectuate the donor's intention. This is done by inviting the charity commissioners to submit a scheme for the approval of the court. According to various legal decisions, founded on the analogy of alienations in mortmain (see MORTMAIN), gifts for superstitious uses or purposes are void. Superstitious uses have been judicially defined as those which are created for the purpose of propagating the rites of a religion not tolerated by the law. The effect of the Toleration Act, combined with present-day public opinion, make it impossible to say that any form of religion is not tolerated by the law, and the meaning of the term superstitious use can seemingly only be inferred from the different purposes which have been declared superstitious, e.g. gifts for saying masses for the dead, or for maintaining a lamp in a church. The various Acts of Parliament removing the religious disabilities of Rom. Catholics and Jews, Unitarians and other dissenters, have resulted in gifts being 'charitable' which would otherwise have been deemed superstitious; but these relieving Acts will not operate

to render valid any trust which is superstitious in the old sense without being charitable. The Scottish law contains no prohibition against donations in perpetuity for a public purpose nor any distinction between charitable trusts or any other public trust. The law in Ireland, which is to be found in the Charitable Donations and Bequests (Ireland) Acts, 1844, 1867, and 1871, allows of bequests for saying masses either generally or to commemorate the named dead. As to the statutory inability of C. to hold lands, and the exceptions thereto by reason of the Mortmain Acts, see under MORTMAIN.

Statutes governing Charities.—The law on C. is of considerable antiquity, but the records would seem to show that in former times charitable benefactions were administered in a casual unsystematic manner. Prohibition against alienation in mortmain dates from feudal times, the earlier statutes being directed against the growing accumulation of land by the religious houses, whereby the mesne lords lost the incidents of tenure. Thus, the famous statute *De Viris Religiosis*, which was passed in the reign of Edward I. and is the precursor of the later mortmain statutes, prohibited the acquisition and retention of land in such manner as to deprive the king and his lords of their feudal dues. A succession of statutes followed, until in course of time what are known as the Mortmain and Charitable Uses Acts were evolved. The first serious attempt to encourage charitable benefactions and to protect the foundations administering C. dates from the statute 43 Eliz. c. 1, repealed by the Mortmain and Charitable Uses Act, 1888. The definition of the term charity, in so far as it is capable of legal definition, is to be found in the Mortmain and Charitable Uses Act, 1888 (section 13), preserving the preamble to the repealed statute of Elizabeth. The statutes governing charity procedure prior to the Charitable Trusts Acts include the Charities Procedure Act, 1812, popularly known as Romilly's Act, which is the basis of the jurisdiction of the chancery div. of the high court to deal with charity matters on petition; and this Act may be regarded as the forerunner of the Charitable Trusts Acts. The Charitable Trusts Acts, 1853-1925, form the basis of modern charity administration; the permanent administrative body (estab. by the early fifteenth- to seventeenth-century Acts) being the charity commissioners, who, sitting as a board, exercise a controlling influence over charitable foundations. They have judicial as well as administrative powers. The Mortmain and Charitable Uses Act, 1888, consolidated the law relating to mortmain and the disposition of land for charitable uses. It did not apply, however, to testamentary dispositions (a disastrous omission); hence an amending Act was passed (1891) providing, *inter alia*, for devises of land for charitable uses; but required such land, notwithstanding anything in the will to the contrary, to be sold within a year of

the testator's death or such extended period as might be determined by the court of the commissioners. There are also a number of statutes relating to Rom. Catholic C., war C., etc.

Administration of Trusts for Old People.—In the Nuffield Foundation's *Report of a Survey of Charitable Trusts in Great Britain providing Funds for the Accommodation, Care and Comfort of Old People* (1947), the most comprehensive survey of Cs. since 1816, there is clear evidence that the 'administration of many endowed charities is so confused, and the trust deeds under which many of them are administered so archaic, that the whole picture is one of chaos and of frustration of the spirit in which the charities were originally endowed' (Rowntree Committee report on *Old People*). The Cs. surveyed possess endowments valued at £75,000,000, including an estimated £10,000,000 for purely parochial Cs., and they hold land and buildings worth £7,500,000 for the use of old people. Their normal ann. income is about £5,000,000 and their expenditure well over £4,000,000, nearly all of which goes on old people, including £1,200,000 devoted to accommodation in almshouses and homes, and to in-pensions and similar benefits. But the bulk of these Cs. were founded to meet wants for which other provision is now made and they have not been sufficiently adapted to serve the needs which still remain to be satisfied. Some of the Cs. are centuries old; nearly all began before the introduction of public pensions and social services in the present century. A lot of their expenditure on pensions and grants to old people serves to-day merely to reduce the obligations of the assistance board. Taxpayers instead of old people are thus being subsidised, and many almshouse trusts which need their money to maintain or improve their premises are still obliged to relieve the board in this way. Almshouses are also frequently hampered by obsolete rules of admittance, just as thousands of small parochial Cs. are ineffectively frittering away their resources on small grants or occasional distributions of bread or coal. There would certainly seem to be need for an extensive revision and rationalisation of the Cs. in this field. In the case of the mass of parochial Cs. the Nuffield Foundation concluded that systematic local amalgamations should be promoted throughout the country and that their consolidated resources might well be applied to the support and modernisation of local almshouses. Consult *Tudor's Law of Charitable Trusts*, 1854, 1900; Boucher-Chilcott's *Administration of Charities*, 1912.

Chariton, Gk. prose writer of probably about the fifth century A.D. A native of Aphrodisias in Caria. His one extant work, *The Loves of Chareas and Callirhoe*, is an erotic romance, written in a pleasant and simple style. The best text, with Lat. version and a commentary, is that of D'Orville (1750).

Chariton, city of Lucas co., Iowa, U.S.A. Pop. 5700.

Charity Commissioners. The C. C. were appointed by the Charitable Trusts Act, 1853, for the better administration of charitable trusts (see CHARITIES). They have jurisdiction over charities by virtue of a number of Acts, such as the Mortmain and Charitable Uses Acts, 1882-92, and such recent Acts as the War Charities Act, 1916, and the Blind Persons Act, 1920. For the purpose of the C. C., a charity or charitable trust includes every institution in England or Wales endowed for charitable purposes, subject to express exemptions in the Charitable Trusts Amendment Act, 1855. These exemptions comprise the univ. of Oxford, Cambridge, London, and Durham, Eton and Winchester Colleges, any building registered as a place of meeting for religious worship, the Brit. Museum, funds under the control of the commissioners of Queen Anne's Bounty, any friendly or benefit society, and generally, any society for religious or charitable purposes wholly maintained by voluntary contributions. Exemptions under later Acts include parochial and prison charities, charity allotments, and the property of dissolved municipal corporations. The Act of 1853, together with the various amending Acts, gives the C. C. power to appoint new trustees of charities, but only with the consent of a majority of the trustees where the ann. income of the charitable trust exceeds £50, and to advise trustees of charities in the administration of trust funds. Trustees who act on the advice of the C. C. are indemnified by statute against all liability. The C. C. are also empowered to give permission to trustees of charities to sell, mortgage, or grant leases of land held subject to a charitable trust. An important power of the C. C. is that by which they can adapt the charitable intentions of a donor to the requirements of modern civilisation in cases where the literal execution of the donor's wishes has become either inexpedient or impracticable. (See as to *cy-près* under CHARITIES.) The court will not interfere with a scheme settled by the C. C. except in a case where the commissioners have either exceeded their jurisdiction or formulated a scheme containing something wrong in principle or law. The administration of a charity by the C. C. may result in a considerable measure of economy, as their orders have the same effect as a judgment order or decree of the chancery div. of the high court, and, moreover, they are invested with adequate powers of demanding accounts, instituting inquiries into the condition and management of charities, supervising the expenditure of income, and controlling the disposition of the corpus or capital of the trust funds by the trustees. By the passing of the Board (now Ministry) of Education Act, 1899, the powers of the C. C. in regard to educational charities were transferred to the Board of Education. Under the A. of 1853 an ann. report must be laid before Parliament, setting forth all schemes finally approved by the C. C. The Act of 1853 makes provision for the

appointment of four C. C., two at least of whom must be barristers-at-law of not less than twelve years' standing, and two of whom are salaried. No paid commissioner, secretary, or assistant commissioner may sit in the House of Commons during the tenure of his office. The aggregate amount of stocks and investments held by the official trustees of charitable funds is over £70,000,000 (1930). See works mentioned under CHARITIES, and ann. reports of the commissioners.

Charity, Orders of. Religious orders of men and women devoted to the service of the poor or afflicted. The earliest sisters of charity in the Rom. Catholic Church were founded by S. Vincent de Paul in Paris in 1633. Sisterhoods of charity were formed in the Anglican communities in the nineteenth century. See also SISTERHOODS.

Charity Organisation Society. The general object of this society is to give a definite aim to, and to direct into the most effectual channels, the large amount of benevolent forces at work in England, and particularly in London. It is a combination of charitable persons, each of whom, with the advantages of co-operation, and a definite plan of work, ought to be better able to fulfil his individual duties. It is not the desire of the society to supersede local charitable agencies, but to be representative of all such within their area—to afford means of mutual assistance and a place of meeting common to all who are engaged in charitable work. The society consists of a federation of dist. committees within the London area, whose general principles of action are determined by a central council formed by representatives of dist. committees, with certain additional members. Any person being a member of a dist. committee, or being an ann. subscriber of not less than one guinea or a donor of not less than ten guineas to the funds of the council, or of any dist. committee, is a member of the society. The dist. committees consist as far as possible of ministers of religion, local administrators, and representatives of all the prin. local charities. The council consists not only of representatives of the dist. committees, but also of additional members selected by the council, additional members of corresponding societies for the organisation of charity specially selected by the council, and honorary members. The president and vice-president of the society are honorary members of the council. The offices of the council are at Denison House, Westminster, S.W. The council's duties may be said to be educative, reformative, and co-operative. They include the propagation of sound principles in regard to the administration of charity; the invitation of co-operation on the part of all societies and individuals engaged in charitable work; the convention of special committees to report on questions connected with the administration of charity and the reform of charitable administration generally; and the suppression by prosecution or other-

wise of impostors on the charity of the benevolent. The dist. committees apply the principles of the council's methods by training workers among the poor, by bringing agencies and charitably disposed persons into touch with each other, and by promoting local schemes for the aid of the poor and the spread of provident habits. The work of the C. O. S., on its educative and reformative side, combined with similar work on the part of other charitable societies, has no doubt played its part in the introduction of legislation in the shape of social reformative measures. The institution of employment exchanges, the provision of medical and other benefits under the Insurance Acts and the Old Age Pension and Widows and Orphans Pension Acts, have to a certain extent effectuated the work of the C. O. S. in the direction of recommending aged and infirm persons for pensions, and promoting improvements in the administration of medical relief and the alleviation and prevention of unemployment.

As the C. O. S. was founded as long ago as 1869, in the heyday of Victorian prosperity, it is of interest to consider how the economic stresses of the twentieth century, especially those since the First World War, have affected its attitude, and, more important, the attitude of the public to the society. Although working in close touch with official agencies, the C. O. S. is, of course, a voluntary society, and in this has lain part of its strength. It was inevitable, therefore, that the society should be forced on the defensive, as it was, when the new era of gov. activity in all manner of social relief was entered upon, and the tendency was enhanced in the period following the Second World War when the re-organisation of social services had become a major political preoccupation. As the society's policy is that of 'appropriate treatment of individual cases,' with its apparatus of 'case papers' and 'case-work,' gov. action on the other hand of necessity tends towards 'legal endowment of categories,' i.e. legislative action, on a large scale, leaving useful investigatory work to the C. O. S. with its 'personal touch' (see annual report for 1929).

Charivari. Fr. term of uncertain origin, used for a wild uproar caused by the banging of pans and kettles, mingled with hissing, groaning, and shouting, expressive of disapproval of the people against whom it is directed. It was originally a regular wedding-custom in France in the Middle Ages, but later it was only used at unpopular weddings, particularly for widows or widowers who remarried too soon. The custom and name were introduced into Fr. America where it became corrupted into 'shivaree.' The violence and coarse nature of the Cs. were strongly opposed by the Church and in the seventeenth century the Council of Tours forbade them entirely under pain of excommunication. The custom still continues in some rural dists., and is similar to the notorious 'Haberfeld-treiben' of the Bavarian peasants. In modern times the name C., from its

suggesting satire and derision, has been taken as the title of various satirical papers, the *Chartari* (Paris) 1832, and as a subtitle for the Eng. *Punch*.

Charkhari, state in the Bundelkhand agency of Central India. The tn. of C. is 40 m. W. of Banda. Pop. 12,000.

Charlatan (It. *ciarlatano*, from *ciarlare*, to chatter), introduced in the sixteenth century as the name for a group of the *jongleurs* who amused the people by their 'patter' and buffooneries. The name quickly became associated with cheap-jacks and quack doctors, hence it has come to be used of any impostor.

Charlemagne (Carolus Magnus), or Charles I. (c. A.D. 742-814), son of P^{ép}in le Bref, king of the Franks, and emperor of the West. On his father's death, 768, he became king of Austrasia and Neustria, and on the death of his brother Carloman, 771, added his dominions, becoming supreme ruler of the whole empire. From 761 he had accompanied P^{ép}in on various military expeditions. He was a great statesman, legislator, and soldier, and founder of the 'Holy Roman Empire.' His success was largely due to his championship of Christianity. His war against the Saxons lasted from 772 to 804, some of the chief incidents being the storming of Fre^{dr}burg, destruction of the Irminsul, the slay-field at Paderborn (777), and submission of the Saxon leader, Wittekind. The result was the complete subjugation and Christianisation of the Saxons. C. divorced his first wife, daughter of Desiderius of Lombardy, and married a Ger. princess, Hildegard. In 773 Pope Adrian I. appealed to C. to crush Desiderius, who was threatening Rome and supporting the descendants of Carloman. By 774 the conqueror had made himself also king of Lombardy. In 778 he fought against the Arabs in Spain. On his return he met with a reverse at Roncesvalles, where Roland and other famous paladins were slain by the Saracens. Then he waged border wars against Lombards, Bavarians, Avars, Bretons, and others (c. 788-800). In 800 Pope Leo III. crowned him at Rome as emperor of the West, with the title 'Caesar Augustus.' In 808-810 he defeated the Danes, driving them back behind the Elbe. To protect his kingdom he erected marks or margraves in the border dists. In 813 he associated his son, Louis le Débonnaire, with him in the gov., Louis was the only son who survived him, and became his successor. His empire at its height stretched between the Elbe and Rh^{ne}, reaching eastward to Hungary, and S. to Calabria. C. was a patron of music and learning, welcoming such scholars as Alcuin, Alcuin, and Warnefried at his court. His descendants were known as Carolingians, forming the second dynasty of Frankish kings. See T. Hodgkin, *Charles the Great*, 1894; H. W. C. Davis, *Charles I. Emperor of the West*, 1900; G. P. Baker, *Charlemagne and the United States of Europe*, 1933; D. Woodruff, *Charlemagne*, 1934.

Charlemont, fort in Ardennes, France, standing on a height of 700 ft. by the R.

Meuse, near the Belgian frontier, opposite Givet.

Charleroi. 1. tn. of Hainaut, Belgium, on R. Sambre, 30 m. S. of Brussels. It is the centre of a great coal-producing region, and stands at the junction of numerous railways which distribute the coal all over Belgium. There are large iron foundries, machine shops, factories of cutlery, glass, mails, electrical industries, fire-bricks, etc. The C. canal connects it with Brussels. Formerly a fortress. At the battle of C. which took place Aug. 22-23, 1914, the Fifth Fr. Army was overwhelmed by the Gers and forced to retreat. C. was taken and 160 houses were burnt. C. fell to the 3rd Armoured Div. of Hodges' Amer. First Army after a rapid advance of 40 m., Sept. 2-3 (1944) which carried them across Belgian border. Pop. 25,800. 2. A bor. in Pennsylvania, U.S.A., with glass works and coal mines. Pop. 10,700.

Charles I. (Karl Franz Josef) (1887-1922), last emperor of Austria-Hungary, b. Aug. 17, at Persenegg, Lower Austria; eldest son of Archduke Otto and Princess Maria Josepha of Saxony. Otto was younger brother of Archduke Franz Ferdinand, who had renounced claim to the throne. Otto dying in 1906, C. became heir-presumptive to Francis Joseph. In 1911 he married Princess Zita of Bourbon-Parma. He succeeded to the throne Nov. 21, 1916, in the midst of war; and the changes he made in military dispositions did not turn out well. In April 1918 it became known that he had conveyed, through his brother-in-law, Prince Sixte of Bourbon-Parma, to the Fr. president a promise to support Fr. claims to Alsace-Lorraine. C. disavowed his action, but the full text was pub. (see also AUSTRIA, HUNGARY). On Nov. 11, 1918, C. renounced control of affairs of Austria, and, temporarily, of those of Hungary. Under Brit. protection, he left Austria for Switzerland in March 1919, and next month the Austrian Parliament formally deposed him. In March 1921 he suddenly appeared at Budapest; but there was no welcome—he became ill and returned to Switzerland, promising to come again. Swiss authorities thenceforth watched him closely; but he managed to leave Switzerland by aeroplane in Oct., and flew to the Burgenland. His small army was defeated near Budapest, and he was taken by a Brit. warship to Madeira, where he d. April 1.

Charles I., king of the Franks, see CHARLEMAGNE.

Charles II. the Bald (823-77). Rom. emperor and king of the W. Franks, son of Louis the Pious. The div. of the empire on the death of Louis the Pious was the cause of the outbreak of war between the sons of that king. C. and Louis the German forced the Emperor Lothaire to make peace at Verdun, 843. On the death of Louis II. C. received the crown of the empire, but Louis the German immediately invaded his kingdom and ravaged it.

Charles II. the Fat (Emperor Charles III.) (832-88), king of the W. Franks

and emperor of the Romans. He was the youngest son of Louis the Ger., and received from his father the kingdom of Swabia. On the death of his two elder brothers he inherited the crown of the Rom. empire (882). His attempt to drive out the Saracens from Italy failed entirely, and he was only able to obtain terms with the Norsemen—who penetrated at this time as far as Paris, which they besieged—by heavy payments. The divorce which he obtained from his wife led to a conspiracy of the nobility which deposed him (887).

Charles IV. (1316-78), emperor of the Holy Rom. Empire and king of Bohemia. He was educated in France and married the sister of the Fr. king, Philip VI. He was chosen as the Ger. candidate for the empire in opposition to Louis IV., who had quarrelled with the papacy. He took part with his father in the battle of Crécy, and succeeded to the kingdom of his father after that battle. He succeeded Louis IV. as emperor, and was supported by the pope, to whom he had granted practically the sovereignty of Italy. He entered Italy only to be crowned, and although the Romans implored him to redress their grievances he returned to Bohemia. He imprisoned Rienzi, who appealed to him on behalf of the Romans, and took no notice of the pleadings of Petrarch.

Charles V. (1500-58), emperor of the Holy Rom. Empire and king of Spain (as Charles I.). He was the son of Philip of Burgundy and Joanna, the daughter of Ferdinand and Isabella, and was born in Feb. Six years later his father died, and C. succeeded to the Netherlands and the Franche Comté. In 1516 Ferdinand died, and C. was recognised as the sovereign of Castile and Aragon in conjunction with his mother in 1517. In the same year he succeeded to the Hapsburg possessions on the death of his paternal grandfather, Maximilian, and two years later, in spite of considerable opposition on the part of France and the papacy, he was elected emperor. C.'s dominions were now widespread and various; he ruled Spain, and the Americas, parts of Italy (Naples, Sicily, and Sardinia), together with the Hapsburg possessions, which were themselves a scattered collection of different races. He was hampered in Spain by the Cortes, in Germany by the Diets, and there was in almost every different part of his empire a different system of gov. The difficulties of the beginning of his reign can be shortly stated as coming (1) from Lutheranism, a force which he found himself opposed to right at the beginning of his reign; (2) from the opposition of France, whose armies he had to fight in the first few years of his reign in order to keep possession of his It. dominions; (3) from the continually increasing Turkish power in Europe, which was made more formidable by its alliance with the piratical races of the N. of Africa. These difficulties were only solved transitorily by C., and were constantly recurring.

His religious policy became manifest from his first appearance at the Diet of Worms—the restoration of Germany to

the Catholic faith, and in this object he never faltered. The Diet condemned Luther and Lutheranism; the constant attempts of C. to restore Germany to Rome accounts to a very great extent for his failure in that country. The early part of his reign may be regarded as a constant struggle with Francis I., a struggle which ended only with the defeat and capture of Francis at Pavia. In 1526 Francis, consenting to the terms of C., was released, and in the following year the Holy League was formed by his quondam allies and his hereditary enemy, Francis. In the same year an army of the emperor gathered from almost every part of his wide empire, attacked, captured, and sacked Rome, making the pope a prisoner. C. immediately disclaimed all responsibility for the act, but made use of the advantages which it gave him. In 1529 Francis and C. made peace at Cambrai. During the events of the earlier part of his reign C. had been resident in Spain. The Spaniards had not been altogether pleased by the election of C. to the empire, since it had relegated them to the background. They had therefore put numerous difficulties in his way, and had in many ways prevented him from raising a sufficiency of supplies for his wars. In 1529 C. was crowned emperor of the Romans, and king of Lombardy, and in the following year was held the Diet of Augsburg, which reiterated the decisions of the Diet of Worms and brought about the formation of the 'Protestant' League of Schmalkald. But the threatened persecution of the Protestants was stayed by political events. Whilst C. was emperor of Germany he would always be dependent upon the goodwill of his Protestant subjects for aid against the natural enemies of the empire. This time the difficulty arose in the E. The Turks were always a thorn in the side of the empire, and they now threatened C., but the danger was avoided without war, and C. returned to Spain. In 1535 he stormed and captured the pirate stronghold of Tunis, and in the following year Francis again declared war. The war did not go fortunately for C., and in 1538 the intervention of the papacy brought about a ten years' truce. In 1539 C. commenced his policy of crushing the power of the prov. Cortes of Spain, which from this time gradually sank into disrepute, and in the same year he cruelly crushed the rising in the Netherlands, depriving the tn. of Ghent of all its privileges. In 1541 he again attempted to attack Tunis, but was unsuccessful, attributing his lack of success to an 'act of God.' War again broke out with Francis, and this time that Christian monarch did not disdain alliance with the Turks, and Europe was horrified when the Turkish fleet anchored and wintered in Toulon. That most Christian monarch, Henry VIII., sprang to arms and assisted C. in his invasion of France, which forced on the treaty of Crépy (1544), when the Fr. claims on Italy were again repudiated. C. was now free to carry out the policy upon which he had set his heart, namely the restoration of Germany to the

Catholic Church. Previously he had been compelled by the exigencies of political events to keep on good terms with the Protestants. The Protestants appealed to arms, but the greater force of C. defeated them and made their leaders prisoners. The Interim of Augsburg followed, but failed to please either the Protestants or the Catholics. Finally the schemes of Maurice of Saxony succeeded, and the Protestants were able to demand terms which they had never expected. The legal recognition of Protestantism followed in the peace of Augsburg of 1555, although this was far from being a final settlement. C.'s greatest and best loved scheme had failed. In addition to this, long and earnestly he had attempted to bring about the succession of his son Philip to the empire. This scheme was again defeated, and the double blow, together with the state of his health, led to his abdication in 1555. In that year he resigned the Netherlands, the most dearly loved of all his possessions, to his son Philip, in the following year he resigned the Sp. possessions, and in 1558 he formally resigned the empire, although his brother Ferdinand had been emperor in all but name since 1555. He spent the remaining three years of his life in retirement at Yuste in the valley of Estremadura, where he died in Sept. 1558. Personally C. was popular. In his policy he was at least sincere, but the inheritance which he left to Philip bore dire results. His religious persecutions were the extreme of sincere conviction, but were unfortunate. The Thirty Years war was in itself the logical sequence of the treaty of Augsburg. See F. A. M. Mignet, *Charles-Quint*, 1854; E. Armstrong, *The Emperor Charles V.*, 1902; R. B. Merriman, *The Rise of the Spanish Empire*, 1925; H. B. Wyndham Lewis, *Charles V.*, 1932.

Charles VI. (1685-1740), emperor of the Holy Rom. empire, second son of the Emperor Leopold I., was born at Vienna. When the extinction of the Sp. Hapsburg house became apparent, he was put forward as the Austrian claimant to the Sp. inheritance. By the second Partition Treaty he was to be recognised as the king of Spain, but on the demise of Charles II. of Spain, Louis XIV. practically tore up the Partition Treaties. He was, however, proclaimed by the allies as king of Spain, and went to Spain in the early stages of the war. He remained there until 1711, meeting with very little success, although he was supported by the Catalans, and even entered Madrid. But he was never popular with the Sp. people and in 1711 he practically forfeited his claim when he became emperor. The idea underlying the war of the Sp. Succession was to preserve the balance of power, and C. was informed that an attempt to revive the dominions of Charles V. would not be permitted by the powers. He ultimately abandoned Spain and turned his attention to securing the succession to the Austrian throne for his daughter, Maria Theresa. He foresaw the struggle which must arise on his death without male heirs, and he sacrificed much in order to get the

Pragmatic Sanction recognised by the powers. During his reign the war with the Turks was brought to a successful issue by the treaty of Passarowitz, but before the end of his reign he had lost almost all that he gained by that treaty. He d. in 1740, the last male of his house.

Charles I. (1600-19), king of Great Britain and Ireland, the second son of James I. and his wife Anne of Denmark,

CHARLES I.

The statue at Charing Cross, London

was b. at Dunfermline in Nov. 1600. He was created duke of Albany on his birth, duke of York in 1605, and four years after the death of his elder brother he received the title of Prince of Wales (1616). At an early age he took a lively interest in political matters, and after 1620 fell under the influence of Buckingham. In 1623 he went to Spain in disguise with Buckingham in an attempt to win the infanta's love by this romantic adventure. The pair reached Madrid, but the Spaniards were too astute to allow their flank to be thus turned. James hoped that, if his son married the infanta, the Spaniards would be willing to interfere on behalf of his son-in-law, Frederick of the Palatinate. This the Spaniards had no intention of doing, but thought that James ought to show some favour to the Eng. Catholics

though James could not do so without the consent of Parliament. They still held to these terms, and as Buckingham proved himself a poor negotiator, the treaty with Spain was broken off and C. returned home, loudly denouncing the ill faith of the Spaniards and calling for war, and in 1624 Parliament voted supplies for war with Spain. In the same year C. entered into a marriage contract with Henrietta Maria of France, and although both the king and the prince declared that no tolerance would be granted to the Catholics by the marriage treaty, this promise was not adhered to. He immediately called Parliament together and promised no remission of the penal laws against the Catholics; but already his duplicity was known, and Parliament granted but small supplies and insisted upon the redress of grievances. In 1625, the year in which he became king, he had married Henrietta Maria, who was allowed to set up a Catholic chapel at court and to hold Catholic services. In the following year the Catholic followers of Henrietta Maria were sent back to France. In the meantime C. had again come into collision with his second Parliament, and although he tried to menace it, victory really rested with Parliament. He was already involved in difficulties, and to these difficulties was added a war with France. In 1628 his third Parliament met and passed the Petition of Right, which forbade taxation without consent of Parliament, and arbitrary and illegal imprisonment. C. was forced to consent to this. In 1627 the expedition to the Isle of Ré had failed, and in 1629 a similar expedition met with a similar fate and Buckingham was assassinated at Portsmouth. In the same year C. dissolved his third Parliament, but not until they had passed a resolution condemning innovations in religion and the collection of tonnage and poundage. From 1629 to 1640 C. ruled without a Parliament. The eleven years' tyranny involved C. in many attempts to raise money for his immediate needs. In almost every way he roused the antipathy of his subjects; he levied tonnage and poundage, he sequestered estates, and this policy led to the loss of the support of London; he estab. a military tyranny in Ireland under Wentworth (Strafford). In 1634 he made his first levy of ship money, and in the following year he made another levy, this time on the inland tns. as well. In 1638 came the great Hampden case, when C.'s right to levy ship money was acknowledged by the courts. His religious policy also roused the ill-feeling of his subjects. The High Church was favoured, the Catholics tolerated, and the Puritans persecuted. His Scottish policy precipitated matters. In 1633 he had visited Scotland for his Scottish coronation; in 1638 Laud's liturgy was introduced; in 1637 this led to a riot in St. Giles's Cathedral and to the signing of the Covenant. A general assembly was called, but when this assembly proposed to discuss episcopacy it was dissolved by the high commissioner.

The assembly, however, refused to dissolve and abolished episcopacy. Having done this, it prepared to meet the king in arms. The king, finding himself unable to raise sufficient forces, on the advice of Strafford called Parliament. The Short Parliament met in 1640; it proposed to discuss grievances and was immediately dissolved. He again went N. to attack the Scots, and again found it impossible to meet force with force. The result was that peace was made with the Scots practically on their own terms, and C. turned his attention to England, where in Nov. 1640 he called the Long Parliament. The result of the eleven years' tyranny had been hopeless failure.

The Parliament which met in 1640 was in no mood for trifling. The imprisoned members of his third Parliament had bitter personal grievances, and the whole country was in favour of reform. The execution of Strafford was immediately decided on by the Long Parliament, and although C. had sworn that not one hair of his head should be touched, he was ultimately forced to consent to the execution of his great minister. C., in fact, treacherously sacrificed his loyal servitor to fears for the queen's safety. Parliament forced concession after concession out of C. Parliament was only to be dissolved with its own consent, the Star Chamber and High Commission Court were abolished, and ship money was declared illegal. C. was, however, still intriguing and still trying to find some way in which he could escape from the clutches of Parliament. In 1641 he was forced to listen to the Grand Remonstrance, and early in Jan. 1642 he made the disastrous attempt to imprison the five members. This ill-starred attempt was motivated by the knowledge of an impending impeachment of the queen herself. He rode back to Whitehall after his failure amidst cries of 'Privilege of Parliament,' and now began to prepare for war. Hull refused to admit C. in April 1642, and in Aug. C. raised his standard at Nottingham. The early stages of the war went on the whole in his favour, but after the advent of Cromwell's Ironsides victory after victory fell to the Parliamentarians. The two great disasters with which the king met were Marston Moor and Naseby, where the New Model Army crushed the Royalists utterly. On May 5, 1646, the king surrendered to the Scots at Newark, and was taken to Newcastle. He was four months in captivity at Holmby House, near Northampton, whence he sent his answer to the Newcastle propositions concerning the militia, Presbyterian, and other matters. But in the midst of the negotiation with the Parliament he was seized on June 3, 1647, by Cornet Joyce under military instructions and, soon afterwards, when the army occupied London, C. was placed at Hampton Court. He was some three months there, but escaped on Nov. 11, 1647, to Carisbrooke Castle, and from there he made fresh offers concerning Presbyterianism and the control of the militia. But soon afterwards he refused

his assent to various Bills on the militia and parl. adjournments, with the result that both Houses of Parliament now resolved to hold no further communication with him. Meanwhile C. had taken the fatal step which was to involve him in complete disaster: at the end of Dec. 1647 he entered into the 'engagement' with the Scots which resulted in the second Civil war and the determination of the ultra-Puritans to bring him to execution. In Jan. 1649, Parliament, having been cleared of all possible supporters of the king by Pride's purge, resolved to bring the king before a high court of justice. On the 19th the trial began. The king refused to recognise the jurisdiction of the court, and on the whole behaved with magnificent dignity and self-possession. His execution, however, was resolved upon, he was brought up to hear the sentence passed upon him on the 27th, and was not allowed to make any answer to the charges. He was executed before Whitehall Palace on Jan. 30, his last word being 'Remember!' Consult the *Maseses Papers*, which include much contemporary evidence of the relations between C. and Parliament, including an account by Denzil (Lord) Holles, *Calendar of State Papers, 1625-19*, 1358-97; histories of the period by Edward Hyde, earl of Clarendon; J. R. Green; H. Stallum; F. Guizot; and L. von Ranke; and, especially, S. R. Gardiner, *History of England, 1603-1642*, 1803-82, 1883-84, and *History of the Great Civil War, 1886-91*, 1893. See also I. D'Israeli, *Commentaries on the Life and Reign of Charles I.*, 1828-31; E. Bruce (ed.) *Letters of Charles the First to Queen Henrietta Maria*, 1856; E. B. Chancellor, *Life of Charles I., 1600-25*, 1886; J. G. Muddiman, *Trial of Charles I.*, 1928; and the elaborate lives by Sir J. Skelton, 1898; A. Foa, 1904; F. M. G. Illgham, 1932; E. Wingfield-Stratford, *Charles, King of England, 1600-1637*; *King Charles and King Pym, 1637-1643*; and *King Charles the Martyr, 1643-1649*, 1949.

Charles II. (1630-85), king of Great Britain and Ireland, was b. on May 29 at St. James's Palace. During the Civil war he was with his father during the early events, but after the defeat at Naseby he went to Falmouth, and from thence to Scilly. From Scilly he went to join the queen in Paris, and he remained there for two years. On the execution of his father in 1649, he was immediately proclaimed king in Scotland. He projected an invasion of Ireland, but in 1650, having signed the Solemn League and Covenant, he embarked for Scotland. On landing in Scotland he found himself in the power of the covenanting party, and was made to take a number of oaths which he had no intention of keeping. On Jan. 1, 1651, he was crowned at Scone, and on Sept. 3 his forces, having penetrated England as far as Worcester, were defeated by Cromwell. C., who distinguished himself by his bravery during the battle, fled, and after wandering in disguise throughout the country for six

weeks, now concealed in an oak-tree at Boscombe, now riding disguised as a serving-man, and anon hiding in Stonehenge, with a price set on his head, he at length escaped in safety to France. In 1654, relations between England and France having altered, he was forced to quit France, and spent the rest of his years of exile in wandering from one country to another. He tried to induce various of the great powers to help in his restoration, but failed. The death of Cromwell in Sept. 1658 changed affairs in England considerably, and from that time his ultimate return was only a matter of time, and was eventually brought about through the influence of George Monck, duke of Albemarle, who conducted

CHARLES II

N P.G.

The painting by J. M. Wright

the negotiations with the exile. On Monck's advice C. in April 1660 issued the Declaration of Breda (which was mainly the work of Clarendon) after a Royalist rising had been put down in the previous year, and early in May he was declared king at Westminster. Towards the end of the month he set forth from Breda and landed at Dover, where he was received with enthusiasm everywhere, the nation dreading a military despotism above all things. But the general rejoicings were soon to cease. C. had returned from his travels with two ideas firmly implanted in his mind: he would not again go on his travels, and he would have his own way in his own affairs. Inmate selfishness is the dominant note in the whole of the policy of C.'s reign. The first seven years of his reign were passed under the domination of Clarendon. The Restoration settlement was not followed by any very great persecution, a number of the

regicides were executed, but on the whole the Restoration was tolerant. The Cavalier Parliament, however, restored the Church in England, and in a similar manner bishops were restored to Scotland. The early years of the reign were disgraced by the Dutch war, during which the Dutch even sailed up the Thames and destroyed the shipping there. In 1667 Clarendon was dismissed, and Buckingham and Arlington became the chief ministers; these, together with Lauderdale, Ashtley, and Clifford, formed in 1672 the famous Cabal. It was during this period that C. entered into those close relations with France which made him practically the pensioner of the Fr. king, gained him incidentally a fresh mistress in Louise de Kéroualle, and cost England her natural foreign policy, which was obviously to attack the aggrandisement of France. No act of C.'s reign was more unpopular than the sale (1662) of Dunkirk. In 1670 were signed the two secret treaties of Dover, the first of which pledged C. to the overthrow of Protestantism and gave him a pension of £200,000 per annum. The Cabal ministry met with considerable opposition in the country, and many of the acts of the king and his ministers at this time were unpopular in the extreme. The 'stop of the exchequer' ruined a number of people, and the second Declaration of Indulgence was declared illegal by Parliament, and the Test Act was passed. Danby now became the chief minister, but even he was carried away by the policy of his royal master, and another treaty with France was signed, a treaty which gave France the control of our foreign policy. By secret treaties in 1676-78 and by intriguing with the opposition Louis XIV. achieved his purpose—to cut England off from continental politics. In 1677, however, William of Orange married Mary, the eldest daughter of James, duke of York. Danby, whose share in the treaty with France was disclosed by Louis XIV. in revenge for his having brought about this marriage, only escaped impeachment by the dissolution of Parliament. In the meantime the country had been agitated by the Popish Plot, a scheme put forward by Shaftesbury and the ultra-Protestant party. C. met it in the best possible way. He recognised that it had received general credence in the country, and he allowed it to continue, knowing full well that in the course of time the falseness of it would be discovered. The Protestant party now pressed for the exclusion of James, duke of York, from the crown. C., whilst reiterating that he would never consent to the Exclusion Bill, sent James out of the country for a short time, and declared his pleasure at the attempts to convert him to Protestantism. The exclusionists, however, went too far in asserting the claim of James, duke of Monmouth, C.'s illegitimate son by Lucy Walters. In the Parliament of Oxford, by insisting on the recognition of the duke of Monmouth, they caused the dissolution of Parliament, and C. appealed

to the nation at large, which supported him against the extremists. For the rest of the reign C. was supreme, he continued his intrigues with France, and did all he could to help on the aggrandisement of that country. His popularity was immense, and was increased by the discovery of the Rye House Plot, for which Sidney and Russell paid the extreme penalty, and he gradually began to attempt the restoration of the Catholic religion. His movements in this direction were barely apparent when he *d.* He declared himself a Rom. Catholic on his deathbed. He left no children by his wife, but a numerous progeny by his many mistresses. By Nell Gwynn (1650-87) C. was father of Charles Beaulieu, duke of St. Albans (1670-1726), Louise de Kéroualle (1619-1734), who was made duchess of Portsmouth (1672) and duchesse d'Aubigny in 1681, was mother by C. of Charles Lennox, duke of Richmond (1672-1723). Other mistresses were 'la belle Stewart' (duchess of Richmond) and the duchess of Mazarin. See the histories mentioned under Charles I.; the diaries of Pepys and Evelyn; A. Hamilton, *Mémoires de la vie du comte du Grammont*, 1713 (trans. A. Boyer, 1714); *Calendar of State Papers*, 1649-67, 1860; D. Masson, *The Life of John Milton*, 1859-74; W. H. Ainsworth, *Old St. Paul's*, 1841; P. Cunningham, *The Story of Nell Gwynn*, 1852, 1893, S. E. Hoskins, *Charles II. in the Channel Islands*, 1854; J. F. Molloy, *Royalty Restored*, 1885; E. Scott, *King in Exile*, 1905; R. Crawford, *The Last Days of Charles II.*, 1909; H. N. Williams, *Royal Sullanas*, 1915. Lives by W. Harris, 1766; O. Airy, 1904; A. Bryant, 1931. See also H. C. Foxcroft's *Life of Halifax*, which contains Halifax's 'Character of Charles II.' 1898.

Charles III. the Simple (879-929), king of France, the posthumous son of Louis the Stammerer. He was not called to the throne on the death of Charles the Fat, because of his extreme youth. In 893, however, he was recognised by some of the nobility as king, and was crowned at Rheims. He forced the *de facto* king, Odo, to cede him Neustria, and ultimately, on the death of Odo, he became king of all France. His reign is of great importance owing to the fact that by the treaty of Saint-Clair-sur-Epte he ceded Normandy to the Norse leader Rollo, and thus established the future duchy of Normandy. The growth of the power of the king, however, roused the jealousy of the nobles, who made a conspiracy against him and placed Robert on the throne. The Robertians were defeated, but C. himself was by treachery captured and imprisoned. He *d.* at Péronne.

Charles IV. the Fair (1294-1328), last of the direct Capetian line, succeeded his brother, Philip V. He tried to continue the policy of augmenting the power of the central authority at the expense of baronial power, but in order to obtain money he resorted to dubious methods, such, for example, as the confiscation of the property of the Lombard merchants.

He arranged with his sister Isabella the plot which finally overthrew Edward II.

Charles V. (1337-80), king of France, sometimes styled C. the Wise. He was the son of King John II., and narrowly escaped the fate of his father at the battle of Poitiers. During the imprisonment of John in England he acted as ruler of the country. The beginning of the Hundred Years war with England had brought many difficulties to the Fr. monarchy, and C. was called upon to face these. The States-General when it met had demanded reforms which would have given them great powers, and would have made the king practically a constitutional monarch. The merchant and bourgeois classes had seized their opportunity to compel the ruler to make reforms, and in 1358 the Jacquerie added to the difficulties of the crown. Politically C.'s great struggle was with the king of Navarre (Charles the Bad), whom he ultimately managed to overcome. The treaty of Brétigny brought with it the return of John, who, however, was unable to raise his ransom, and returned to England, where he d. in 1364. C. was now able with the aid of Bertrand du Guesclin to put down the most formidable of his foes and to get rid of a number of the free companies that were ravaging the country, and order was at last restored. War was now renewed with the Eng., and C. was successful in winning it, after which, until by 1380 only a few ins. remained in Eng. hands. In 1378 he made a premature attempt to annex the duchy of Brittany to the Fr. crown, but his attempt brought in its train a national rising. Before any settlement was made C. d. C. was no soldier, and he owed his successes largely to his well-chosen advisers and administrators. He was a versatile student, and collected a large library of works on astrology, law, and philosophy, at the Louvre, which eventually formed the nucleus of the *Bibliothèque Royale*. Letters of C. are in J. J. Champollion-Figeac's *Lettres de rois et de reines*, vol. II. (1839). See Froissart, *Chroniques*; Benoist, *Policy of Charles V.*, 1874; R. Delachanal, *Histoire de Charles V.*, 1908.

Charles VI. (1368-1422), son of Charles V. and the first of the Fr. princes to bear the title of the Dauphin from birth. He succeeded to the throne at the age of twelve, and during his minority France was governed by the dukes of Berry and Anjou. The excesses of the regents brought with them rebellion in the chief ins. of both N. and S. France. The N. rebels were at first successful in winning for themselves terms, but those of the S. were ruthlessly crushed. The Eng. gave some aid to the rebels, and C. prepared a fleet for the invasion of England. His forces amounted, according to Froissart, to 20,000 men-at-arms, 20,000 cross-bowmen, partly Genoese, and 20,000 'stout valets.' A fleet almost innumerable, 1287 vessels according to some, was collected on the coast of Flanders; and an enormous wooden bulwark was constructed capable of sheltering, it was said, the whole army from the dreaded archery

of England; it could be taken to pieces and replaced at pleasure. But various delays, whether from contrary winds or other causes, prevented the sailing of the fleet, or a tempest so far shattered it as to frustrate its object. In 1388 C. asserted his authority by driving from power the royal dukes and appointing ministers of his own, who, because of their humble origin, were called the *marionettes*. In 1392, however, C., whose constitution had been undermined by excesses, had his first fit of madness, and this was followed by others of such frequent occurrence as to show that it would be unlikely that C. would be able to rule personally. The royal dukes immediately regained their power in France, and the struggle commenced between the Burgundians and the Orleansists. Externally, during the latter years of the century, affairs were quiet. Peace had been restored with England, but this again was upset by the deposition of Richard II. (C.'s son-in-law) and the accession of Henry IV. The struggle between the Burgundians and Orleansists was now pronounced, and matters were brought to a head by the murder of Orleans in 1407. The Burgundians for the time held the upper hand, and in league with the Parisians forced the king to do their will. In 1413 the Orleansists entered Paris and drove the Burgundians into the arms of England, with whom they concluded an alliance. Henry V. put forward the claim to the Fr. crown and invaded France. In 1415 Agincourt was fought, and in 1418 Paris was captured by the Burgundians. In the following year John the Fearless was assassinated, and the Burgundians definitely became the allies of the Eng. In 1420 the treaty of Troyes, followed by the marriage of Henry V. to the daughter of C. took place, and Henry became practically master of France. See Froissart's *Chroniques*; *Lettres de rois*, vol. II. containing correspondence of Charles V. and Charles VI. in *Lettres de rois et de reines*, printed by J. J. Champollion-Figeac, 1839, and F. Funck-Brentano, *Le Moyen Age*, 1922.

Charles VII. (1403-61), king of France, the fifth son of Charles VI. became lieutenant-general of the kingdom in 1417. His power and authority, however, sank after the murder of John the Fearless in 1419, and by the treaty of Troyes he was passed over in the succession to the crown. He retired to Mehun, near Bourges, and remained there for some time. On his father's death he was recognised as king of France by the S. provs., but he gradually lost all hold on the N., and the victories of the Eng. during the early part of his reign lost him still more power. The central provs. of France were involved in internal civil struggles, and C. seemed to have no hope of success when the 'Maid of France' came to his rescue and led him to success after success. Orleans was captured, and he was crowned at Rheims, but even then the ingratitude of the court party gave Jeanne d'Arc a prisoner to the hands of the Eng. Later in his reign C. recognised

the services of the 'Maid of France.' After 1435 affairs in France assumed a brighter state, since the duke of Burgundy joined forces with the Fr. in driving out the Eng. The Eng. were gradually driven out of their Fr. possessions until by 1455 they retained only Calais. In the meantime C. had had difficulties to face at home, and had managed to restore order both amongst the nobility and the people. Most of the king's councillors were drawn from the bourgeoisie, and most of C.'s ministers served him well; for this reason the title of Charles the Well Served

Hansstaengl

CHARLES IX. OF FRANCE

From the painting by François Clouet

is often applied to him. During his reign the power of the central authority was greatly increased and by the end of his reign France had once more begun to settle down to days of peace and prosperity. The hist. of the reign of C. VII. has been written by two modern writers, Vallet de Virville, *Histoire de Charles VII. et de son époque* (1862-65), and G. du Fresne de Beaucourt, *Histoire de Charles VII.* (1881-91). Jean Chartier's *Histoire de Charles VII.* was re-edited in 1858-59 by de Virville.

Charles VIII. (1470-98), king of France, the only son of Louis XI. He succeeded his father, and although he was declared capable of ruling he left the gov. of the country in the hands of his sister, Anne of Beaujeu. He married in 1491 the duchess of Brittany, thus uniting the last independent duchy in France to the monarchy. In 1492 he took up the reins of gov. for himself. Imbued

with wide and romantic projects, he decided to attempt to obtain the kingdom of Naples, to reconquer the E. empire, and to become its emperor. To obtain this desire he sacrificed everything; he entered Naples in 1495, but was unable to proceed any further with his plan since a coalition of the powers was formed against him. He was forced to return to France, and here, whilst preparing for a second expedition, he died.

Charles IX. (1550-74), king of France, the third son of Henry II. and Catherine de' Medici. He succeeded to the throne at the age of ten, and naturally the chief power still remained in the hands of the queen mother. He was a youth of extreme weakness, and had very queer tastes. He was passionately devoted to the chase, but his excesses undermined his constitution. He married in 1570 Elizabeth of Austria. On the appearance of Coligny at the Fr. court, he showed great friendliness, but his weakness and his fanaticism were so cleverly played on by the Catholic party that in 1572 was perpetrated the massacre of St. Bartholomew's Day. After this event C. aged rapidly, and at the time of his death he appeared to be an old man worn out by fever and nightmare. See S. Desjardins, *Charles IX.*, 1873; L. Battifol, *Le Siècle de la Renaissance* (1909; trans. 1916), and L. Roulier, *Catholiques et Huguenots à la cour de Charles IX.*, 1924.

Charles X. (1757-1836), king of France, the son of the Dauphin, the son of Louis XV., and hence a brother of Louis XVI., b. at Versailles. His youth had been passed in the wildest dissipations, and he had made himself and his party exceedingly unpopular in France. He became the leader of the ultra-Royalists on the outbreak of the Fr. Revolution, and in 1789 he left France to become the leader of the Émigrés. He visited many of the courts of Europe, attempting to gain help for the Royalist party. In 1795 he landed in France to put himself at the head of the rising of La Vendée, but his courage failed him, and he left the Royalists of the W., unsupported, to be crushed by the ferocity of Hoche. He lived for the rest of his period of exile in Holyrood Palace, and later at Hartwell. In 1814 he returned to France, and during the reign of his brother Louis XVIII. he was at the head of the party of ultra-Royalists and was successful in gaining the day for the party of reaction. On his accession in 1824 he speedily became popular, but his popularity was not increased by the obvious efforts which he made to restore 'Royalism' in France on the basis of the divine right of kings. His reactionary measures soon made him exceedingly unpopular, and in 1825 he was openly insulted in the streets. He had no desire to become a constitutional monarch, and although he was compelled to get rid of the unpopular minister Villèle he still showed no signs of giving up the Royalist pretensions. The compromise ministry which he set up failed to please him, and he dismissed it. In 1830, the elections having gone against

him and finding violent opposition in the chamber of Deputies, he suspended the constitution. The result was the outbreak of a revolution which C. at first did not treat seriously. But he retired from Paris, and, when the seriousness of the state of affairs was evident, he abdicated in favour of his grandson, Louis Philippe, duke of Orleans, however, was chosen king, and C. retired again to England. He died at Gritz, where he had retired for his health. See A. de Lamartine, *Histoire de la Restauration*, 1851-52; P. Vedrenne, *Vie de Charles X.*, 1879; J. de Saint-Armand, *La Cour de Charles X.*, 1892; J. M. S. Allison, *Thiers and the French Monarchy*, 1926; J. Lucas-Dubreton, *Le Comte d'Artois, Charles X.*, 1927.

Charles II. (1661-1700), king of Spain, son of the old age of Philip VI. He was from infancy weak, deformed, and diseased, but his birth was received with acclamation by the Spaniards, who dreaded the settlement of the succession question. For years he was not allowed to walk, and his education, because of his weakness, was neglected. But it quickly became apparent that the king would never rule, and the whole of his reign was taken up with struggles between the Austrian and Fr. parties at court. Each of these scored a triumph by arranging a marriage for the king. The Fr. party married him to a Fr. princess, and on her death he was married to an Austrian princess. It was obvious throughout the reign that on the death of C. the question of succession would be disputed. The Fr. party continually drummed into the ears of the king the fact that only the power of France could save the Sp. Empire from dismemberment, whilst C. himself could barely be persuaded to assimilate this fact owing to his extreme pride in the house of Hapsburg. Finally, on his deathbed, he was practically forced to sign a will leaving the Sp. dominions to Philip of Anjou, grandson of Louis XIV.

Charles III. (1716-88), king of Spain, the eldest son of Philip V of Spain by his marriage to Elizabeth Farnese of Parma. He was duke of Parma by right of his mother, and spent his early youth in Italy. In 1734 he became king of the Two Sicilies, and these he mastered by sheer force of arms, although he was not a great soldier, nor had he any special liking for arms. He early showed great hostility towards Great Britain, a fact which influenced his foreign policy at a later date, and which was probably due to the fact that at the beginning of the war of the Austrian Succession he had been forced to remain neutral under threat of bombardment by the Eng. fleet. On the death of Ferdinand VI. of Spain, he succeeded to the throne. His foreign policy was not noted for its enlightenment. He signed the family compact with France, and took part in the later phases of the Seven Years war against England somewhat disastrously. He again joined the Fr. in 1779 in their attacks upon England during the Amer. War of Independence. But his internal policy is a great contrast

to his foreign policy. Whilst king of the Two Sicilies he had shown his desire to act as an enlightened and benevolent despot, now he proceeded to carry out that policy still further. He forced the Spaniards to adopt sanitary reforms. He recognised that the power of the Church had become too great, and he curbed it. He destroyed the Society of Jesus in Spain, and reduced the number of monastic buildings. In spite of this somewhat drastic policy he always remained a true son of the Church. Roads and canals were constructed, and altogether the period may be regarded as one of great prosperity for Spain. C. died just on the eve of the Fr. Revolution. See J. Addison, *Charles the Third of Spain*, 1900; F. Bousseau, *Règne de Charles III. d'Espagne*, 1759-88, 1907.

Charles IV. (1748-1819), king of Spain, the second son of Charles III. He was noted during his youth for his extreme strength, being a man of fine physical build. He succeeded his father in 1788, but devoted his time to the chase, leaving the gov. of the country to be administered by the queen and her lover, Godoy. He was terrified by the excesses of the Fr. Revolution, and attempted by a policy of extreme reaction to prevent the growth of a 'reforming' party in Spain. He was a man of great credulity, and it is most probable that he never understood the relations of Godoy and his queen. In fact, he always had great faith in his minister, and even went so far in 1808 as to abdicate to save him. He took refuge in France, where he abdicated in favour of Napoleon; he was a strong believer in the theory of divine right, and probably saw nothing wrong in his action in betraying his people. He died at Rome.

Charles VII., king of Sweden during the middle of the twelfth century. Helped to organise the Christian Church in that country and created the archbishopric of Upsala, 1161.

Charles VIII. (d. 1470), elected king of Sweden in 1449. His name was originally Karl Knutsson Bonda. He was forced to retire before Christopher of Bavaria in 1441, and after the death of the latter prince was restored, but had again on two occasions to seek safety in flight. After his death the three kingdoms of Scandinavia were again united.

Charles IX. (1550-1611), king of Sweden, third and youngest son of Gustavus Vasa, and is known principally by his stern Calvinism and his struggles in order to obtain the recognition of Sweden as a Protestant nation. In 1568 he was the leader of the rebellion against Eric XIV., and he was involved in struggles with John III. during the greater part of that king's reign. When Sigismund, a Catholic, and already king of Poland, succeeded to the Swedish throne in 1592, C. came forward as the champion of Protestantism. He was appointed regent in 1595, and became king in 1600, when Sigismund was deposed. He did not, however, assume the title until 1604, and was not actually crowned until 1607. His foreign

policy, which is the most important aspect of his reign, involved him in wars with Russia and Denmark, which were not successful. His importance is due to the fact that he prepared the way for his great son, Gustavus Adolphus, by his fervent Protestant policy.

Charles X. (1622-60), king of Sweden, and nephew of Gustavus Adolphus. A great warrior king, he took part in the later campaign of the Thirty Years war, but was for a short time forced to remain inactive by the treaty of Westphalia (1648). He was the recognised heir to the Swedish throne, to which he succeeded on the abdication of Queen Christina. In 1655 he determined upon war with Poland, and called the Riksdag to grant him supplies. He gathered together a great army and navy and attacked the Poles. Warsaw was easily won, and after a long siege Cracow fell also, and Poland appeared to be conquered, but the Poles were stirred to the depth of their national feeling by these events, and forced the Swedes to retire from the siege of Czenstochowa, which had held out for over ten weeks. This success roused the feelings of the Poles to a very high degree, and the Polish army became again active. C., who desired the conquest of Brandenburg, was by his unfortunate position forced to buy the support of the elector at the price of Prussian independence, and in the following year the Danes declared war against him. This helped rather than hindered him since he was able to give up the Polish campaign on the same justification and concentrate against Denmark. He attacked from the S., but his most astounding feat was the crossing of the Little and Great Belts with his army over the ice. The effect of his unique movement was to crush the Danes who immediately opened negotiations for peace (1658) and agreed to the cession of large tracts of ter. C. however, again without warning attacked the Danes in the midst of these negotiations, and it was only with considerable difficulty that he could be persuaded to reopen negotiations with them. In 1660, when he was meditating an attack upon Norway, and had crossed to Sweden to persuade the Riksdag to grant him further supplies, he died, worn out probably with the strenuous life he had led. See M. J. J. Veibull, *Sveriges Historia: Storhedstida, 1611-1718*, 1877-81; E. Hauman, *War on the North and Peace of Oliva*, 1893; G. Jones, *Diplomatic Relations between Cromwell and Charles X.*, 1897; J. Stefansson, *Denmark and Sweden*, 1916.

Charles XI. (1655-97), king of Sweden, succeeded to the throne at the age of four, being the only son of Charles X. His education, both general and particular, was shamefully neglected by the regents, and C. was practically illiterate when he was called upon to rule the state and to make the final struggle against Denmark. The whole court was corrupt and degraded, yet C. showed great courage and skill in tackling the difficulties of the situation. He commanded his armies

in person, and spent much time and thought in preparing for the national struggle. He defeated the Danes at Fyllebro in 1672, and in the same year he defeated Christian V. of Denmark in the great battle at Lund. The battle was hardly contested, and although the losses of the Swedes were great, still they gained the victory and practically annihilated the forces of Denmark. In 1678 he again defeated the Danes at the battle of Malmo, and in the following years was forced to consent to a peace dictated by Louis XIV. The rest of his reign was devoted to the estab. of Sweden upon a sound basis, and to the rectification of her financial position. Practically every side of the administration was overhauled, financial matters were looked into, commerce encouraged, and church gov. and education reformed. C. died in 1697, leaving behind him a reputation which places him high in rank amongst the kings of Sweden.

Charles XII. (1682-1718), king of Sweden, the only surviving son of Charles XI. He was given an extraordinarily careful training in every respect when young. At an early age he showed considerable natural ability. He was a good rider, a good marksman, and in mathematics and languages he excelled. He was also carefully trained in matters of administration, and at an early age was interested in all the duties of his station. He succeeded his father in 1697, and was given the full sovereignty at once. He was generally popular at the beginning of his reign, although there were indications that he intended to rule according to his own ideas. He was a hard worker, and also showed far more humanity than was customary at that time in one of such high rank. The great northern war of 1699 forced C. into the field. He resolved to attack his nearest enemy first—Denmark. He succeeded, with the co-operation of Sir George Rooke's Anglo-Dutch squadron, in defeating the Danes and wringing from the Dan. king a promise to abstain from further hostilities. He then marched against the Russians who were besieging Narva, and after a week of forced marches succeeded in defeating the besieging force with but small loss to himself. He now turned to pursue the foe whom he regarded with the greatest bitterness, Augustus of Saxony, king of Poland. He captured Warsaw and marched against Cracow, defeating the Poles and Saxons at Kilsow. He ravaged the ter. he passed through, spoiled the ins. and harried the inhabs. In 1703 C. won the battle of Pultusk, and later another battle at Plewitz. He deposed the Saxon Augustus, and set up a candidate of his own for the throne of Poland, a candidate who was crowned in 1705. He came into W. Europe just at the crisis of the war of the Sp. Succession, but he had no designs on W. Europe—he desired only the ruin of his natural enemies. In Sept. 1707 he forced Augustus to sign a treaty by which he resigned his claims to the Polish crown and his hostility to Sweden. He now

marched against Russia, defeated them at Holowczyn, and as the Russians fell back followed slowly towards Moscow. Realising that he could not reach Moscow, he now marched southward to join the hetman of the Cossacks, Mazepa. Peter had already destroyed Mazepa's conspiracy, and when the hetman joined C. it was as a fugitive. The winter of 1708 was the most severe Europe had known for 100 years; the sufferings of the Swedes were unimaginable; food failed them, and later the weather became so severe that they could not possibly keep themselves warm. 'The king was at his best at this time, cheering and encouraging his men. Finally, when the frost broke and the Russians were attacked, the Swedes were practically annihilated, and C. with the remnant of his army took refuge in Turkey. He had great influence in Turkey, where he remained during 1709-14, and caused the Turks to declare war on Russia no less than three times. He finally, however, became so troublesome that after a desperate fight he was taken prisoner at Bender, and finally quitted Turkish ter. and arrived in Stralsund in Nov. 1711. C. immediately raised an army which was strong enough to prevent his being attacked by his enemies, and in 1717 he opened hostilities with Norway. He now formed an ambitious plan involving the surrender of the Swedish Baltic provs., as a *quid pro quo* for terms with Russia; the conquest of Norway; the invasion of Jutland and the substitution of himself for the Stuarts on the throne; his conditors being the Jacobites and Cardinal Alberoni. But in the following year, whilst again leading an expedition to Norway, he was shot in the trenches whilst besieging Fredriksten. C. was an able, sagacious, and brave king, but determined to the pitch of obtuseness; while his admirable physique enabled him to share extreme privations with his soldiers. The best life is Voltaire's *Histoire de Charles XII.*, 1731. See also sketches by N. Bam, 1896, and O. Browning, 1899, and Franklin B. Scott, *Bernadotte and the Fall of Napoleon*, 1935.

Charles XIII. (1748-1818), king of Sweden and Norway, the second son of King Frederick Adolphus, b. at Stockholm. He distinguished himself as an admiral in the Russo-Swedish war, and later became regent of the country. He practically dropped out of state affairs after 1796 until 1809, when he was elected king in place of Gustavus IV., who was deposed. In 1810 Bernadotte (Charles XIV., q.r.) was elected crown prince and practically took all power out of the hands of the king, who had by this time become decrepit. In 1814 he became the first king of a united Norway and Sweden, and in 1818 he died, having for ten years been king only in name.

Charles XIV. (1763-1844), king of Norway and Sweden; known also as Jean-Baptist Jules Bernadotte; the son of a lawyer at Pau. He was b. at Pau and entered the Fr. service in 1870, and showed considerable ability in his

profession. On the outbreak of the Revolution he received speedy promotion. He was present at the battle of Fleurus and took part in the campaigns in Germany. In 1797 he took reinforcements to Napoleon in Italy, and in the following year he became ambas. in Vienna. In the same year by his marriage to Désirée Clary he became the brother-in-law of Joseph Bonaparte. He did not take an active part in the *coup d'état* by which Napoleon became First Consul, but he was given in 1801 the command of the army in La Vendée. In 1801, when the empire was declared, he was made a marshal of France, and was also appointed to the governorship of the prov. of Hanover. He took part in the campaigns of Ulm and Austerlitz, and was later made governor of the Hanse tns. For his conduct at Austerlitz he was named in 1805 prince of Pontecorvo. After the battle of Jena he pursued the Prussians to Halle and Gen. Blücher to Lübeck, driving him into surrender. After the battle of Wagram he returned to Paris, having incurred the displeasure of Napoleon by issuing an order which congratulated the Saxons on the courage which they had displayed at Wagram. In 1810 he was appointed to command in the Netherlands. In the same year he was offered the crown of Sweden, because he had considerable popularity there and also because the Swedes desired a strong military ruler, and in the same year was elected crown prince. In Nov. he went to Sweden, where he was adopted by the king, Charles XIII., under the name of Charles John. He almost immediately became exceedingly popular and never really lost his popularity, although some of his views were displeasing to the majority of his subjects. He took part in the later Ger. campaign against Napoleon, and in 1818 he succeeded his adopted father Charles XIII. with the title of C. XIV. His policy from the beginning had been to bring about a union with Norway, and in this he was ultimately successful. His reign on the whole was one of development and peace, and he proved himself an enlightened monarch. See Sir D. P. Barton, *Bernadotte and Napoleon*, 1921; *The Amazing Career of Bernadotte*, 1929.

Charles IV. (1826-72), king of Sweden and Norway. He was the eldest son of Oscar I., and became regent in 1857. He was an exceedingly popular and enlightened king, and during his reign a number of great reforms were made. The laws of the church and the criminal laws underwent considerable reform at this time, and the King also gave his support to the laws which reformed the constitution. He was himself a man of great gifts and had considerable ability. He was a firm supporter of the policy of a strong Scandinavia.

Charles I. (1226-85), king of Naples and Sicily, count of Anjou, and seventh son of Louis VIII. of France. He was b. before the accession of his brother, Louis IX., and was later, on the decease of another brother, given the countries

of Anjou and Maine. In 1246 he married the heiress of the co. of Provence, and after some difficulty succeeded in establishing his authority over his new possessions. He accompanied St. Louis on his first crusade, and was with him when he was defeated and captured, he himself sharing the same fate. Ransomed and released before the king, he returned to France to intrigue with the countess of Flanders against the emperor. In 1257 he captured the important tn. of Marseilles and began to make his influence felt in Piedmont. His great opportunity came when the pope decided to break down the power of the Hohenstaufen in Italy. He was offered the crown of Naples and Sicily, for which he was to pay a yearly tribute to the pope, and which also he would have to win from their allegiance to Manfred, the natural son of Frederick II. He finally accepted the papal offer, and dispatched an expedition to Italy in 1264. In the following year he was crowned king of the Two Sicilies, and a year later he defeated and killed Manfred at Benevento. In 1268 a battle was fought at Tagliacozzo with Conradin, the last descendant of Frederick II., which resulted in the defeat of the supporters of the Hohenstaufen and the capture and execution of Conradin. He was recognised as one of the most powerful monarchs in Europe, and his power was the greater owing to his influence over the papacy. In 1272 he took part in the second and ill-fated crusade of Louis IX., after whose death he returned to Italy. In 1282 occurred the massacre and expulsion known as the Sicilian Vespers, inspired by the cruelty and misrule of the Fr. C. determined to avenge this disaster, but after two defeats, finally had to give up all hope of regaining Sicily. He was preparing another attempt from Naples when he died.

Charles VII. (1697-1745), emperor of Germany, elector of Bavaria, the son of the elector of Bavaria. Since Bavaria took the side of France in the war of the Sp. Succession, C.'s early youth was spent in Vienna, where he was taken by the Austrians. The electorate, however, was restored at the end of the year, and C. took part in the campaign of Austria against the Turks. He succeeded to the electorate in 1726, and his reign was taken up (in spite of having recognised the Pragmatic Sanction) in plotting to obtain the imperial crown on the death of Charles VI., uncle of his wife Maria Amalia. The Bavarian house had some claim to the imperial throne. In 1740 he claimed the imperial crown and was put forward as the puppet of the anti-Austrian faction. He was crowned in 1742, but his sovereignty was merely nominal. His hereditary dominions were overrun, he was twice restored to his cap., but he died, worn out by his many illnesses and troubles.

Charles I. (1859-1914), king of Rumania. Prince Karl Eitel, second son of Prince Karl Anton of Hohenzollern-Sigmaringen, the Rom. Catholic branch of the Hohenzollerns, was b. at Sigmaringen. Served

in the Prussian Army; and, on the enthronement of Alexander John, was elected prince of Rumania (then under Turkish suzerainty), April 1866. He was energetic in developing the country; but in 1871, when the Fr. sympathies of many of his subjects, together with the failure of a Jewish speculator to whom he had entrusted railway schemes, made the prince unpopular, he offered to abdicate. The ability of a Conservative statesman, Lascar Catargi, aided over this unfortunate period. Prince C. took the field as an ally of Russia in 1877, and on May 21 the independence of Rumania was proclaimed. On May 22, 1881, C. was crowned king at Bucharest, with a steel crown made from a Turkish gun. He married Princess Elizabeth of Wied—'Carmen Sylva', the poetess and musician—in 1869. On the death of their only child, the succession was settled on a nephew, Prince Ferdinand. The opening of the First World War, wherein Rumania's interests were against the Central Powers with which the king was linked, caused much friction between him and his ministry—terminating only with his death at Pelesch, Oct. 10.

Charles (Carol) II. (b. 1893), king of Rumania; b. Oct. 16, at the castle of Pelesch (Sinaia); son of King Ferdinand (q.v.), and Marie, daughter of the duke of Edinburgh. Toward the end of the First World War, he married, at Odessa, a Moldavian lady named Zizi Lambrino—or Lambrino—and they had a son. In 1919 he renounced his claim to the succession, since he had no taste for kingship and his wife was not recognised as princess; but his parents persuaded him to give up the lady, the marriage was annulled as illegal for want of banns, and C. was sent on a mission to Japan. On his return, he married, at Athens, March 10, 1921, Helen, daughter of King Constantine of Greece; by whom he had issue the Prince Mihai (Michael), b. 1921. After attending the funeral of the queen-dowager of England, Nov. 1925, instead of going home he went to Paris and thence to Milan—where he publicly renounced the succession, Dec. 28, 1925. Renunciation was accepted by his father, and made legally effective. C. went back to Paris, Feb. 24, 1926, accompanied by a Mme. Lupescu. In Paris, in March, Mme. Lambrino claimed heavy damages for the annulment of her marriage. C. took the surname of Carolman; the infant Prince Michael succeeded his grandfather, July 20, 1927; and Princess Helen obtained a divorce from C., June 21, 1928. By that time he again changed his mind about kingship, and had been expelled from England (May 16, 1928) for intriguing against the Rumanian Gov. He resided in Brussels for a while. On June 5, 1930, he left Paris by aeroplane, and next day he descended at Bucharest, a new ministry was formed, and the regency resigned. On Sunday, June 8, Carol II. was proclaimed, while his deposed son was given the titles of crown prince and prince of Alba Julia. After the outbreak of the

Second World War the Iron Guard began an agitation for C.'s abdication, and, following riots, C., on Sept. 6, 1940, signed a proclamation announcing his decision to resign in favour of his son Michael. His efforts to stem the pro-Axis current in Rumania were unavailing and he left the country. He settled in S. America, where he married Mme Lupescu in 1947.

Charles Albert (1798-1849), king of Sardinia, the son of Prince Charles of Savoy-Carignano. The early death of his father led to the neglect of his education. During the early years of his life Piedmont was overrun by the Fr., but after 1814 the king of Sardinia restored his court to Turin. C. A., who was in the direct line of succession, was regarded with horror by the Royalists on account of his supposed revolutionary ideas. He was, however, recognised as heir-apparent. In 1821 a revolution forced the king (Charles Felix) to abdicate, and C. A. became regent. He granted a constitution which was repudiated by the king, and he himself became distrusted by both Royalists and Liberals. He was still, however, regarded as the heir-apparent, although Metternich strongly favoured the selection of an Austrian prince. In 1823 he fought in Spain, and in 1831 he succeeded Charles Felix. He attempted to reform the finances and administration of Piedmont, but was only partially successful. In 1848 he granted a Liberal constitution, and in the same year declared war on Austria, and went to the help of the Milanese. At first successful, he was finally beaten, and on his entrance into Milan was received badly. He, however, continued the struggle, but failing to obtain terms after the battle of La Bicocca, he abdicated in favour of his son and retired to a monastery, where a few months later he died. See N. Bianchi, *Storia della diplomazia europea in Italia*, 1865; and *Scritti e lettere di Carlo Alberto*, 1879; L. Cappelletti, *Storia di Carlo Alberto*, 1891; C. de Beauregard, *La Jeunesse du roi Charles Albert*, 1899; and A. di Saluzzo, *Carlo Alberto della restaurazione all'avvenimento al trono*, 1926.

Charles Augustus (Karl August) (1757-1828), grand duke of Saxo-Weimar. His father d. before he was one year of age, and the duchy was administered by his mother. The prince received a very careful education, and spent the early part of his youth in travelling. In 1775 he was declared of age, and began actually to rule. His reign is noted for the enlightenment of the policy which he adopted. He introduced the poet Goethe to the court and to his councils, and although he was a hard drinker and a good sportsman, this was not allowed to interfere with the serious policy that he had adopted. His people were not to be governed despotically nor yet benevolently, but were to be so educated that they would be capable of governing themselves. This policy speedily made the univ. of Jena the most important in Europe. During the early part of his reign he was driven by the Austrian policy into the arms of Prussia, with whom he concluded an

alliance. The revolutionary wars found him fighting in the ranks of the Prussian Army, and he fought against Napoleon until the Jena campaign forced him to join the confederation of the Rhine. Again in 1812 he was in arms against Napoleon, and continued so until the end. In 1815 he took part in the Congress of Vienna and pleaded hard for the recognition of the rights of the people. His home policy made Saxo-Weimar one of the few free countries in Europe, but his enlightened policy drew down on him the censures of the reactionary ministers of other countries, especially of Metternich. He granted a liberal constitution to his people, and was one of the few princes who were not driven by the excesses of the revolution to a policy of reaction. See F. X. Wegele, *Karl August, Grossherzog von Sachsen-Weimar*, 1850; and lives by W. Bode, 1913, and H. von Egloffstein, 1913, 1915.

Charles Edward, see STUART, CHARLES EDWARD.

Charles Eugene (Karl Eugen) (1728-93), duke of Württemberg. Succeeded in 1737, but did not come of age until 1744. He had good ability, but he wasted his talents in extravagant and vicious living. He fought against Prussia during the Seven Years war, a course that was decidedly unpopular in the duchy. His methods of financial and political administration roused much resentment amongst his people, and although he was forced to promise reforms, he continued his former practices. His period of rule was continually disturbed by internal troubles.

Charles Louis (1771-1847), archduke of Austria, and duke of Teschen, the third son of the Emperor Leopold II.; became one of the most distinguished generals of the Napoleonic period. He began his career as a soldier during the revolutionary wars, being at that time stationed in the Netherlands. He commanded a brigade at Jemappes, and during the subsequent campaigns proved himself a general of such ability that in 1796, after serving for a year with the army of the Rhine, he was given the chief command of that army. His campaign of 1796 was one of the most brilliant of the whole of the war. He defeated Jourdan twice during the year, and finally drove the Fr. across the Rhine. Although in the following year he found Napoleon more than a match for him, he again showed his consummate skill as a general in the manner in which he conducted the retreat of his armies. The campaign of 1799 found him again in command of the Austrian armies of the Rhine and again opposed to his old enemy Jourdan. He defeated the Fr. general twice during the year, and even tried conclusions successfully with Masséna, and once more he forced the Fr. to retire over the Rhine. After this campaign his health drove him for a short time into retirement in Bohemia, but he again commanded the Austrian armies during the short campaign which succeeded Hohenlinden, and after that battle concluded an armistice with the Fr. In 1805 he took up the command of the armies in Italy, but

events in Germany soon drew him from Italy, where he had fought the battle of Caldiero and defeated Masséna. The peace which followed the disasters of Ulm and Austerlitz was used by the archduke to reorganise the Austrian forces. In 1809 he again became commander-in-chief of the Austrian Army, which he had not yet been able completely to reform. The struggles of the Austrians against Napoleon were not altogether unsuccessful, and the victory of Aspern had certainly a good moral effect on the rest of Europe. Aspern was followed by Wagram, where the Austrians were totally defeated, although not before they had made a most desperate struggle. This was the last battle in which the archduke took part. He lived the rest of his life in retirement, becoming duke of Saxe-Teschen in 1822.

Charles 'Martel' ('the Hammer') (A.D. 689-741), natural son of Pépin d'Héristal, mayor of the palace under the later Merovingian kings, grandfather of Charlemagne. In 714 the Austrasian Franks chose him as their duke: by force of arms he united the kingdoms of Neustria and Austrasia, 720, becoming virtual ruler of the Franks, the titular kings (among them Chilperic II. and Clotaire IV.) being merely his puppets. He fought against Saxons, Alemanni, and Bavarians, and rolled back the tide of Moslem conquest in the desperate and famous battle between Tours and Poitiers, 732. For this crushing defeat of the Saracens he was given his surname, and looked upon as the saviour of Christendom (see Gibbon). C. tried to convert Saxony and Frisia to Christianity and helped St. Boniface in his missions. He again drove the Saracens out of Burgundy and Langue-doc, 737. On his death he left the kingdom to his sons, Carloman and Pépin le Bref. See Baron de Nolinse, *Charles Martel, histoire des maires du palais*, 1851; U. Chevalier, *Bio-bibliographie*, 1904.

Charles of Blois (1319-64), duke of Brittany, sometimes known as C. of Châtillon. Married the daughter and heiress of Guy of Brittany. On the death of the latter, the succession of his daughter, Jeanne, wife of C. of B., was disputed. C., aided by his uncle Philip VI. of France, was able at first to defeat John of Montfort l'Amaing, who was supported by Edward III. of England. But his success was only transitory, and in 1347 he himself was wounded and taken prisoner. He was only released in 1356, but continued the war, and finally perished at the battle of Auray. He was noted for the consistent piety of his life, and was canonised by the Rom. Church.

Charles of Orleans, see ORLEANS, CHARLES, DUKE OF.

Charles the Bold (le Téméraire) (1433-1477), duke of Burgundy, son of Philip the Good. Before the death of his father he bore the title of count of Charolais, and during his youth he quickly estab. a reputation for himself as a general and warrior. In 1465 he became the practical ruler of the duchy, and adopted at once his policy of opposition to the aims of

Louis XI. He succeeded after hard fighting in wresting from Louis XI. by the treaty of Conflans some of the privileges which Louis had gained, and just previous to the death of his father was engaged in subduing a revolt of the townsfolk of Liège, a revolt which was renewed when he succeeded to the duchy. His successes had aroused the anger of Louis XI., who desired to curb as much as possible the ambitions of Burgundy. Negotiations were opened at Péronne, and although C. was convinced of Louis's double dealing, still, at the same time, he treated with him. The treaty of Péronne was futile, and in the following year Louis seized some tns. on the Somme, whilst C. invaded France and laid it waste as far as Rouen. From 1470 onwards C. was engaged upon wider schemes than simply checking the ambition of Louis. He desired the restoration of the middle kingdom, and aspired to the kingship himself. He had added to his ter. and power, but in so doing he had raised up many enemies. He had offended the emperor, he was at enmity with the Lorrainers and Swiss, and finally, after sev. defeats, he was overthrown and slain before Nancy. His body was only recovered sev. days after the battle. The death of C. extinguished the male line of the dukes of Burgundy, and with it the grandeur and importance of the duchy. C. had left an only daughter, Mary, who succeeded to all the dominions of her father out of France. She married the Archduke Maximilian, to whom her father had proposed her, and through whom her Flemish possessions descended to the Sp. branch of the house of Austria. There are lives by J. F. Kirk, 1863, R. Putnam, 1908, and J. Bartier, 1941.

Charles, Mrs. Elizabeth (1828-96), b. at Tavistock, Devonshire, the daughter of John Rundle. She was the author of many books of a semi-religious character, the chief of which, *The Chronicles of the Schonberg-Cotta Family* (1864), is about Martin Luther, and has been trans. into most of the European languages, into Arabic and many Indian dialects. Others of her books are *The Diary of Mrs. Kitty Trevelyan* (1865), dealing with the rise of the Methodists in England; *The Draytons and the Darcenants* (1867), about the Eng. Civil war; *On Both Sides of the Sea* (1868), a tale of New England. Among her friends were Dean Stanley, Charles Kingsley, Jowett, and Pusey.

Charles, Robert Henry (1855-1931), Brit. theologian, b. in co. Tyrone, N. Ireland; educated at Queen's Univ., Belfast, and Trinity College, Dublin. He left parochial work in 1889 to devote himself to the studies which made him famous, choosing a line of research, the Testaments of the Twelve Patriarchs, till then little known and involving a great effort of the acquisition of oriental languages. He began the series of these eds. in 1893 with *The Book of Enoch*, continued with kindred documents, and ended with the *Testament of the Patriarchs* in Gk., with variants from the versions in Heb., Aramaic, Armenian, and Slavonic, in 1907. He

was Schweich lecturer for the Brit. Academy, and received the first award of the academy's medal for biblical studies. His industry as an editor made him master of the thought and the doctrinal development of the age of the Apocrypha, as appears in his historical study, *A Critical History of the Doctrine of a Future Life* (1899), and in *Religious Development between the Old and the New Testaments* (1904). His ed. of *The Apocrypha and Pseudepigrapha of the Old Testament* was issued in 1914, and throughout the years of the First World War he laboured at his great work on the Book of the Revelation of St. John, with a succession of students to assist him. This book is notable for positive pronouncements on points generally regarded as largely conjectural, and it roused the resentment of the advocates of literal inspiration; but, generally speaking, it has met with the widest commendation. C. was appointed to a canonry at Westminster Abbey in 1913 and became archdeacon there in 1919.

Charles, Thomas (1755-1814), Welsh preacher and author. He early came under the influence of Rees Hugh, a disciple of Griffith Jones, and joined a Methodist society. He met many noted evangelical leaders at Oxford from 1775 to 1784; in the latter year became curate of a charge in Somerset. His opinions made it difficult for him to retain a post in the Estab. Church, and after 1784 he threw in his lot altogether with the Methodist body. He did much valuable work in the introduction of Sunday schools, and the printing and distribution of religious books in Welsh.

Charles City, city of Floyd co., Iowa, U.S.A. Pop. 8000.

Charleston: 1. Cap. city and seaport of C. co., S. Carolina, U.S.A., standing on a low tongue of land between the Rrs. Ashley and Cooper, 7 m. from the Atlantic. The two rivers unite just below the city and form a spacious harbour, about 15 sq. m. in area. Across the entrance is a sandbar with only about 18 ft. of water, but having a deeper channel near Sullivan's Is. By recent improvements, vessels of 24 ft. draught can safely enter. The city is regularly and handsomely built, retaining many of the features of old S. architecture, and having a profusion of trees and gardens. Standing as it does in a rich cotton and rice dist., C. has a large trade, and is the chief commercial city of S. Carolina. It is the terminus of the railway lines, and steamships run regularly to and from the chief ports of the U.S.A., the Antilles, S. America, and Europe. The chief exports are cotton, rice, phosphate, naval stores, lumber, and grain. There are machine-shops, shipyards, dry docks, and manufs. of cotton, flour, carriages, baggage, textiles, and fertilisers, the last, owing to the large deposits of lime-phosphates found on the Ashley R., being the main industry. C. is the seat of a Catholic bishop. The city was founded by the Brit. under Wm. Sayle about 1670. The Civil war began in 1861 with the capture by the S. Caro-

linians of Fort Sumter, on an is. 1 m. below the city. It suffered terribly in an earthquake in 1886. Pop. 72,000. 2. Cap. of W. Virginia, U.S.A., and co. seat of Kanawha co., on the N. bank of the Kanawha R., at the mouth of the Elk, about 200 m. E. of Cincinnati, Ohio. It is the centre of a dist. containing bituminous coal, oil works, iron and salt mines. The manufs. include axes, chemical fire-extinguishers, lumber, furniture, and woollen goods. Pop. 62,000. 3. City of Coles co., Illinois, U.S.A. Pop. 8200.

Charlestown: 1. Fishing vil. and seaport, 2 m. S.E. of St. Austell, Cornwall, England; has boat-building yards and exports china clay. Pop. 3000. 2. Tn. in N.W. of Natal, 5000 ft. above sea level, close to Mapuba Hill and Laing's Nek, and until 1895 the terminus of the railway from Durban. 3. Chief tn. of Nevis Is., Leeward Is., W. Indies. Pop. 1100. 4. Originally a city in the state of Massachusetts. It is now, however, a part of Boston, and contains the Bunker Hill monument commemorating the battle of that name.

Charles's Law. In heat, the law that equal vols. of all gases, when heated under constant pressure, expand by equal fractions of their vols. at 0° C. for each degree rise of temp. This fraction—the coefficient of expansion of gases at constant pressure—is equal to $\frac{1}{273}$.

Charles's Wain, see *URS A MAJOR*.
Charlet, Nicolas Toussaint (1792-1845), Fr. designer and painter, b. in Paris. He served in the National Guard in 1814, but lost his employment as clerk in the *mairie* (1816) owing to the political changes. He then studied art under Gros, and was particularly successful in military subjects (*C Grenadier de Waterloo*, 1817) and sketches of children. See *La Combe, Charlet, sa vie et ses lettres*, 1858.

Charleville: 1. Mk't tn., 34 m. N. of Cork, co. Cork, Ire.; pop. 1926. 2. Tn. in Queensland, the terminus of the W. railway, 130 m. N.W. of Brisbane. The railroad is linked to Camooweal, near the Barkly Tableland, by a weekly air-mail. Pop. 2300. 3. Tn. of Ardennes, France, on R. Meuse, opposite Mézières. Has manufs. of metal goods, fire-arms, and nails, and a large trade. The public library is very fine. Pop. 23,000.

Charlevoix, Pierre François Xavier de (1682-1761), Fr. Jesuit missionary and traveller, b. in Saint-Quentin, joined the Jesuits, 1698; taught in their college at Quebec, 1705-9; travelled up the Great Lakes and down the Mississippi to New Orleans, 1720-22. Wrote a tour., sev. hist., and *Histoire et description générale de la Nouvelle France* (1714) (Eng. trans. by J. G. Shea, 1866-72).

Charlieu (anc. *Carilocus*), tn. of Loire, France, near the border of the dept., 10 m. N.E. of Roanne. It has manufs. of textiles. Pop. 5000.

Charlock, species of *Crucifera*, is the *Sinapis* (or *Brassica*) *arvensis* found in Brit. cornfields, and usually known as the wild mustard. The small, four-petaled flowers make a pretty sight in the summer

time, but the plant is very troublesome to farmers, and is difficult to destroy.

Charlotte: 1. Co. seat of Mecklenburg co., N. Carolina, U.S.A., on Sugar Creek, in the S.W. of the state, 175 m. S.W. of Raleigh. The terminus of sev. railways, and has manufs. of carriages, cotton mills, machinery, furniture, and cotton-seed oil. A branch mint was estab. here in 1837, and the Johnson C. Smith Univ. (for coloured students) in 1887. Pop. 101,000. 2. Co. tn. of Eaton co., Michigan, U.S.A., 20 m. S.W. of Lansing. It has carriage factories, flour mills, and malt works. Pop. 5500.

Charlotte Amalie, the only tn. on the is. of St. Thomas (*q.v.*) in the Virgin Is. group (belonging to the U.S.A.). It was so named after the consort of King Christian V. of Denmark, to which country the is. belonged up to 1917, when it was purchased by the U.S.A. The U.S. Geographic Board decreed on Jan. 5, 1921, that the tn. would in future be known as St. Thomas, but its more picturesque name was restored to it in 1937. The harbour is one of the finest in the W. Indies; there is a large coaling station and a floating dock. Pop. 11,000.

Charlotte Augusta, Princess (1796-1817), was the daughter of George, Prince of Wales (afterwards George IV.), and Caroline of Brunswick. Her parents separated when she was a few months old, and while she lived she was a source of contention between them. Both father and mother desired to have the custody of her, but while she was growing up George III. decided to entrust her to neither, and she was placed in charge of governesses. She became engaged in Dec. 1813 to William, hereditary prince of Orange; but discovering that to marry him would mean residence in Holland, she broke off the match. On May 2, 1816, she married Prince Leopold of Saxe-Coburg, and died in childbirth on Nov. 5 of the following year. There is a biography by Lady Rose S. M. Welfall, 1874.

Charlottenberg, tn. in Sweden, co. Värmland, 21 m. N.N.W. of Ärvika, and 3 m. from the Norwegian frontier. The centre of the iron-working industry.

Charlottenburg, until 1920 a tn. of Brandenburg, Germany, but in that year it was incorporated in Berlin, in which its pop. is included. Its old name was Lietzenburg. It grew up around the palace which Frederick I. built for Sophia Charlotte in 1696, and was well built and laid out. The palace, with its park, in which is the mausoleum containing monuments to Queen Louisa, the Emperor Frederick William III., the Emperor William I., and the Empress Augusta, was the chief attraction, but there were also an institute of glass-painting, schools of artillery and engineering, an institute of technology. But, together with other suburbs, C. was very heavily damaged in the allied air raids on Berlin and in the siege by the Russian armies. Its pre-war manufs. included ironware, machinery, porcelain, glass, paper, leather, chemicals, beer, electric appliances, pottery, and stoneware, and there were iron foundries

and machine shops. *See also* EASTERN FRONT, OR RUSSO-GERMAN CAMPAIGNS, IN SECOND WORLD WAR.

Charlottesville, city in Albemarle co., Virginia, U.S.A., on R. Rivanna, 80 m. N.W. of Richmond. The seat of the Univ. of Virginia, founded by Thomas Jefferson in 1820, which has a fine natural hist. museum, an observatory, and a library. Agric. implements and cigars are manuf., and there are iron works and wool mills. Pop. 16,000.

Charlottetown, cap. of Prince Edward Is., Canada. It is situated on the S. side of the is., in Queen's co., on the Hillsborough estuary, and possesses a large and safe harbour. Its chief buildings are the Prince of Wales College, the Rom. Catholic College of St. Dunstan's, and a normal school. Its manufs. include woollen goods, lumber, furniture, and canned goods. It has also shipbuilding and foundry works. Pop. 14,500.

Charlton, dist. of London, England. It is in the bor. of Greenwich on the S. bank of the Thames. C. House, now the property of the bor. council, is an excellent example of Jacobean architecture.

Charm (through Fr. from Lat. *carmen* a song), form of words, generally a verse, which when said or sung is supposed to have power to avert evil or bring good luck. When worn in written form about the person it is called an amulet. The meaning of the term has been extended figuratively to pleasing qualities of appearance or manner. *See* INCANTATION and AMULET.

Charmey, canton of Fribourg, Switzerland, 15 m. S. of tn. of Fribourg. A favourite tourist resort, and the centre of the Gruyère cheese industry.

Charmouth, par., vil., and watering-place in W. Dorsetshire, 6 m. S.E. of Axminster. Pop. 700.

Charnak, *see* BARRACKPUR.

Charnel-house, place for the deposit of bones thrown up in digging. Sometimes a separate building, but often a part of the crypt of a church.

Charnock, Job (d. 1693), Eng. founder of Calcutta. Arrived in India about 1655, and entered the E. India Company. He refused to move when besieged by the Mogul's viceroy at the vil. of Sutanati, and finally obtained the grant of the site upon which Calcutta now stands.

Charnwood Forest, tract in the N.W. of Leicestershire, England. Though a great part of it is barren, the scenery is pretty and it has considerable geological interest. The lowest elevation is 600 ft., while Bardon Hill, the highest point, is 912 ft. It contains coal mines and granite quarries, and the Whittle Hill bones come from there. It was enclosed by Act of Parliament in 1812.

Charolais, or Charolais, old dist. of France, which was situated in the S. of Burgundy, and now forms a part of Saône-et-Loire. The dounts of C. took their title from it. The dist. now is famous for its cattle.

Charolles, tn. of Saône-et-Loire, France, 39 m. W.N.W. of Mâcon. On a neighbouring hill is the ruined castle of the

counts of Charolais which has been transformed into a tn. hall. Pop. 3400.

Charon, in Gk. mythology, the son of Erebus and Nox. He ferried the souls of the dead across the rive. of the lower world. Each shade paid him one obolus, which was placed in the mouth of the dead body before burial.

Charon of Lampascus, Gk. historian, probably of the early fifth century B.C., and certainly before Herodotus. He is known to have been alive in 464 B.C. His works, which include hist. of Lampascus, Crete, and Persia, have only survived in fragments, which have been ed. by F. Creuzer (Heidelberg, 1806) and by C. and T. Müller (Paris, 1841). He is mentioned by Tertullian and Suidas.

Charondas, celebrated Gk. law-maker of Catana, Sicily. His date is not known, but the tyrant Anaxilaus of Rhegium, 494-476 B.C., abolished the laws which were in force. His laws were adopted by the Chalcidian colonies in Italy and Sicily, and according to Aristotle their chief import lay in the precise rules against perjury, fines on judges who neglected their duties, etc. The story of his suicide because he broke one of his own laws is also told of Diocles and Zaleucus.

Charonne, former vil. of Seine, France, now forming one of the outlying arrons. of Paris added to the city in 1860.

Charpentier, Gustave (b. 1860), Fr. composer, b. at Dieuze, June 25. After studying at the Lille Conservatoire, he was awarded a pension to enable him to continue study in Paris, whither he went in 1881. Six years later he received the Prix de Rome for his cantata *Didon*. In 1902 he founded the 'Cercle Mimi Pinson' and the Popular Conservatoire to give free courses of popular music and in classical dancing. He succeeded Massenet in 1912 as a member of the Institute. His fame rests mainly on his opera *Louise*, a musical romance produced in 1900, and performed some five hundred times in the ensuing twenty years. His appeal is essentially popular and romantic, and he tries, not without success, to give social questions an appropriate musical setting. Among his other works are *Impressions d'Italie* (orchestral suite) (1890); *La Vie du Poète* (symphonic drama) (1892); *Julien* (opera) (1913). His songs include *Poèmes chantés* (1894); *Les Fleurs du Mal* (from Baudelaire) (1895); and *Impressions fausses* (from Verlaine) (1895). Consult A. Brunau, *La Musique française*, 1901.

Charpentier, Jean de (1786-1855), geologist, b. at Freiberg in Saxony. He was appointed chief engineer of the salt mines at Bex (Vaud, Switzerland) in 1813, but his fame as a geologist rests on his book *Essai sur les glaciers, et sur le terrain erratique du bassin du Rhône* (1841), in which he extended and proved the theory, which had previously been evolved by Venetz, that the blocks on the slopes of the Alps and Jura, although of quite different sorts and periods of rocks, had been brought there by glaciers, and left when the glaciers themselves disappeared. But his theory of the dilatation of glaciers was disproved by J. D. Forbes

in his *Travels through the Alps of Savoy* 1842.

Charpentier, Marc Antoine (1634-1704), Fr. composer, b. and d. in Paris. Studied painting in Italy but gave it up for music, which he studied under Giacomo Carissimi, composer of many oratorios, whose work C. greatly admired. He was master of music in the household of Mlle de Guise, and he also gave music lessons to the duke of Orleans, regent of France. Became Kapellmeister of the Sainte-Chapelle and remained so till his death. He was associated with Molière in the performance of some of his plays. His *Mélie*, described as 'une tragédie lyrique,' words by Thomas Corneille, was performed in Paris (1693) with success, yet was never repeated. His other works include the operas *Circé* and *Amours d'Acis et Galatée*, but he is chiefly remembered for his oratorios, in the style of his It. master, and his masses.

Charr, or **Char**, the name of sev. species of *Salvelinus*, the salmon and trout genus which is typical of the family Salmonidae; they differ from their allies in having teeth on the head only of the vomer. The deeper parts of fresh-water lakes are their favourite habitation; *S. alpinus*, the N. C., is common to England and Switzerland; *S. Willughbi* is a native of Lake Windermere; and *S. fontinalis* is the Amer. brook trout.

Charrière, Isabelle Agnes van Teyuyl, Madame Saint-Hyacinthe de (1741-1805), b. at Utrecht, Holland; married her brother's tutor and settled at Colomblar, near Lausanne. Her *Lettres neuchâteloises* (1784) made her famous. Her long friendship and liaison with Benjamin Constant is her chief claim to remembrance. See P. Godet, *Mme de Charrière et ses amis*, 1904.

Charrington, Frederick Nicholas (1850-1936), Eng. social reformer, b. at Bow, son of Frederick C., a wealthy brewer, but gave up the succession to a fortune of over £1,000,000 in order to devote his time to temperance work. In 1885 he founded the Tower Hamlets Mission; made the Great Assembly Hall in the Mile End Road a centre of Christian work in the E. end of London. Member of L.C.C. 1889-95. Prominent in an attack on music-halls.

Charron, Pierre (1541-1603), Fr. philosopher and theologian, b. in Paris, the son of a bookseller. He studied law, but his practice as an advocate was unsuccessful, and he entered the Church, becoming a well-known preacher and obtaining the post of preacher in ordinary to Marguerite, wife of Henry IV. His friendship with Montaigne is famous. In 1594 he pub. *Les Trois Vérités*, in defence of Catholicism. His great ethical treatise, *Traité de la sagesse* (1601), showed a remarkable change. It is entirely sceptical and rationalist in principle, and was violently attacked by the Jesuits, and C. was denounced as an atheist. His sudden death from apoplexy was regarded by the orthodox as a judgment for his impiety. See W. E. H. Lecky, *Rationalism in Europe*, 1865.

Charruas, tribe of S. Amer. Indians, noted for their warlike propensities. At one time they inhabited Uruguay and part of S. Brazil, and Gauchos, who now occupy that part, have a strain of Charrua blood in them. They were well-made, dark-skinned people, and used horses in their wars with the Spaniards, their weapons being the bolas, or weighted lasso, and bows and arrows. Juan Diaz de Solis lost his life at their hands, 1516.

Charsadda, tu. in Peshawar, N.W. Frontier prov., Pakistan, 14 m. N.W. of Peshawar. It is supposed to be the same as Pushkalavati, which was in existence at the time of Alexander the Great's invasion, and the Peukolaotis mentioned by Gk. historians, the adjoining vil. of Prang no doubt forming part of it. Some interesting earthenware jars bearing inscriptions have been found in the neighbourhood. Pop. 9000.

Chart, or **Sea-Chart**, marine map, showing the coasts, i.e., lighthouses, and ships, soundings, currents etc., of a part of the sea, compiled for the use of navigators. Cs. seem to have been made as early as the thirteenth century, the invention being variously ascribed to the lts. and to Prince Henry of Portugal. The first C. to recognise the roundness of the earth was produced by Mercator in 1569, and his system was improved by Edward Wright in 1594. Modern Cs. are prepared in Great Britain by the hydrographic dept. of the Admiralty. They are supplied gratis to the navy and sold to the merchant service through agents. Valuable Cs. of the coasts of the U.S.A. have been pub. since 1807 by the Coast Survey. Cs. are constructed with the greatest possible accuracy, and the use of recognised symbols admits of the inclusion of considerable detail. Prominent features on land which may serve as landmarks, shore-lines at high and low water, details of tide in harbours, the proper courses for entering ports and channels, and the buoys marking them, etc., are shown. Signal stations and lights receive detailed attention, lights being shown by a yellow circle surrounding a red dot, with abbreviations describing whether the light is fixed, flashing, or revolving. Deep-water soundings are given in fathoms, and shallow-water soundings in feet. The character of the sea-bottom is also indicated, and sandbanks, bars, rocks, hidden, awash, or protruding, currents, and sunken wrecks are clearly shown. Lines of lat. and long. are drawn in, and sev. compass-roses, showing magnetic variation, appear on different parts of the C. The Mercator projection is generally used, but polyconic Cs. are issued of small areas, and the gnomonic projection is used for mariners wishing to follow great-circle courses. After the Second World War, the hydrographic dept. of the Brit. Admiralty commenced the task of recharting the oceans of the world with the assistance of the 'echo-sounder,' a device based on radar (q.v.), which records electric impulses reflected off the sea-bed, thereby giving a picture of its configuration.

The aeroplane is also employed in modern chart-making in shallow waters. Simultaneous vertical air pictures on pan-chromatic film are taken by dual cameras, fixing the depth by contrast to within 3 ft. See Hydrographic Dept., *Charting the Seas in Peace and War* (I.M.S.O.), 1948.

Charte, charter or system of constitutional law, contained in a single document. The Grande C., or the Charter of King John, 1355, was the first such document known in France. The constitution to which the name C. was the most often given was the one in which Louis XVIII. acknowledged the rights of his subjects upon his restoration to the throne, 1814. Since that time this C. has been held as the fundamental law of constitutional monarchy, whenever that particular form of gov. has existed in France.

Charter (Lat. *charta*; Gk. *χάρτης*, signifying paper). The usual import of the word indicates any formal writing in evidence of a contract, or agreement between persons. In England we no longer use the word to signify a written document, though in France it is still in use. In private affairs, its most general use is in the transference of estates, the written documents given by the former owner as a proof of the transference being called a C. In public affairs, it is the name given to the deeds by which those in power guarantee the rights of their subjects. There may be also a C. of a bank, or some other association, whereby it may confer privileges and powers on a body of persons for some particular object. In Scotland, a C. is the written evidence of a grant of heritable property, under certain conditions enforced by the feudal law, i.e. that the person receiving shall pay at stated times a sum of money, or perform certain duties to the person conferring the property.

Charter, the Great, see MAGNA CHARTA; ENGLISH HISTORY.

Chartered Companies. The common element in C. C. at all stages of their development is the possession of a special charter from the Crown, granting them certain trading privileges in a particular locality, to be exercised subject to a varying degree of control by the Crown. There appear to be three tolerably well marked phases in the development of C. C., the final if unintended or unavowed cause of which, judged by the light of later experience, is the foundation of a colonial empire. C. C. appear, first, as associations of individuals, emanating from early trading guilds, and enjoying a monopoly of trade in the exportation of Eng. products to other European nations. England first granted a charter to a foreign country, the Hanseatic League, and, later, charters were granted to Eng. companies trading in the Baltic, Russia, and Turkey. Secondly, as chartered associations possessing delegated sovereign powers of extraterritorial jurisdiction in the countries in which they traded. The rise of these later companies

was a consequence of the impulse given to foreign trade by the discovery of the New World and the opening out of trading routes to the Indies and America, and the object of their formation was to foster commercial intercourse with distant countries. The Russia Company, the Turkey Company, the Eastland Company developed such relations with Russia, Turkey, and Persia. But the more important were the Hudson's Bay Company, and a number of other C. C. that opened up the Brit. N. Amer. colonies, and the famous E. India Company. The significance of these companies lies in the part they played in the building up of the foundations of the Brit. colonial empire through their acquisition of ter. either by the process of planting and settling in unoccupied regions or by conquest or cession of occupied land, as in the case of India. Thirdly, as purely joint-stock companies possessing no delegated sovereign powers, and trading under the direct control of the Brit. Gov. This phase of their development, or rather revival, was the expression of the desire for colonial expansion and commercial prosperity universally prevalent among the European nations towards the end of the nineteenth century. The prin. Eng. C. C. formed during this period were the Royal Niger Company, chartered in 1886 and bought out by the gov. in 1899 for £265,000; the Imperial Brit. E. Africa company, formed in 1889 to exploit Uganda and neighbouring dists., and which fell into financial straits in 1892, with the result that Uganda became a Brit. protectorate some two years later; the Brit. S. Africa Company, chartered in 1889, and owing its origin to the activities of Cecil Rhodes, who secured various mining concessions from Matabele chiefs; and the Brit. N. Borneo Company, incorporated in 1881 to take over the concessions and ter. acquired from the sultan by a syndicate formed in Labuan in 1878. Some of the C. C. of the latter two places still exist as companies, but in most cases they have been merely a step, though an important one, in the transition from exploitation to colonial expansion, and their rights and treaties have for the most part been bought out by the Crown. The greater degree of success in this direction of the later companies was due to their more economic organisation, their control of a larger capital, enjoyment of better credit, their closer surveillance by the Brit. Gov. with a view to safeguarding the rights of native rulers, and the absence of any monopoly in trading rights. The rights of the Brit. N. Borneo Company were bought out by the Crown in 1946 when N. Borneo became a crown colony.

Charterhouse, corruption of Chartreuse, a religious house of the Carthusian order. In sev. places in England the name occurs, such as C-on-Mendip C. Hinton, thus denoting where the Carthusians estab. themselves in the past. The most celebrated is the C., London. In 1371 Sir Walter de Manny founded a C. monastery by the old city wall of London.

Upon the dissolution of the monasteries in the time of Henry VIII., the property passed through many hands, until, in 1611, it was bought by one Thomas Sutton, 1532-1611, a native of Snaith, Lincolnshire. The same year of his death he founded a hospital on the site of the monastery, and in his will bequeathed moneys with which to found a chapel, almshouse, and a school. The almshouses provide for eighty inmates, who must be over fifty years of age and according to the founder's wish, 'gentlemen by descent and in poverty, soldiers who have carried arms over sea and land, merchants whose livelihood was destroyed by shipwreck, or other misfortune, or servants in the royal household.' The school ranks among one of the foremost of the public schools and has by now far outgrown the original intentions of the founder. In 1872 it was removed to Godalming and the old buildings were sold for the accommodation of the Merchant Taylors' School (moved to Moor Park, near Northwood, in 1932). The quaint old chapel and hospital still remain on the old site, but suffered severely by bombing during the Second World War.

Charter-party (Fr. *charte-partie*, divided deed, one given to each party concerned), in maritime law a contract by which the owner or master of a ship lets the ship or part of her to a second party for the purpose of conveying goods from one port to another. It is one form of the contract of affreightment, the other being the bill of lading (used when the goods shipped form only part of the intended cargo). A C. may be a lease of the vessel (the charterer then assuming entire charge, while the master is only his agent), but more often it merely gives the shipper permission to have his cargo conveyed in the chartered vessel, the master assuming the responsibilities of a common carrier. Usually the C. describes the contracting parties, the ship, and the voyage. The shipowners state that she is seaworthy, will take the cargo at a certain charge, and make the voyage as quickly as possible, delivering the cargo within a fixed time. The freighter agrees to load and unload within a certain number of lay or running days. The rate and time of payment for the freightage, and date of the beginning of demurrage, are also stated. The contract may be for a definite time, or for definite voyages. Perils of the sea for which the shipmaster declines to be responsible are noted down. See Scrutton, *Contracts of Affreightment as expressed in Charter-parties and Bills of Lading* (12th ed.) 1925.

Charters Towers, mining tn., Devonport co., Queensland, Australia, 82 m. S.W. of Townsville. It is the centre of a famous gold-field, the gold being of very fine quality. An excellent water supply is available from the Burdekin R. Pop. 7000.

Charters, Town, royal grants of certain privileges, rights, or immunities made to tns. from early times. William I., seeing the importance of the tns., included most

of them in the royal demesne, and the practice arose of granting C. of incorporation, with privileges. Such privileges were, generally, the right of independent jurisdiction and the right of paying *firma burpi*, or a fixed sum as rent to the king in lieu of submitting to the exactions of the sheriffs. These C. were granted to the 'fully qualified members of the township or hundred court of the town,' either by the king, or, in the case of tns. belonging to nobles, by the owner—thus Leicester obtained a charter from its earl and Beverley from Archbishop Thurstan. Most of the large tns. seem to have been vested in the Crown in the time of Henry I., and by the reign of Henry III. had succeeded in obtaining a clear recognition of their privileges and immunities. The readiness with which the tns. undertook municipal gov., and the ease with which they were incorporated by charter, was due to the fact that they already had a more or less complete organisation in the gild system (Stubbs's *Select Charters*). When in course of time the election of the mayor of a municipal bor. passed from the whole body of burgesses to the aldermen and councillors, the latter formed themselves into a close corporation, ignored the rights of their fellow townsmen, and secured their position by applying for and obtaining C. of incorporation framed according to their wishes and modifying any charter or C. which the tn. may already have possessed. This restrictive tendency was carried still further towards the end of the fifteenth century. The rights of the freemen disappeared, the corporation came to be looked upon as the owner of the tn. property, and developed into an exclusive oligarchy; and even the election of members of Parliament was, in some cases, entrusted into their hands. In this way the Crown could secure the return to the Commons of its own candidates; but the independence shown by the corporations under the Stuarts moved Charles II. to remodel their C. He proceeded against the corporations by writ of *quo warrantum* (q.r.), calling on the corporation to show by what authority it exercised its prerogative powers (it may be noted that in 1690 an Act of 2 William & Mary c. 8 declared all these legal proceedings null and void). The C. of the tns. surrendered through the instrumentality of the notorious Judge Jeffreys were replaced by others 'framing the constitution of these municipalities in a more oligarchical model and reserving to the Crown the first appointment of those who were to form the governing part of the corporation' (Hallam). The very use of the word oligarchical shows that the king was concerned not for the rights of the burgesses but for his own powers. James II., in the hope of conciliating the nation over the abrogation of its privileges, restored a number of the old C.; but this in no way improved the position of the burgesses as a whole, and throughout the eighteenth century the principle of the close corporation was maintained and all the bor. patronage was

in the hands of the councillors, who almost invariably neglected their duties to the tn. in order to further their own private interests. This corrupt state of things continued until the Municipal Corporations Act of 1835, which made provision for the election of the tn. councillors by the burgesses or resident ratepayers (see further under LOCAL GOVERNMENT). See also MUNICIPALITIES, and under the names of the various large cities or tns. of Britain.

Chartier, Alain (1385-1433), Fr. poet and satirist, b. at Bayeux, studied at the univ. of Paris. His first poem, written after the battle of Agincourt, was *Liure des quatre dames*; his *Belle Dame sans merci* was trans. into Eng. by Sir Richard Ros about the middle of the fifteenth century. He was made secretary to the dauphin, afterwards Charles VII. In 1422 he wrote his famous *Quadrilogue invectif*, describing the sufferings of the people or appealing to national patriotism to combine against the common enemy. By his eloquence and patriotism he cheered his countrymen with the belief that the cause of France was not lost. The story of the kiss given to him by Margaret of Scotland for his poems is a fable. His satire on the court, *Le Curial*, was trans. by Caxton, 1484. He attacked the vices of the clergy in the *Liure d'espérance* (1429), and his *Breviaire des nobles* was studied by the youthful members of every noble household. His influence on Clément Marot, John Lydgate, and others was great.

Chartists, name given to a body of political reformers (largely working men), who sprang up in England about 1838. Discontent and disappointment were felt among the workers of Britain after Grey's reforms and the Bill of 1832, resulting in the movement known as Chartism, from the document or charter in which the agitators presented their demands publicly. In 1838 six members of the House of Commons held a conference with representatives of the Working-men's Association, and together they drew up the People's Charter for alleviating the sufferings of the artisans and labouring classes. They petitioned for (1) universal suffrage (of men), (2) abolition of the property qualification for a seat in Parliament, (3) annual Parliaments, (4) equal representation, (5) payment of members of Parliament, (6) vote by ballot. Among the chief Chartist leaders were Feargus O'Connor, Thomas Attwood, the Rev. J. R. Stephens, Richard Oastler, Wm. Lovett and Henry Vincent (both working men), Ernest Jones, Thomas Cooper, and Henry Vincent. The *Northern Star* became the newspaper organ. In 1839 the National Charter Association was formed in Birmingham, and by 1848 the magnitude and significance of the agitation were felt in the highest degree. Members of the extreme section favoured appeals to arms, or popular risings and riots, if their demands could not be obtained by peaceable methods (cf. militant suffragists of the years immediately before the First World War).

This section of the C. were called physical-force men. Their demands were adopted from earlier reformers, John Cartwright's (*q.v.*) *Plan of Reform*, 1776, and the duke of Richmond's Bill, 1780, known as the People's Rights measure. The struggle of the C. may be divided into two periods—1836-39, aiming merely at industrial amelioration, and 1840-48, taking on rather the nature of a socialistic revolution. The second period was more

Hammond, *The Age of the Chartists, 1832-1854*, 1930.

Chartres, cap. of the dept. of Eure-et-Loir, 55 m. S.W. of Paris, and situated on the l. b. of the Eure. The tn. is divided into two parts—upper and lower—which are connected by very steep roadways. It is famed for its fine cathedral, Notre-Dame, founded in the eleventh century by Bishop Fulbert, and regarded by some as the finest church in

CHARTRES CATHEDRAL

E.N.A.

important for this very socialistic character. The C. refused to support the Anti-Corn Law League, as helping only the middle classes. Disturbances were most frequent in the N. Finally a great demonstration was announced to be held on Kennington Common. Gov. forbade the procession, and Wellington posted troops to guard the city, special constables being also enrolled, among them being Louis Bonaparte (Emperor Napoleon III.). As a party the C. disappeared after 1849, the movement declining partly owing to improved conditions of labour, partly to the legislative concessions made in reform Bills. See R. C. Gammage, *History of the Chartist Movement, 1837-54*, 1894; T. Carlyle, *Chartism*, 1840; C. Kingsley, *Alton Locke*, 1856; *The Life of Thomas Cooper, written by Himself*, 1872; J. McCarthy, *A History of Our Own Times, 1872-80*, 1903; M. Howell, *The Chartist Movement*, 1925; J. L. and B.

France. Its towers are noted for their beauty and perfect proportion; the one, 351 ft. high, dates from the twelfth century; the other, 377 ft., and of a far richer design, was not finished until the sixteenth century. The tn. is the seat of a bishop, a court of assizes, and possesses a chamber of commerce, training colleges, a communal college for girls, and a *lycée* for boys. The corn market, which is held once a week, is one of the largest in France. The industries are chiefly flour-milling, brewing, distilling, iron-founding, leather manuf., dyeing, making of stained glass and hosiery. In 858 C. was burnt by the Romans, and in 911 unsuccessfully attacked by them. In 1417 it fell into the hands of the Eng., who lost it again in 1432. In 1591 it was taken by Henry IV., who was crowned there in 1594. In the Franco-Ger. war it was taken by the Gers., and during that time it was an important centre of operations. In the

Second World War. C. was held by the Gers. from 1940 to 1944. It was recaptured by Gen. Patton's troops on Aug. 17, 1944. Pop. 26,400.

Chartreuse, La Grande, formerly a Carthusian monastery, founded in the year 1084 by St. Bruno. It is situated in a wild, picturesque valley in the Fr. dept. of Isère, about 13 m. N. of Grenoble. Its name was derived from a neighbouring vil. called Cartusia, now known as St. Pierre de C. The original monastery was founded between the years 1132 and 1137, but that of to-day dates only from 1676, the one of earlier times having been destroyed by fire. It contains four halls, where formerly the priors of other monasteries in France, Burgundy, Germany, and Italy used to be entertained. The chapel dates from the fifteenth century, but the cloisters, with their thirty-six houses, which were built for the use of the monks, are of later date. The monks were famed throughout the world for their manuf. of the celebrated liqueur. Since the expulsion of the monks in 1903, the buildings had been falling into decay but have been restored. In 1181 a Carthusian monk named St. Hugh of Lincoln went over to England and founded a monastery in Somerset.

Charybdis, see SCYLLA AND CHARYBDIS.

Chase, John (1810-79), Eng. water-colour painter, b. in London; was a pupil of Constable. One of his best-known works is of the interior of Westminster Abbey.

Chase, Salmon Portland (1808-73), Amer. lawyer and statesman, b. at Cornish, New Hampshire. In 1830 he settled in Cincinnati, where he won a great reputation as counsel for sev. fugitive slaves whose cause he enthusiastically upheld. On account of the question of slavery he left the Whig party in 1841. He was the first Republican governor of Ohio, which position he held from 1855 to 1859, but was unsuccessful as Republican candidate in the presidential election of 1860. From 1861 to 1864 he was secretary of the treasury, managing the country's finances with the greatest ability and credit during the years of the Civil war. The estab. of a national banking system and the issue of treasury notes ('greenbacks') were two of his most successful measures. In 1864 Lincoln appointed him chief justice of the U.S.A., in which capacity he presided at the trial of President Andrew Johnson, 1868. See A. B. Hart, *Salmon Portland Chase*, 1899; and J. W. Schuckers, *Life and Public Services of S. P. Chase*, 1874.

Chase, Samuel (1741-1811) Amer. jurist, b. in Maryland; admitted to the Bar at Annapolis. Was a member of the Continental Congress and was sent with Franklin to win over Canada to the revolting colonies; he signed the Declaration of Independence and helped to draw up a constitution for Indiana. An ardent Federalist, he was made a justice of the Supreme Court. Impeached by the House of Representatives, 1804, the impeachment fell through. See *Trial of Samuel Chase* (Washington, 1805).

Chase, William Merritt (1849-1916), Amer. painter, b. at Franklin, Indiana. He was a pupil of B. F. Hays of Indianapolis and of J. O. Eaton in New York, and later of Piloty and A. Wagner in Munich. He taught painting in New York for some years. He was a most successful portrait painter, his pictures of Whistler, Duveneck, Gen. Webb, etc., being well known. He was president of the Society of Amer. Artists.

Chasidim, see ASSIDEANS.

Chasing (Lat. *caelatura*; It. *ceselatura*; Ger. *Ciselieren*; Fr. *ciselure*), signifying chiselling. The art of producing figures and various ornamental designs, which can be either raised or hollowed on metallic surfaces with steel implements. It is employed chiefly for the ornamentation of goldsmith and silversmith articles, electro-plate, etc., being used to create flutings and bosses; it is also used to imitate engraved surfaces. Very delicate results may be achieved by this method, the most perfect examples of which may be seen in the chasing on the watch-cases by G. M. Moser, 1704-83. The worker first outlines the design on the surface he wishes to ornament; then, should bold and high embossments be the desired effect, these are blocked out by a process called snarling. The snarling iron is a long iron tool turned up at the end, and made so that when it is securely fixed in a vice, the end that is turned up can easily reach and press against any part of the inside of the article that is to be chased. The part of the article to be embossed is held firmly against the upturned end of the snarling iron, then a strong blow is given by the worker at the opposite end of the iron, with the result that the point touching the object gives it the sudden stroke that is needed to throw up the surface of the metal just where it meets the tool. When the blocking-out process from the interior is accomplished, or when the process of C. instead of embossing is required, the object to be chased is filled with molten pitch, which is allowed to harden. When this has taken place, it is then fastened to a sand-bag, and all the details of the design—lined, smooth, or rough—are worked out by a hammer and sev. small punches of varying outlines.

Chasles, Michel (1793-1880), Fr. mathematician, b. at Epernon, was prof. at the Ecole Polytechnique and later at the Sorbonne. He received the Copley medal from the Royal Society, 1863. In 1867 he made a report to the Academy that he had obtained a number of letters of Pascal which proved that he had anticipated the discoveries of Isaac Newton. These letters, as well as thousands of others alleged to be of Dante, Shakespeare, and other famous men, were proved to be forgeries committed by one Vrain Lucas, who was duly convicted. In his chief work, *Aperçu historique*, etc. (1837), he gives a brilliant account of the progress in modern times of geometrical methods. Other works are *Traité de géométrie supérieure* (1852); *Traité des sections coniques* (1865), etc.

Chasles, Victor Euphémien Philarète (1798-1873), Fr. writer and critic, b. at Mainvilliers near Chartres. His father was a member of the National Convention, and voted for the death of Louis XVI. C. was brought up in accordance with Rousseau's theory in *Émile*, and learned the printing trade. He was imprisoned for his share in a Jacobite plot, 1815, and on his release went to England, where he worked for Valpy the printer and pub. critical articles in the reviews. On his return to France he did much in introducing Eng., Russian, and Scandinavian literature. He was made librarian of the Bibliothèque Mazarin in 1837; and in 1841 he became prof. of comparative literature at the Collège de France. He d. at Venice. Some of his voluminous literary and critical works are pub. in *Trente Ans de critique*, twenty vols. of studies in comparative literature. 1846-1875.

Chassé, David Hendrik, Baron (1765-1849), Dutch general. He served with the Fr. Army after 1793 and during the Peninsular war; in 1815 with the Dutch at Waterloo. In 1830 he was governor of Antwerp and conducted a brave defence against the Fr. He was named by his soldiers 'General Bayonet,' from his devotion to that weapon in attack.

Chasseloup-Laubau, François, Marquis de (1754-1833), Fr. officer of engineers. Was a divisional general under Napoleon in 1799, but, later, he went over to the Bourbons and was made a Fr. peer. Was an expert in fortifications and on warfare generally.

Chassepot, Antoine Alphonse (1833-95), Fr. inventor of the rifle known by his name. He was b. at Mutzig, and was a mechanic in the gov. arsenal. The Chassepot was a breech-loading rifle, calibre .433 in., muzzle velocity 1328 f.s., sighted to 1200 metres. It was adopted by the Fr. Army, 1866, and was most successful in the Franco-It. war, 1867. The Prussian needle gun was matched against the Chassepot in the war of 1870. The Gras rifle replaced the Chassepot in 1874. C. received the cross of the Legion of Honour.

Chassériau, Théodore (1819-56), Fr. painter, b. at Samana, Santo Domingo. He was a pupil of Ingres, and subsequently studied in Rome. He was influenced by Delacroix. His 'Tepidarium at Pompeii' is in the Louvre. His frescoes at the Cour des Comptes, Paris, were partly ruined in the Paris Commune. He was well known as a portrait painter.

Chasseurs (Fr. for hunts-men, cf. Ger. *jäger*). In the eighteenth century the name was given to soldiers who formed a light company of skirmishers attached to a regiment; in the modern Fr. Army it is used of a class of light regiments capable of rapid movement. They are both mounted (C. *d'cheval*) and on foot (C. *d'pied*). The C. d'Afrique, first organised in 1831 and stationed in Algeria, are famous for their speed and endurance, and for their Arab horses. The C. Alps are regiments of Infantry stationed

on the S.E. frontier of France, and are trained to cover 3½ m. of mt. ground in a day in full marching order. In the seven months of snow they are trained to use ski and snow-shoes.

Chastelard, Pierre de Boscosel de (1540-1563), Fr. poet, born in Dauphiné. He was a descendant of the family of the Chevalier Bayard, and became a page in the household of the Constable Montmorency and of Marshal Damville. In 1561 he accompanied the latter to Scotland in the suite of Mary Queen of Scots, with whom he fell violently in love. He came a second time to Scotland with Ronsard's poem, *Les Regrets*, and recommendations from Montmorency. Entering the queen's service, he wrote passionate poems to her, and if she did not encourage him, she at least accepted his verses. He was found under her bed by her maids of honour, but was forgiven. A second offence was unpardonable, and he was hanged. According to Brantôme he went to his death reciting Ronsard's hymn to death. His last words, addressed to the queen in Holyrood, 'Adieu, toi si belle et si cruelle, qui me tues et qui je ne puis cesser d'aimer,' have often been quoted. He is the subject of Swinburne's *Chastelard* (1865) the first of his Scottish trilogy written after the Elizabethan model.

Chastelain, Georges (1404-75), Burgundian or Flemish poet and chronicler, b. near Alost, Flanders. Celebrated as the author of the *Grande Chronique des ducs de Bourgogne* and similar chronicles. His other works include *Douze Dames de rhétorique*, *Épithètes d'Hector et d'Achille*, and a number of rondeaux and ballades.

Chastellux, François Jean (1734-88), Fr. author and general, b. in Paris. He served with honour during the Seven Years war, and fought in the Amer. war of Independence. His best-known works were *De la liberté publique* (1772); and *Voyages dans l'Amérique septentrionale* (1764).

Chasuble, eccles. vestment, worn by bishops and priests of the Rom. Church during the celebration of mass, formerly known as *planeta*. Originally the C. fell below the knees; it became gradually modified till in the sixteenth century it reached its present form, that of a sleeveless vestment, open at the sides and covering the chest and back. The C. was formerly plain, but it is now frequently embroidered and adorned with orphreys. It must be of silk. An exquisite example of sixteenth-century It. work may be seen in the Victoria and Albert Museum, S. Kensington. The C. owes its origin to the Rom. *pænula*, a cloak worn by both sexes and all classes. Though specially a clerical garment it had no special significance in early church use, and it was first definitely reserved as a eucharistic vestment in the eleventh century, and was formally assigned to the celebrating priest in the thirteenth century as the special mass vestment. The C. was abolished by the Eng. Church after the Reformation, with the other mass vestments. (See illustration, p. 512.)

Chat, popular name for birds belonging

to the genera *Saxicola* and *Pratincola*, both of which are included in the Turdidae, or thrush family. *S. oenanthe*, the wheatear, *P. rubicola*, the stonechat, and *P. rubetra*, the whinchat, are all birds to which the term is applied. They are lively, insectivorous creatures, dwelling in N. lands and nesting in stony places.

Chata, or *Pterocles alchata*, representative member of the Pteroclididae, or sandgrouse family. It is a desert bird living in S. Europe, Africa, and Asia, and is considered to be good eating.

CHASUBLE

Chatalja, tn. of European Turkey, 25 m. N.W. by W. of Istanbul. To the eastward are the Heights of C., upon which are extensive fortifications. C. was the scene of much heavy fighting between the Bulgarian and Turkish forces in the Balkan war (q.v.) of 1912 and 1913. Here, too, during Nov., occurred the heavy mortality from cholera among the Turkish troops. This outbreak commenced about Nov. 7, and during the height of the epidemic about 1000 fresh cases were reported each day. It was also at C. that the *pourparlers* took place which led up to the truce in the war. The delegates of the Balkan allies and Turkey first met on Nov. 25, and on Dec. 3 all the parties, with the exception of Greece, signed the armistice. During this armistice, which lasted till the end of Jan. 1913, the delegates of the belligerent countries met in London. The C. lines were most strengthened in the First World War.

Château, Fr. word (from Lat. *castellum*, fortress) for a castle (q.v.). During the late fifteenth and sixteenth centuries, when houses began to be built for residence only and not as castles for defensive

purposes, the term became applied to all large country houses. The fortified castle was termed *C. fort*, and the residence *C. de plaisance*; the latter often retained some, at least, of the architectural features, *lourvelles* etc., of the medieval castle of defence.

Chateaubriand, François René, Vicomte de (1768-1848), prin. Fr. writer under the First Empire, was b. at St. Malo, and after a somewhat unhappy childhood, entered the regiment of Navarre. In 1791, inspired by a desire for adventure and the natural life, he went to America, but was recalled by the news of the arrest of Louis XVI. He married immediately on his return, and then joined the ranks of the 'émigrants.' After being wounded at the siege of Thionville, he visited England, where he managed to secure a livelihood by giving Fr. lessons. In 1797 he pub. his *Essai historique, politique et moral sur les révolutions anciennes et modernes*, etc., a confused work marked by much ill-digested learning. It is sceptical and despairing, and its very uneasiness prepares one for the conversion which the deaths of his mother and sister brought about. This conversion led to his great apology for Christianity in poetry. In 1801, *Atala*, an episode detached from the greater work, was pub. It showed a new, daring, and brilliant writer, a reformer both in prose and in poetry. In 1802 appeared *Le Génie du christianisme*. The writer does not attempt directly to prove that Christianity is true, but that it is beautiful, and that it is capable of inspiring far higher poetry than is the pagan mythology. His romanticism appears in a more concentrated form in *René* (1805), another episode detached from the main work. On his return to France, C. received an appointment under Napoleon, and in 1809 pub. *Les Martyrs*, which contains the argument of *Le Génie du christianisme* cast in an objective form. Two years later he pub. *L'itinéraire de Paris à Jérusalem*, after a pilgrimage to the latter tn. C. is, with Mme de Staël, the leader of the Romantic movement of the early nineteenth century. He reformed poetry, hist., the novel, and in addition to this he was one of the greatest masters of Fr. prose. See C. A. Sainte-Beuve, *Chateaubriand et son groupe littéraire sous l'Empire*, 1860; E. Faguet, *Le XIX. Siècle*, 1887; M. H. Miller, *Chateaubriand and English Literature*, 1925; A. Maurois, *Chateaubriand*, 1938.

Châteaubriant, tn. in the dept. of Loire-Inférieure, France, situated on the R. Chère. It is a centre of importance on the State and Orleans railway routes, where the manuf. of leather and agric. implements is carried on. It is named after a castle founded in the eleventh century by Briant, count of Penthièvre, parts of which are still in existence. It is the seat of a sub-prefect, and possesses a tribunal of first instance. Pop. 8000.

Châteaudun, anct. picturesque tn. in the dept. of Eure-et-Loir, France, with 6700 inhab. It was a Gallic tn. in Rom. times and was destroyed by the Normans in 875. The tower of the castle is of the

twelfth century, the church of St. John of the eleventh; that of St. Valerian of the thirteenth and earlier; the abbey church of the twelfth-thirteenth. The abbey buildings are occupied by the hospital and law courts. C. resisted the Gers. heroically in 1870, and was pillaged and burnt by them. It bears the Legion of Honour in its arms.

Château Gaillard, ruined Fr. fortress on the Seine, not far from Les Andelys. Built at the close of the twelfth century by Richard Cœur de Lion to defend the dukedom of Normandy against the Fr. king. Captured by Philippe Auguste in 1204.

Château-Gontier, tn., dept. Mayenne, France. It is said that a castle was built here by Gunther in the eleventh century. It possesses chalybeate springs not far from the tn. There is wool and cotton spinning, and the manuf. of oil, flannel, and serge. There is also an agric. market. Pop. 6000.

Château-Renault, François Louis de Rousset, Marquis de, (1637-1716), Fr. vice-admiral, who fought at the battle of the Dunes, and, with Turenne, at the siege of Dunkirk. Fought the Levantine corsairs and captured a number of their vessels. Was made governor of Brittany and a marshal of France. Became baron of Poulmic and vicomte of Artois.

Châteauroux, cap. of the Fr. dept. of Indre and situated on the R. Indre. The anct. quarter of the tn. lies close to the riv., and round this centre a newer quarter has now sprung up. Its name is derived from a castle built in the tenth century by Raoul of Déols. This castle, called Château-Raoul, and the modern Gothic church of St. André, form the prin. buildings of the tn. It has textile, machinery, and furniture manufs. Pop. 34,600.

Château-Thierry, tn. in the dept. of Aisne, on the Marne, France. It was here that La Fontaine was born in 1621 and his dwelling-house still stands in the street that was named after him. Not far from C. the Russians and Prussians were defeated by Napoleon in 1814. C. fell to the Gers. in their advance on Paris in Aug. 1914, when endeavouring by their southward sweep to envelop the Fr. left wing and cut off the Brit. force from all contact with the Fr. The Gers. were brought to a halt on a line about 15 m. S. of C. and when the Anglo-Fr. army counter-attacked in early Sept. 1914 desperate fighting took place at C. which had been selected as the point at which the Marne was to be crossed. It was, in fact, crossed on Sept. 8 and C. did not see any more fighting until the final Ger. advance in 1918. By March 1918 the Gers. had reached a line just N. of the R. Aisne. During their drive from here to the Marne, the Gers. encountered the 2nd U.S. Div. Four Amer. regiments of the regular infantry reached Meaux on May 30, 1918. They took over the line from the weary Fr., and the next day began the fight for C. They defeated the Gers. N.W. of that tn. and prevented them from crossing the Marne. Six

Amer. divs. stayed the final offensive of the Gers. and the tn. of C. itself was recovered from the enemy on July 21, as part of the general allied counter-offensive. Up to that date it was the most serious engagement in which the Amers. had taken part and was considered as a test of their stamina. Occupied by the Gers. 1940-44, and recaptured by Amer. troops on Aug. 28, 1944. Its industries are the making of pottery and cloth, and trade is carried on extensively in the white wine of the country, also in cattle, sheep, and agric. products. Pop. 8000.

Chatel, Ferdinand Toussaint François (1795-1857), b. at Gannat, Allier. He was a religious reformer and separated from the Catholic Church, founding a new communion, the Gallic Church. He denounced celibacy and private confession, and wrote many religious essays.

Chatelaine, Fr. term for the mistress of a castle; she carried the keys of the castle suspended from her girdle and thus the term is used of a collection of small chains with useful small articles, such as keys, penknife, scissors, thimble, etc., attached to the ends, fitted with a clasp and worn at the belt.

Châtelet, tn., Hainaut, Belgium, on R. Sambre. It is a mining centre, and manufs. explosives. Pop. 14,000.

Châtelet, Le Grand, old fortress on the r. b. of the Seine in Paris, on the site now occupied by the Place du C. The first mention of it is in a charter of Louis le Jeune, 1147. It was the city prison in the time of the Renaissance, and a court of justice, but was destroyed in 1802. Le Petit C., a smaller fortress on the opposite bank of the riv., also used as a prison, was destroyed in 1782.

Châtelet-Lomont, Gabrielle Emilie de Tonnelier de Breteuil, Marquise du (1706-1749), b. in Paris. She was the beautiful daughter of the Baron de Breteuil, and married the marquis du C. in 1725. Her fame is due to her intimacy with Voltaire who, attracted by her cleverness and beauty, took up his abode with her at the Château of Cirey in 1735. Many accounts of the life at Cirey have been written, the best known being those of Mme de Graigny, who credits the fair Emilie with a very bad temper and describes her quarrels with Voltaire with considerable humour. She seems to have tired of him eventually, and in 1747 turned her attention to Saint-Lambert, an officer in the guard of King Stanislaus. She pub. sev. works and translations, and in conjunction with Voltaire wrote a treatise on the Newtonian system.

Châtellineau, tn. of Hainaut, Belgium, situated on the R. Sambre, 27 m. E. of Mons; it is a mining tn. with big coal-fields and iron works. Pop. 17,000.

Châtellerault, tn. in the Fr. dept. of Vienne, 40 m. S. of Tours. It is not of much interest, the prin. industry being the manuf. of cutlery; it has also a gov. small-arms factory. A fine stone bridge connects the tn. with a suburb on the other side of the riv. Pop. 22,800.

Chatfield, Sir Alfred Ernie Montacute Chatfield, first Baron (b. 1873), Eng. admiral, son of Adm. A. J. C. Entered navy, 1886; captain, 1909; rear-admiral, 1920; vice-admiral, 1926; admiral of the fleet, 1935. Served as flag-captain to Sir David Beatty, H.M.S. *Lion*, in action off Hellgoland, 1914; Dogger Bank, 1915; battle of Jutland, 1916. Fourth sea lord, 1919; assistant chief of naval staff, 1920-22; commanded light cruiser squadron, 1923-24; third sea lord and controller of the navy, 1925-28; commander-in-chief of Atlantic fleet, 1929-30, of Mediterranean fleet, 1930-32; first sea lord and chief of the naval staff, 1933-38; chairman of expert committee on Indian defence, 1938-39; minister for co-ordination of defence, 1939-40, with seat in the War Cabinet. K.C.B., 1922; G.C.B., 1934; O.M., 1939. In the inter-world-war decades he held key posts which placed him in a position to warn the gov. and the people of the risk that the country might once again find itself facing a world war without being prepared. As assistant chief of the naval staff he attended the Washington Conference of 1921-22 (q.v.) as expert adviser to the Brit. delegation, being instrumental in securing such concessions on battleship tonnage as enabled the Admiralty to build two new 16-in.-gun ships. Played a prominent part in designing *Nelson* and *Rodney*. As controller of the navy he served at a time when the efficiency of the navy was dangerously impaired by false economy; by the short-sighted Ten Year Rule or empirical assumption that no major war could recur for ten years, a period probably justified as at 1919 but not if it were renewed at the end of each year of peace; and by the cuts of the Colwyn Committee on Estimates. None fought harder than C. for naval efficiency at a time when the 'super-domination of Britain's defences given to the Treasury and successive chancellors by the gov. was bringing the defences of the empire to a state that became a public scandal'—though it should be borne in mind that, apart from the financial stringency of the inter-war period, it was sincerely believed by many, both politicians and experts, that the capital ship, for which C. argued, was outmoded by the bomber. That belief, however, was at the time unsupported by any direct evidence. In the struggle for new cruisers in 1925 following the Washington Conference C. had to contend against the neutral or hostile attitude of both press and Parliament, but in the event the gov. gave way because the case against C. and the Admiralty was indefensible. In 1930, however, at the time of the London conference (q.v.) other counsels prevailed, which 'led the sea-security of the empire to its most dangerous point for 150 years.' When, in 1933, C. was once more appointed to the Admiralty, he aimed at three objectives: to rebuild the battle fleet; to increase Brit. cruiser strength to a minimum of seventy; and to free the Fleet Air Arm (q.v.) from Air Ministry control; and generally he was successful.

At the time of the fourth naval conference his long struggle with America over cruiser-parity came to its natural end by mutual goodwill, but only after the dispute had lasted ten years. Equally tenacious was his stand, at this latter conference, on the question of the rebuilding of the battle fleet. As chief of the naval staff he set as the basic aim the unity of the three services and, through that unity, the strengthening of the chiefs of staff committee in their task of rebuilding the fighting services, which, by 1933, had been reduced to 'such a serious state of unreadiness for war.' C. succeeded Lord Caldecote (then Sir Thomas Inskip) as minister for the co-ordination of defence, with a seat in the Cabinet, the appointment being hailed with enthusiasm by public opinion. As deputy chairman of the committee of imperial defence (q.v.) he deputised for the Prime Minister on all ordinary occasions. Publications: *The Navy and Defence* (1942); *Defence after the War* (1944); *It Might Happen Again* (written in 1940) pub. 1947 (autobiographical).

Chatham, riv.-port tn. in Kent, situated on the r. b. of the Medway, and joined on the W. side by Rochester, and the E. by Gillingham. The tn. possesses very few objects of interest, and owes most of its importance to its military fortifications and dockyards. It is one of the most celebrated shipbuilding centres in England, the length of the dockyards being nearly two m., which contain sev. building slips and wet docks, the latter capable of holding the largest ships. In the Middle Ages C. was merely a suburb of Rochester, but Henry VIII., to whom we owe the foundation of a regular navy, estab. dockyards, and the natural harbour formed by the deep channel of the riv. was made use of by Elizabeth, who built a dockyard and an arsenal here. The defences of C. constitute a fortification of great strength, and are a great protection to London should invaders succeed in landing on the S. coast, in order to march on the cap. Fort Pitt, rising above the tn. to the W., built in 1779, is utilised as the general military hospital. There is a large convict estab.; also an almshouse built in 1592 by Sir John Hawkins for disabled seamen, which has since those days been entirely rebuilt. At one time traces of old Rom. remains were discovered in the form of weapons, Rom. bricks, and tiles; also human remains. The modern church of St. Mary's, opened in 1903, stands on the site of an old Saxon church. There is also St. Bartholomew's Chapel, which was formerly attached to the hospital for lepers, one of the first founded in England, by Gundulph, bishop of Rochester, 1070, partly of Norman architecture. In 1905 King Edward VII. unveiled a memorial arch in memory of the Royal Engineers who fell in the S. African war. The Naval War Memorial was unveiled by the Prince of Wales in 1924., and that of the Royal Engineers by the duke of Connaught in 1923. Pop. 45,000.. With Rochester and Gillingham C. forms a parl. bor. returning two members.

Chatham, also called **Miramichi**, tn. in Northumberland co., New Brunswick, Canada, a port on the Miramichi R., 24 m. from its mouth. Extensive fisheries are carried on, also a trade in lumber. Pop. 5000.

Chatham, co. tn. of Kent Co., Ontario, Canada, on the Thames R. 12 m. from its mouth, 64 m. S.W. of London and 180 m. W. of Toronto. Connected with Detroit and the cities on Lakes Huron and Erie by steamboat service. It is the centre of a large natural gas field, and has also cheap hydro-electric power. The chief industrial products are motor cars, pumping and well machinery, textiles, malleable steel, flour, lumber, sugar, cigars, furnaces, gloves, and fertilizers. The crops of the co. are husking corn, tobacco, tomatoes, and soy-beans. C. has two large parks and four more on the nearby lakes. There are two business colleges, a new collegiate institute or senior high school, and a vocational school; also there are two hospitals. The community was first surveyed in 1794 by Governor Simcoe, as a naval shipyard; hence its name. It became a city in 1895. It was famous in pre-Amer. civil war days as the N. terminus of the 'underground railway' for escaped negro slaves. Pop. 18,000.

Chatham, **William Pitt**, first Earl of (1708-78), statesman, was educated at Eton and Trinity College, Cambridge, and early in 1731 was gazetted cornet in Lord Cobham's Horse. Four years later he entered Parliament as member for the family bor. of Old Sarum. He supported the Opposition, and for a speech made on the marriage of Frederick, Prince of Wales, which the king found offensive, he was dismissed from the army (1736). Shortly after, the prince rewarded his supporter by making him one of his grooms of the bedchamber. Pitt soon took an active part in the debates of the House of Commons, and his great powers of oratory within a short time marked him out for future distinction. He had, however, to contend against the king's dislike, which blocked his progress for a long time. Under Pelham he was appointed early in 1746 joint vice-treasurer of Ireland, but in May of the same year he was promoted to the position of paymaster-general of the forces. This was the most lucrative office in the ministry, owing to the numerous and valuable perquisites attaching thereto; but Pitt, to his great credit, declined to accept anything but the actual salary. On Pelham's death, Pitt hoped to lead the House of Commons, and, disappointed in his ambition, he attacked the new leader, Sir Thomas Robinson, and the new Prime Minister, the duke of Newcastle. He was dismissed late in 1755, but a year later he was invited to form an administration. In April 1757, dismissed by the king, whose dislike of him was even stronger than before, he was, after a few weeks, recalled to power, and held office (under the nominal leadership of the duke of Newcastle) until Oct. 1761. It was during this period that he was able to give the fullest

proofs of his ability as a war minister, for he had returned with full powers to direct the war and to take charge of foreign affairs. He declined office in 1763, but continued to take as active a part in debate as his health would allow. When Rockingham was dismissed in July 1766, Pitt was invited to form another administration, but he was not well enough to do more than take the sinecure office of Lord Privy Seal in his own ministry. This necessitated his accepting a peerage—a step that made him for a time very unpopular. The city especially resented the 'Great Commoner' becoming the earl

EARL OF CHATHAM

Engraving after a picture by Richard Brompton

of C., and actually cancelled a banquet that was to have been given in his honour. His health now completely gave way, and he resigned the office of Prime Minister in Dec. 1767 to the duke of Grafton, holding, however, that of Lord Privy Seal until the Oct. of the following year. He was taken ill while making a vigorous speech in the House of Lords against the acknowledgment of Amer. independence (albeit he had never approved the war) on April 7, 1778. He died at Hayes on May 11, and was buried in Westminster Abbey on June 9. C. is one of the greatest figures among Eng. statesmen, and he stands for all time as one of the greatest parliamentarians of this or any other country. His popularity throughout the kingdom was enormous, and it was due not more to a general appreciation of his abilities than to his fearlessness and his well-deserved reputation for integrity and self-disinterestedness. There are biographies by F. Thackeray (1827), A. von Ruville (1905), and B. Tunstall (1939). See also Sir C. Grant Robertson, *Chatham and the British Empire*, 1946.

Chatham Chest, charitable fund originated by Sir Francis Drake and Sir John Hawkins in 1588 to assist sick and wounded seamen. It takes its name from the money having been placed in a chest kept at Chatham that had five locks, the keys of which were held by the officers who had charge of it. Four supervisors and seven directors were appointed to look after the accounts, which had to be placed before Parliament every year. Twelve ac. of land were assigned to the charity by Charles II., and the fines imposed by the courts martial were also handed over to it in 1688. In 1802 the chest was moved to Greenwich and the fund incorporated with Greenwich Hospital; up till 1829 a considerable part of the money was raised by deductions from seamen's pay.

Chatham Islands, small group of is., including some rocky islets, in the Pacific Ocean, lying 360 m. E. of New Zealand, to which they belong. These is. were discovered in 1791 by Lieut. W. R. Broughton, who named them after the boat which he was commanding at the time of the discovery. The natives he called *Maori*, after the name which the New Zealand natives gave themselves (*see* MAORIS) and their dress consisted of sealskins or mats. In 1831 they were conquered by 800 Maoris from New Zealand, and in 1849 there were only ninety survivors out of a total pop. of 1200, the race being therefore all but exterminated. The chief export of the is. is wool, and the industries comprise cattle- and sheep-breeding, and seal-fishing. The climate is colder than that of New Zealand, while the soil is extremely fertile, with luxuriant growth of fern and fax. Area, 372 sq. m. Pop. 700 (300 Maoris).

Châtillon-sur-Seine, tn. in the dept. of Côte-d'Or, France, situated on both banks of the Seine. The industries consist of brewing and iron-founding, and trade is chiefly in wood, charcoal, and stone. There are many old houses of interest in the tn. Pop. 4700.

Chat Moss, peat bog in Lancashire, England. It lies between Manchester and Liverpool, and stretches over about 6000 ac. One of the finest feats of engineering accomplished by George Stephenson was the railway that he built across it (1828-30). Many attempts have been made to drain it, works being constructed for the purpose by Roscoe in 1805, and by Edward Baines in 1821; the greater part of it is now cultivated.

Chatou, tn. of France in the dept. of Seine-et-Oise and the arron. of Versailles, on the R. Seine. It is 3 m. E. of Saint-Germain, and 8 m. from Paris. Pop. 12,000.

Chatra, or Chiltira, tn. of Brit. India, in the dist. of Hazaribagh. Pop. 11,000.

Chatsworth, vil. in Derbyshire, England, containing the famous seat of the dukes of Devonshire. The original C. House was commenced by Sir Wm. Cavendish (d. 1557) and completed by his widow. It was in this building that Mary Queen of Scots was imprisoned under the care of

the earl of Shrewsbury. Later it was pulled down and the present house was built in 1688 by Wm., first duke of Devonshire. It is a quadrangular building with an open courtyard in the centre, and Ionic in style, standing on the l. b. of the R. Derwent about 2½ m. from Bakewell. The magnificent gardens with the vast conservatory and numerous fountains were designed by Sir Joseph Paxton. The house contains priceless collections of pictures and statuary, and some very beautiful wood carving.

Chattahoochee, riv. in Georgia, U.S.A., forming part of the boundary on the W., and joining the Flint, after which it becomes the Appalachicola. It is navigable for about 200 m., up to Columbus, the total length being 500 m.

Chattanooga, cap. of Hamilton co., Tennessee, U.S.A., on the Tennessee R. It is important as a commercial and railway centre, doing a large trade in lumber, grain, and coal, and manufacturing iron, steel, machinery, etc. It is famous for the battle fought there during the Amer. Civil war, which consisted of a series of engagements including that of Lookout Mt., known as the 'battle above the clouds,' and that of Missionary Ridge, when the Federals under Grant defeated the Confederates under Bragg, Nov. 23 to 25, 1863. The national cemetery to the E. of the city contains the graves of over 13,000 Federal soldiers. The city contains some fine buildings, and possesses a univ. known until June 1907 as the Grant Univ. This, the univ. of C. (Methodist Episcopal), was founded in 1867 and now comprises schools of law, medicine, and theology. It has about 2900 students. Pop. 128,000.

Chattels (O.F. *chatel* from Low or late Lat. *capitale*, Lat. *capitale*, 'property,' as also 'cattle,' which is essentially the same word as chattel, but the latter is much more modern), the phrase goods and C. in Eng. law means all property not included under one or other of the terms 'lands, tenements, and hereditaments' (*q.v.*), and is thus the equivalent of personality. This property is divided into C.-real and C.-personal. The former include any estate or interest in lands or buildings which does not amount to a freehold, this inclusion being based on the fundamental principle of Eng. real property law that a term of years of any length whatsoever is no more than personal property, and descends as such on intestacy. The latter are either corporeal, *i.e.* having an actual physical existence, such as money, plate, furniture, and minerals when severed from the land; or incorporeal, *i.e.* having a mere notional existence, such as debts, patents, stocks and shares, and copyrights.

Chatterer, in ornithology, is a word that has been applied in a loose sense to many birds without special regard to its applicability. It is often used particularly for *Ampelis garrulus*, the waxwing, but is frequently used for other passeriform birds which are members of the family Cotingidae.

Chatteris, mkt. tn. in Cambridgeshire, England, situated in the administrative co. of the Isle of Ely. A thousand Rom. coins of 305-6 and part of the skeleton of an elephant have been found here. There are remains of a Benedictine convent of the tenth century. Pop. 5000.

Chatterton, Edward Keble (1878-1945), Eng. author and journalist, b. at Sheffield and educated at Oxford. Entered journalism in London in 1902 and, for a time, took up art criticism, publishing *T. Sydney Cooper, R.A.* (1903) and *Modern Journalism* (1909). But he was chiefly known as a copious writer on ships and the sea. His book *Sailing Ships: the Story of their Development from Earliest Times to the Present Day* appeared in 1909, *Steamships and their Story* in 1910, and also in 1910 *Down Channel in 'Virelle'*, on his yachting experiences. Other books were *The Story of the British Navy* (1911); *King's Cutlers and Smugglers* (1912); and, after an interval of employment in the historical section of the committee of imperial defence, *Q-Ships and their Story* (1922); *The Epic of Dunkirk* (1940); and *Beating the U-Boats* (1943).

Chatterton, Thomas (1752-70), poet, was b. at Bristol, the son of a poor schoolmaster. He is said to have been a dull child, but after he entered Colston's Hospital at Bristol at the age of eight, his faculties seem to have awakened. He began to draw, and he became an omnivorous reader, his tastes inclining to poetry. At the age of twelve he wrote a poem, *Elinore and Jaga*, on old parchment and with obsolete spelling, which deceived the junior usher of the school, Thomas Phillips, who was convinced of its antiquity. Thus encouraged, he continued what was to him a delightful game, and forged a pedigree of the De Berghams, which was accepted by their descendant, a pewterer named Henry Bungum. In 1767 he was apprenticed to an attorney at Bristol, and in the following year hoaxed that whole city with a description, alleged to be from an old MS., of the opening of Bristol Bridge in 1248. He now carried the joke further. He sent to Horace Walpole a 'transcript' of *The Ituse of Peyneleyne in England*, written by T. Rowley, 1469, for *Maistre Canynge*. Walpole was deceived, and had some thought of printing them at his own press, but before doing so showed them to Gray and Mason, who pronounced them forgeries. Whereupon Walpole returned the MS. to the lad. C. came to London in 1770, and, living in a garret, wrote many verses, including the excellent *Balade of Charitie*. He seemed to have a fair prospect of making his way, for Alderman Beckford became his patron; but Beckford d. on June 21, and he could find no publisher or editor to employ him. Rendered desperate by his penniless condition, on Aug. 24 he poisoned himself with arsenic. That C. should have d. at the age of eighteen is one of the crying pities of literature, for what might not he have done who, at this early age, should have written the

Balade of Claritie, a poem that beyond all doubt places him in the front rank of Eng. poets? Walpole has been blamed for his treatment of C., but this is not fair. He had every right to be indignant at being imposed upon, but had he been a finer critic of poetry than he was, he would not even have been deterred by the discovery that the poems were not by 'T. Rowley' but the work of a lad still living, for the merit of the poems is not so much in the old-world manner as in the matter. There are many who might have turned a modern poem into the spelling of other days, many, indeed, who might have done so better than C., but how many have had the genius to write them? The Rowley controversy survived the author's death, but the question has been definitely settled by Prof. W. W. Skeat in his ed. of Chatterton's works, 1875. See D. Wilson, *Chatterton*, 1869; J. H. Ingram, *The True Chatterton*, 1910; E. H. W. Meyerstein, *The Life of Thomas Chatterton*, 1930; J. C. Nevill, *Thomas Chatterton*, 1948.

Chattisgarh, see CHHATTISGARH.

Chaucer, Geoffrey (c. 1340-1400), Eng. poet, b. in Thames Street, London, the son of a vintner. At about sixteen years of age he became page to Elizabeth, the wife of Lionel, duke of Clarence, and continued at court till 1359, when he joined the army which invaded France under Edward III. He was made prisoner, but ransomed some months before the treaty of Bretigny in 1360. Nothing is known of the next six years of his life, but in 1366-72 he was again connected with the court, being at one time a valet of the king's household. At the death of his patron, Prince Lionel, in 1368, his services were transferred to John of Gaunt, duke of Lancaster. It was at this time that he first began to write. For the next twelve or fourteen years C. was constantly employed as a foreign diplomatic agent. During 1372-73 he was in Italy, first visiting Genoa on a commercial mission, and later Pisa and Florence. On his return he was rewarded by the grant of sev. privileges, including, in 1374, the office of the comptroller of the customs and subsidy of wools, skins, and leather for the Port of London. In 1375 he received the custody of the lands and person of Edmond Staplekat of Kent, and in 1376 was employed upon a secret mission in conjunction with Sir John Burley. During 1377 he went to Flanders, and later to France, to treat for peace with Charles V.; in 1378 to France and Lombardy; in 1382 was appointed comptroller of the petty customs. He became a justice of the peace in Kent in 1385, and in 1386 became member of Parliament and a knight of the shire for Kent. Later in the year he was reduced to comparative poverty by being removed from both his offices of comptroller, apparently at the instigation of Thomas, duke of Gloucester. In 1387 he lost his wife, Philippa, and in 1389, on the return of his patron, John of Gaunt, from an absence abroad, was appointed clerk of the works at the palace

of Westminster and the Tower of London. In 1390 he superintended works at St. George's Chapel, Windsor, at Woolwich, and at Smithfield, but in 1391 lost his position. In 1394 Richard II. granted him a new pension of £20, and in 1398 a yearly tun of wine; and in 1399 Henry IV. promised him an additional pension of forty marks. He *d.* on Oct. 25, 1400, in a house he had recently rented in the grounds of St. Mary's Chapel, Westminster, and was buried in St. Benet's Chapel (now Poets' Corner) in Westminster Abbey.

CHAUCER

An engraving after the 'Oocleve' portrait.

The works of C. fall into three periods, named, from the main influences exhibited in them, respectively Fr., It., and Eng. During his life at court, previous to 1372, his work was entirely imitative, and based on the popular Fr. poems which would be the natural models of a young poet of the time. He himself tells us that he made a trans. of the famous romance, *Le Roman de la Rose*, but of this all trace has been lost except three fragments of doubtful authenticity except, perhaps, the first. Probably his earliest poem which remains to us is the *A B C*, a prayer rendered out of Fr. at the request of Blanche, duchess of Lancaster. To this period also belong the *Complaint to Pite*, a poem of rejected love, possibly autobiographical, and *The Dethe of Blaunche the Duchesse*, written in 1369, to commemorate the death, at the age of twenty-nine, of the wife of his patron, John of Gaunt. The second, or It., period (1372-84) is marked throughout by a love and knowledge of It. poetry, gained during his first mission to that country. Fr. romance was thrown over as he came to learn more of the full range and power of poetry, and the work of this time shows an enormous advance in form,

simplicity and directness of diction, humour, and, above all, the art of telling a story. Parts of sev. of the *Canterbury Tales*, such as the Second Nonnes tale, the Clerkes tale, the Knightes tale, the Man of Lawes tale, the Monkes tale, the Doctors tale, the tales of the Prioress, Squire, Franklin, and the rhyme of Sir Thopas, were probably composed during this period, but the most important complete poem produced under It. influence was *Troilus and Crescide* (c. 1382), a very free trans., with many additions, of Boccaccio's *Filostrato*. The additions are excellent and full of originality, and while the passionate description of the ruined love of Troilus and Cressida may be reminiscent of the *Complaynt to Pite*, the character of Pandarus foreshadows the humour of the *Canterbury Tales*. Other poems of this period are the *Complaynt of Mars*; *Anelida and Arcite*; *The Former Age*, mainly taken from Boethius; the *Wordes to Adam*; the *Parlement of Foules*, full of delightful humour; and the *House of Fame*, an unfinished poem, showing the influence of Dante. The prose trans. of Boethius was also written at this time. The third, or Eng. period, beginning about 1381, shows C. an entirely original poet except in the subject-matter of his work, and establishes his claim to be called the father of Eng. poetry. Between 1386 and 1389 he composed many of the most characteristic of the *Canterbury Tales* and the *Prologue*, revised and completed earlier tales, and consolidated the whole work. He also wrote the *Legende of Good Women* (1385-86), which was left unfinished; the *Treatise on the Astrolabe* (1391), compiled mainly from Messahala, for his little son Lewis, and left unfinished; the *Complaint to his Purse*; and sev. minor poems of doubtful date, such as *Truth*. The *Canterbury Tales*, upon which C.'s fame chiefly rests, owe their plan to the *Decameron* of Boccaccio, in which stories are told by a band of fashionable ladies and gentlemen who had retired to a garden outside Florence to escape the plague. C. transposes the idea to contemporary Eng. life by making the tellers of his tales members of a party of pilgrims on the road from Southwark to the shrine of Thomas à Becket at Canterbury. The pilgrims include men and women of every rank of social life, and represent the church, the army, the court, law, medicine, trade, the sea, and the kitchen. The plots of their tales come from various sources. Many are foreign in origin, but much skill is shown in assigning these to suitable characters and bringing them into harmony with the general scheme by adaptation and addition. Many, such as the tales of the Miller, the Reeve, the Cook, the Wife of Bath (prologue), the Merchant, the Friar, the Nun's Priest, and the preamble of the Pardoner, are typically Eng., shrewd, good-tempered, inclined to be boisterous and full of a humour, which, if at times too broad for modern taste, is frank, hearty, and healthy. Among the numerous odes of C.'s works may be mentioned those of

John Stowe (1561); W. W. Skeat (1894-97 and 1895); F. N. Robinson (1933). Bibliographies have been pub. by E. P. Hammond (1908), D. D. Griffith (1926), and W. E. Martin (1935). See also W. Godwin, *A Life of Geoffrey Chaucer*, 1803; G. G. Coulton, *Chaucer and his England*, 1908; E. Legouis, *Geoffrey Chaucer*, 1913; G. L. Kittredge, *Chaucer and his Poetry*, 1914; G. K. Chesterton, *Chaucer*, 1932; J. L. Jones, *Geoffrey Chaucer*, 1934; H. S. Bennett, *Chaucer and the Fifteenth Century*, 1947; and J. S. P. Tatlock and A. G. Kennedy, *A Concordance to the Complete Works of Geoffrey Chaucer and to the Romaunt of the Rose*, 1927.

Chaucer, Thomas (c. 1367-1434), Eng. statesman, supposed son of Geoffrey. He had the early patronage of the duke of Lancaster, and held sev. posts under Richard II. and Henry IV., notably that of chief butler. He had large estates in Oxfordshire, which he represented in numerous parliaments. In 1407 and in 1414 he was elected Speaker of the House of Commons. He served on sev. diplomatic missions, and in 1424 became a member of the council.

Chaucer Society, The, founded in London (1867) by F. J. Furnivall with the aim of supplying scholars with MSS. and early texts relating to Chaucer not accessible to the public generally, and of facilitating Chaucerian research, and encouraging knowledge of his works by all. Furnivall issued in 1868 a six-text print of the *Canterbury Tales* for the society, and an index of proper names and subjects has been prepared by it (1911).

Chaouli, anct. and powerful Ger. tribe, mentioned by Tacitus as a people of great nobility, who lived by the shores of the Ger. Ocean, in the dist. stretching between the Rs. Elbe and Ems.

Chaudesaigues, tsn. in the dept. of Cantal, France, 19 m. S.S.W. of St. Flour. It is renowned for its hot mineral springs, which have a varying temp., and at their highest point are among the hottest in France. Pop. 1200.

Chaudet, Antoine Denis (1763-1810), Fr. sculptor, b. in Paris. After obtaining the Grand Prix he left his bp. and went to Rome in 1784, and here, influenced by the enthusiasm which prevailed in those days for the antique under Canova, he wrought his most famous works, 'Love,' 'Peace,' 'Paul and Virginia,' all of which are in the Louvre; 'Odipus' and the bas-relief 'Fine Arts' being in the Musée Napoléon. He produced also a bust of Napoleon.

Chaudfontaine, Belgian vil. charmingly situated on a hill above the R. Vesdre, 5 m. S.E. of Liège. It possesses hot mineral springs. Pop. 2100.

Chaudière, riv. and lake in Quebec, Canada. The riv. rises in the vicinity of Maine, U.S.A., flows into Lake Megantic, and from thence travels in a N.W. direction to join the St. Lawrence R., 7 m. distant from the tn. of Quebec. The C. Falls occur about 2½ m. from its mouth. The lake is 18 m. in length, and 5 m. in width. The R. Ottawa flows

through it, and the lake has its termination at its E. end in the Great and Little C. Falls, close to which lies the tn. of Ottawa.

Chaud-Medley, see CHANCE-MEDLEY.

Chaudoc, arron. of Cochín-China, on the lower arm of the R. Mekong. The country is mountainous in the W. part, and flat and marshy in other parts, and forms the plateau of Thatson, 1300 to 1600 ft. The chief products are rice, maize, vegetables, and indigo. The inhab. are composed of Malays, Chinese, Tsiams, Cambodians, and Annamites. The cap. tn., C., stands at the head of a canal which forms a connection with the riv. and the port Ha Tien.

Chaulieu, or Chaulieuc, Guillaume Amfrye, Abbé de (c. 1630-1720), Fr. poet and wit, styled the 'Anacreon of the Temple,' the coterie of which the grand prior Vendôme was the head. He was b. at Fontenay, Normandy, and educated at the Collège de Navarre. Received the abbey of Aumate and other livings from his patron Louis Joseph, duc de Vendôme. He and his friend, the marquis de la Fare (1644-1712), who were always quoted together, were the most prominent Fr. poets at the beginning of the eighteenth century, and their works were ed. together in 1714 and twice later in the same century. Both derive, on the one hand, from the artificial school of Voiture (1598-1648), who was the incarnation of the aspirations of the Hôtel de Rambouillet and, on the other, from the Baccic sect of St. Amand. C.'s compositions were generally lyrical quatrains of the kind ridiculed by Molière, yet some are not without merit, as *La Solitude de Fontenay*, *La Goutte*, and the *Ode sur l'Inconstance*.

Chaulmoogra, E. Indian tree, *Gynocardia odorata*, of the family Flacourtiaceae. Its fruit yields a light brown oil or soft fat, acrid in taste containing glycerides of lauric and linolic acids, together with the active principle gyno-cardine. This oil is used in the treatment of leprosy.

Chauquette, Pierre Gaspard (1763-94), Fr. revolutionist, son of a shoemaker at Nevers. He was for some years a seaman, and led a wandering sort of life, becoming in 1790 a student of medicine at Paris, and an orator at the club of the Cordeliers.

Chaumont, cap. of the dept. of Haute-Marne, France. A picturesque tn. situated on a height between the Rs. Marne and Suize. The chief industries are those of glove-making and leather-dressing. There is good trade in grain, leather, and iron, the latter found in the neighbourhood. It was here, in March 1814, that Great Britain, Austria, Russia, and Prussia concluded the treaty, or the Holy Alliance as it was afterwards called, against Napoleon. Pop. 15,900.

Chauncey, Isaac (1772-1840), Amer. naval commander, b. at Black Rock, Connecticut; entered the U.S. Navy as a lieutenant in 1798. Served with distinction against the Barbary pirates in Tripoli, and on the lakes during the war of 1812. Taking the command

at Sackett's Harbour in 1812, C. then a commodore, increased the strength of Amer. ships from a single vessel (the brig *Owida*) to ten ships. Later, when Sir James Yeo was sent out from England, he lost two of his schooners in a skirmish with the Eng. commander, but Yeo's resources proving inadequate, C. compelled him to give up the blockade of Sackett's Harbour. Was president of the Board of Naval Commissioners from 1833 till his death.

Chauncy, Charles (1592-1672). Eng. nonconformist divine, b. in Hertfordshire; became Gk. prof. at Cambridge, and later vicar of Ware, Hertfordshire. His religious convictions brought him into difficulties, and in 1638 he emigrated to Massachusetts. He preached for twelve years at Seltuate, and in 1654 became president of Harvard College.

Chauny, tn. in the dept. of Aisne, France, situated on the Oise and the St. Quentin canal, which at this point becomes navigable. Much fighting took place here during the Hundred Years war. Chief industries are the sugar factories, metal foundries, and breweries; there are also important chemical works. The tn. was rebuilt after its destruction by the Gers. in the First World War. Pop. 9200.

Chausey, group of small is. belonging to France, in the Eng. Channel, nearly opposite the port of Granville (cf. CHANNEL ISLANDS). The largest is about 10 m. long by 4 m. wide. Granite is quarried in large quantities during the summer months.

Chausée, Pierre Claude Nivelles de la, see LA CHAUSÉE.

Chautauqua, beautiful lake of glacial origin in the co. of Chautauqua, New York, U.S.A. 1300 ft. above sea level. Its length is about 20 m., while the greatest breadth is 2 m. It lies 10 m. away from Lake Erie, and is 700 ft. above it. On its shores stands the Chautauqua Institution, an adult school, founded by John H. Vincent and Lewis Miller in 1874, for instruction in literature, art, and science. The C. Assembly grounds, lying to the N. of the lake, cover about 165 ac., and contain about 500 cottages, a hall with seating accommodation for 5000 persons, a fine hotel, and a museum.

Chauvinism, term used for unreasonable and exaggerated patriotism and pride in one's own country, with a corresponding contempt towards other nations. It is the Fr. equivalent to the Eng. 'Jingoism'. Nicolas Chauvin was an old soldier of the republic, and well known in Paris for his devotion to the cause, his name became a synonym for the blind worship given by Frenchmen to Napoleon. Chauvin has been represented on the stage as a patriotic character by many writers, e.g. in T. and H. Cogniard's *La Cocarde tricolore*, 1831.

Chaux de Fonds, La, industrial tn. in the canton of Neuchâtel, Switzerland. Chief centre of the watchmaking industry, and has a school for the engraving and enamelling of watch-cases. Pop. 37,700.

Chavanne, Joseph (1846-1902), great Austrian traveller and geographer, who was b. at Graz. From 1867 to 1869 he

travelled in N. America, Central America, Morocco, and the Sahara; and from 1884 to 1885 he explored in the Congo.

Chavannes, Pierre Cécile Puvion de, see PUVION.

Chavasse, Francis James (1846-1928), Eng. bishop, son of Thomas C. of Sutton Coldfield. Vicar of St. Peter-le-Bailey, Oxford, 1878. Succeeded Dr. Kyle as bishop of Liverpool, 1900. The building of Liverpool Cathedral owed much to his energy and zeal.

Chaves, fort. tn. on the r. b. of the Tamega, Portugal. It has silk and linen industries, and is famous for its hot saline springs. Pop. 6800.

Chazelles, Jean Mathieu (1657-1710). Fr. mathematician, b. at Lyons, who assisted Cassini in drawing the meridian line, and in 1685 was appointed hydrographical prof. at Marseilles. Later he went to Egypt and measured the Pyramids, when he discovered that the four sides of the pyramid of Cheops answer to the cardinal points of the compass. Elected a member of the Academy of Science in 1695.

Chazelles-sur-Lyon, com. in the Loire dept. of France, 23 m. from Lyons; has felt hat factories. Pop. 5250.

Chazy, name given by Amer. geologists to the limestone found at Chazy, New York, and elsewhere in N. America.

Cheadle, mrkt. tn. in Staffordshire, England, 13 m. N.E. of Stafford. There are important collieries in the neighbourhood; also manufs. of brass, copper, and tin. The silk mills and tape factory form other considerable industries. The Rom. Catholic Church of St. Giles was designed by Pugin, and erected in 1864. Pop. 6000.

Cheaps, Sir John (1792-1875), Eng. general who in 1849 did admirable service in the battle of Gujrat under Lord Gough. It was due to his efforts that Pegu and Tenasserim were added to the E. India Company's possessions in 1850.

Cheapside, street in the city of London, between St. Paul's Cathedral and the Poultry. In olden times it was known as the Cheap or West Cheap and in the fourteenth century tournaments and jousts were held there. They were given by the king, and held opposite Bow Church, from a balcony of which the queen, court, and nobility used to watch the proceedings. Until 1390 there stood the Old Cross, at the W. end of Cheapside, beside which Stapleton, bishop of Exeter, was beheaded. At Wood Street stood also until 1643 the Eleanor Cross. The cross was badly damaged in the Second World War, and the church of St. Mary-le-Bow, save its Norman crypt and 221-ft.-high steeple, was destroyed.

Cheating, see FRAUD.

Cheb (formerly Eger or Erlau) tn. of Czechoslovakia on the R. Eger. The tn. was an important fortress until 1809. It is the cap. of Egerland, Bohemia, inhabited by Gers. Wallenstein was assassinated in the tn. hall (which was later converted into a museum) on Feb. 25, 1834 by an Irishman. Schiller lived in the Schillerhaus in 1791. The Gothic church of St. Nicholas dates from 1230

to 1270. Manufs. include textiles, agric. machines, and earthenware. Pop. 32,000 (Gers. 24,000). The Elger rises in the Fichtelgebirge and after flowing 190 m. joins the Elbe 30 m. N.W. of Prague. In 1939 the tn. fell to the Gers. on the invasion of Czechoslovakia.

Chebichev, Pafnuty Lvovitch (1821-94). Russian mathematician, b. at Borovsk, educated at Moscow Univ. Was a member of the Royal Society of London. Wrote treatises on the theories of prime numbers, probabilities, and integrals; on quadratic forms, gearings, etc. Came near to devising a straight-line motion—but this was only actually devised by one of his pupils. Pub. *Traité de la théorie des nombres*.

Cheboksari, cap. of the Chuvash autonomous S.S.R., Russia, near Kazan. Pop. 10,000.

Cheboygan, city in C. co. Michigan, U.S.A. It is situated in a fertile farming dist., and possesses paper and lumber mills, and tanneries. Pop. 5600.

Checoy, **Checoy**, or **Checky**, in heraldry the term signifying small squares which constitute the field or charge of a shield, or escutcheon.

Cheddar, vil. in Somerset, England, 22 m. S.W. of Bristol. Famed for the large stalactite caves which form a source of great attraction to summer visitors. The remains that have been found in these caves prove the existence of Rom. settlements at C. The beautiful rocky way which leads from the Mendip Hills down into the vil. is known as the C. Gorge. The noted C. cheese is made here and in the surrounding dist. Pop. 2000.

Cheddite, generic name of various blasting explosives consisting essentially of a chlorate incorporated with a nitro-compound dissolved in castor oil. The salt generally employed is potassium chlorate. Cs. are used in considerable quantities for blasting operations.

Cheedorlaomer (Kudur-Lagamar), king of Elam, the chief of the four kings who fought a victorious campaign against the five rebel Canaanite princes mentioned in the fourteenth chapter of Genesis. Lot was taken by the kings, but was rescued one night in an attack made by Abraham.

Cheduba, or **Man-aung**, is. in the bay of Bengal, 10 m. from Arakan. The soil is fertile, the chief crops being rice and tobacco, also cotton, indigo, and the sugar cane. The is. is noted for its good petroleum wells.

Cheera, see CHIRA.

Cheering, or **American College Yells**. There is little analogous in Eng. univs. and schools to the Amer. college 'yells' in Brit. C. or in the Fr. *chœur*, or in any other known conventional C. or form of acclamation. The yell in Amer. univs. both those of the U.S.A. and Canada, is a cry consisting of certain sounds or words agreed or fixed on to be used by the students as distinctive of the particular college or institution to which they happen to belong. The Amer. college yell is rhythmical, and though C. conducted rhythmically is familiar enough in England and elsewhere, it is generally

no more than a preconcerted rhythm with nothing of the habit or usage so characteristic of the student of W. nations. In all probability the college yell has evolved itself out of the primitive war-cry like the *houzè* or *vital* of France, and this origin indeed is certain in the case of the yell adopted by the 'All-Blacks' or team of rugby footballers that first visited England in 1907 from New Zealand. The yell of this team was admittedly a kind of war-cry adopted from some customary cry of the Maoris. Amer. schools and colleges generally have one yell for the institution as a whole and different yells for the different classes. The oldest cheers are those of the New England colleges, Yale and Harvard, the basic element in which *rah* is really nothing more than an abbreviation of the Eng. *hurrah*. The original yells of these two leading univs. are identical in form, being simply the cry 'rah' shouted in unison nine times with the name of the univ. at the end of the repetition; but the yell of Yale is uttered more quickly than that of the great rival institution. Some institutions have sev. different yells or variants of the original yell, Yale itself favouring a cheer which runs thus:

'Brekekekex, ko-ax, ko-ax
Brekekekex, ko-ax, ko-ax
O-op, O-op, parabaloou
Yalo, Yale, Yale,
Rah, rah, rah, rah, rah, rah, rah,
rah, rah,
Yale! Yale! Yale!'

The yell of Princeton Univ. runs

'H'ray, h'ray, h'ray, tiger
Siss, boom, ah; Princeton!'

and this college also expands this into a triple cheer on occasion. The United States Naval Academy adopts a yell or cheer which is aptly enough an imitation of a nautical steam syren. The Amherst cheer is very similar to the original yells of Yale and Harvard, while the Toronto Univ. students repeat or spell the word 'varsity' sev. times and end with the stereotyped 'rah, rah, rah.' There are also besides these individualised cheers, yells or cheers common to all Amer. colleges and generally made use of in acclaiming some successful athlete or popular prof. For the most part the college yell is used at athletic contests. In most of the large colleges there are sev. leaders, elected by the students, who stand in front and call for the different songs and yells, directing the cheers with their arms in the manner of the conductor of an orchestra.

Cheese (Lat. *caseus*), preparation of milk, produced by separating the proteinous or nitrogenous substance known as casein or curd from the whey. The fatty matter in milk forms an important constituent of C., and often there is present in C. a greater percentage of fat or butter than of casein. Therefore, the finest Cs. are made from the richest milk, and the various kinds of C. on the market are as much due to the different qualities of milk in various dists., as to

the different processes of making. *C.* was known in very early times; frequent references to it occur in Gk. and Rom. authors, and the methods used in *C.*-making are described by Columella. The casein in milk is separated by acids in the case of sour milk, or by rennet prepared from the stomach of sucking calves. Fresh milk is warmed to a temp. of about 80° to 85° F., when the rennet is added in a liquid form, which causes the milk to ferment. The curd thus produced is cut across into sev. pieces. The mass is stirred for a few minutes, and then heated up to 90°-100° F. The object of the operator is to bring about the proper consistency of curd, without losing any of the fat of the butter in the whey. The whey is finally drawn off, and the curd left to settle until it becomes a firm solid. The fermenting action of the rennet continues during the period of ripening the curd. The curd is tested from time to time with a hot iron. If the development of acidity has been allowed to go too far, the curd becomes brittle and cracks easily. When the hot-iron test shows fine long flakes the curd is cut up into slabs and passed through a small grinder. Salt is now added to the substance to prevent any further development of acidity, and the substance is wrapped in cloths, and left to mellow in a cool room or cellar. The hard *Cs.*, made in the United Kingdom and in America, improve in quality by keeping. They are generally left for sev. months to ripen, and when finished are fairly hard in substance. Continental *Cs.*, on the other hand, are soft, and most of them require to be eaten when quite fresh. The chief hard *Cs.* are Cheddar, Stilton, Eng. Cheshire, Gloucester, Wiltshire, Gorgonzola, and Gruyère. The best-known soft *Cs.* are Brie, Neuchâtel, Camembert, and Limburg, and Philadelphia cream. *C.* is a very nutritious food. Well-cured *Cs.* contain about 30 per cent water to 6 per cent sugar, the rest of the contents being fat and protein. Stilton *C.*, made from rich milk, contains about 36 per cent fat and 28 per cent protein. See E. R. Ling, *A Text Book of Dairy Chemistry*, 1930; A. L. Simon, *A Catechism concerning Cheeses*, 1936; J. Squire (ed.), *Cheddar Gorge: a Book of English Cheese*, 1937; L. C. van Slyke and W. V. Price, *Cheese*, 1938.

Cheese-hopper, or **Cheese-skipper**, is the larva of a small dipterous insect, *Piophilæ casei*, of the family Sepsidae.

Cheese-mite, or *Tyroglyphus siro*, is an arachnid related to many other mites which are either parasitic or live on organic matter such as carrion and plants.

Cheese-rennet, or *Galium verum*, species of Rubiaceæ allied to the cleavers (*q.v.*), and obtains its popular name from having been formerly employed to curdle milk. See also **BEDSTRAW**.

Cheetah, **Cheeta**, **Chita**, and **Hunting Leopard** are all names of *Cynaelurus jubatus*, which with the various species of *Felis*, e.g. lion, tiger, and leopard, constitute the family Felidæ in the group *Æluroidea*, or cat-like carnivores. It

differs from other members of the family chiefly in having longer limbs with non-retractile, blunt claws, and the upper carnassial tooth has no inner tubercle. With such claws it is more adapted to obtaining its prey in chase, like the dog, rather than by cat-like stealth, and it is readily domesticated, again like the dog; when tamed it will purr like a huge cat. It is distributed over the whole of Africa, W. Asia, and India, and in S. India it is largely used in hunting.

Chefoo, port in the prov. of Shantung, China, with a Chinese pop. of 132,000. *C.* is noted for its large fruit-growing industry. Silk thread and twist are largely made and exported to France and America. There are many Amer. Presbyterian missionaries and the schools for the children of China Inland Mission missionaries. It is the only port that remains open through the winter, and is much frequented by invalids as a health resort in summer. The port was of considerable importance during the Russo-Jap. war.

Cheilanthes, genus of Polypodiaceæ, contains over fifty species of small but beautiful ferns. The fronds are often curved and bear small hairs. *C. fragrans* will grow in Britain under sheltered conditions.

Cheiranthus, genus of Cruciferae which contains ten species of W. and Mediterranean plants, and is represented in Britain by *C. cheiri*, the common wallflower (*q.v.*).

Cheiomancy, see **PALMISTRY**.

Cheiron, see **CHIRON**.

Cheiroptera, see **BAT**.

Cheirostemon Platanoides, handtree, is the single species of its genus and belongs to the Sterculiaceæ. It inhabits Mexico and will not grow in Britain. The plant is a lofty tree with the habit of a plane and a trunk the thickness of a man's body; at the head are dense branches, brownish at the tip from the short, fawn-coloured hairs that beset them. The

leaves are heart-shaped, and the bright red flowers bear stamens arranged in the form of a hand. The tree has been an object of curiosity and veneration from time immemorial.

Cheke, Sir John (1514-57), Eng. classical scholar, educated at St. John's College, Cambridge, where in 1529 he became a fellow. On account of his great abilities, he gained an exhibition from the king and in 1540 he was made prof. of Gk. at the univ. He numbered amongst his pupils at St. John's Roger Ascham, who always spoke of him in high terms of praise, both for his learning and character. He introduced a new pronunciation of Gk., which at first raised much opposition at the univ., but C. finally prevailed, and the system was used in England until quite recent years. He was apostrophised by Milton in his 'Tetrachordon' sonnet. In 1554 he was made tutor to young Prince Edward. In later years he was banished from England on account of his zealous religious opinions. He remained abroad from 1554 to 1556, then whilst travelling one day from Brussels to Antwerp, he was treacherously arrested by order of Philip of Spain and sent to the Tower of London. Terrified by the threat of death, he publicly renounced his religion, and was received into the Church of Rome.

Chekhov, Anton Pavlovitch, see TCHERKHOV.

Chekiang, or **Chehkiang**, coastal prov. of China. The Hanshan range runs through the centre of the prov. from S.W. to N.E., and divides it into a N. portion, the greater part of which is drained by the Chientang R., and a S. portion, which is chiefly occupied by the Tachi basin. The hilly portion of the prov. provides large supplies of tea, and in the plains a great quantity of silk is produced. Minerals are poor—a little coal and iron and occasionally some copper are found—but other products such as cotton, rice, ground-nuts, wheat, indigo, and beans may be had in abundance. The prin. cities are Hangchow and Wenchow. Area 39,500 sq. m. Pop. over 21,000,000.

Chelan, Lake, in Okanogan co., Washington. It is 55 m. long, and from 1 to nearly 2 m. wide. All round are rock walls 4000 to 5000 ft. high, and the greatest depth is about 14,000 ft. It discharges by a short outlet into Columbia R.

Chelate Compounds, compounds in which a ring occurs, some part of the ring being formed by a co-ordinate linkage, thereby differing from the ordinary type of ring, in which all the valencies in the ring are co-valencies.

Chelický, Petr (c. 1390-1460), Bohemian writer. He has been called the Tolstoy of the fifteenth century, for his horror of bloodshed and determination to accept unresistingly even the tyrannical rule of worldly authorities. Born at Chelčic, near Vodňan, the son of a small landowner, he studied for some years at Prague. During the Hussite wars he took no part, although opposed to the Church of Rome. His prin. work is *Sil vřty* (The Net of Faith).

Chelidonium majus, see CELANDINE.

Chelifer, genus of arachnid in the order Chernetidea, and is typical of family Cheliferidae, the only one of the order. *Ch. cancrroides*, the book-scorpion, is sometimes found in houses among old papers and furniture; it occurs in Britain with four other species.

Chelm, see Kholm.

Chelmo, see KULM.

Chelmsford: 1. Co. and mkt. tn. in Essex, England, 29½ m. N.E. of London; situated between London and Colchester. The prin. industries are the manuf. of agric. implements, electric light, and engineering works, iron foundries, malt works, and corn mills. The corn and cattle markets are among some of the most important in the co. The tn. possesses a grammar school founded by Edward VI. and works of Marconi's Wireless Telegraph Company Ltd. Pop. 27,000. 2. City of Middlesex co., Massachusetts, U.S.A. Pop. 8000.

Chelmsford, Frederic Augustus Thesiger, second Baron (1827-1905), eldest son of the first Baron C. He was educated at Eton, and in 1844 entered the Rifle Brigade. From an ensign in 1854 C. became a general in 1888. After serving in the Indian Mutiny, and taking part in the capture of Magdala, C. was made Companion of the Bath and aide-de-camp to Queen Victoria. He routed the Zulus in the war of 1879 under Cellinaga at Ulundi, and in 1881 was appointed Lieutenant of the Tower of London, which post he held until 1889.

Chelmsford, Frederic, John Napier Thesiger, first Viscount and third Baron (1868-1933), eldest son of Frederic Augustus, second Baron. He was educated at Winchester and at Magdalen College, Oxford; and was fellow of All Souls, 1892-99, and fellow of Magdalen, 1917. He was a member of the London School Board, 1900-4, and of the London Co. Council 1904-5—alderman 1913. He succeeded to the barony in 1905, and was governor of Queensland 1905-9. In 1908 there was a constitutional crisis in that state—the Prime Minister demanding appointments to the legislative council for a purpose similar to that of the threatened creation of peers in England in 1910. Lord C. refused and dissolved the Assembly, an act that aroused much indignation in Australia and some demand for a system of Australian-bred governors. In Aug. 1909 he was transferred to New S. Wales, where he governed till 1913. He was a captain in the Dorset Regiment, and served with it in India early in the First World War. In 1916 he was appointed viceroy of India, and in the following year he produced jointly with E. S. Montagu, the secretary of state, a report on constitutional progress, recommending a limited application of representative gov., which, introduced in 1919, created what was called dyarchy. On April 13, 1919, occurred the famous Amritsar riot (q.v.). In April 1921 Lord C. gave place to Lord Reading. In 1924 he was First Lord of the Admiralty in the Labour Gov.

Chelmsford, Frederic Theaiger, first Baron (1794-1878), lord chancellor of England. He entered Gray's Inn in 1812, and became a member of Parliament for Woodstock in 1840. In 1844 he became solicitor-general, and in 1845 attorney-general. On Lord Derby coming again into office in 1858 Sir Frederic was raised straight from the Bar to the lord chancellorship.

Chelonia, genus of lepidopterous insects of the family Arctiidae, the species of which are known as tiger-moths.

Chelonia (Gk. *χελώνη*, tortoise), name of a sub-class of reptiles which comprises such well-known animals as the tortoises, turtles, terrapins, and loggerheads, and of which many fossil species have been found. There are about 300 living species, dwelling chiefly in warmer climates, some as terrestrial animals, while others are aquatic, and may inhabit either fresh or salt water.

Chelsea, pari. and metropolitan S.W. bor. of London, of much historical interest. Here is situated the Royal Hospital for Invalid Soldiers, which was opened in 1694, and accommodates 500 inmates. Chelsea Bridge, leading from Chelsea Hospital to Battersea Park, was reconstructed and widened in 1937. The Chelsea Physic Garden (Royal Hospital Road), a garden of general botanical research, was estab. in the latter part of the seventeenth century by the Society of Apothecaries. The duke of York's School, for the education of boys for the army, founded 1801, was removed from here to Dover in 1909. In 785 the name was *Cealchythe* and a similar name is to be found both in a Saxon charter of the eleventh century and in Domesday Book; in the sixteenth century it was called *Chelith*. The later ending *ea* or *ey* was associated with the insular nature of the land and the prefix with *shingle* (*Chesil* *ea*, shingle island or bank; but the older suffix, *hythe*, means a haven). In the picturesque church of St. Luke, or Old Church, as it is generally called, there are many memorials to past notabilities which to a great extent establish the hist. of C. Amongst others are those of Sir Thomas More, Lady Jane Guydeford, Sir Hans Sloane, Thomas Shadwell (poet laureate), Woodfall (printer of *Junius*), and Sir John Lawrence. In modern days C. has been the home of many noted men, Turner, Rossetti, Leigh Hunt, Whistler, Carlyle, and others. Carlyle's house, 24 Cheyne Road, is now maintained by the National Trust as a museum. The bor. was formerly famous for its buns and porcelain. C. returns one member to Parliament. Pop. 64,000. See R. Blunt, *The Lure of Old Chelsea*, 1922.

Chelsea, city in the co. of Suffolk, Massachusetts, U.S.A., situated on a peninsula between the Mystic and Chelsea Rs. Flexible tubing for electric wires was first made here in 1889. Pop. 48,000.

Cheltenham, municipal and pari. bor. of Gloucester, England. The tn. lies in the valley of the Chelt, under the Cotswold Hills. In 1718 mineral springs were discovered, and after a pump-room had

been built in 1738, it soon became an important as well as a fashionable health resort. The visit of George III. in 1788 still further ensured the success of the tn. The chief spas are the Old Wells, Montpellier, Pittville, and Cambray. It is quite modern in appearance, and has a new tn. hall, with a spa and assembly rooms, opened 1903. There is also a very fine museum and art gallery. The oldest church is St. Mary's, dating from the fourteenth century, but since that time it has been entirely restored. Not only is C. famed for its mineral waters, it is also a great educational centre, the Ladies' College being one of the most celebrated in England (see CHELTENHAM LADIES' COLLEGE). Cheltenham College (1840) is one of the great public schools of England. There are a school of arts and crafts and also a college for the training of male and female teachers in the national schools. Pop. 51,500.

Cheltenham College, public school, founded in 1841, and incorporated in 1894 by Act of Parliament. The buildings are extensive and handsome, and include sev. boarding-houses for the students. The military side of education is made a strong point. Recognised as a medical school for the teaching of chem. and physics, by the College of Physicians and Surgeons. The average number of students amounts to about 600, who may gain numerous scholarships to the univs. Among former pupils may be mentioned Lord James of Hereford, W. E. H. Lecky, John Morley, and Briton Rivière.

Cheltenham Ladies' College. The opening of Queen's College (q.v.) in 1848 having already begun a movement for the better education of women, the C. L. C., in a humble way, came into being in 1851. The founding of the college was chiefly due to the Rev. W. Dobson, principal of Cheltenham College, and the Rev. H. Walford Bellairs, then inspector of schools for Gloucestershire, and, later, hon. canon for Worcester. Incorporated 1880 it is now one of the most important colleges for girls in England. It is notable as being the first school to provide a sound education on the public school boarding system like that for boys. It comprises three divs. for girls under various age groups and prepares its pupils for London Univ. degrees, the Higher Certificate, the London General Certificate, and the School Certificate examinations, and also for music, science, and art. Besides possessing 120 rooms, it has a museum, a library, art studios, observatory, and laboratories.

Chelyabinsk, or **Tochelyabinsk**, tn. and region of the R.S.F.S.R., on the E. side of the Urals. The dist. is a grain-producing centre but is liable to periodic droughts. The tn. is 347 m. E.N.E. of Chkalov (Orenburg). It has some of the largest tractor works in Russia. Brown coal is mined at C. for use locally as a fuel. Other industries are the distilleries and tanneries, and there is an active trade in corn. The railway station lies about 3 m. from the tn., and is the junction of

the lines from Moscow, Kuiblishev, and Ufa on one side, and from Sverdlovsk on another. Pop. 274,000.

Chelyuskin, or **Cape Severo**, Taimyr National Region, Siberia, is the most N. part of the Taimyr peninsula; it is 50 m. wide, and stretches for a length of 100 m. into the Arctic Ocean.

Chemical Action, see **CHEMISTRY**.

Chemical Affinity, see **AFFINITY** and **CHEMISTRY**.

Chemical Analysis, see **ANALYSIS**, **CHEMICAL**.

Chemical Energy. Since molecules and atoms are conceived of as being in a state of motion, it is evident that by virtue of this motion they must contain *energy* (*q.v.*). In most chemical reactions heat is evolved, and they are said to be exothermic. On the other hand, heat may be absorbed, in which case the reaction is endothermic. This contained energy cannot be measured directly, but the energy set free during chemical reaction can, and this is termed chemical energy. It can even then only be measured by converting it into heat or electric energy. It might here be noted, perhaps, that the amount of energy measured only represents the difference between the contained energy in the resultant compound and that contained in the substances which took part in the reaction. See **THERMO-CHEMISTRY**.

Chemical Engineering. This subject is defined broadly by the Institute of Chemical Engineers as 'the branch of engineering which relates to the design, construction, erection and operation of plant and works in which matter undergoes a change of state or composition.' The work of the chemical engineer is therefore very varied, and as stated by Prof. Hinchley, one-time honorary secretary of the Institution of Chemical Engineers, 'he must be able to devise simple and effective methods of recording operations and determining actual costs; prepare designs, specifications, and estimates free from error; report efficiently on any problem investigated; obtain technical information readily and compile and index it for future use.' A chemical engineer should possess a good knowledge of chem. and physics, particularly physical chem. and thermodynamics; and should be well grounded in the theory of design of structures as well as the strength of materials. In addition, the commercial or economic aspect must be studied, including business management and factory organisation, together with the Factory Acts, Trade Union Law, and the various other points with which works managers have to deal. The Institute of Chemical Engineers was incorporated in 1923, and by various means, including holding of examinations and granting certificates of competency, has done much to clarify the position of C. E. The processes of C. E. fall into three classes: (1) transport and storage of materials; (2) treatment of materials; (3) production, transfer, and conservation of heat energy. These may be further subdivided, but in each case exact knowledge is necessary if

efficiency is to be secured. The difficulty of translating a laboratory idea to the works scale is often very great, and failure to appreciate the differences between familiar laboratory apparatus, such as beakers, crucibles, retorts, mortars, etc., and their works equivalents, may easily lead to failure. Methods of weighing and measuring are very important, because the cost of transport may be the most expensive item in the production, and the cost of carrying material to a machine or an apparatus may be as great as the cost of the operation carried out. In the layout of a works or factory, after arranging for satisfactory facilities for carriage by road, rail, or water, many civil engineering problems may be encountered in the erection of heavy plant, furnaces, and chimneys in various subsoils. Provision of power, light, and heat, and the nature or source of the motive power to be used, together with the provision of suitable water-supply, often in large volume, and the satisfactory disposal of effluents, all call for knowledge and judgment of a high order.

The materials of plant construction for chemical processes are very numerous, and include timber, metals, alloys, bricks, cements, and compositions. Continuous search for new materials to meet more stringent conditions of service has resulted in great advances during recent years, and special alloys and alloy steels, silica ware, glass, and stoneware have all resulted in modified design. In chemical reactions, the processes contemplated must be first studied on the small scale by the chemist and then dealt with, if satisfactory, by the chemical engineer on the large scale. In the latter case additional factors, apart from reaction time, effect of impurities, and strength of materials, arise, such as cost of plant and materials, continuous or discontinuous operation, etc. Very often efficiency is much increased by changing from batch to continuous operation.

The flow of fluids, processes of extraction, evaporation, crystallisation, distillation, condensation, and the drying of gases, liquids, and solids are all processes the study of which may convert failure into success, while the transfer of heat involves some of the most exacting problems known to the chemical engineer.

Chemical Industry, Society of, was estab. in 1881 to forward the extension of industrial and scientific chem. The society was incorporated by royal charter in 1907. There are eleven local sections of the society in Great Britain, five in Canada, and one each in Australia and America. In addition there is a special chemical engineering group. The society publishes its jour. weekly, over 5000 copies being distributed. It contains a review section, 'Chemistry and Industry,' the Transactions, and Section B of 'British Chemical Abstracts.' The yearly subscription includes the jour. and membership of a local section. The presidential chair has been occupied by many eminent chemists.

The headquarters of the society are at 56 Victoria St., London, S.W.1.

Chemical Society, formerly the Chemi

Society of London, estab. in 1841, and incorporated by Royal Charter, 1848, for the advancement of chemical science. Its centenary celebrations were postponed owing to the war, from 1941 to 1947. The society consists of fellows, associates, and members, both honorary and foreign, and is governed by a council chosen by the fellows. Those wishing to be elected as fellows must possess a certificate which has been signed by five fellows of the society, and they must be known personally to at least three of them. The headquarters are at Burlington House, Piccadilly, London, W.1.

Chemical Warfare, although now regarded as a barbarous practice, is by no means new. The ancients in Greece, centuries before the Christian era, poisoned or choked each other with sulphur fumes. It was also a practice to place dead animals in such a position that the gases emitted from the carcass during decay would drift towards the enemy and cause disease. The use of poisonous gases in the Middle Ages is also on record. With the 'humanising' of war and the recognition of laws of war, drawn up and agreed to by most civilised nations, C. W. was prohibited by a declaration of The Hague Conference in 1899. Great Britain at first withheld assent to the rule, because the conference was not unanimous, but agreed in 1907. The U.S.A. never agreed to the rule, on the ground that sufficient information on the subject was not available on which to base a decision. During the wars of the latter half of the nineteenth century—the Crimean, Amer. Civil war, and Franco-Ger. war—suggestions for the employment of poisonous gases were not wanting, but in no case were they adopted. Poisonous gases are not mentioned specifically in the Convention of 1907, but Article 23 prohibits the signatories from employing poison or poisoned weapons. Although Germany was one of the signatories to this convention, she was the first to use poisonous gas during the First World War. On April 22, 1915, in the Ypres salient, Germany launched a gas attack from cylinders charged with a mixture of phosgene and chlorine, causing its victims either intense pain or death. It appears to have been a foregone conclusion in military circles that Germany would break the convention on this point, the belief being based on the fact that an official publication of the Ger. Army dated 1910 advocated the fullest use of modern inventions, however dangerous. The effect of this attack was terrible, because the forces of the Entente were not prepared for the violation. As the greenish-grey cloud spread over the unprotected troops it blasted everything it touched and shrivelled up the vegetation. A cry went up at once for protective methods against gas, and a simple respirator was immediately devised and issued to the troops in the trenches. The Entente had no alternative but to retaliate in kind, and throughout the war new methods of attack with, and defence against, gas were devised. In attack the gases were either released from cylinders

and carried to the enemy lines by a favourable light wind (and usually in damp weather) or were enclosed in shells fired from artillery or dropped in bombs from aircraft. The defensive measures usually consisted of some form of respirator containing a chemical which neutralised the harmful gas. The most dangerous gas was mustard gas, which burned the body, piercing clothing and equipment with ease. Gas drill became essential, and sentries were regularly posted to watch and give warning of its approach. Dug-outs were partially protected by hanging damp curtains before the doors. At the Washington Conference in 1922 the great powers agreed to prohibit the use of every kind of asphyxiating and poisonous gas in war. Chemical warfare was not practised in the Second World War, unless the use of the atomic bomb may be so described; this was, however, rather physical than chemical. See also **CHLORINE IN WARFARE**. See J. B. S. Haldane, *Callincus: a defence of chemical warfare*, 1925.

Chemin de Fer, Baccarat. One of the two forms of the ant. card game of baccarat, the other being *baccarat banque*. The element of chance is all-preponderating. The object of the game of baccarat, whether C. de F. or *baccarat banque*, is to hold such cards as shall together amount to the point of 9. Every card of the value of 10, and every 10 occurring as part of a total, are disregarded, or, as it is called, is *baccarat*, i.e. zero. For C. de F. six packs of cards are required. The croupier then hands an arbitrary quantity from the top of the pack to the player on his right, who for the time being is dealer or banker. The latter then places in front of him the amount he wishes to stake, and the rest, or punters, make their stakes. Any punter may, if so disposed, 'go bank,' i.e. play against the whole of the banker's stake. If the total staked does not equal the amount in the bank, other players standing round may add stakes. The banker then deals four cards, face downwards, the first for the players on his right, the third for the player to his left, the second and fourth to himself. The player who has the highest stake represents the other punters, but if two have staked equal amounts, the first in rotation has the preference. If the banker wins he takes the stakes, but if the punters win the amount of his stake is paid to each punter in rotation out of, but only to the extent of, the amount in the bank, the banker not being liable for more than his stake. If the banker wins he deals again; if not, the player next in rotation becomes banker. The game may not end, however, in the way above described. If either the banker or representative punter finds that he can score neither 9 nor 8 (the next best point) with his two cards, he need not turn up his cards. The punter may then draw another card on the offer of the banker. Apparently by the etiquette of the game, the punter, if his point is 0, 1, 2, 3, or 4, must accept this third card; if his point

is 6 or 7 he must refuse; if 5 he has a real option. It is then the banker's turn to decide whether he himself will draw a card, and having drawn or not drawn, as he elects, to expose his cards. A tie neither wins nor loses, the stakes abiding the result of the next hand. In the variation, *baccarat banque*, the bank is put up to auction. The same rules as to offering and accepting and turning the cards up apply as in C. de F. If the stakes of the punters exceed the amount in the bank, the banker on losing does not have to pay out beyond the amount of his own stake. The punters are paid in rotation so far as this stake extends, and those who have got nothing must wait for another successful coup. Both forms of *baccarat* are included in the games made illegal by the Eng. criminal laws against keeping common gaming-houses.

Chemin des Dames, area in France situated just N. of the R. Aisne, between Rheims and Laon, and the scene of much fighting during the First World War, in the Champagne prov. (*q.v.*). In their initial offensive in the autumn of 1914, the Gers. swept over this area, and in the counter-attack the Entente pushed them back as far as this point, on which they rested for many months. A Fr. offensive on a large scale in the Champagne area was planned for the spring of 1917, but sev. highly placed politicians who disliked Nivelle, the new commander-in-chief, caused it to be postponed. Eventually an advance was commenced in the middle of April, and after much fighting at great sacrifice the Fr. gained a little ground in the C. des D. sector. The importance of this sector was appreciated by both sides, and during the autumn of 1917 the possibility of capturing it again exercised the minds of the Fr. higher command, and it was decided that another attempt to seize it should be made before the end of the year. An offensive was commenced in the middle of Oct., and by the 26th so much progress had been made on the flanks of the position that the Gers. considered it wise to evacuate it. Being in the direct road to Paris from Belgium and N.E. France, C. des D. became the scene of much fighting when the Gers. made their offensive during the spring of 1918. Here their overwhelming numbers, aided by secrecy of their intentions, easily overran the surprised Fr. garrisons and drove them across the R. Aisne. In the following July the Entente delivered its counter-offensive and drove back the Gers. the way they came. This necessarily brought C. des D. once more to the fore as a scene of action, and much fierce fighting took place in this region. In this sector the Fr. troops were under the command of Gen. Mangin, a vigorous and able man who knew every detail of the ground over which the fighting was taking place. The Gers. held this stepping-stone to Paris as long as possible and it was not until the end of Sept. 1918 that they were eventually driven beyond this area. Once Mangin's army had forced the Gers. into retreat they were given no respite until the armistice brought operations to a close.

Chemin des Rondes, level space, about 12 ft. broad, which is formed outside the rampart of a fortress or of an outwork, and raised a few feet above the ground. It is protected on the exterior by a low wall. It is useful as a path for superintending officers, and is a station for defenders who are preventing scaling-ladders from being placed against the escarp-revetment.

Chemiotaxis, see under FERTILISATION.

Chemist and Druggist. Since the Pharmacy Act of 1868 this title is especially reserved for those who have passed the 'minor' examination of the Pharmaceutical Society of Great Britain (founded 1841). In U.S.A. the terms apothecary, druggist, pharmacist, and chemist are used practically as equivalent names for those licensed to compound and sell medicinal drugs and poisons, but the three classes are quite distinct in the United Kingdom, apothecaries forming the lowest rank of the profession, and pharmaceutical chemists the highest (having passed a 'major' examination). Chemists and druggists have a licence to compound and sell medicinal drugs and poisons under the Acts of 1852 and 1868. To gain the title an apprenticeship of three years must be served under someone already qualified, and a general knowledge examination equal to the Medical Preliminary of the General Medical Council must be passed. For a long time in England the policy of Cs. and Ds. was defensive, and by 1802 a defensive association was formed, which, later, strongly opposed the Bill of the Associated Apothecaries, 1812-15. Laws have been passed to define the liability for injuries caused by carelessness or ignorance. The hist. of Scottish druggists has practically coincided with that of Eng. since the Pharmacy Act of 1868.

Chemistry, branch of that science which consists in the study of the changes which matter is capable of undergoing. These changes may be divided into physical and chemical, and although in the higher stages it is impossible to draw a definite distinction between them, C. and physics being converging sciences, examples can be given of both varieties of changes. For example, a steel needle rubbed on a magnet in a definite way undergoes *physical* change by means of which it acquires the power of the magnet. On the other hand, a match rubbed on a match-box undergoes a *chemical* change by means of which flame is produced. Thus it is possible to make a distinction between the sciences of C. and physics. A chemical change involves some alteration in the composition of the substance. The match having been ignited has undergone a permanent change, whereby it is no longer combustible. The physical change quoted above involves no alteration in the substance itself, and the acquired property is further only temporary and can be continually lost and reacquired. The difficulty occurs in this fact, however, that every chemical change is accompanied by physical change, and the

physical change may often be the only sign that chemical change has taken place. But it might be said that C. is concerned with the investigations of the changes that occur when the molecular structure of any substance is altered.

History.—The anct. civilisations, Egyptians, Phœnicians, Gks., and Roms., were familiar with sev. of the metals and the processes of extracting them from their ores, while they also knew how to make alloys usually copper, lead, and tin. In addition to this the anct. were

although it might possibly have been better directed—the discovery of radium and its congeners having proved the theory that the transmutation of elements is possible. Modern C. may be said to commence with Robert Boyle (1627–91), for he was the first to endeavour to rid C. of its alchemic tendencies. In his book the *Sceptical Chymist* (1661, 1680) he discredited the alchemic theory regarding salt, sulphur, and mercury as the elements of substances, and at the same time gave a scientific definition of an element. He

AN OLD CHEMICAL LABORATORY

familiar with the manufacturing processes concerned in the making of soap, starch, glass, leather, stoneware, wine, and beer, before they were familiar with the process of distillation. Geber (Jabir ibn Hayan) an Arabian chemist of the eighth or ninth century A.D. knew white arsenic, borax, common salt, alum, copperas (ferrous sulphate), and possibly sulphuric, nitric, and acetic acids. The apparatus used by him was similar to that used until the eighteenth century. From the eighth to the seventeenth century the science of C. drifted into the hands of the alchemists. They were concerned with the production of gold from baser metals, and in their search for the philosophers' stone; and in the course of their studies they discovered many potent medicines. Their writings are preserved, but the majority of them are of doubtful value from a scientific standpoint, for they are so mixed with philosophical extravagance that they are unintelligible. At the same time it must be remembered that their work was not entirely valueless,

it was who introduced the air-pump and the thermometer to this country, and his experiments on the physical properties of gases gave us Boyle's law concerning the relation of the volume of a gas to the pressure exerted on it. Following him we have Becher (1635–82), and Stahl (1660–1734), who formulated the phlogiston theory of combustion. This theory stated that phlogiston was contained in all combustible substances. The act of combustion was regarded as the escape of phlogiston from the burning substance. Thus, when lead was burnt the material left, lead oxide, was regarded as the other constituent of the metal and was the calx. By heating a calx with some other substance rich in phlogiston, the metal was again produced, as when lead oxide is reduced on charcoal. This theory received a fatal blow when Boyle showed that the calx was heavier than the metal, and that consequently the addition of the phlogiston to the calx results in a loss of weight. This was explained away, however, by supposing that phlogiston had

negative weight! But it was thoroughly disproved after the discovery of oxygen by Priestley, Scheele (independently), and Lavoisier who finally destroyed it. In the meanwhile Boerhaave (1668-1738) pub. a system of C., and Marggraf (1709-1782) studied alumina and magnesia and worked on the quantitative analysis of substances in solution. Among famous Eng. chemists of this time may be named Cavendish (1731-1810), who studied hydrogen and atmospheric air, and made the important discovery of the compound nature of water and nitric acid, and Priestley (1733-1804), who discovered oxygen and studied nitric oxide, nitrous oxide, hydrochloric acid, and ammonia gases, etc. Lavoisier (1743-94) was the first to lay down a real system of chemical nomenclature. Scheele (1742-86), who lived in Sweden, discovered a large number of acids, chlorine, and oxygen. Richter (1762-1807) discovered the law of reciprocal proportions, *i.e.* that if the weights of various elements, which combine with a given weight of another element, be compared, then they bear a simple relation to the proportions in which those elements will combine amongst themselves, *e.g.* chlorine and hydrogen combine with phosphorus in the proportions of weight—phosphorus: chlorine = 1 : 3.3; phosphorus : hydrogen = 1 : 0.097. Chlorine and hydrogen also combine to make hydrochloric acid, and they do so in the proportion—chlorine : hydrogen = 35.5 : 1; and 35.5 : 1 = 3.43 : 0.097. Berthollet (1748-1822) studied chemical affinity and applied chlorine to bleaching, and Dalton (1766-1844) stated the atomic theory which placed C. on the basis of an exact science. Among the great chemists since may be mentioned Gay-Lussac (1778-1850), Dulong (1785-1838), Wollaston (1766-1828), and Davy (1778-1829), who discovered the use of electricity for decomposing soda and potash with the consequent separation of the metals sodium and potassium. Berzelius (1779-1848) confirmed the law of constant proportions, fixed many atomic weights, and formulated the electro-chemical theory of the constitution of salts. Those chemists mentioned above, while not regardless of organic C., devoted their attention to the study of inorganic C. In 1828 Wohler (1800-1882) discovered that urea could be made in the laboratory, and this has led to a great research into organic C., so making it a distinct and important subsistence. This work has been led by Dumas (1800-84), Liebig (1803-73), Laurent (1807-53), Gerhardt (1816-56), Wurtz (1817-84), Kolbe (1818-84), Frankland (1825-99), Williamson (1816-95), and others. Among general chemists of more recent times may be mentioned Faraday (1791-1867), Rose (1795-1864), Bunsen (1811-99), Regnault (1810-78), Mendeleev (1834-1907), Ostwald (1853-1922), Van't Hoff (1852-1911), Sir Wm. Ramsay (1852-1916), Sir Wm. Crookes (1832-1919), Sir James Dewar (1842-1923), Mme Curie (1867-1934), and Irving Langmuir (b. 1881).

Elementary Principles of Chemistry.—

Now to proceed from the general consideration of the science, in the first place we must recognise that to the chemist all matter, solid, liquid, or gaseous, is composed of minute particles called *molecules*. The molecules of any substance are all similar. In each of the three states, solid, liquid, and gaseous, the molecules are always supposed as moving. The movement will be greatest in the gaseous state, where the spaces between the molecules are greatest, and smallest in the solid state, where the inter-molecular spaces are smallest. Then, further, molecules themselves are in most cases possessed of a structure. These particles of which molecules are formed are called *atoms*, and the force that holds these together is called chemical affinity (that holding molecules together being physical, and known as cohesion), and, again, these atoms are conceived as being in a state of motion. With this in mind it is now possible to say that any change which leaves the molecules intact is a physical change, while any change in the structure of the molecule itself may be said to be chemical. It is now known that the atom is not the simple, ultimate particle of matter once supposed, but that atoms consist of an electrically positive nucleus, where resides most of the mass, surrounded by electrons, or units of negative electricity, which rotate in different orbits, variously inclined to each other, and at different distances from the nucleus. The atom may be roughly compared to a miniature solar system with the nucleus representing the sun. In the case of the lightest element, hydrogen, the atom has the simplest structure, and consists of one electron rotating about the nucleus, while the most complicated structure is presented by the heaviest known element, uranium, the atom of which has ninety-two electrons. Many names, such as those of Rutherford, Thomson, Lewis, Langmuir, and Bohr, are associated with theories of the structure of the atom, but undoubtedly much work remains to be done. The latest theories are due to Schrödinger, Dirac, de Broglie, Chadwick, and others.

Elements and Compounds.—Some molecules contain atoms of the same kind, while others contain atoms of different kinds. Thus, in a molecule of water there are atoms of hydrogen and oxygen, while in that of sulphur all the atoms are alike. When all the atoms are similar, we call the molecule an *elementary* one and speak of the substance as an *element*. On the other hand, we speak of the molecule with different atoms as a *compound* molecule, and the substance as a *compound*. Now it is evident that if a substance is composed of more than one kind of matter, *i.e.* is a compound, it can be built up from the component substances (*synthesis*), or separated into these simpler substances (*analysis* or *decomposition*). If any substance can neither be split up into simpler substances nor built up from them it is said to be an *element*, and we assume that it consists only of similar

atoms. At the present time there are about ninety elements. It is possible that some of these may, in time, be proved not to be elements, but at present it has not been possible to decompose further any of them, except into electrical particles. The number of compounds is practically infinite, since they consist of combinations of these elements. All substances which are not elements are not necessarily compounds. They may be *mechanical mixtures*. When elements are brought together, they may just mix without losing their identity or separate properties, or the atoms in molecules of the various sorts may separate out and re-mingle to form other and different molecules with perhaps quite distinctive properties. The former would be said to be a mechanical mixture and the latter a chemical compound. For example, carbon, sulphur, and nitre mix to form a dark grey mechanical mixture, which can be separated out again into its three constituents by quite mechanical methods. This mixture is called gunpowder, but if by any means this mixture be exploded the result is a rearrangement of the atoms into different molecules with the consequent formation of chemical compounds. Chemical compounds are only produced by *chemical action*, which really consists in the rearrangement of various atoms into new molecules. This may result by: (1) the direct union of two molecules to form a more complex molecule; (2) an exchange of atoms between molecules; (3) the rearrangement of atoms within a molecule. As an example of (1) we may take the union of a molecule of carbon with one of oxygen to form carbon dioxide; of (2) the union of a molecule of hydrogen with one of chlorine, each containing two atoms, to form two molecules of hydrochloric acid each containing one atom of hydrogen and one of chlorine; of (3) ammonium cyanate warmed gives urea. Both contain the same atoms, only in different arrangements, yet their properties are entirely different. Chemical action may result from a variety of causes. In some cases it is sufficient just to bring two substances together. In others heat is required to cause it. Chemical action is always accompanied by the evolution or the absorption of heat. In the latter case, heat must be supplied to the substances to cause the action, e.g. if iron be brought to a dull red heat and it be placed in oxygen, it burns fiercely with the formation of oxides of iron. Phosphorus, on the other hand, combines with the oxygen in the air at the ordinary temp. with the evolution of heat and light. In some cases light is essential to chemical action, as, for example, when chlorine and hydrogen gases are mixed, unless light be given them they will not combine. Photography depends entirely upon the fact of light causing chemical action. Again, in some cases while heat is required to start chemical action, the great evolution of heat in the process is afterwards sufficient to keep the action proceeding, e.g. it is necessary to heat a

strip of magnesium in order that it may take fire. Then, however, no further heat is required, the great heat evolved being sufficient to set the strip burning furiously until the end is reached. Pressure also may cause chemical action, e.g. the two gases hydrogen chloride (HCl) and hydrogen phosphide (PH₃) will combine to form the solid phosphonium chloride under pressure. Sound also may cause chemical action. An explosion of mercury fulminate causes acetylene gas to break up the solid carbon and hydrogen gas. A peculiar process of chemical action can only be brought about in the presence of a third substance. In some cases this third substance is known to take a part in the action, while in others its action cannot be traced. In any case, however, that third substance is, at the end, unchanged. This type of action is known as *catalytic*. Further, some forms of chemical action require moisture. The rusting of iron, or the combination of sodium and chlorine to form common salt, cannot take place in an absolutely dry atmosphere if the substances have also been thoroughly dried.

Chemical Symbols.—In order that we may shortly express chemical compositions, certain symbols are used to denote the various elements. Under ELEMENT (*q.v.*) these symbols will be seen following the name of the element. As will be seen, in some cases the symbol is the first letter in the name of the element, e.g. the symbol for Sulphur is S. In other cases where sev. elements start with the same letter, the first and some prominent letter in its pronunciation is used, e.g. the symbols for Carbon, Cobalt, and Chlorine are C, Co, and Cl respectively. In other cases the symbol is taken from the first and some other letter in the Lat. name for the element, e.g. Antimony (Stibium), Gold (Aurum), Lead (Plumbum), and Iron (Ferrum) are represented by Sb, Au, Pb, and Fe. These symbols in all cases stand for 1 atom of the element. A molecule is composed of various numbers of atoms, e.g. a molecule of hydrogen contains 2 atoms always, while a molecule of phosphorus always contains 4 atoms, while that of oxygen is always composed of 2 atoms. When 3 atoms of oxygen unite to form one molecule we get ozone. So to represent a molecule of an element it is necessary to state how many atoms are in it, and that is done by means of a small numeral placed after the symbol. To express the above facts molecules of hydrogen, phosphorus, oxygen, and ozone would be represented by H₂, P₄, O₂, and O₃. Again, the composition of a compound molecule is denoted in the same way. A molecule of sulphuric acid is composed of 2 atoms of hydrogen, 1 of sulphur, and 4 of oxygen, and would be represented symbolically by H₂SO₄. In some substances groups of atoms are combined to act as a single atom within a molecule, and to express this fact brackets are necessary, e.g. (NH₄)₂SO₄ represents a molecule of ammonium sulphate, which contains 2 atoms of nitrogen, and 8 of hydrogen combined into two groups.

each consisting of 1 atom of nitrogen and 4 of hydrogen, together with 1 atom of sulphur and 4 of oxygen. These groups within brackets are known as *compound radicals*, and any representation of chemical formation of molecules is termed a *formula*. Whenever it is necessary to represent more than 1 molecule, a numeral is placed before the formula, e.g. $2\text{H}_2\text{O}$ represents 2 molecules of water. By means of these formulæ chemical reactions can be shortly expressed in the form of an equation. The substances used are placed on the left and the resulting substances on the right. Thus $\text{MnO}_2 + 4\text{HCl} = 2\text{H}_2\text{O} + \text{MnCl}_2 + \text{Cl}_2$ means that 1 molecule of manganese dioxide unites with 4 of hydrochloric acid, forming 2 molecules of water, 1 of manganese chloride, and 1 of chlorine gas. Whenever chemical changes occur that are understood, they can be expressed in this form, and as matter is indestructible, all the atoms that appear on the left must have a place on the right of the equation. This explains the qualitative use of symbols. They have a further quantitative use which will be better understood after a brief consideration of the 4 laws of chemical combination.

1. *The law of constant proportions.*—'The same compound always contains the same elements combined together in the same proportion by weight.' However a chemical compound is obtained, this law holds, and therein lies an essential difference between it and a mechanical mixture which can obviously consist of varied proportions of the mixed substances; for example, common salt, a molecule of which consists of an atom of sodium combined with 1 of chlorine gas, may be obtained from salt mines, by bringing sodium into an atmosphere of chlorine, by adding hydrochloric acid to sodium carbonate, and by a variety of other means. But whenever it is analysed it is always found to consist of 1 part of chlorine to 0.6479 of sodium by weight.

2. *The law of multiple proportions.*—'When the same two elements combine together to form more than one compound, the different weights of one of the elements which unite with a constant weight of the other, bear a simple ratio to one another.' This law was first recognised by Dalton. In some cases the same elements combine together in different proportions, giving rise to two or more compounds. This does not violate the law of constant proportions, for each separate compound always exists with the same proportions by weight of the composing elements. When elements do combine in this way, however, this law holds, and it is best explained by means of examples. The following given by Newth represents the law well. Nitrogen and oxygen unite together to form five different compounds, in which the proportions of nitrogen to oxygen by weight are: Nitrous oxide, 1 : 0.671; nitric oxide, 1 : 1.143; nitrogen trioxide, 1 : 1.714; nitrogen peroxide, 1 : 2.286; nitrogen pentoxide 1 : 2.857. Thus, the relative proportions of oxygen which unite with a constant proportion of

nitrogen are in the proportion 1 : 2 : 3 : 4 : 5 to one another. This holds in all cases, thus verifying the law stated above.

3. *The law of reciprocal or equivalent proportions.*—'The weights of different elements which combine separately with one and the same weight of another element, are either the same as, or are simple multiples of, the weights of these different elements which combine with each other.' In the brief hist. of C. a simple illustration is given of this in the combining proportions of phosphorus with chlorine or hydrogen, and the consequent proportions of combination of hydrogen and chlorine. To show the remarkable application of this law, the following illustrations will serve. Hydrogen, sodium, and potassium will unite with chlorine in the proportions by weight respectively as 1 : 23 : 39 : 35.5. Again, these same elements will unite with bromine in the proportion 1 : 23 : 39 : 80, and with oxygen in the proportion 1 : 23 : 39 : 8. So that taking these separately, we can say that 1, 23, 39, 80, 35.5, and 8 are the *equivalent weights* or *combining proportions* of hydrogen, sodium, potassium, bromine, chlorine, and oxygen respectively. From which we would deduce that were sodium and chlorine (say) capable of chemical combination, they would so combine in the proportions by weight of 23 : 35.5. This is found to be correct.

Atomic theory.—Dalton connected these three laws together and revived the atomic theory. Briefly, it is that matter is made up of minute particles called atoms. Chemical combination takes place between these atoms, i.e. they are drawn and held together by chemical affinity. Should they come into contact with other atoms for which either of the already combined atoms has a much greater affinity, then a process of redistribution of these atoms will take place. The atoms of different elements are supposed as having different relative weights, and these relative weights are supposed as being the same as those numbers which represent their combining proportions. So the equivalent weight of an element is supposed as being its *atomic weight*. Now this theory will satisfactorily account for the three laws mentioned above, and it is a generally accepted fundamental of the science of C. Dalton's theory has to be revised in particular instances. For reasons which need not be given here, the combining proportions of oxygen, carbon, and sulphur with 1 of hydrogen, are respectively 8, 6, and 16, while in any table of atomic weights the numbers will be 16, 12, and 32.

4. *The law of gaseous volumes or of Gay-Lussac.*—'When chemical action takes place between gases, either elements or compounds, the volume of the gaseous products bears a simple relation to the volumes of the reacting gases.' That is to say, that under similar conditions of temp. and pressure, simple relationship can be estab. between the volumes of gases in any chemical reaction. The important point here can be easily reached

by the following illustration: 2 volumes of nitrous oxide will decompose, producing 2 volumes of nitrogen and 1 of oxygen. Again, 2 volumes of nitric oxide will decompose, giving 1 volume of nitrogen and 1 of oxygen. But a further generalisation can be noted here. Taken by weight, in nitrous and nitric oxides respectively, nitrogen: oxygen :: 28:16 and 32, if we keep the weight of nitrogen constant. By volume in these two gases nitrogen: oxygen :: 2:1 and 2:2 respectively. So that there is twice as much oxygen by weight and by volume in nitric oxide as there is in nitrous oxide. While if 14 and 16 be the atomic weights of nitrogen and oxygen, then the numbers showing the relative volumes give the number of atoms. This development was brought about by Avogadro, who formulated a hypothesis now known by his name, which stated that 'Equal volumes of all gases or vapour under the same conditions of temperature and pressure contain an equal number of molecules.' So that weighing equal volumes of gases at the same temp and pressure should give the relative weights of their molecules. Since hydrogen is the standard and the molecule of hydrogen is known to contain 2 atoms, the ratio between the weights of equal volumes of hydrogen and other gases not only gives the densities of the gases, but it helps materially towards determining the number of atoms in a molecule and the consequent discovery of true atomic weights. From this, if we return for a moment to chemical symbols, we shall see that a chemical formula or equation expresses certain quantitative facts. It can easily be seen now, for example, that by the equation $\text{MnO}_2 + 4\text{HCl} = 2\text{H}_2\text{O} + \text{MnCl}_2 + \text{Cl}_2$, we can read that since the atomic weights of manganese, oxygen, hydrogen, and chlorine are respectively 55, 16, 1, and 35.5, 87 parts by weight of manganese dioxide unite with 146 of hydrochloric acid, giving 36 parts of water, 126 of manganous chloride, and 71 of chlorine gas. Since in scientific work the metric system is generally used, the word gramme could be substituted for parts by weight. Not only so, but if the reacting substances are gases we can tell the volumes that react and the resultant volumes, e.g. $2\text{H}_2 + \text{O}_2 = 2\text{H}_2\text{O}$ represents the fact that 2 molecules of hydrogen unite with 1 of oxygen to form 2 of water; it also means that 4 parts by weight of hydrogen unite with 32 of oxygen to form 36 of water, while finally it means that 2 volumes of hydrogen unite with 1 of oxygen to give 2 of steam. These four rules or laws, together with Avogadro's hypothesis, make up the fundamental basis of the science of C., always bearing in mind the fact that underlying all this again is the law of the conservation or indestructibility of matter. Among other principles which underlie the science may be mentioned that of *valency*. In the study of the science it will be noticed that one atom of chlorine and one only will unite with 1 atom of hydrogen. On the other hand, an atom of oxygen

requires 2 atoms of hydrogen to satisfy the conditions of its affinity for hydrogen, while carbon requires 4. All those elements which only require one atom of hydrogen for purposes of combination are said to be *univalent* elements, those that require 2, *bivalent*, and so on through the terms *trivalent*, and *quadrivalent*. Some elements, however, do not combine with hydrogen, in which case they have to be compared with some element with which they do enter into chemical combination, and which is at the same time univalent. One atom of sodium, for example, unites with 1 of chlorine, and may, therefore, be said to be univalent. With elements that combine with hydrogen no higher valency is shown than 4, but with other elements the valency may rise to 6, as is the case with tungsten, which requires 6 atoms of chlorine to unite with 1 atom of itself. As in all the other instances difficulties arise which are beyond the scope of this article, as, for instance, the fact that measured by hydrogen the valency of phosphorus is 3, while measured by chlorine it is 5. As a general rule, however, the highest number of atoms with which 1 atom of an element will combine is taken as representing its valency. The modern electron theory enables us to distinguish (a) positive valency, which represents the number of electrons that an atom—or group of atoms—loses, (b) negative valency, which represents the number of electrons an atom—or group of atoms—gains, and (c) co-valency, which is the sharing of pairs of electrons between atoms. Loss of electrons is characteristic of metallic elements while gain of electrons is characteristic of non-metallic elements.

Metals and non-metals.—Chemists divide the whole range of matter into two great classes: metals and non-metals. The metals generally are opaque, and have surfaces which will reflect light so highly that they are generally spoken of as having a 'metallic lustre.' They conduct heat and electricity well, and are generally malleable and ductile. Non-metals do not possess these properties although they merge into one another, giving transitional elements which may be placed in either group, this depending on whether we consider their physical or chemical properties.

Periodic system.—Thus we could classify elements either as metals and non-metals or according to their valency. But Newlands (1864) developed a system, afterwards improved and estab. by Mendeleev, now known as the Periodic system. It depends upon the atomic weights of the elements. It can be noticed that if a group of elements be taken which closely resemble each other in their general properties; then the atomic weight of one element will be approximately the mean of the atomic weights of the nearest before and after it, ranged in order of atomic weights: e.g. lithium, sodium, and potassium have atomic weights of 7, 23, and 39. Now $(7 + 39) \div 2 = 23$. If the elements in the various families or groups are arranged in the

order of atomic weights, it will be seen that the increase in these weights in each group is practically the same. Thus fluorine, chlorine, and bromine have atomic weights of 19, 35.5, and 80, while nitrogen, phosphorus, and arsenic have atomic weights of 14, 31, and 75, and oxygen, sulphur, and selenium are represented by 16, 32, and 79. Now each three mentioned together here belong to the same family, and the differences between the atomic weights of the first and second in each group are 16.5, 17, and 16, while between the second and third in each they are 47, 45, 47, and these numbers are approximately equal. This cannot be pure chance, and Newlands pointed out that if the elements be arranged in order of increasing atomic weights, the properties of the first seven would reappear in the next seven, so that the first and the eighth, the second and the ninth and so on, would belong to the same group or family. This he called the law of octaves. Mendeleev, as we have before stated, developed this into the periodic law. This, of course, depends upon the hypothesis that the properties of elements are related to their atomic weights. The first seven elements after hydrogen are lithium, beryllium, boron, carbon, nitrogen, oxygen, fluorine, with atomic weights of 7, 9, 11, 12, 14, 16, and 18. The next seven are sodium, magnesium, aluminium, silicon, phosphorus, sulphur, and chlorine with atomic weights of 23, 24, 27, 28, 31, 32, 35.5—the approximate difference of 16 being evident through all—and the element in the second row which corresponds in order with the element in the first row does possess similar properties, and will be found to belong to the same family. As we traverse the rows and pass from lithium and sodium to fluorine and chlorine, we pass from electro-positive soft white metals to electro-negative corrosive gases, while the valency increases as one passes along either row or any succeeding row from one to four and back again to one. After the second row, however, the table gets complex, for the next row consists of seventeen elements: seven take their right places under the other two rows, then come three elements (iron, cobalt, and nickel) which are termed transitional elements, and then seven others which, while they exhibit certain likenesses to the seven preceding, can hardly be placed directly under them. These seventeen elements are known as a *long period* as against the short period of the seven. From here on the periods are all long, and should consist of seventeen elements, but two gaps occur, representing elements of which we yet have no knowledge. The vertical columns in these rows of seven are taken and the alternate elements after the first two rows are placed together and form a family, with similar properties. Thus group one will consist of lithium, sodium, potassium, copper, rubidium, silver, caesium, and gold. Of these, copper, silver, and gold form one family, and the rest fall together. This periodic table is of the utmost value in the study

of inorganic C. It has aided in the true estimation of atomic weights of elements, and has aided in the discovery of new elements; e.g. Mendeleev himself predicted the discovery of an element which he called eka-aluminium, and gave its properties by a study of the series and families in his table. Four years later gallium was discovered by means of the spectroscope (as he had predicted) and justified his predictions completely. A study, however, of a periodic system based upon atomic weights brings out several anomalies; for example, argon and potassium, iodine and tellurium, cobalt and nickel would, judging from their properties and behaviour, be placed in wrong positions if arranged according to atomic weights. For long this remained unexplained, but it is now known that the atomic number (see ATOM) of an element is of more fundamental importance than its atomic weight. The above anomalies disappear when the elements are arranged according to their atomic numbers.

Isotopes.—The discovery of radium and the phenomenon of radioactivity, which revealed the startling fact that the atoms of certain heavy elements, such as uranium, thorium, and radium, were undergoing spontaneous disintegration, led Soddy (1910) to suggest that elements might exist which were chemically identical but differed in atomic weights ('isotopes' or 'isotopic elements'). This has since proved to be the case, and although it would appear that chemists about the year 1813 were justified in rejecting the hypothesis of Prout, to the effect that the atoms of all elements were aggregations of hydrogen atoms, yet modern research has shown that when our chemical atomic weights are fractional, it is due to the existence of two or more isotopes of even atomic weight, but present in such proportions that the average weight is a fractional one. Thus, chlorine with atomic weight 35.46 consists of two isotopes of mass 35 and 37. No satisfactory means, chemical or physical, has been found for the complete separation of isotopes so that, in view of the relatively enormous number of atoms taken in all chemical operations the ordinary atomic weights are still used. Much of the work on isotopes has been done by Sir J. J. Thomson, Aston, and Dempster.

Atomic Numbers.—Kaye (1909) found that a solid element, when bombarded by a rapid stream of cathode rays, emits a characteristic X-radiation, which may be resolved into a spectrum by reflection from a crystal, because as shown in the classical researches on crystal structure by the late Sir W. H. Bragg, and his son Sir Laurence Bragg, the internal surfaces of crystals act as diffraction gratings towards X-rays. Moseley (1913-14) used a crystal of potassium ferriocyanide and photographed the spectra of various elements. In this way he obtained what are known as the atomic numbers of the elements. These are whole numbers and when the elements are arranged according to them the periodicity of properties is shown without any anomalies. Briefly

defined, the atomic number of an element is numerically equal to the charge on the nucleus of its atom.

Chemical Nomenclature.—If a substance is a *binary compound*, i.e. is composed of two different elements, then its chemical name is made up from the names of its composing elements, e.g. when hydrogen and sulphur enter into chemical combination the resultant substance is termed hydrogen-sulphide. Sometimes, however, the same two elements will combine together in more than one proportion. Names are then necessary to distinguish one from the other. Prefixes or terminal endings are used for this purpose. Phosphorus unites with either 3 or 5 atoms of chlorine, when it is known as *phosphorous* or *phosphoric chloride* according as there are 3 or 5 atoms of chlorine in the compound. Another and perhaps better method is that by which it is known as *phosphorous trichloride* or *phosphorous pentachloride*. The latter is the more general method. *Sub-* and *proto-* were terms generally in use, but they have fallen into disuse. When oxygen is one of the two elements in the compound, the substance is known as an *oxide*. Some of these oxides, when combined with water, form acids, and are known as *acid-forming oxides* or *anhydride*. All the non-metallic elements except hydrogen form these oxides, and the so-formed acids are called *oxyacids*. Metals give rise to oxides which form *hydroxides* with water, and these oxides are called *basic oxides*. When an acid is brought into contact with a basic oxide a salt is formed. All oxides are named after the substance with which the oxygen is united, and oxyacids are also named after the same substance. Thus carbon dioxide gives rise to *carbonic acid*. When a substance forms two acid-forming oxides the terms *ic* and *ous* are used to denote the one with the greater and the lesser amount of oxygen respectively. Thus sulphur trioxide forms *sulphuric acid*, while sulphur dioxide forms *sulphurous acid*. Acids used to be considered as always containing oxygen, but this view is incorrect, as can easily be seen from the fact that chlorine, fluorine, bromine, and iodine, known in C. as the halogen group, form acids when in combination with hydrogen. When acids are added to bases, salts are formed, and acids which contain more than one atom of hydrogen (all acids have, at least, one atom) can form more than one salt, for a salt is formed by the replacement of the atom or atoms of hydrogen in the acid by the metallic atoms of the base. Thus sulphuric acid (H_2SO_4) contains 2 atoms of hydrogen, and it can give rise to two salts of any metal, e.g., normal potassium sulphate represented by K_2SO_4 and $KHSO_4$. Hydrochloric acid, on the other hand, has only one atom of hydrogen in it, and can only give rise to one salt. Thus according as there are 1, 2, 3, or 4 atoms of hydrogen in an acid, it is known as *mono-*, *di-*, *tri-*, or *tetra-basic*, while a normal salt is one in which all the replaceable hydrogen atoms have been replaced by the base.

Organic and Inorganic Chemistry.—

Organic C. is the C. of the carbon compounds. The element carbon is unique in its remarkable power of forming compounds, principally with hydrogen, or hydrogen and oxygen. The special branch of organic C. is necessary on account of their great and increasing number. The term 'organic' has lost its original significance, that of bodies which could only be produced by the so-called 'vital force' in living matter. That view was practically overthrown in 1828, when Wohler synthesised the organic body urea from the inorganic compound ammonium cyanate. A phenomenon found with extraordinary frequency in the case of carbon compounds is that known as 'isomerism.' Isomers or isomeric compounds are different bodies having the same gross composition but possessing different molecular constitution. For example, one hydrocarbon of the paraffin series has 801 isomers. Many organic bodies are compounds of hydrogen and carbon, and so are called *hydrocarbons*. Petroleum consists of a mixture of hydrocarbons known as the 'paraffins' on account of their comparatively great resistance to chemical attack. The simplest member of the series is methane or marsh gas, the fire-damp of our coal mines. Methane may be looked upon as the type-compound of a div. of organic C. containing many hydrocarbons, animal and vegetable fats and other bodies known as 'aliphatic,' while the hydrocarbon benzene, not to be confounded with benzine (which is a petroleum product), is looked upon as the type hydrocarbon of the aromatic div. of organic C. Many organic bodies have extremely complex structures and so-called graphic formulæ are used largely to express their composition. Organic C. enters into and has a profound bearing upon modern civilisation. Many drugs and medicinals which can only be obtained with difficulty from natural sources can be synthesised in a state of purity. The enormous dyestuff industry of the world has been built up largely upon the 'intermediate' compounds prepared from benzene, toluene, naphthalene and anthracene, which are aromatic hydrocarbons obtained usually from the tar produced when coal is destructively distilled in gas-retorts or coke-ovens. The dyestuffs, of which there are thousands, mostly laboratory products, are used to colour food, clothes, shoes, paints, artificial silk—itsself an organic substance—inks, paper, and in fact most of the coloured objects used in everyday life, may be said to have emerged from the effort of Sir W. H. Perkin, who, in 1856, made the first aniline dye, 'aniline purple' or 'mauveine.' Most of our modern explosives, of which tri-nitrotoluene or T.N.T. is an example, are also organic bodies. Organic C. is a fascinating branch of science, the possibilities of which are practically limitless.

Physical Chemistry.—Although of very recent development this is now an absolute essential to the study of any

branch of C. with any design. It seeks to explain processes, and to formulate laws for these processes, and is divided within itself again into electro- and thermo-C., etc. One branch of physical C. in which great strides have been made is the study of the general properties of gases. It is really as much in the realm of physics as it is in the realm of C. In this we may start from Charles's law, *'That when a gas is heated, the pressure being constant, it increases in volume to the same extent whatever the gas may be.'* This law is not quite accurate, in fact physical C. has found the co-efficient of expansion of sev. of the gases. That of air is 0.003665, and from this the absolute temp. is stated as being -273° C. This law, together with Boyle's law, *'The volume occupied by a given weight of gas is inversely as the pressure,'* give a basis to this branch of the science. Boyle's law is not absolutely correct either. All gases except hydrogen require less than this theoretical pressure to reduce them in volume, while hydrogen requires more than the theoretical pressure to do so. This deviation is explained by the kinetic theory of gases, which regards gases or vapour as molecules held together by the smallest possible force of attraction. These molecules are supposed as in a state of violent motion, moving in straight lines until they strike against other molecules or the sides of the containing vessel, when they rebound or continue in another direction. The energy remains the same with constant temp., but any increase in temp. results in an increase of energy or speed, a decrease of temp. naturally causing the opposite. The pressure of the gas is the effect of this bombardment of the sides of the vessel, and is proportionate to the sum of $\frac{1}{2}$ mass of each molecule multiplied by the square of its velocity. If the confining space be reduced, the pressure is increased because the number of impacts is increased. Thus if the space be reduced one-half the impacts, and consequently the pressure, is doubled. This, of course, is Boyle's law. Again, heating a gas causes the temp. to rise, and since by Avogadro's hypothesis equal volumes of gases contain the same number of molecules, the increase in kinetic energy would be the same in any gas subjected to the same range of temp. Now since molecules of different gases have different weights, and since the pressures and consequently the energies of all gases are the same at the same temp., and since the energy is $\frac{1}{2}mv^2$, where m = mass of a molecule and v = velocity, it follows that the velocities of molecules of different gases must vary. Calculations bring these velocities out as being proportional to the inverse square roots of their densities. Now it is a well-known fact that gases (and liquids) diffuse, i.e. will gradually pass through partitions if there be partitions, and will mix. Thus if an explosive mixture of hydrogen and oxygen be passed through porous tubes, then, by the time they reach the far end, the hydrogen will have diffused so much that a glowing splinter will re-ignite, the gas being mainly oxygen. Graham

estab. a law which took note of the well-known fact that light gases diffuse more rapidly than heavy gases. His law is: *'The relative velocities of diffusion of any two gases are inversely as the square roots of their densities.'* The same result was arrived at, as shown above, by a study of the kinetic theory of gases. From this it will be seen that while Charles's and Boyle's laws are upheld by this theory, yet, since molecules are not mathematical points, and since impact occupies time, and that, further, since there must be some slight attraction between the molecules themselves, then there must be some deviations. Furthermore, there is one point at which both laws absolutely break down. If a gas be cooled from 0° C. to -10° C., theoretically by Charles's law 100 c.c. of it should be reduced to 96.4 c.c. But in the case of sulphur dioxide instead of occupying 96.4 c.c., a liquid will have been formed and only a few c.c. of gas will remain. This, of course, is a development not accounted for in the law. Similarly by Boyle's law 100 c.c. of a gas at standard pressure should occupy 25 c.c. at a pressure of 4 further atmospheres. On the contrary, at a pressure of 4 atmospheres, sulphur dioxide gas breaks down into a liquid. And it is in this branch of the liquefaction of gases that physical science has perhaps made greatest strides. Chemical apparatus has been brought to such a pitch that temps. approaching absolute temp. can be reached. All gases now with the exception of hydrogen can be liquefied when subjected to certain conditions of temp. and pressure, which vary for different gases. Northmore in 1806 was the first to liquefy gases, and the gas that he used was chlorine. Faraday was the first, however, to recognise the fact that it was liquid chlorine. An interesting application of this subject was the liquefaction of helium, which requires the lowest temps. This gas, together with argon, krypton, and xenon, forms a remarkable group. They occur in the atmosphere and in certain rare metallic ores, and their discovery is chiefly due to Sir Wm. Ramsay. Radium, which has opened up an entirely new field in C., also emanates helium rays, which can be collected. A further dept. of physical C. which has received great attention is that of the theory of solutions. It has been estab. that the pressure exerted by a substance in dilute solution (its osmotic pressure) is the same as would be exerted by the same amount of the substance if it existed as gas, and occupied the same volume at the same temp. Much research has been carried out on what is known as the colloidal state. This may be regarded entirely from the point of view of size of particle. The particles are of greater molecular dimensions than exist in true solutions, and yet sufficiently small to be kept in suspension, against the action of gravity, by molecular bombardment. Such particles represent an enormous surface area and to this fact many of the properties characteristic of the colloidal state are due. Further the laws relating

to gaseous pressure are similar to those relating to osmotic pressure, and diffusion of dissolved substances can be compared with the diffusion of gases, although it is a much slower process. This theory involves the theories connected with electrolysis, for solutions of some substances act in such a manner that it is necessary to suppose that molecules of the dissolved substances unite in solution to form complicated molecular structures, while in the case of certain acids, bases, and salts, their resultant action can only be explained on the hypothesis that their molecules dissociate into ions (*see below*).

plate, while an electric current will pass along the wire. The liquid through which the current must pass is known as the electrolyte, and the poles in the electrolyte are known as electrodes, the negative being the cathode, and the positive the anode. It will be sufficient for the purposes of this article to mention that the theory of electrolytic dissociation at present held is that it involves a flow of electrons. If an aqueous solution of copper sulphate be electrolysed the primary products may be supposed to be copper Cu, and the radical SO_4 . The copper is deposited on the negative

PLASTICS: AN ACHIEVEMENT OF MODERN CHEMISTRY

One of the most interesting and important of the synthetic plastics is the acrylic resin 'Perspex,' made by chemical reactions between acetone, hydrocyanic acid, wood alcohol or methanol, and sulphuric acid. The photograph shows 'Perspex' cocktail-glasses.

Dissociation is a term used of reversible reactions. Thus chalk on heating will split up into lime and carbon dioxide. But the lime and the carbon dioxide can re-unite to form chalk. That fact may be expressed thus: $CaCO_3 \rightleftharpoons CaO + CO_2$. Decomposition, on the other hand, refers only to reactions which only take place in one way. As, for example, $2NH_3 = N_2 + 3H_2$, signifies that ammonia on heating is decomposed into nitrogen and hydrogen, and not that nitrogen and hydrogen recombine to form ammonia. The conception of ions in C. is a branch of electrolysis. An electric battery is formed if strips of zinc and platinum be placed in dilute sulphuric acid always provided that a metal wire outside joins the plates. The zinc dissolves in the acid and bubbles of hydrogen are evolved at the platinum

electrode, and the SO_4 group passes to the positive pole, where it is decomposed by the water into oxygen, which is liberated, and sulphuric acid. Thus $SO_4 + H_2O = H_2SO_4 + O$. The primary factors in electrolysis, for example in this case copper and SO_4 , are known as *ions*. Those which proceed to the positive pole are negatively charged, and vice versa. Among electronegative ions may be named fluorine, chlorine, bromine, and acidic radicals such as SO_4 , while electro-positive ions include hydrogen and the metals. Among the laws of electrolysis may be mentioned Faraday's, which says that if the same quantity of electricity be passed through different electrolytes, then the ratio between the liberated products of the electrolysis is the same as that between their chemical equivalents. It

used to be supposed that the electricity caused the dissociation of the electrolyte into ions, but it has been shown that electricity travels as freely through electrolytes as along metals, and that consequently work is not done. Arrhenius (1887) proposed that some of the molecules of an electrolyte are always in a state of dissociation. A development of this theory leads to the conclusion that a solution, say, of sodium chloride has sodium and chlorine existing in the free state within the solution. This goes against all preconceived ideas, particularly as sodium causes immediate chemical action if brought into contact with water. To support this theory, however, they must be in such a state and highly charged with electricity. Whenever they lose their charges they either reunite into sodium chloride or form molecules of sodium and chlorine and assert their usual properties. It is now believed that electrolytes consist not of molecules but of assemblages of ions, even in the solid state. Solution merely sets the ions free to move, and passage of a current directs their movement. Thermo-C. is concerned with the thermal changes which accompany chemical changes. Determinations in this branch of the science are made by means of calorimeters in which the heat that is liberated in chemical action is transferred to definite volumes of water, and its application chiefly lies in its efficacy for determining economic commercial processes. The structure of the atom is, of course, of fundamental interest and importance to chemistry, but the methods employed in this study are almost entirely physical. Finally, it may be stated that a knowledge of C. is evidently essential in many walks of life, whether it be the surgery, the kitchen, the dairy, the farm, the factory, the mine, or the great iron and steel industries. The arts and, of course, the great chemical and dye works are dependent upon it, and it stands out as the first study in any scheme of technical education.

Chemnitz, important manufacturing town of Saxony, Germany, situated in a fertile

valley at the base of the Erzgebirge, about 45 m. S.W. by rail from Dresden. Chief industrial tn. of the state, it is noted for the manuf. of cottons, woollens, silks, leather goods, locomotives, machinery, and agric. tools. Its many buildings of interest included the Old Rathaus in the Hauptmarkt, the Neumarkt, the church of St. James, etc. There are fine technical schools, as well as schools of engineering, agriculture, and commerce. The tn. was created a free imperial city in 1125, when Emperor Lothaire founded in it a Benedictine monastery. It received municipal rights in 1494. The tn. suffered during the Thirty Years war, but later became a cotton manufacturing centre. C. suffered severely in the Second World War from allied bombers in Jan.–March, 1945 particularly in co-operation with Marshal Koniev's invasion of Silesia. It fell to Gen. Patton on April 19. Pop. 351,000 (1943).

Chemnitz, or **Kernitz**, **Martin** (1522–86), staunch Lutheran divine, son of a cloth-worker, b. at Treuenbrietzen in Brandenburg, followed his father's trade, but soon abandoned it, and became a student at the univ. of Frankfurt-on-Oder, thence to Wittenberg, where he came under the influence of both Luther and Melancthon. He soon gained attention as a brilliant orator and able controversialist. He was bitterly opposed to the Jesuits, and inveighed against them in many pamphlets, chief amongst which are his *Theologiae Jesuitarum praecipua capita* and his *Examin concilii Tridentini* (1563–73). He was recognised as the head of his church throughout Saxony.

Chemnitz, **Bogeslaus Philipp** (Bogeslaw von) (1605–78), a Ger. historical and political writer, grandson of Martin C. (q.v.). He served as an officer in the service of Sweden during the Thirty Years war, becoming historiographer to Queen Christina in 1644, councillor in 1675. His *Dissertatio de ratione status in imperio nostro romano-germanico* appeared in 1640 under the pseudonym, of 'Hippolytus a Lapide.' C. also wrote *Der königlich schwedische in Deutschland geführte Krieg*, 1648 (new ed. 1855–59). The *De Ratione* was answered by an anonymous writer, 1657; by Bruggemann, 1667; and Boecker, 1674. It was trans. into Fr. by de Chastelet, 1712; by Forney, 1762.

Chemnitzia, term sometimes used for *Pseudomelania*, a large genus of marine gastropod molluscs which resemble the elongated fresh-water *Melania*. The species occur fossil in the Trias and Jura and less frequently in Cretaceous and Eocene.

Chemosh (god of Moab), national deity of the Moabites, and was designated by the Israelites as the 'abomination of the Moabites.' The Moabites were also called the children of C. (Jer. xlviii.). This god's name frequently occurs in the O.T., and is found engraved on the Moabite stone (q.v.). The sacrifices sometimes consisted of human victims. Solomon was guilty of having idolised this deity by building an altar to him, nor was it pulled down until Josiah's accession.

Chemulpo (Kinsen), port on the W. coast of Korea, was opened to foreign trade in 1883 when it was a poor fishing vil.; it was later a flourishing and rapidly increasing centre of trade with a pop. of 103,000 (Jap. 25,000).

Chemung, name given by Amer. geologists to a div. of the Devonian.

Chenab, riv. of Kashmir, India, and E. Punjab, Pakistan. Together with the Sutlej, Beas, Ravi, and Jhelum, it forms the R. Punjab or Panjnad (Five Waters), which finally flows into the Indus. When the C. reaches the Punjab dist., it attains to a breadth of 600 ft. It takes its rise in Lahul at an altitude of nearly 14,000 ft. It is 590 m. long.

Chencanfu, tn. of Kwangsi prov. in S. China.

Chenchine, Afanasi, see FET.

Chenchowfu, or **Shenchow**, tn. of central China, Hunan prov., on the Nuenkiang trib. of the Loikiang, 169 m. from Changsha, 110 m. from Lake Tungtinghu.

Chénédollé, Charles Julien Lioult de (1769-1833), Fr. poet who fought in the army of Condé against the revolutionaries. His prin. works are *Le Génie de l'homme* (1807) and *Études poétiques* (1820). He belonged to the romantic school of poets, and his works were ed. by Sainte-Beuve in 1864, who has also paid tribute to his memory in his *Chateaubriand et son groupe*, 1860.

Chénée, tn. situated at the conjunction of the Ourthe and Vesdros in the prov. of Liège, Belgium. Pop. 10,000.

Chenery, Thomas (1826-84), distinguished Eng. scholar, also editor of *The Times*, after appointment he received in 1877. He was a student of Caius College, Cambridge, and served in the Crimea as war correspondent to *The Times*. He had an excellent knowledge of Arabic and Heb., and was one of those appointed to revise the O.T.

Chenevix, Richard (1774-1830), Irish writer, chemist, and mineralogist, of Fr. parentage, F.R.S. of London and Edinburgh. He was a Copley medallist in 1803. Among his scientific words are *Chemical Nomenclature* (1802), and *Observations on Mineralogical Systems* (1808). He also wrote the comedy *Mantuan Revels*; the tragedy *Henry VII.* (1812); *Essay on Natural Character* (1830); papers on palladium, nickel, and platina; *Leonora*, and other poems.

Chengalpat, see CHINGALPAT.

Chengchow, city of China, Honan prov., 80 m. from Kaileng.

Chengteh, see JEHOL.

Chengtu, cap. of prov. of Szechwan in China, situated in a fertile plain watered by the Min, a trib. of the Yangtse. It is the seat of the W. China Univ. The pop. is estimated at over 400,000.

Chengyangkuang, tn. in the prov. of Anwei, China; noted for its market.

Chénier, André Marie (1762-94), Fr. poet and miscellaneous writer, son of the Fr. consul at Constantinople, his mother being Gk. He was educated at the Collège de Navarre, and began to write verse at the age of sixteen, with imitations of Homer and Virgil. He held at one

time a commission in the army, but soon threw it up and devoted himself to literature. He wrote many idylls and elegies, which show his powers as poet. Singularly chaste in style, he approached the Gks. in their powers of eloquence and choice selection of words. He was largely influenced by Milton, whose classic style he sought to imitate. In 1787 he accepted a post in the Fr. embassy in London, but after three years returned to France, where, after joining the revolutionary movement for a short time, he threw in his lot with the Moderate party, being disgusted with the extreme methods adopted by the revolutionaries. Most of his political writings appeared in the *Journal de Paris*, among the most important being one dated Feb. 26, 1792, entitled *De la cause des désordres qui troublent la France, et arrêtent l'établissement de la liberté*—a manifesto against the Jacobins. His *Arts aux Français sur leurs véritables ennemis* also drew upon him the malevolence of the Jacobins. When his party was defeated and the king executed, he paid for his outspokenness, was arrested and thrown into the St. Lazare prison, and guillotined four months later. C. is regarded as the foremost Fr. poet of the eighteenth century. A classicist, he differed only from the great classicists in that he was more of a Hellenic than they— a trait which he owed to his Gk. mother's influence. The only long works he projected were in the spirit of the eighteenth century and belonged to the Encyclopédic movement. The best known of his classical pieces are *La Jeune Tarentine*; *L'Aveugle* (on the legend of Homer wandering and blind); and *Le Jeune Malade*. Of the odes the best known are the Pindaric *Jeu de Paume* and one addressed to Charlotte Corday. The *Iambes*, which contain some of his finest poetry, were all written during his incarceration in St. Lazare. In style his importance lies in his use of *enjambement* (running of the sense into the next line) and he was the first since the Péléade (q.v. and see also RONSARD), with which group he has some features in common, who in this manner systematically modified the somewhat monotonous uniformity of the Alexandrine so as to lend it more flexibility. His works on scientific questions or current problems include *L'Amérique* (planned as a poetic geography of the known world); *L'Hermès* (a universal philosophy in verse); *L'Astronomie*; *La Superstition*; and *L'Invention*, later works which show a deeper skill in literary craftsmanship. His *Poésies lyriques* were pub. after his death in 1819. See P. DIMON, *La Vie et l'œuvre d'André Chénier jusqu'à la Révolution française*, 1762-90, 1936.

Chénier, Marie Joseph Blaise de (1764-1811), brother of André, was a Jacobin, and served in the legislative assembly for a period of thirty years. He was both a poet and dramatist with a large output of work. C. was a keen politician with democratic principles, which account largely for the popularity of his tragedies, chief amongst which are his *Charles IX.*

(1790); *Henry VIII.* (1791); *Jean Calas* (1791); and *Timoléon* (1794). He became a member of the Convention, and was on the Council of Five Hundred. He was distinguished for his satires, amongst which may be mentioned his *Épître à Voltaire* (1806).

Chenille, special kind of pile yarn used in millinery manuf., curtains, and carpets. It may be of silk or worsted according to the purpose required. It is made by weaving a gauze cloth of very open texture which is then cut into strips and finished off into a rounded-pile thread.

Chenonceaux, vil. in the dept. of Indre-et-Loire, situated in central France and watered by the R. Cher. Its château, situated on the r. b. and with a wing

basal ovule; there are no stipules, and the fruit is a nut or an achene.

Chenopodium, important genus of Chenopodiaceae, contains numerous plants growing in a temperate climate, and many of them are endowed with extraordinary names, e.g. fat hen, lamb's quarters. There are nine Brit. species, usually known as goosefoot, which grow in waste places as weeds; they are insipid and of little value, but the leaves and young shoots may be eaten as spinach. *C. bonus-Henricus*, good King Henry, Eng. mercury, or wild spinach, is a Brit. perennial of which the shoots are eaten like asparagus. *C. oldum* and *C. Fulvaria* are both known as the stinking goosefoot, and *C. album* is the white or

THE CHATEAU OF CHENONCEAUX

D. McLeish

stretching over the riv. is of great historical interest. It was built in 1515 in Renaissance style, and passed through many hands. It had been confiscated by Francis I. in 1533; presented by Henry II. to Diane de Poitiers, and taken from her by Catherine de' Medici; occupied by Henry III.'s wife; by the house of Vendôme; and by the Bourbon-Condé family. Claude Dupin (1684-1769), celebrated for his hospitality, also owned it for a time.

Chenopodiaceae, fairly large family of Dicotyledons, contains numerous species used either for culinary purposes or for the manuf. of soda; spinach, beet, orach, goosefoot sea blite, and saltwort are examples of the family. All are characterised by their salt-loving tendencies, and frequent seashores. Most of the plants are herbaceous, with dense inflorescences of small flowers. There is usually a simple, persistent perianth of sepaloid leaves, one to five in number, the stamens typically equal the perianth-leaves in number, the ovary is superior and unilocular with a single campylotropous,

common goosefoot, an ann. plant eaten like spinach. *C. Quinoa*, the celebrated quinoa of Peru, is an important food-plant of S. America; it is grown on land where neither barley nor rye will ripen, and the seeds are used much as is rice in India. *C. anthelminticum* (or *ambrosioides*), the wormseed or Mexican tea has an aromatic odour; its medicine it forms a well-known vermifuge and as an article of diet it takes the place of tea.

Chenyuen, tn. in the prov. of Kweichow, China, 100 m. E.N.E. of the cap., Kweichow. It is noted for its gold and copper mines.

Cheops, king of Memphis, Egypt, who reigned second in the fourth dynasty of Manetho; celebrated for being the builder of the Great Pyramid. This colossal sepulchre was built at the cost of much human suffering, and at enormous expense. According to Herodotus, all the Egyptians were put to work in relays of 100,000 working for three months, quarrying, constructing the road for transport, and preparing the site. All this work took ten years, and the work of

building the pyramid twenty years more.

Chepman, Walter (c. 1473-c. 1538), printer and merchant of Edinburgh, one of the first Scottish printers. He was introduced to the court of James IV., and was trained as a clerk and writer under Panter, the royal secretary. C. and Andrew Myllar were granted the sole patent to print books in Scotland (1507). They set up their printing-press (the first in Scotland) at the foot of Blackfriars Wynd in the Cowgate, Edinburgh. Two of their pubs. remain, one, the first book printed in Scotland, consisting of eleven small quartos bound together (1508), the other *Breviarium Aberdonense* (1510). See introduction by D. Laing, *The Chepman and Myllar Prints, 1508, 1827*; R. Dickson, *Introduction of the Art of Printing into Scotland, 1885*.

Chepping Wycombe, see HIGH WYCOMBE. **Chepstow**, seaport tn. of Monmouthshire on the R. Wye, near its junction with the Severn. The tn. lies on a slope between steep cliffs, and is surrounded by beautiful scenery. It possesses the ruins of a castle which sustained sev. sieges during the Great Rebellion, and in its neighbourhood are the remains of the famous Tintern Abbey. The Wye is crossed near here by Brunel's tubular suspension bridge, and here occur the highest tides in the Brit. Isles, the water sometimes rising 70 ft. above low level. Some shipbuilding is carried on, and the chief exports are timber, iron, coal, cider, and millstones. Pop. 4600.

Cheque, money order on a banker drawn out by a person who has money in the bank, and payable on presentment by the person to whom the C. is written out or by the bearer. The rules with regard to a bill of exchange (q.v.), defined in the Bill of Exchange Act, 1882, are also applicable to Cs. A C. must bear a two-penny stamp, and must be signed by the drawer. Before payment, it must be endorsed on the back by the recipient. It must be presented within a reasonable time. A banker who pays a forged C. cannot debit his customer with the amount. When the amount is fraudulently altered, the banker who pays it can recover from his customer only the amount originally placed thereon. Negligence on the part of the customer causing or giving facilities for fraud may excuse the banker, if it be gross; but merely leaving one's C. book in an unlocked drawer will not *per se* be sufficient for this. Bankers paying on forged endorsements stand on somewhat different footing. A banker who pays in good faith and in the ordinary course of business a C. on himself to order on demand, bearing a forged endorsement, will not be held liable to his customer for the amount (Section 60, Bills of Exchange Act, 1882—a section which protects only bankers). The banker is bound to pay the C. on demand, except in cases when the drawer has previously given notice to him not to pay on his account, or when the drawer has d., or committed an act of bankruptcy. In England Cs. may be crossed in order to

lessen the risk of loss by theft or fraud. A *crossed C.* has two parallel lines drawn across it, in which may be written a particular banker's name, or merely the words '& Co.' In the former case, it is said to be *specially* crossed, and will only be paid through the banker mentioned. When it is *generally* crossed, it is payable only through a bank. If the words 'not negotiable' are added, the person taking the cheque does not have and cannot give a better title to it than that of the person from whom he took it. Cs. are returned, after payment, by the banker to the person who originally drew them, and, as every C. is endorsed with the receiver's name, it is evidence of payment in the absence of a proper receipt.

Chequers, popular name for C. Court, a country mansion and estate in Buckinghamshire, England, the official country residence of Brit. Prime Ministers. The house is situated in a sheltered hollow of the Chiltern Hills at nearly 700 ft. above sea level, and its grounds contain Coombe Hill, 852 ft., one of the highest points in the Chilterns. The estate, which lies near Princes Risborough, is about 38 m. from London, and contains 1500 ac. of farmlands and woods. The nation owes this picturesque and historic mansion to the munificence of Lord Lee of Fareham, who in 1917, when Sir Arthur Lee, M.P., created a trust for the upkeep, staffing, etc., of the house and estate for the use, on his death, of Brit. Premiers. In 1920 he decided not to await that event, and on Jan. 8, 1921, Mr. Lloyd George first occupied the residence. The mansion is Elizabethan, and contains a collection of Cromwell portraits and relics.

Cher: 1. Fr. riv. about 220 m. long, flowing generally N.W., and joining the Loire about 12 m. below Tours. It is navigable from Vierzon. The riv. gives its name (2) to the central dept. of France. The climate of the dept. is temperate; the surface generally level and well wooded; the soil fertile and productive of corn, wine, fruit, hemp, and flax. Horses, sheep, and cattle are reared, and bee-keeping is a popular industry. There are iron and coal mines, and quarries of marble. The chief manufs. are woollen goods, cutlery, porcelain, brick, and glass, but the chief occupation is agriculture. C. is divided into two arrons.: Bourges, Saint-Amand-Mont-Rond. The cap. is Bourges. Area 3770 sq. m. Pop. 286,070.

Cherasco, com. of Cuneo, a S. prov. of Piedmont, N.W. Italy. The prin. industry is silk-weaving. One of the tns. was embroiled in the Napoleonic wars, when its fortifications were razed to the ground by Fr. troops in 1801. Pop. 8700.

Cherbourg, fortified seaport tn. and naval station in the dept. of Manche, France, situated at the head of the peninsula of Cotentin, 85 m. W. of Havre. It has tribunals of the first class, and is the seat of a sub-prefecture. It is the headquarters of one of the five naval arrons. of France, and possesses a lycée and a naval school. Its prin. industry is centred in the works of the dockyard, but there are manufs. of hosiery and lace, chemicals and

leather, as well as sugar and salt refineries, sawing and flour mills. Nothing certain is known of the origin of C., but a common supposition is that it occupies the site of the Rom. station of *Coriatum*, and the name C. was long regarded as a corruption of *Cæsaris Burgus*. The tn. certainly existed in the tenth century. In the eleventh century, under the name of *Carusbur*, it was a favourite resort of the Norman kings of England. In 1686 Vauban planned the harbour works, which were continued under Napoleon I., but not finally completed until 1856, when they were formally inaugurated by Napoleon III. in the presence of Queen Victoria. Thirty years later the gov. expended 49,000,000 francs on the construction of fresh works. The commercial and naval ports are quite distinct from each other. The latter consists of three basins cut out of the rock, 55 ac. in area with a minimum depth of water of 30 ft. Adjoining are dry docks and some of the largest shipbuilding yards in France. The bay is sheltered on the N. by a huge *digue*, or breakwater, 24 m. from the harbour, over 2 m. long, 650 ft. wide at its base, and 30 ft. at its summit. The passages for vessels on the E. and W. of the *digue* are protected by batteries, the chief being Fort National with 100 guns on the Il. de Pelée, and there is a fort in the centre of the breakwater. A series of coast redoubts and large fortifications behind this outer ring of defence renders C. almost impregnable from the sea. In the Second World War the Port Militaire and the Gare Maritime were heavily damaged, and the naval arsenal completely destroyed. The Allies captured C. by a land attack up the Cotentin Peninsula. Amers. entered C. on June 25, 1944. See further under WESTERN FRONT IN SECOND WORLD WAR, *Battle of Normandy*.

Cherbuliez, Charles Victor (1829-99), son of André C. (a well-to-do Genevan bookseller who became prof. of Lat. and of anet. literature at the Genevan Academy), distinguished for his interesting works of fiction. He was b. at Geneva, and studied philosophy, philology, and mathematics, visiting the following places in the course of his studies, viz. Paris, Bonn, and Berlin. He was first a teacher, and afterwards wrote, besides his works of fiction, thoughtful essays on various topics. His novels are a blend of narrative and philosophic reflection, and the amusing, if eccentric, originality of their style appealed to a large class of readers. Some of his most popular novels are *Le Prince Vital* (1864), *Samuel Brohl et Cie* (1877), *Noirs et rouges* (1880); and *Le Secret du précepteur* (1893), most of which appeared in the *Revue des deux Mondes*. He also contributed political and serious articles, such as *L'Art et la nature* and *L'Espagne politique* (1874). His works were very popular in other countries.

Cherchel, see CASAREA.

Cheremisses, Finnish race settled in some parts of E. Russia. It is very exclusive, and is composed of two

different types, some being fair and others being very dark. Its religion is of a mixed character, elements of Christianity being mingled with Mohammedanism.

Cheremkovo, tn. of the Irkutsk region of the R.S.F.S.R. (E. Siberia) in the Cheremkov Basin, a rich coal area. It has a calcium carbide industry. Pop. 66,000.

Cherepovetz, tn. of the Leningrad region of the R.S.F.S.R., with manuf. of agric. implements and boots and shoes. Pop. 25,000.

Cherethites and **Pelethites**, these two tribes formed the royal bodyguard of King David, and were probably Philistines. The Gittites, who were Philistines, were also coupled with these other tribes in serving as a protection to the king. It has been suggested that C. is another form of Carites or Cretans, for it is surmised that the Philistines came from Caphtor, which is identified with Crete. These tribes were particularly loyal to David in all his manifold dangers. Proceeding further along in scripture, the officers of the Carites were instrumental in bringing about Athalia's downfall, and in making Joash king. There is no certain indication of their existence after the first years of the reign of Solomon. (The C. were settled in the Negeb (1 Sam. xxx.). In the R.V. they are called Carites.

Cherhill, a par. in the co. of Wiltshire in England, lying 12 m. S.W. of Swindon. The figure of a horseman is sculptured on one of the slopes of the chalky hills. Pop. 251.

Cheribon, residency possessing a seaport of that name in Java, E. Indies. The dist. is very fertile, having an extensive trade in coffee, cotton, indigo, and teak-wood.

Cherimoyer, or **Cherimolia**, edible fruit of a Peruvian downy-leaved species of Anonaceae closely allied to the custard-apple of the W. Indies. The fruit is obtained from *Anona Cherimolia*, and is much esteemed by the people of the W. parts of S. America. Its cultivation has spread to Central America and to Europe, India, and Africa.

Cherith, Brook of, the brook 'before,' i.e. E. of, the Jordan (1 Kings xvii.). Elijah's hiding-place during the first part of the three years' drought.

Cheriton, par. of E. Kent, England, 3 m. N.W. of Folkestone, of which it may be said to form a suburb. Pop. 6995.

Cherkassy, tn. of Ukrainian S.S.R., in the Kiev region. It is situated on the r. b. of the R. Dnieper, 96 m. S.E. of Kiev. It was an important tn. of the Ukraine, under Polish rule, till 1648, the year of the revolt of Chmielnicki. In 1795 it was annexed by Russia. Agriculture is the chief industry; there are distilleries, and manuf. of sugar and tobacco. Pop. 53,000.

Cherleria, genus of Caryophyllaceae, usually included in *Arenaria*, contains a single species in Britain. This is the cyphel, or *C. redoides* of Linnaeus; the plant is Alpine, and now bears the name *Arenaria C.*

Chermes, or **Kermes** (Arabic *qirmiz*,

a little worm, from Sanskrit *krimi*, a worm), gall-forming genus of insect which causes much damage to forest conifers. The trunk and twigs or leaves of a C.-infested tree appear more or less covered with a white flock, like tufts of cotton. This fine flock consists of threads thrown out by the insects from abdominal glands, with which they cover and protect themselves. The most serious damage is caused by females of *C. abietis* hibernating in young shoots of the spruce and laying eggs; for this process is followed by abnormal growth and the grubs creep into the spaces between the swollen leaf bases and there is then formed a gall like a cone, with needle-tips sticking out from it. This gall is completely closed while the grubs go through their metamorphosis, and the mature insects eat their way out and fly to the larch, where they live and lay eggs on the needles. The death of the twig follows on gall formation and the quality of the timber is always impaired. The colouring matter, kermesic acid, obtained from the dried bodies of these insects, dyes cloth a dark red.

Chernigov: 1. Region of the Ukrainian S.S.R. It covers an area of about 20,233 sq. m. The country is level, but there is higher land near the Dnieper and in the S.W. Agriculture and cattle grazing are two important industries, and there is trade in timber, hemp, flax, tobacco, honey, and wax. Fruit is also grown. Its manufs. are linen, glass, and beet sugar, and the minerals found are saltpetre, iron, slate, and alum. 2. Tn. and an archiepiscopal see in S.W. Russia, cap. of the region of the same name, situated 20 m. from Kiev, near the Desna, a trib. of the Dnieper. Before the Second World War it had extensive factories for the making of candles, soap, bricks, carriages, and cables. The chief trade was in salt, sugar, cereals, stone, and wood. There is some oil production. Interesting excavations were carried on near by between the years 1873 and 1877. Pop. 68,000.

Chernovitsl, see CERNAUTI.

Cherokee, tn., C. co., Iowa, U.S.A., on Little Sioux R., 50 m. from Sioux City. Noted for its medicinal springs. Pop. 7400.

Cherokees (native *Tsalgi*, cave people), tribe of N. Amer. Indians of the Appalachian stock, numbering 25,000. They formerly possessed a large tract of land on either side of the S. Appalachian Mts., which they cultivated as excellent and prosperous farmers. They sided with the Eng. in most of the disputes between the European colonists and with the Royalist party in the revolutionary war. The failure of the Royalist party led to their subjugation by the new republic and the loss of a large part of their ter. The increasing number of white settlers led to disputes with the original owners of the land, and those who had not already moved were driven to their present position in the N.E. corner of Oklahoma, while others live in Tennessee, by Gen. Winfield Scott in 1838. The C. are considered the most civilised

of all N. Amer. Indians. Many of them have become Christians; they have a written alphabet of eighty-five characters invented in 1821 by George (Guass, or Sequoyah, a half-breed. Until 1906, when tribal rule virtually ceased, they had a constitutional gov., consisting of an elected chief, a senate, and a house of representatives, with their cap. at Tablequah.

Cherra Punji, vil. in Assam dist., India, in Khasi Hills. It has the heaviest known ann. rainfall in the world, the average for twenty-five years being nearly 500 in. per annum.

Cherry, name given to various species of the genus *Prunus* of the order Rosaceae and sub-genus *Cerasus*, to which belong the plum apricot, almond, sloe,

and other well-known fruit-bearing trees. The C.-trees differ from the plum-trees very slightly, and there is little to distinguish them from one another beyond the folding of the leaves in the bud—in the C. they are flat, in the plum rolled up. The fruit in both cases is stony and is termed technically a drupe. From early times the C. has been cultivated for its edible fruit, and Lucullus, the epicure, is said to have brought it into Europe. *C.* (or *P.*) *arum*, the wild C., gear, or hedge-berry, and *C. vulgaris* (or *P. Cerasus*), the common dwarf or morello C., are the two species from which all the Brit. varieties are believed to have been derived. The former is a native of W. Asia and the woods of Europe, while the latter acquires a very large size in the woods of Asia Minor. *C. chamæcerasus*, the ground C., a dwarf species, never rising above 3 or 4 ft. high, is common to Lower Austria, Hungary, and Siberia; *C. nigra*, the black Amer. C., is a handsome tree with loose umbels of pinkish flowers; *C. serrulata*, the fine-toothed C., is a native of China, and in our gardens bears double flowers; *C. depressa*, the sand C., grows well in N. America, and in Britain is a handsome, but short-lived bush; *C.*

prostrata, the spreading C. is a small prostrate bush which brightens the rocks of Dalmatia, Candia, and Asia Minor with its pink blossoms; *C. (or P.) Japonica*, the Japan C., is a beautiful plant with double flowers which appear in Great Britain in March. In all the above species of true Cs. the leaves come out later than the flowers, but in the bird Cs. the racemes of flowers appear after or at the same time as the leaves. Of these may be mentioned *C. Mahaleb*, the Mahaleb or perfumed C., a sweet-smelling shrub with a bitter and nauseous fruit; *P. Padus*, the common bird C., a species which grows wild in the woods and hedges of central Europe; *C. virginiana*, the choke C., a large tree with shining deciduous leaves, used in cabinet-making in N. America; *C. Capollim*, the capollim or Mexican bird C., which has a pleasant-smelling fruit, while the bark is reputed to be a valuable febrifuge. The C. laurels are allied to the bird Cs. and true Cs., and are distinguished from them by having evergreen leaves and long racemes of flowers which appear with the leaves. *C. Caroliniana*, the evergreen or Carolina C. laurel, is an ornamental tree with poisonous leaves; *C. Laurocerasus*, the common or broad-leaved C. laurel, is a hardy evergreen much cultivated in Brit. shrubberies and is remarkable for the amount of hydrocyanic acid secreted in its leaves; *C. lusitanica*, the Portugal laurel, a native of Portugal and the Canaries, flourishes in Britain, where it is readily propagated from its abundant fruit.

Cherso, long and narrow is. of Italy in the gulf of Quernero. Sheep are pastured there, and its chief products are wines and fruit. It covers an area of 127 sq. m. About half the pop. live in the chief (cathedral) tn. of C. on the W. side, the chief industries there being fishing and boat-building. Pop. of entire place 8570.

Cherson, see **KHERSON**.

Chersonesus (Gk. Χερσόνησος, a continent is., i.e. a peninsula), anc. name of sev. peninsulas in Europe and Asia, the most important being C. Taurica, or Scythica (Crimea), C. Cimbrica (Jutland), C. Thracia (Gallipoli), C. Aurea (Malay). By the C. Thracia was generally meant by the Athenians. See **CRIMEA**, **GALLIPOLI**, **JUTLAND**, and **MALAY**.

Chert, variety of quartz which occurs in limestone in much the same way as flints occur in chalk, though it occurs in tabular masses rather than in nodules. Its formation is due to what is called concretions; that is to say, silica derived from sponges passed into solution, then filtered down through the calcareous ooze, and was reprecipitated when conditions were suitable for the deposition of the silica and the solution of the limestone. Thus in certain localities in the limestone the calcium carbonate has given place to silica. C. occurs in a variety of colours (grey, white, red, yellow, and brown), is coarser than flint, and is generally more brittle. The coarser varieties are called hornstone.

Chertsey, tn. in Surrey, on the r. b. of the R. Thames, 25 m. W.S.W. of

London. The riv. is crossed here by a seven-arched bridge. C. possesses the remains of a famous abbey, in which Henry VI. was buried, and an endowed charity school. Its chief trade is in malt and flour, and in garden produce for the London market. The poet Cowley d. there and Charles James Fox lived at St. Anne's Hill, a mile away. Pop. 17,000.

Cherubim, plural of the Heb. word cherub (*kérub*). It is very difficult to understand clearly what C. were supposed to be like, as there is such a variety of notions. According to parts of the Scriptures they are imaginary winged animal figures, and there is an especially fine description of them in the passage dealing with the building of the temple of Solomon. They are supposed to represent the guardians of the house of God, and they symbolise His eternal presence. They are also supposed to be the guards of Paradise, and sometimes supposed to be the supernatural steeds upon which the Almighty sets out to deal with mortal affairs. In a poetic theophany (Is. xviii. 10) we see 'upon a cherub' parallel to 'upon the wings of the wind.' From this one might infer that they were sometimes looked upon as a kind of bird or possibly as a stormcloud, gathering with the winds. There have always been conflicting ideas as to what the C. are like, for according to the Revelation of St. John they had four faces. Other myths set out a bird-like form, while another version of them is a winged animal type. Probably this latter conception was derived from the drawings of the winged bulls and lions seen on the anc. Assyrian and Babylonian tombs and houses. If we study the scriptural description of these superhuman beings, we can but notice that the popular idea of a cherub being the winged bodiless head of a young child is utterly without foundation. The only similarity is that these heads are always depicted as coming out of clouds, but the faces never correspond with the old notion that they were spirits of the storm-cloud. At all events the C. are now used to adorn secular places even more than religious houses, for one often sees them in the ceilings of public halls. The meaning of the word is unknown, and may derive from a non-Semitic language.

Cherubini, **Maria Luigi Carlo Zenobio Salvatore** (1760-1842), b. at Florence, the son of a musician at the Pergola Theatre. He began to study composition at the age of nine under the Felici, and after their deaths under Bizzarri and Castrucci. In 1773 he composed a Mass, and by 1778 his growing success as a writer of church music led to his being sent to Venice to study under Sarti, who not only taught him well but gave him minor parts of his own scores to finish. From 1780 for fourteen years dramatic composition occupied C. In 1784 he visited London, and produced *La Finta Principessa* and *Julio Sabino*. In 1788 he produced *Agide in Aside* at Turin, but from 1788 Paris was his home, and he produced there *Démophon*, *Lodoiska*,

Elisa, Médée, Les Deux Journées, Anacréon. In 1806 he produced *Faniska* at the Imperial Theatre, Vienna. In 1815 he composed an overture and a symphony for the Philharmonic Society, London. In 1816 he was made one of the superintendents of the royal chapel, and in 1822 had become director of the Conservatoire. In 1833 he produced his last work for the theatre, *Ali Baba*. Henceforward he devoted himself to church music, and his Requiem in D minor (1836) is one of his finest works. As a composer he is, with Gluck, the chief glory of the Fr. classical music, but as a teacher his influence was harmful in restricting his pupils by the narrow rules of an earlier age. Beethoven greatly admired him, and was influenced by his *Deux Journées* in his opera *Fidelio*, but C. neither understood nor appreciated Beethoven and his intolerance of fixed rules. He said of him, after meeting him in Vienna (1801), 'He was always brusque,' and of his music, 'It makes me sneeze.' Mendelssohn was the only young contemporary whom he openly praised.

Chéruef, Pierre Adolphe (1809-91), Fr. historian, b. at Rouen. He became prof. of hist. at Rouen College and then principal of the normal school in the same place in 1849. In 1866 he was made prof. of hist. at the Strasburg Academy, and in 1874 he occupied the same position in Poitiers. His prin. books are *Dictionnaire historique des institutions, mœurs, et coutumes de la France* (1849); *Histoire de France pendant la minorité de Louis XIV.* (1879-80). He also ed. *Lettres du Cardinal Mazarin pendant son ministère* (1870-91); the memoirs of Saint-Simon (1865); and the memoirs of Mlle de Montpensier (1891).

Cherusci, anct. Ger. tribe occupying the basin of the Weser, N. of the Harz Forest. They were under Rom. rule in 11-9 B.C., and are mentioned by Cæsar. In A.D. 9 Arminius, a prince of the C., revolted and destroyed the Rom. general Quintilius Varus and his army, and in vain Rome tried again to subdue them. Their prestige was wrested from them towards the end of the first century A.D. by their neighbours, the Chatti, and their ter. was later occupied by the Saxons. (Tacitus, *Annals*, i. 2, 11, 12, 13.)

Chervil, name of sev. species of umbelliferous plants, distributed throughout various genera. *Scandix* or *Anthriscus cerefolium* is a little-cultivated annual, a native of S. Europe, with slightly aromatic leaves which are used in soups and salads. *Anthriscus sylvestris* is a common weed found in woods. *Cherophyllum temulentum*, or *temulum*, the rough C., or cow-parsley, is a species occurring wild in the Brit. Isles, and *C. tuberosum*, the turnip-rooted C., is grown for its carrot-like roots which are eaten after the manner of carrots. *S. Pecken-Veneris*, the Venus's comb, or shepherd's needle, is a European plant which bears very large fruit, and their dehiscence is by a powerful jerk.

Cherville, Gaspard Georges Pascew, Marquis de (1821-98); was b. at Chartres.

He was a collaborator of Dumas père, but he wrote independently a number of books on country life and sport. He also wrote *Au village, légendes et croquis rustiques* (1887), and *Les Chiens et les chats* (1888).

Cherwell, River, trib. of the Thames. It rises in the S.W. of Northamptonshire and flows S. for 30 m. through Oxfordshire, joining the main stream at Oxford.

Chesapeake Bay, in Maryland and Virginia, and dividing the former into two parts, is the largest inlet on the E. coast of the U.S.A., extending 200 m., with a width of from 4 to 40 m., from the mouth of the Susquehanna R. southward to Hampton Roads. Its entrance has on its N. side Cape Charles, and on the S., Cape Henry, 12 m. apart. The land on either side of the inlet is greatly indented, and receives the Rs. Susquehanna, Potomac, Rappahannock, and York on the W., and James on the S.W., all navigable rivs. The water is so deep that the largest ships can proceed almost to the mouth of the Susquehanna, and Baltimore is virtually washed by the ocean.

Cheselden, William (1688-1752), b. at Somerby in Leicestershire. He studied anatomy in London under Cowper (1666-1709), and in 1711 himself began to give lectures on the subject. He was elected a fellow of the Royal College of Science in 1712, and pub. a series of interesting papers, one of which recounted the sensations of a boy of fourteen on recovering his sight through the formation of an artificial pupil after being blind from infancy. In 1713 he pub. *Anatomy of the Human Body*, long the standard book on the subject. He was surgeon at the St. Thomas's, St. George's, and Westminster hospitals, and his skill as an operator has seldom been surpassed. The lateral operation for lithotomy as it is now practised was his invention. In 1737 he retired from practice owing to the jealousy of his colleagues, and d. of apoplexy at Bath, 1752. Alexander Pope was one of his intimate friends.

Chesham, mrkt. tn. in Buckinghamshire, England, 26 m. W.N.W. of London, is pleasantly situated in the valley of the R. Chess, and shut in by wooded hills. It manufs. straw-plait, shoes, wooden wares, and paper. The Chess is noted for its watercress and trout-fishing. Pop. of par. 10,500.

Cheshire, co. of England, bounded on the N. by the Irish Sea and the Mersey, and on its other sides by the shires of Lancaster, York, Derby, Stafford, Salop, Flint, Denbigh, and by the estuary of the Dee. Its greatest length from N. to S. is 48 m., breadth from E. to W. 32 m., total area (of land and water) 1027 sq. m., 76 per cent of which is under cultivation. The surface of the co., except on the extreme E. and W. borders, is level, well-wooded, and studded with small lakes or meres. The plain rests on red sandstone, crossed by a ridge some 370 ft. high, running from N. to S. The chief rivs. are the Dee, Mersey, and Weaver, all navigable. In addition there is a splendid system of canals—C. contains the greater

part of the Manchester Ship Canal—and an excellent service of railways. The soil is chiefly clayey or sandy loam with marl and peat, and is very fertile. C. has the finest pasture land in England. The climate is moist and temperate. The land is divided into grazing and dairy dists., which provide the chief occupations. Cereals grow well here, especially oats, but the chief product of the co. is its cheese. Cotton and woollen goods, silk, and lace are manufactured at the tns. near the Lancashire and Yorkshire boundaries. One of the most remarkable products of C. is the rock salt found in mines in the Weaver valley, especially near Northwich, also saline springs from 20 to 40 ft. deep. There are numerous coal mines, and copper and lead are also found. Chester is the cap., and other big tns. are Birkenhead, Macclesfield, Stockport, Congleton, Crewe, Northwich, and Stalybridge. The co. is divided into eight parl. divs., each returning one member. C. contains numerous antiquities: Rom. roads, tumuli, barrows, remains of religious houses, and many old castles and manors. Egbert in 828 added C. to the A.-S. kingdom of Mercia. William the Conqueror made it a co. palatine under Hugh Lupus. Henry VIII. subordinated it to the Eng. crown, but the co. of C. did not send representatives to the Eng. Parliament until 1549. Pop. 1,090,000.

Cheshire Regiment (formerly 22nd Foot). Raised in 1689. Fought under Marshal Schomberg in Ireland and, in 1727, took part in the defence of Gibraltar, and the capture of the Is. of Louisbourg in 1758. Its grenadiers served under Wolfe at the capture of Quebec. Served many years in W. Indies, then participated in the Amer. war of Independence. Under Sir Charles Napier it gained great distinctions in the Scinde war of 1843. Bears honours for S. African war, 1899–1902. During First World War, raised thirty-eight battalions which served in France, Flanders, Gallipoli, Macedonia, Palestine, and Mesopotamia. Received title of C. R. in 1922. In the Second World War the regiment fought in N.W. Europe and Italy. Its badge is the well-known acorn issuing from oak-leaves.

Cheshunt, par. and vil. in Hertfordshire, England. It is situated on the R. Lea, 14 m. N. of London. In 1792 the countess of Huntingdon founded a college here, known as C. Theological College. Historically it is interesting, as Cardinal Wolsey stayed for a time at C. Great House, and Richard Cromwell d. at Pengelly House in 1712. Pop. 15,000.

Chessil Bank, or **Beach** (A.-S. *ceosil*, pebble-bank), curious shingle beach on the coast of Dorset, England. It runs 18 m. S.E. from Abbotsbury, and ends in the so-called isle of Portland. At Portland end the bank is 35 ft. above spring-tide level, and 200 yds. broad. A peculiar fact about it is that the pebbles decrease in size from 1 to 3 in. in diameter at Portland to the size of peas at the W. end.

Cheesme, or **Cesme**, small seaport in

Asiatic Turkey, 40 m. from Izmir (Smyrna) and opposite the Is. of Chios. The Turkish fleet was burned here in 1770 by the Russians under Orlov and the Eng. under Adm. Elphinstone and Sir Samuel Greig. The tn. suffered extensive damage from earthquake in 1881. Pop. 6000.

Chesné, **André du** (1584–1640), Fr. geographer and historiographer to Louis XIII. He was b. in the prov. of Touraine and became famous for his historical and philological learning, which won him the name of 'father of French history.' The work for which he is best known is his valuable collection of the oldest Fr. chroniclers, *Historiæ Francorum Scriptores coetani, ab Gentis Origine usque ad Philippum IV. tempora*, of which he ed. four vols., and his son pub. the fifth after his father's death. He pub. many other historical works, among them a hist. of England.

Chesnelong, **Pierre Charles** (1820–99). Fr. politician. As leader of the Conservative opposition, he brought about the fall of Thiers in 1875. In the General Assembly in the following year, he waged decisive action in Italy in support of the Vatican against the National Monarchy. Promoted the estab. of Catholic univs. in France.

Chesney, **Charles Cornwallis** (1826–76), prof. of military strategy at Sandhurst, and a nephew of the explorer, Francis Rawdon C. He held the position of chairman of Sandhurst in 1861, during which time he acquired fame for his 'Waterloo Lectures' delivered there.

Chesney, **Francis Rawdon** (1789–1872). Eng. general and explorer, was b. in co. Antrim, Ireland. It was his report, drawn up in 1829, on the subject of the isthmus of Suez, that made de Lesseps project his canal scheme. The one great wish of his life was to have an overland route to India via the Euphrates, but the Fr. and Russian opposition was so great that the idea was abandoned. In connection with the scheme, however, he made three separate journeys to prove how far the Euphrates was navigable. He wrote the histories of his expeditions, one of which was *Narrative of the Euphrates Expedition* (1835–37).

Chesney, **Sir George Tomkyns** (1830–95), brother of Charles Cornwallis C. In 1848 he joined the Bengal Engineers, served in the Indian Mutiny, and in 1892 became a general, and entered Parliament as member for Oxford. He wrote sev. novels, *The Private Secretary* (1881), being the best known. He also wrote a highly imaginative description of a supposed invasion of England, entitled *The Battle of Dorking* (1871).

Chess, game played by two persons on a board composed of sixty-four squares, alternating black and white, so placed that a white square is on the right-hand extremity of the board before each player. Thirty-two chessmen are used, sixteen being black and sixteen white. One player takes the black men, the other takes the white, and each arranges his pieces on the board before him as shown in the illustration. Naming them from

the white square on the players right, the pieces in the back line are thus arranged: Queen's rook (the rook is known also as the castle), queen's knight, queen's bishop, queen, king, king's bishop, king's knight, king's rook. The front line is composed entirely of pawns. Considering the back line, it will be seen that each piece is directly opposite to an opposing piece of the same denomination; that queen faces queen and that king faces king. The white queen is on a white square and the black queen on a black square. The object of the game is to force the king of

for the beginner. The king has the power of moving one square from that which he is occupying, so long as the move does not expose him to capture by any of the enemy's pieces. Neither the king nor any other piece may move to a square which is already occupied by a piece of its own colour. Thus from his own square the king could move to Q square, Q 2, K 2, K B 2, and K B square, but no further by one move. The queen may move any distance in a straight line, either laterally or diagonally, but neither queen, rook, nor bishop may pass over an intervening

CHESSBOARD AND CHESSMEN

the adverse party into such a situation that he can neither move nor remain without the danger of being taken by some other piece; for the law of the game, as will be seen later, does not allow of his being actually captured, but only threatened, and he must then remove, if possible, out of danger. If he cannot, the game is lost. From the accompanying diagram, the names of the various squares on the board may be seen. That in front of the queen's rook is known as the queen's rook's second square. Two squares in front of the queen's rook is the queen's rook's third square. Similarly Q R 4 signifies the queen's rook's fourth square, etc. The pawns are known from the piece before which they stand. Thus, in front of the queen's rook is the queen's rook's pawn, in front of the king's knight is the king's knight's pawn, and similarly for the other pieces. It is necessary to consider now the ways in which the pieces move, as the complicated nature of these moves forms one of the main difficulties

piece. The rook also can move any distance, but his motion must always be lateral. The bishop, on the contrary, may move any distance diagonally, but may not move laterally. It will thus be noticed that the bishop always remains on squares of the same colour as his own. The white Q B can never be on a white square, and the white K B can never be on a black square. The knight's move is limited in distance and is composed of two short moves, a lateral move of one square followed by a diagonal move of one square. Thus, the Q Kt might move to Q R 3, Q B 3, or Q 2. The knight alone has the power of passing over another piece. The 'taking' of an opponent's piece is done by moving one of one's own pieces into the square occupied by one's opponent's piece and removing the latter. The pawn can only move in a forward direction (laterally) whereas all the other pieces may move either forward or backward. Its first move may be two squares or one, i.e. it may move to its

piece's third or fourth square, but after this first move it can only move forward one square at a time. Whereas it moves laterally, it can take diagonally alone. Thus, a pawn on Q 4 may take pieces on Q B 5 and K 5, but is stopped by a piece on Q 5. If a player succeeds in getting one of his pawns into a square occupied at the beginning of the game by one of his adversary's back line, he may exchange it for any piece except a king, either a queen, rook, bishop, or knight, so that he may possibly have two queens on the board at

each game, the privilege of *castling*, yet remains to be mentioned. The operation consists of a double move performed in conjunction with either the king's rook or the queen's rook, and counts as an ordinary move. In the first case K moves to K Kt sq., and K R moves to K B sq. In the second K moves to Q B sq., while Q R moves to Q sq. This move is only allowed if neither the king nor the rook has yet been moved, and it is further necessary that no piece should intervene between the two, that no square passed

NUMERICAL POSITIONS OF A CHESS-BOARD

once. A king, as has been said, cannot be taken. When another piece attacks him and he is in such a position that he might be taken at his adversary's next move, he is said to be *in check*, and a player putting his adversary's king in such a position says 'Check' on doing so. A player whose king is in check must do one of three things at his next move. He must move out of check, or interpose another piece so as to shield the king, or take the checking piece. When he can do none of these things he is said to be *checkmated*. 'Checkmate' is called, and the game is over. Should a player be in such a position that he can move none of his pieces without putting his king in check, but yet his king is not in check at the moment, the game is drawn, the result being given as a *stalemate*. A drawn game also results through neither player being able to checkmate the other. An important privilege allowed to the king, once in

over should be commanded by one of the enemy's pieces, and that the king should not be in check. Note must also be made of a particular method of taking by the pawn known as *taking en passant*. It may occur when a white pawn is on a fifth square, say K B 5. If, then, the black K Kt pawn makes its initial move of two squares (*i.e.* to K Kt 4 or K 4), it may be taken *en passant* by the white pawn on K B 5, the white pawn moving to K Kt 3 or K 3 as the case may be. A *gambit* is a method often used to secure an opening for attack. By it a pawn or piece, usually a pawn, is sacrificed in order to enable a piece to secure a better position. There are various gambits, such as king's gambit, queen's gambit, etc., to each of which there is a recognised defence. The various methods of opening a game of C. may soon be learnt. White generally makes the first move, and so it is usual for the players to draw for colours. The

commonest first move is that of the king's pawn to K 4. The commonest second move is that of K Kt to K B 3, and these two form an excellent opening for beginners. Sometimes the stronger player gives odds to the weaker player to make the game more even. It may consist of the removal of any piece from the stronger player's ranks according to the odds to be given. If a pawn be given, it is almost invariably the king's bishop's pawn. It is not necessary to go into further detail as to the method of playing C., as there are many valuable handbooks to which reference may be made. On account of the interest derived from the infinite variety of its combinations, and from success depending entirely upon skill wholly independent of chance, it has become a favourite game among the educated persons of all nations, and in the course of centuries a vast literature has gathered round it.

History.—The game is of the greatest antiquity, and much dispute has arisen as to the country whence it first took its rise. The game was not known to the ancients, Greeks or Romans. A distinct balance of historical tradition inclines to Hindustan. Here it has been known immemorially under the name of *chaturanga* (from *chatur*, four, and *anga*, a part or member), that is, the four *angas*, or members of an army, which are said in the *Amara-kosha* to be elephants, horses, chariots, and foot soldiers. As applicable to real armies, the term *chaturanga* is often used by the epic poets of India. In a Sanskrit MS., *Bhavishya Purana*, is given a description of a four-handed game of C. played with dice, and some historians consider this to be the most ancient form of the game. But it is not shown precisely how the four armies commanded by four kings in the above MS. became converted into two opposing armies (see on this Van der Linde, *Geschichte und Literatur des Schachspiels* (Berlin, 1874). From India the game passed into Persia and became known there by the name of *shatranj*. The game passed from the Persians to the Arabians after they took possession of Persia in the seventh century, and from them, directly or indirectly, it is conjectured that it came to Spain and other parts of Europe, perhaps about the eleventh century. It was known to the cultured classes throughout Europe by the time of the Crusades. The original method of play differed widely from the present one, the development of the game continuing until the sixteenth century, when castling, the latest addition, was introduced. The first book printed in England was *The Game and Playe of the Chesse*, issued by Wm. Caxton in 1475, and this fact shows the popularity of the game. The most masterly treatises on C. begin in the sixteenth century with the Portuguese Damiano, whose work is, however, distinctly inferior to the treatise by Ruy Lopez, a Sp. cleric, pub. at Alcalá in 1561. By the end of this century, the chief home of the game had shifted to Italy, where the city of Venice had the pre-eminence. Among the chess-

masters of this period may be named Salvio, Greco, and Polerio. The seventeenth century is comparatively unimportant, but the eighteenth century saw a great revival in the study of C. In the N. of Europe the name of Philidor stands alone, and in the S. the names of Ercole del Rio, Lolli, and Ponziani deserve mention. In the nineteenth century England became the supreme chess-country, and Howard Staunton was generally recognised as the world's greatest player. A greater genius, however, Paul Morphy (1837–1884) by name, arose in America, and defeated the strongest players of Europe. He never actually encountered Staunton, who evaded his challenges, but after Morphy had retired from the game, Staunton was defeated by Anderssen, who was in turn succeeded as champion by Steinitz. Anderssen belonged to the older school, advocating combinative methods, and Steinitz, who has had great influence on modern theory, believed in positional methods. In 1894 he was defeated by the third Ger. champion, Emanuel Lasker, who held the title for twenty-seven years. A long projected match between him and Capablanca, the Cuban chess genius, eventually took place in 1920, and Lasker resigned after losing four games and drawing ten. Since that date C. has been dominated by the personalities of Capablanca (b. 1888) (*q.v.*) and the Russian, Alekhine (b. 1892) (*q.v.*). In 1927 Alekhine challenged Capablanca to defend his title, and after a match of thirty-four games Alekhine won six, Capablanca three and twenty-five were drawn. In 1934 Alekhine defeated Bogoljubow, winning eight, losing three, and drawing fifteen. Max Euwe became champion in 1935, beating Alekhine, 15½–14½ points, but in 1937 Alekhine beat Euwe 17½–12½ points. Lasker, however, excelled in tournament play and defeated both Alekhine and Capablanca at a tournament in New York. It is ruled that the title goes to the player who wins the greatest number of games, provided that the number won is not less than six. During his championship Capablanca proposed enlarging the board and adding two new pieces, the 'Chancellor' and the 'Marshal', with the idea of avoiding drawn games, so recurrent in championship matches, but his proposals have not been adopted. International C. is governed by the Fédération Internationale des Échecs, which held its first tournament at Budapest in 1926. Ann. Eng. championships are held by the Brit. Chess Federation, founded 1904.

See J. R. Capablanca, *Chess Fundamentals*, 1922; A. Alekhine, *My Hundred Best Games of Chess*, 1927; *Practical Chess Players' Hand Book*, 1928; M. Euwe, *Strategy and Tactics in Chess*, 1937; G. Abrahams, *Teach Yourself Chess*, 1948.

Chest, or **Thorax**, anatomical term for the uppermost section of the trunk, or that part of the body which is above the abdomen and below the neck. It contains the heart and lungs, the great arteries and veins, the windpipe and its

branches, the gullet and the thoracic duct, and is conical in shape, with rounded sides which are flattened at front and back. (For the organs of the chest, see the diagram accompanying article on ABDOMEN.) The upper end is small, slopes downwards and forwards, and contains the gullet and windpipe, and those arteries and veins leading from and to the heart through the neck, together with certain nerves. The lower end is larger, slopes downwards and backwards, and is enclosed by the diaphragm, which is convex when viewed from above, and which separates the C. from the abdomen. Muscles radiate from this diaphragm to the body wall, and in respiration, by the contraction of these muscles and the consequent flattening of the diaphragm, together with the action of the layer of muscles covering the C., which draw the ribs upwards and outwards, the cavity of the C. is enlarged. The C. is constructed of twelve pairs of ribs starting from the vertebral or spinal column, together with the *breastbone*, the *diaphragm*, and the *intercostal muscles*. Since the C. contains the heart and lungs, two of the three vital organs of the body, the other being the brain, it is the seat of a large number of the diseases of the human system. The common diseases of the C., such as pneumonia, pleurisy, consumption, etc., are really diseases of the lungs and air tubes. Tight lacing and rickets, which cause alterations in the form of the C., often cause C. diseases. See HEART, MAN, SKELETON, ANATOMY, PHYSIOLOGY, etc.

Chest, large box made of wood or iron with a hinged lid, used as a receptacle for treasure, records, or linen, etc. It is of very ant. origin, being one of the oldest pieces of household furniture. In the old days Cs. were sometimes covered with leather and often very much ornamented. They were frequently transferred from place to place as personal luggage. Cs. are now often found in churches for the reception of vestments, plate, and par. records, etc., equivalent to being modern safes or strong-boxes. *Coffer* (O.F. *cofre*; Low Lat. *cofrum*) is a C. or box for money or valuables, and the word was used as a synonym for treasury (cf. 'Comes to the privy coffer of the State,' *Merchant of Venice*).

Chester, episcopal city, parl. and co. bor. and the administrative and geographical cap. of the co. of Cheshire, England, on the r. b. of the Dee, 16 m. S.E. of Liverpool. It is an important shopping and residential centre to which has been added the development of progressive specialised light industries such as the manuf. of electrical switch-gear and metal window frames, aided by the fact that it is an important road and rail centre.

It is almost 2,000 years ago since the 20th Rom. Legion chose as the site for its fortress a low sandstone hill at the head of the estuary of the R. Dee and called it after the riv.—*Deva*; this was the beginning of C. In late Saxon times, it was a place of consequence with its

own mint and royal palace, and not until six years after the battle of Hastings did it submit to Norman rule. The early Middle Ages were perhaps the time of C.'s greatest glory; its port had by then become the centre for the trade with Ireland, and the city itself was the base for many a warlike royal expedition into Wales. In 1237, on the death of the last of the Norman earls, the earldom was taken into the hands of the Crown and has since always been one of the titles of the eldest son of the king—Prince of Wales and earl of Chester. King Richard II. held the city in especial esteem,

John H. Stone

GOD'S PROVIDENCE HOUSE, CHESTER

elevating the earldom to the dignity of a principality. By the fifteenth century the sitting up of the R. Dee had begun to interfere with traffic to the harbour and in time it gradually strangled the seaborne trade of C. The city has possessed sheriffs since the time of the Norman earls and mayors since 1238. Its constitution was confirmed by the great charter of Henry VII. in 1506, the city being constituted a co. of itself. The mayor is by virtue of his office admiral of the Dee (a relic of C.'s former maritime greatness).

C.'s most distinctive architectural feature is its rows. These consist of a double tier of shops, one at ground level and the other at first-floor level, each provided with a footway, the upper one being set back and covered by the second storeys of the buildings. The first historical reference to the rows occur in the early fourteenth century. C.

is the only city in England which still possesses its walls perfect in their entire circuit of two miles. Built originally by the Romans in the first century A.D., and later extended, they still contain substantial portions of Roman work. The old gateways have been rebuilt but some of the towers still remain. There are many picturesque timber-framed houses, notably Bishop Lloyd's House (early seventeenth century), God's Providence House (built 1652 and reconstructed 1862), Leche House (sixteenth century), Stanley Palace (1591) in Watergate Street, the 'Bear and Billet' (seventeenth century), Tudor House (seventeenth century), and the Falcon Café (1626) in Lower Bridge Street.

The cathedral, which up to the time of Henry VIII. was a Benedictine abbey, dates from 1053. Built in a combination of every style from Norman to Late Perpendicular, it was restored in 1876. In a comparatively modern set of corbels on the walls of its S. transept are included the old story of Alexander and the griffins, besides caricatures of Disraeli, represented as the Brit. lion defending the Crown against Dr. Kencaly, and Gladstone with daggers and lion's body, in the act of overthrowing the Irish Church. Also noteworthy are the churches of St. John the Baptist (traditionally said to have been founded by King Ethelred in A.D. 689 and perhaps more probably by Earl Ethelred in 901); St. Mary-on-the-Hill (belonging mainly to the fifteenth and sixteenth centuries); and St. Peter (a church has occupied this site since A.D. 907). The chief modern buildings are the tn. hall (1869); Grosvenor Museum and School of Art, built at the suggestion of Charles Kingsley, who was then canon of C., and the King's School, founded by Henry VIII. (1541) and reorganised as a public school in 1873. Roodee Common (69 ac.) is the scene of the ann. race meeting in May. *The city returns one member to Parliament. Pop. 47,500.

Chester, city in Delaware co., Pennsylvania, U.S.A., and 15 m. from Philadelphia. The Pennsylvania Military College and the Crozier Theological Seminary are both estab. here. It has large shipyards, boiler and engine works, factories and foundries, etc. Pop. 59,000.

Chester, Earl of, see BLUNDEVILLE, RANDOLPH DE.

Chesterfield, mrkt. tn. and municipal bor. in Derbyshire, 24 m. N.N.E. of Derby, on the R. Rother, and a canal connecting it with the Trent. It has manufs. of cottons, silk, lace, hosiery, earthenware, and machinery. In the neighbourhood are iron, coal, and lead mines. Pop. 64,000.

Chesterfield House. Mayfair mansion at the junction of S. Audley and Curzon Streets, London, W. It was built in 1750 by Isaac Ware for the fourth earl of Chesterfield, and, after the latter's death, was held by the Chesterfield family until 1850. Purchased in 1910 by Viscount Lascelles (later earl of Harewood) who left it in 1931.

Chesterfield (Earls), title borne by the

family of Stanhope, later Scudamore-Stanhope. In 1883 the direct line failed, and Henry E. Scudamore-Stanhope became the ninth earl. The earl's eldest son is styled Viscount Porchester.

Chesterfield, **Phillip Dormer Stanhope**, fourth Earl of (1694-1773), statesman, courtier, and letter-writer, eldest son of the third earl. Went to Trinity College, Cambridge. In his youth was in the household of the Prince of Wales (afterwards George II.). He succeeded to the earldom in 1726, and two years later went as ambas. to The Hague, where he remained until 1732. He had formed an intimacy with Mlle du Bouchet, by whom he had a son, but the connection did not endure, and in 1733 he married the daughter of the duchess of Kendal. Soon after he became the recognised leader of the opposition in the House of Lords, and subsequently held important ministerial and diplomatic appointments. Nowadays, however, he bulks more largely on the public mind because of his connection with letters. He was a friend and correspondent of Voltaire, and at one time offered to befriend Johnson, who in 1747 addressed to him the 'plan' of his dictionary. C. thought no more of Johnson until the pub. of that work was announced seven years later, when he wrote in the *World* about it, a belated attention which the lexicographer resented. 'The notice which you have been pleased to take of my labours, had it been early, had been kind; but it has been delayed until I am indifferent and cannot enjoy it; till I am solitary, and cannot impart it; till I am known, and do not want it.' So Johnson wrote to him, and the letter has been universally acknowledged as a masterpiece of indignant rebuke. C.'s fame rests mainly upon the letters to his natural son, in which he, the most elegant of mankind, endeavoured to teach his son the art of being agreeable in society. He preached the graces rather than the morals, and it was the cross of his life that the recipient of his worldly sermons was in no way improved by them. These letters were pub. by his son's widow, Eugenia Stanhope, in 1774, and were included in Lord Mahon's *Letters of Philip Dormer Stanhope, Earl of Chesterfield* (1845-53). See W. Ernst, *Memoirs of the Life of Philip Dormer, fourth Earl of Chesterfield*, 1893; S. Shellabarger, *Lord Chesterfield*, 1935.

Chester-le-Street, mrkt. tn. in the co. of Durham, 6 m. N. of Durham city. Its par. church of St. Mary and St. Cuthbert was formerly collegiate, and the vil., situated on the anct. Karmine Street, was the seat of the bishop of Bernicia from 883 to 995, under the name of Cunceastre. In its neighbourhood are Lambton, Lumley, and Ravensworth Castles. Collieries and iron works are numerous. Pop. 17,000.

Chester Plays, see under MIRACLE PLAY, MORALITY.

Chesterton: 1. Par. and vil. in Cambridgeshire on the N. bank of the R. Cam, 1 m. from Cambridge, and forming

a suburb. Pop. 12,000. 2. Par. and vil. in Staffordshire, 2 m. from Newcastle-under-Lyme, noted chiefly for its extensive colliery and iron works. Pop. 10,000.

Chesterton, Cecil Edward (1879-1918), Eng. journalist and author, *b.* in London, Nov. 12, brother of G. K. Chesterton (*q.v.*). Educated at St. Paul's School. His first book, *Gladstonian Ghosts* (1905), was directed against traditional liberalism. In 1910 appeared *Party and the People* and *Nell Gwynne* in 1911; and in the latter year, in collaboration with Hilaire Belloc (*q.v.*), he wrote *The Party System*. On executive of Fabian Society, 1905-7; first secretary of Anti-Puritan League, 1907. Sub-editor of *Eye Witness* (afterwards *New Witness*), 1911-1912; then editor. Became a Rom. Catholic 1912. His persistent criticism of the circumstances connected with a contract between the gov. and the Marconi Wireless Telegraph Company led to the House of Commons appointing a committee of inquiry, and he was fined for criminal libel. In the war period, before he joined the colours, he pub. *The Prussian hath said in his Heart*—(1914) and *The Perils of Peace* (1916). He d. in a military hospital in Boulogne.

Chesterton, Gilbert Keith (1874-1936), Eng. journalist and author, *b.* at Campden Hill, Kensington, May 29, educated at St. Paul's School until 1891, and then entered the Slade School to study art. He soon began literary work, however, at first reviewing art books for the *Bookman* and the *Speaker*, and working in a publisher's office. He definitely took up literature as a career in 1900, and contributed largely to the *Daily News*, the *Pall Mall Magazine*, *Black and White*, *Daily Herald*, the *World*, the *Clarion*, the *English Illustrated Magazine*, the *Bystander*, the *Fortnightly* and the *Independent* reviews, and the *Illustrated London News*. It was his *Browning* in the Eng. Men of Letters series that first gave him a place among the critics. With *The Napoleon of Notting Hill* (1904) he began the fantastic romances which, together with the 'Father Brown' detective stories, captured the larger public. A Saturday column in the *Daily News* stung the party liberals through a decade. For thirty years he wrote the Notebook page of the *Illustrated London News*—an astonishing feat for the most anarchic of journalists. Prose and verse flowed unceasingly from his pen. In 1901 he married Frances Blogg. He is popularly regarded as merely a fountain of brilliant paradox, but that is a very superficial reading of him. Largely influenced by his friend Hilaire Belloc, he gradually discarded, or became aware of his innate mistrust of, all ideas of evolutionary development—which appeared to him to involve a mechanistic conception of mankind. The student of his analyses of social nuisances will be struck by his way of finding the whole source of the mischief in the wickedness of somebody's heart, and by his seeming inability to go farther than deliver an

eloquent and indignant pronouncement of blame upon some person or persons. This line of thought could have but one issue—C.'s reception into the Church of Rome was announced in Aug. 1922.

Being, like all good Catholics, rigidly logical, C. applied the same principle in his positive politics. Regarding the conscious will as the cause of all action, he saw no reason why a past state of affairs should not be resuscitated anywhere if desirable. So he was president of the Distributist League, of which *G.K.'s Weekly* was (more or less) the organ. Distributism (*q.v.*) is a term invented by Belloc (*q.v.*) to connote a revolt against Capitalism in the direction opposite to Socialism. It was C.'s view that it would strengthen the 'small man,' discourage 'big business,' and endeavour to re-localise the population.

Among his books are *The Wild Knight and other Poems* (1900), *The Defendant* (1902), *Twelve Types* (1902), *G. F. Watts* (1904), *The Club of Queer Trades* (1905), *Dickens* (1906), *Orthodoxy* (1908), *George Bernard Shaw* (1909), *The Innocence of Father Brown* (1911), *The Victorian Age in English Literature* (1913), *The Flying Inn* (1914), *The Wisdom of Father Brown* (1914), *Poems* (1915), *A Short History of England* (1917), *Irish Impressions* (1918), *The Uses of Diversity* (1921), *Eugenics and other Evils* (1922), *What I saw in America* (1922), *St. Francis of Assisi* (1923), *William Cobbett* (1925), *The Return of Don Quixote* (1927), *Generally Speaking* (1928), *Catholic Essays* (1929), *Chaucer* (1932), *The Scandal of Father Brown* (1935), *Autobiography* (1936) *The Paradoxes of Mr. Pond* (1937).

See E. Cammaerts, *The Laughing Prophet*, 1937; Missis Ward, *G. K. Chesterton*, 1944; H. Kenner, *Paradox in Chesterton*, 1948.

Chesters, residence near Chollerford, Northumberland, England. It is in the midst of a part containing a section of the Rom. wall and remains of the Rom. station of Cilurnum. Much excavation work has been carried out and a fine collection of Rom. remains is housed in the museum in the park.

Chestnut, or **Castanea**, genus of Fagaceae known to the N. hemisphere and cultivated for the handsome appearance of the species and the economic value of the fruit. *C. sativa*, or *vulgaris*, the Sp. or European C., helps to form dense forests, and the fruit consists of two or three nuts enclosed in a prickly burr; the bark is used in tanning, and the wood is made into furniture and palings. The fruit, called the sweet C., forms a common article of diet in Europe in its raw state, when roasted, or when ground into flour. As confectionery they are candied, and receive the name of *marrons glacés*; the starchy matter contained in them makes them of great value as a food. The horse C., or *Aesculus Hippocastanum*, differs in most important botanical points from the sweet C.; it is a species of *Illicacastanaceae* which is cultivated for its stately appearance, and the fruit is a loathly capsule resembling the sweet C. only in

being prickly. The specific name was given to the plant on account of the marks of the leaf-scar which seem like a miniature horse-shoe. The Australian *C.*, or *Castanospermum australe*, is a leguminous plant which is the only species in the genus; its outward appearance is unlike *Castanea*, but the roasted seeds taste like those of the sweet *C.*

CHESTNUT

Chetham, Humphrey (1580-1653), b. at Crumpeall Hall, Manchester. He was in turn a merchant, a private banker, and a cloth manufacturer in Manchester. He amassed a considerable amount of money, £7,000 of which he left for the foundation of a hospital for forty poor boys. This was opened in 1656, and the number of boys now cared for has greatly increased. With a further £1000 and the residue of his property he founded a library, now containing over 100,000 vols.

Chettie, Henry (c. 1560-c. 1607), dramatist and pamphleteer, son of Robert C., a dyer of London. In 1577 he bound himself as apprentice to a stationer. In 1592 he pub. *Green's Groat's-worth of Wit*. He found it necessary to repudiate any share in the pamphlet in his *Kind hart's dream* (1593), and to apologise to three persons who were abused in it, of whom Shakespeare is supposed to be one. In 1595 he pub. *Piers Plainnes seaven yerres prentiship*, and between then and 1603 he wrote, or collaborated in, over forty plays. Meres speaks of C. in his *Palladis Tamia* as 'one of the best for Comedy.' His pecuniary difficulties were constant, and are sev. times referred to by Henslowe in his *Diary*. Of C.'s own plays only *The Tragedy of Hoffman* was printed (1631). For *Troyes Revenge* and the tragedy of *Palaeeme* Henslowe paid him 'fiftye shillings.' In *The Pleasant Comedie of Patient Griswilt* (1603) he collaborated with Dekker and Haughton, and in *The Death of Iobert, Earle of Huntingdon* (1601), with Munday. In 1603 he pub. *England's mourning garment*,

an elegy of Queen Elizabeth, in which he alludes to contemporary poets. See H. Jenkins, *The Life and Work of Henry Chettle*, 1934.

Chetwode, Sir Philip Walhouse, first Baron (b. 1869). Brit. soldier. Educated at Eton. Entered 19th Hussars (from militia), in 1889. Colonel 1911, major-general 1916, lieutenant-general 1919, general 1926. Fought in the Burma campaign 1892-93, and in the S. African war 1899-1902. In the First World War he commanded the 5th Cavalry Brigade in 1914-15, the 2nd Cavalry Div. in 1915-16, the desert column and canal defences, Egypt, 1916-17, and finally the 20th Army Corps 1917-18, which captured Jerusalem. Mentioned in dispatches eleven times. After the First World War he was military secretary to the secretary of state for war 1919-20, deputy chief of the Imperial General Staff 1920-22, adjutant-general to the forces 1922-23, general officer commanding-in-chief Aldershot Command 1923-27, chief of the General Staff, India, 1928, commander-in-chief in India 1930-35, field marshal 1933, constable of the royal palace and the fortress of London 1933.

Chetwood, Knightly (1650-1720), Eng. divine and writer, b. at Coventry, became dean of Gloucester about 1707. He contributed a life of Lycurgus to the trans. of Plutarch's *Lives* pub. in 1683, and wrote the life of Virgil and the preface to the *Pastorals* in Dryden's trans. of Virgil (1697). And sev. biographies, essays, trans., sermons, and poems.

Chetwood, William Rufus (d. 1766), an Eng. dramatist and critic. He was for many years a bookseller in Covent Garden, and later became a prompter at Drury Lane Theatre. His works include *The Stock Jobbers and South Sea* (1720); *The Lovers' Opera* (1729); *The Generous Freeman* (1731); and *A General History of the Stage* (1749).

Cheval de Frise, or *Chevaux de Frise* (Fr. *cheval*, a horse; *de Frise*, of Friesland), in fortification, an obstacle consisting of pieces of timber traversed with iron spikes, five or six feet long and pointing outwards, used to close a breach or defend a narrow passage against the advance of cavalry. It was first used in the Dutch war of Independence at the siege of Grouningen in anct. Friesland.

Chevalier, formerly a horseman, or a knight; it is also an honorary title used by the younger sons of a Fr. noble family. The name is still in use among members of certain foreign orders, such as Chevalier of the Legion of Honour. Prince Charles Edward was known as the 'Young Chevalier.'

Chevalier, Albert (1861-1923). Eng. coxter comedian and music-hall artist, b. in London, the son of a Fr. master at Kensington Grammar School. In 1877 he acted in *An Unequal Match* at the Prince of Wales's Theatre, taking the name of Knight, and later he was associated with John Hare. In 1891 he introduced his famous coxter comedian sketches and songs at the Pavilion Music

Hall. He wrote many plays, sketches, and monologues; and one of the former, *Tommy Dodd*, was produced in 1898 at the Globe Theatre. In his later years he frequently gave entertainments consisting of items from his former 'turns.' His last public appearance was in Nov. 1922, in *My Old Dutch*, by himself and Arthur Shirley. He d. at his house at Woodberry Down, near Stoke Newington, July 10.

Chevalier, Michel (1806-79), eminent Fr. economist and statesman, b. at Limoges. In his early days he trained as an engineer, but in 1829 he joined the Socialist school of Saint-Simon. He became the editor of the *Globe*, the organ of the Saint-Simonians, and in 1832 he was arrested, and sentenced to a year's imprisonment on account of certain articles which had been pub. He was released after six months, and sent by Thiers to America to inquire into the railway and water systems there. Later he went on an economic expedition to England, which resulted in the pub. of his *Des intérêts matériels de la France* (1838). In 1840 he was made prof. of political economy at the Collège de France. In 1851 he pub. an important book advocating free trade; and he, with Richard Cobden, played an important part in securing the commercial treaty between France and England, 1860. The same year he was created member of the Senate, and for many years took an active part in discussions, until he retired from public life in 1870.

Chevalier de St. George, see STUART, JAMES FRANCIS EDWARD.

Cheviot Hills, range of hills stretching from N.E. to S.W. between England and Scotland, and covering about 35 m. of the border between the two countries. The larger part of the range is in England, the smaller portion being in Roxburghshire. The highest peak is Cheviot, 2676 ft. The other peaks forming the range are Cairn Hill, 2545 ft., Hedgehope Hill, 2348 ft., Windygale Hill, 2001 ft., Peel Fell, 1964 ft., and Carter Fell, 1815 ft. The range is well covered with grass, and affords excellent pasturage for the flocks which graze on its sides. The S.W. portion of the range consists chiefly of limestone belonging to the carboniferous system, but the highest peaks are of volcanic origin, pointing to the Lower Old Red Sandstone Age. A huge mass of granite pierces these volcanic-formed rocks for about 20 sq. m., forming the highest peak, Cheviot.

Chevreul, Michel Eugène (1786-1889), Fr. chemist, b. at Angers, where his father was a physician. At the age of seventeen he went to Paris, and entered L. N. Vauquelin's college, where he studied with much zeal and success, becoming in time Vauquelin's assistant at the natural hist. museum in the Jardin des Plantes. In 1813 he was made prof. of chem. at the Lycée Charlemagne, and took charge of the Gobelins tapestry works, where he performed his researches on colour contrasts. In 1826 he became a member of the Academy of Sciences, and was elected foreign member of the

Royal Society of London. In 1830 he became director of the natural hist. museum in Paris. In 1886 his hundredth birthday was celebrated with great public rejoicings, and a grand fête given at the museum in his honour. His name is famous for his discoveries of margarine, stearin, and olein, as well as for research work on dyes and soap-making.

Chevron (Fr. *chèvre*, a goat), in architecture a decoration introduced into England in the eleventh century, and consisting of a moulding with a zigzag outline, examples of which are to be found in Canterbury Cathedral and some parts of Durham Cathedral. It is a common decoration in the Zimbabwe ruins, Rhodesia, and in S. Arabia. It is used also on shafts, as in the cloisters of Monreale, near Palermo, in those of St. Paul, outside Rome, and in many Ger. churches. Its first appearance was on the tomb of Agamemnon, at Mycenae. In heraldry C. is one of the ordinaries formed of two bands, joined together at the top, and coming down to the ends of the shield in the form of a pair of compasses. Shields may have one, two, or three Cs., and in some as many as five have been found. It is probably the earliest among the Eng. armorial charges. As badge of rank, see STRIPES AND CHEVRONS.

Chevrotain, or Mouse-deer, of the mammalian ungulate family Tragulidae. The family includes two genera, *Tragulus* and *Doratherium*. The first contains many species of small animals, which have more or less the characteristics and habits of some rodents. They inhabit Asia, the Malay Archipelago, Ceylon, and India. To the second belongs only one species, known as the water C., which comes from Africa.

Chevy Chase, name of a well-known Eng. border ballad. The incidents in the ballad are not founded on historical fact, though it may refer in part to some encounter which took place between its heroes, Percy and Douglas.

Chewing-gum, preparation made from a gum called chicle, which is the production of a Mexican tree of the same species as the india-rubber tree. It is sweetened, and various flavouring substances are added to it. It has become in the U.S.A. a very favourite sweetmeat, which is chewed but not swallowed.

Cheyenne: 1. The cap. tn. of the state of Wyoming, U.S.A., situated near the Laramie Mts. It is a centre of the cattle industry, and coal and iron are found in the vicinity. Here is the State Capitol, the Federal building, and the governor's mansion. Pop. 22,000. 2. A riv. in U.S.A., composed of two branches, which take their rise in Wyoming, and flow N.W. through S. Dakota to join the Missouri, 35 m. N.W. of Pierre. Length of each branch about 350 m.

Cheyennes, N. Amer. Indians, part of the Algonquin family, and separating in the seventeenth century from the Arapahoes, forced a way through many fierce Siouan tribes, and after crossing the R. Missouri, reached the Black Hills of

S. Dakota, from where they passed into Wyoming and Colorado. In 1850 they were numerous in the tracts of land between the Platte and Upper Arkansas Rs., but now they inhabit only the dists. round Montana and Oklahoma.

Cheylesmore, Herbert Francis Eaton, third Baron (1848-1925), Eng. soldier. Entered Grenadier Guards 1867, and reached the rank of major-general. On retirement from the army in 1899, he devoted himself to municipal work, being mayor of Westminster 1905-8 and chairman of the London Co. Council, 1912-13. A skilled marksman, C. was the leading spirit in the foundation of the Bisley ann. meeting. During the First World War he presided over sev. courts martial, including that which condemned to death Karl Loder, the Ger. spy.

Cheyne, George (1671-1743), celebrated Scottish physician who was b. in Aberdeenshire. He first thought of entering the Church, but finally abandoned the scheme and studied medicine under the famous Dr. Pitcairn. He took his M.D. degree in 1700, and practised in London in the winter months and at Bath during the summer. He grew enormously stout, and lived on milk and vegetable diet so as to reduce his size. Pub. many medical treatises.

Cheyne, Thomas Kelly (1841-1915), Eng. theologian and O.T. scholar, b. in London. He was educated at Merchant Taylors' School, and afterwards went to Worcester College, Oxford. Later he went to Gottingen, and studied the Ger. theological methods. At Oxford he won the chancellor's medal for the Eng. essay, and in 1869 became fellow of Balliol College. He was appointed rector of Tendring in Essex in 1881, where he remained until 1885, when he was made prof. of the interpretation of Holy Scripture at Oriel College, Oxford, which post also held a canonry at Rochester. In 1889 he delivered the Bampton lectures at Oxford. He was a member of the O.T. revision company, and joint editor of the *Encyclopaedia Biblica*, 1899-1903. He was also in earlier years editor of the O.T. portion of the *Variorum Bible*, and organised the theological part of the original *Academy*. In 1908 he resigned his post as prof. He was author of many books and lectures, the most important of which are *The Prophecies of Isaiah* (1880-81); *Exposition of Jeremiah and Lamentations* (1883); *Book of Psalms* (1884, 1888); *Job and Solomon* (1887); *Jeremiah, his Life and Times* (1888); *The Hallowing of Criticism* (1888); *Aids to the Devout Study of Criticism* (1892); *Introduction to Isaiah* (1895); *Isaiah* (1897-99); *Jewish Religious Life in Post-Exilic Times* (1898); and *Critica Biblica* (1903).

Cheyne, Sir William Watson (1852-1932), Scottish surgeon and author. He was associated at King's College Hospital in London with Joseph Lister, afterwards Lord Lister, his former teacher at Edinburgh. He went out as consulting surgeon in the S. African war. He was the author of a great number of books on antiseptic surgery; arranged, with Burgard, a *Manual of Surgical Treatment*

(1899-1903), and wrote *Lister and his Achievement* (1925).

Cheyne-Stokes Respiration, breaking up of the ordinary rhythm of breathing into periods of waxing and waning, occurring in affections of the central nervous systems. The breathing increases in depth until it reaches a maximum, becomes shallower again until it ceases altogether, then recommences and gains in depth once more, the cycle being repeated again and again. The cause of the condition is the insensibility of the respiratory centre in the medulla due to meningitis, general paralysis, intoxications, etc. The respiratory centre is only stimulated sufficiently when the blood has become venous; after deep breathing the venous condition is mitigated, so that the breathing becomes shallower and eventually stops until the consequent venosity of the blood starts the cycle afresh. The symptom is obviously dangerous, as exhaustion of the respiratory centre proceeds until no stimulation is possible.

Chhatapur, cap. tn. in C. State, Central India, situated 120 m. S.W. of Cawnpore. The manuf. of cutlery forms the chief industry.

Chhattisgarh, name of one of the dists. in the Central Provs., India, which includes the dists. of Raipur, Bilaspur, and Sambalpur. The total area is 25,013 sq. m. Large quantities of Indian corn are cultivated.

Chhindwara, or **Chindwara**, dist. in the Central Provs., India, with an area of 4630 sq. m. The cap. tn. is C., situated on a plateau rising 2200 ft. above sea level, and 70 m. N.W. of Nagpur. The climate is generally considered healthy.

Chhota Udaipur, state in Rewa Kantha, in Gujarat, Bombay Presidency, India, with an area of about 870 sq. m. The country is hilly, with a thick growth of forest, and the climate in most parts is unhealthy. Chhota Udaipur is the cap.

Chiabrera, Gabriello (1552-1637), It. poet, b. at Savona, and founder of the l'indarie school of poetry. He wrote many odes, lyrics, and *canzonetti*, which are full of mythologic allusions and affectations, the error of the times in which he lived. His best poetry is to be found in the *canzonetti* and *scherzi* written for music. Some of his *canzonetti*, like the anacronies of Ronsard, are most elegant and graceful. Some of his epitaphs have been trans. by Wordsworth. There were eds. of his lyric work pub. in Rome (1718), Venice (1731), Leghorn (1781), and Milan (1807). All the rest of his work has long sunk into oblivion.

Chlachou, see **TSINGTAO**.

Chiamdo, see **CHAMDO**.

Chiana, Val di (in Italy), one of the most fertile spots in Tuscany, situated about 25 m. S. of Arezzo. It possesses a watercourse, partly natural, partly artificial. About the end of the eighteenth century engineering operations were started so that the waters of the R. C. should discharge themselves into the Arno as well as the Tiber, thus helping to drain the valley.

Chianfu, or Kianfu, tn. in Kiangsi prov., China, situated on a trib. of the Kan R.

Chiang Kai-shek (b. 1886). Chinese marshal, b. in Ningpo. Whilst quite a youth he identified himself with the Kuomintang, but it was not until he was thirty-four that he gained a position of prominence by being appointed to the headship of the Whampoa Cadet School. At this period Borodin, the Russian Soviet agent in China, dominated Chinese affairs in an endeavour to model the

of the Military Affairs Commission; but his power again declined in 1933 when Dr. Sun-to, son of Sun Yat-sen, became president of the Yuan (legislative body). C. apparently favoured closer relations with Japan, but Soong, the foreign minister, wanted better relations with Britain and America. But later, as C.'s lectures to the Officers' Training Corps at Kuling in 1934 showed, he cited Japan as the flagrant and inevitable enemy of China and made it his dominating mission

MARSHAL AND MADAME CHIANG KAI-SHEK

country on Soviet lines. When Sun Yat-sen d. in 1925 C. was appointed commander-in-chief, but he was to some extent under Russian influence and the Russian Soviet general, Galen, was his chief of staff. Towards the end of 1925 he waged a successful campaign against Chen Chiung-ming, which led to the formation of the Nationalist Gov. In the following year he set up an administration at Wuchang. His success was due as much to an army of trained agitators who prepared the way for him, as to his skill at arms. His succession of victories and growing prestige stimulated in him a desire to throw off all external restraint and to give his cause a truly Chinese national character; and to this end he cleared the country of his Russian advisers. In 1927, however, he retired, but on the anniversary of the revolution, Oct. 10, 1928, he assumed office as president. In 1931, under the gov. of Lin-Shen, he was made president

in life to unite China—a strange conversion after having spent ten years waging a series of civil wars against his own people. By this time he was commander-in-chief of all the forces of China, president of the National Military Council, president of the National Aviation Commission, 'Tsungtai' or director general of the Kuomintang, and, in fact, as popular leader, in spite of his inconsistent politics, of the rank of Mussolini or Stalin. He is psychologically a strange man—a Christian imbued with a granite-hard puritanism, a disciplinarian who seldom laughs and has no relaxation, a man of infinite patience, calm, stubborn, and secretive. It may be noted that the members of his wife's family, the notable Soongs, are Methodists. There seems to be no doubt that his apparently defeatist attitude of supine submission to Jap. designs in 1932-33 was due really to his longer vision and his realisation of the necessity of uniting China before pursuing his real

end—the expulsion of Japan. He has done more than any other man in China to instill into the Chinese a sense of national unity and to inspire them to fight as a united nation, even if they are repeatedly defeated—for C., like the soul of his country, thinks in terms, not of decades, but of centuries. He became president of the Executive Yuan in 1935 and was president of China from 1943 until 1949. By 1937 C., in sev. hard-fought campaigns, succeeded in unifying China once more under the Kuomintang, and in the Second World War he continued to lead until the defeat of Japan. But thereafter his political fortunes suffered eclipse owing to the maladministration of the Kuomintang Gov. and the incapacity of the Nationalist generals in face of the Communist invasion. Following the loss of Manchuria and Peiping, C. sought peace with the Communists (Jan. 1949) but without success owing to the 'no surrender' attitude of C. and a group of his adherents. See R. Payne (*Chiang Kai-shek: the Generalissimo*, 1948).

Chiangyin, or **Kiangyin**, tn. in the prov. of Kiangsu, China. It stands in a strongly fortified position commanding a narrow part of the Yangtze River, distant 80 m. from Shanghai.

Chianti, group of mts. in Italy, near Siena, belonging to the Apennines. The slopes are occupied by vineyards, olive and mulberry plantations, and a celebrated wine takes its name from it.

Chiaochou, or **Kiaochou**, see TSINGTAO.

Chiapas, Pacific state of Mexico, bounded on the W. side by Vera Cruz and Oaxaca, area 28,700 sq. m. It is mountainous, especially in the N. and S.E., one of the highest peaks being Tacana, 13,940 ft., an active volcano, and another, the Soconusco, 7450 ft. On the E. side stretches an undulating plateau, well wooded, with a plentiful water supply. Agriculture and fruit farming flourish, and stock-raising is an important industry. Cap. is Tuxtla Gutiérrez. Pop. 680,000.

Chiaromonte, tn. of Sicily, situated 30 m. W. of Syracuse; it is noted for its wine trade. Pop. 16,000.

Chiari, tn. of Italy in Lombardy; 14 m. W. of Brescia. In 1701 Prince Eugène of Savoy here defeated the Fr. and Spaniards. There are manufs. of silk and twist. Pop. 13,000.

Chiari, Pietro (1700–88), It. writer, who was b. and d. at Brescia. He started his career as a Jesuit priest, but soon became a writer of plays, of which he produced sixty in twelve years, *Commedie*, pub. in 1756–62, and *Nuova Raccolta* (1762). They are full of absurd intrigues and plots, and abounding in irregular invention.

Chiarini, Giuseppe (1833–1908), It. poet and critic, b. at Arezzo. For some time he was the director of the lyceum at Leghorn, and in 1884 was made director of the Liceo Umberto I. at Rome. His poems are full of charm and tenderness, especially his *In Memoriam* (1875), and *Lacrymæ* (1879), and the influence of Carducci is felt, whose principles he strongly advocated. A complete ed.

of his works was pub. in 1902. The *Studi Shakespeariani* is a collection of his papers on Shakespeare.

Chiaroscuro (Lat. *clarus*, bright, and *obscurus*, dark), in painting, a term used to express the art of reproducing colour in light and in shadow, so that the one is always present in the other. It is C. which gives perfect proportion to a picture, and only the great masters, such as Raphael, Titian, Correggio, and Rembrandt, have attained to it. See also ENGRAVING.

Chialtolite, variety of the mineral andalusite (q.v.), which consists of silicate of alumina. Crystals of C. are long, narrow, and grey or white in colour. When broken across they often exhibit a cruciform pattern, and cut and polished crystals, giving a black cross on a lighter ground, are often worn as amulets by Sp. peasants. This pattern is caused by the fact that the outer portion encloses a darker one of regular geometric form. C. is met with in certain slates altered by the intrusion of igneous rock.

Chiatingfu, or **Kiatingfu**, in Szechwan prov., China, tn. situated on the r. b. of the Min R., where it joins the Tatu R. It is a centre of the silk-weaving industry.

Chiavenna, tn. in Lombardy, Italy, on the Little R. Mera, not far from Lake Como. It commands a view of the famous Splügen and Maloja passes, and is looked upon as one of the keys of N. Italy. The Splügen route runs N. from C. to Coire, and a new road was made by the Austrians in 1819. Celebrated for its breweries, and carries on trade with Switzerland. Pop. 5000.

Chiayukuan, or **Kiayukuan**, tn. of Kansu prov. in China, situated at the W. end of the Great Wall, near Suchow.

Chiba, city of Hondo, Japan, situated on Tokyo Bay, 20 m. E. of Tokyo. Pop. 41,500.

Chibchas, or **Muyscas**, one of the civilised nations of S. America, whose kingdom at the time of the conquest consisted of the plateau of Cundinamarca and some surrounding dists. of Colombia. The nation was divided into two separate states, which were hostile to one another. One was governed by the *cipa*, or king, of Bacatá, and the other by the *zaque*, or lord, of Ramiriqui and Hunsa. Their total pop. amounted to over one million. They now no longer exist, having been overthrown in 1538. Evidence of their great culture is seen in their stone temples, highways, statues, suspension bridges, and their beautiful gold and silver work, also their weaving and dyeing.

Chica, colouring matter of an orange-red shade which is obtained from a native plant (*Bignonia Chica*), and made into a pigment by the Indians of the Upper Orinoco and Rio Negro; it is used by them to adorn their bodies. The name is also used for a beer in S. America.

Chicacole, tn. of India, in the Ganjam dist. of the Madras Presidency, situated on the R. Languliya. It is a holy town of the Muslims of India. It was once famous for muslins, but the industry is no longer carried on. There are sev. old Moslem mosques. Pop. 18,000.

Chicago, cap. of Cook co. in the state of Illinois, U.S.A. It lies on the extreme S.W. shore of Lake Michigan, its lat. being $41^{\circ} 53' N.$ and its long. $87^{\circ} 37' W.$ Its distance W. of New York is about 911 m., and N.W. of Washington about 100 m. less. The city occupies an important position, being a large railway centre, and consequently carrying on an enormous trade with other large places, so that it is now the second city of the U.S.A. The area of C. is about 204 sq. m., and it is built along the shore of Lake Michigan. The land on which it is built

Canadian Pacific

MICHIGAN AVENUE, CHICAGO

is extremely flat, scarcely rising above the level of the lake. The C. R. divides it into dists. known as the N., W., and S. parts, characterised by long, regular, and straight streets. Great improvements have been made to the old city, although some slum dists. remain. Streets have been widened, bridges built, and boulevards constructed; land has been reclaimed from the lake for the formation of new parks, bathing beaches, and lagoons. The business quarter of the city lies in the S., and has a number of fine streets, among the largest and most important being State, Madison, La Salle, Clark, Wabash Avenue, and Dearborn, while Michigan Avenue, Grand Boulevards, Drexel, and Lake Shore Drive are some of the prin. ones in the residential quarter. Here the houses are mostly built with a framework of steel, as in the case of those used as offices, the latter towering up to

tremendous heights, and accommodating at the same time a large number of people. Among the most important buildings in the business quarter may be mentioned the Chamber of Commerce, which is fourteen storeys high. The city hall and court house is a double building, the erection of which cost considerably over \$4,000,000, and close to it is a statue of Columbus. Others of considerable importance are the Board of Trade, a granite building with a tower over 300 ft. high; the Rookery, the Tacoma, the New York Life Insurance Building, and the Illinois Trust and Savings Bank. The new Federal Building, occupying a complete block, is situated quite close to the Great Northern Hotel, the Manhattan, the Monadnock, and the Monon, four immense buildings, while the offices of Marshall Field & Company, the Masonic Temple, and many theatres and concert halls are also worthy of note. In addition to these is the Auditorium, containing a theatre and an hotel, the Art Institute, containing a valuable collection of pictures and other treasures, the public library, the Chicago Historical Society, and the Newberry Library. The Chicago Univ. (q.v.), which dates from 1892, was endowed by John D. Rockefeller and has faculties of science, arts, commerce, and law. It is housed in buildings which occupy 100 ac. of ground in the Midway Plaisance. The univ. has greatly developed in recent years, notably on the medical side. There are also many other educational buildings, including schools of theology, medicine, law, and sev. others. C. is well provided with parks, occupying in all over 8000 ac and connected by means of the boulevards. The chief of these are Lincoln Park at the end of Lake Shore Drive and containing a statue of Lincoln; Washington Park, which is connected with Jackson Park by the Midway Plaisance, the latter park being the site of the World's Columbian Exposition in 1893. The Field Columbian Museum was also situated in this park until its new buildings beside the lake were completed in 1920. Among the W. side parks are Douglas Park, Garfield Park, which possesses a conservatory, Humboldt Park, and Lake Front Park, which joins the business quarter of the tn. There are also many hospitals and institutions of various kinds in this city, the chief one being Cook Co. Hospital; another is the Presbyterian Hospital. The other institutions include Armour Institute, Lewis Institute, Hull House, a social settlement planned on the lines of Toynbee Hall, and many asylums, nurseries, and homes. The water supply of the city is extremely good, owing to the construction of a number of tunnels, the prin. of which extends 4 m. into Lake Michigan, while the sewage of the city is carried by a canal into the Illinois R. This canal, which cost \$75,000,000, was opened in 1900, and connects the C. R. with the Des Plaines R., and finally with the Illinois. C. owes its great advance in commercial activity to its advantageous position. In addition to its being on the Great Lakes, it is in such a position as to be an extremely

good railway centre, and, being served by twenty-seven railway systems, is by this means connected with all parts of the U.S.A. There are also steamship lines with regular services connecting it with other places on the lakes, while in addition it ranks among the largest commercial ports in the world—ships of over 7000 tons being able to enter the harbour—there is, in fact, no other Amer. city, with the exception of New York, that does a larger trade. C.'s retail trade, according to the census of 1929, amounted to \$2,127,520,000 in net sales. The city's foreign trade is mainly by rail through other ports, although vessels of less than 14-ft. draught can reach C. Imports for the fiscal year 1934 amounted to \$29,621,000. Direct exports for the fiscal year 1934 were valued at \$5,500,000. Just N. of the mouth of the C. R., a new pier, 3000 ft. long, was completed in 1915. Ships can also moor in the riv. and its branches. The chief sources of the city's wealth are grain, live-stock, lumber, and meat; as for these products it holds the premier place. The grain, which has reached a total of 300,000,000 bushels per annum, consists chiefly of corn, oats, and barley, and the enormous grain elevators are a feature of the city. The union stock-yards, which are situated in the S.W. part of the city, are also worthy of notice, as they constitute the largest live-stock market in the world, employing as many as 25,000 workers and having accommodation for hundreds of thousands of animals. In these yards the animals are slaughtered, and large quantities of canned meat, glue, butterine, and other products are turned out from them. In addition to this all kinds of manufs. are carried on in C., including iron and steel products, electrical machinery, foundry products, cars, agric. implements, clothing, bread and bakery, and furniture. Printing and publishing are other important industries. Thousands of harvesting machines are made, the two largest firms being the Deering Company and the International Harvester Company, successor to the McCormick Harvesting Machine Company, and the largest manufacturer of agric. machinery in the world. Pullman, situated in the S. of C., is a model tn. built by the Pullman Car Company, and here are the Pullman car works, at which are produced the railway cars known by that name. The Western Electric Company is the largest manufacturer of telephone equipment in the world. There are in all about 1000 manufacturing works in C. The gov. of C. is regulated by a general charter law of 1875, the power being vested in a council elected from the wards. The mayor, who is elected for seven years, is at the head of the council, and has the power of appointing single commissioners to rule the different depts., all of which are under the power of the council. The growth of pop. in C. is remarkable, its increase during the period 1890-1930 being from 503,000 to over 3,000,000. It is now the second largest city in the U.S.A. and the fifth largest in

the world. There is also a large percentage of foreigners in the city, including Bohemians, Gers., Swedes, Norwegians, Poles, Its., and Russians; indeed, in 1910 little over a quarter of the pop. were of Amer. birth and descent. The origin of the name of the city is uncertain, but is said to be derived from Ojibwa *she-kag-onp*, meaning 'wild onion place.' The site was in 1673 visited by Joliet and Marquette, and, after the giving up of a piece of land to the gov. near the end of the next century, Fort Dearborn was built in 1803. In 1812 the Indians massacred the settlers. C. was rebuilt very shortly afterwards, and by the year 1837 had received its charter as a city. In 1871 nearly the whole city was swept by fire, and the loss was tremendous. It was, however, soon restored, and was furnished with buildings of much better construction. In May 1886 occurred the Haymarket riot in which a bomb was thrown among the police force who were trying to put down an anarchist meeting, called owing to troubles in the labour world. Owing to the low number of European immigrants during the years of the First World War, there was a great influx of unskilled Negro labour from the S. Difficulties caused by the return to normal conditions and the bad state of housing combined to cause a serious race riot in 1919, when, on one day, 38 people were killed and 543 injured. From about the same period dates C.'s extraordinary crime wave. C. has never been a city noted for its orderliness, which considering the mixed pop. and the large element of rough characters employed in slaughtering yards, packing mills, etc., is hardly to be expected; but from a time roughly coincidental with the enforcement of prohibition, crime and violence alarmingly increased. Gambling and bootlegging were the two main factors of violence in the city, and enmity between rival gangs led to frequent shootings, the police or any one else inclined to interfere being also shot down. During the First World War C. attracted attention through the anti-war, anti-Brit. attitude of its mayor, Wm. Hale Thompson, who was first elected in 1915. In 1935 C.'s revenues were disorganised as the result of the worst economic depression in the hist. of the city. The full effect of the depression of 1929 struck C. in the period of a general reassessment of real property to remove great inequalities of tax burden, and on Jan. 1, 1934, the gross city debt was \$383,158,000 or \$113 per capita, not a heavy burden if compared with that of New York, but vexatious on account of deficient and disorganised revenue. In May 1934 a fire broke out in the Union stock-yards, and, spreading through forty blocks of the S. side, at one time threatened the whole city. This was the most disastrous fire in C. since that of 1871, the most important meat-packing centre in the U.S.A. being destroyed, the total damage being estimated at \$25,000,000. The land area of C. in 1946 was returned at 132,297 ac. C. is the headquarters of one of the six army areas. In 1920 the

pop. was 2,701,705, in 1930 3,376,438, and in 1940 3,396,808. See E. G. Mason, *Early Chicago and Illinois*, 1890; J. Kirkland, *The Story of Chicago*, 1892-94; E. D. Sullivan, *Look at Chicago*, 1930; E. L. Masters, *The Tale of Chicago*, 1933; F. Mather, *The Making of Illinois* (rev. ed.), 1942.

Chicago Heights, tn. in co. Cook, Illinois, U.S.A., 25 m. S. of Chicago. It has manufs. of chemicals, stoves, boilers, furniture, and pianos. Pop. 22,231.

Chicago River, which runs W. from Lake Michigan, is of great commercial importance, and with regard to its harbour is one of the greatest in the world. It is perhaps the most important of non-tidal rvs. of its length, having about 15 m. of navigable channel.

'**Chicago Tribune**.' This popular Amer. daily paper, which entitles itself 'the world's greatest newspaper,' is one of the greatest financial successes of the newspaper world of to-day. Early in the nineteenth century there existed a tiny paper, *The Gem of the Prairie*, which was later merged into the *Chicago Democrat* founded by John Calhoun in 1833, and from these arose the *Chicago Tribune*. The first issue was pub. on June 10, 1847, only 400 copies being printed, and the early years of the paper were full of financial vicissitudes. On one occasion it became bankrupt, but triumphantly overcame its difficulties and in less than two years paid off all its debts. In 1856 Joseph Medill bought an interest in the *Tribune* with two other purchasers, but it was not until 1874 that he took over the editorship from Horace White, who had been a part proprietor and ed.-in-chief since 1864. Medill's genius raised the paper to a position of power during the many years it was under his control. In 1901 Joseph Medill Patterson, grandson of Joseph Medill, joined the staff of the *Tribune*, while his cousin, Robert Rutherford McCormick, two years later followed him. The united energies and abilities of these two young men were responsible for the rapid rise in circulation of the *Tribune*, and the serious attention they paid to advertising of a reliable and reputable nature soon raised the paper's financial status to great heights. A feature of the paper's foreign policy in the years preceding America's entry into the Second World War was Col. McCormick's isolationist and anti-Brit. attitude.

Chicago, University of, was incorporated in 1892, the foundation being initially endowed by John D. Rockefeller, who acted through the Amer. Baptist Education Society. Subsequent gifts from the founder have exceeded \$30,000,000, and the permanent endowment is now over \$50,000,000. The U. of C. is situated on the Midway Plaisance in Chicago, Illinois, and occupies a number of imposing buildings, among which may be named the Wm. Rainey Harper Memorial Library, a specimen of Eng. Gothic architecture, and named after the first president to whose genius the U. of C. owes its initial success. The Yerkes Observatory at Williams Bay,

Wisconsin, is part of the univ., and Chicago house, Luxor, Egypt, was endowed by John D. Rockefeller, junior, for the furtherance of oriental study. Under the administration of Prof. Judson, who succeeded Harper in 1906, medical research was advanced, and the Rush Medical College became an organic part of the univ. Later, in 1924, a clinical laboratory was built. In addition to the faculties of classical, oriental, and literary studies and of branches of science, there are schools of law, of commerce and administration, and also a graduates school of social service administration. There are summer schools and extension courses, and also a summer quarter session, increasingly popular among graduate students. The U. of C. is open equally to men and women, the total enrolment being over 12,000. There is no religious discrimination among students, but the president, and also a two-thirds proportion of the trustees, are required to be members of the Baptist Church. The number of profs. and instructors is about 600. In 1930, in place of the traditional graduate schools and undergraduate college, a divisional organisation was estab., consisting of the college, four upper divs. in arts and sciences, and the professional schools. See T. W. Goodspeed, *The Story of the University of Chicago*, 1925.

Chichas, S. Amer. people of the Gran Chaco, Argentina, who are not at all similar to the other tribes who dwell in that region, and who are mostly of plundering habits. They have their own settlements, and cultivate the land in the Upper Bermejo dist., where they were known as 'mitinaes,' or Peruvian colonists. They dress in a cloth which they weave themselves from the llama wool, and the Incas are said to have employed them in silver mines.

Chichele, or **Chicheley**, Henry (1364-1443), Eng. archbishop and founder of All Souls' College, Oxford. He was b. at Hingham Ferrers, Northampton, and was the youngest son of Thomas C. He was educated at Winchester, and went to New College, Oxford, in 1387. Three times he went as ambas. to France, and on his return the last time, in 1414, he was made archbishop of Canterbury. The official record of his pontificate, *The Register of Henry Chichele*, ed. by C. F. Jacob, was pub. in 4 vols. (1932).

Chichen, or **Chichenitzá**, ruined city in Yucatán, Mexico, 100 m. S. E. of Merida. At one time it was apparently a place of religious importance, as there are many evidences of early civilisation in the time of the Itzas, a most powerful Maya nation, who were still inhabiting the city at the time of the Sp. conquest. There is a nunnery, a castle, and a central pyramid, the latter being 550 ft. sq., with a height of 70 ft.

Chicherin, Yury Vasilievitch (1872-1936), Russian statesman; was b. in 1872 in the prov. of Karaul Tambov; educated at a higher school and at St. Petersburg Univ., and then entered the archives dept. of the Foreign Office. Left the service in 1904, and went to Berlin,

where he joined the Social Democratic party. Active for many years in the revolutionary movements of England, France, and Germany, he became, in 1907, secretary of the foreign central bureau of the Russian Social Democratic party. In that year he was banished from Prussia in connection with a discovery of falsified passports. In England during the First World War he assisted Russian political refugees. After the Bolshevik rising of Nov. 1917 he was imprisoned in Brixton jail for having enemy associations. In Jan. 1918 he was released and banished, having been exchanged for Sir George Buchanan. In the following March he became temporary commissary for foreign affairs, but proved more permanent than any other foreign minister in Europe. In 1922 he was chief of the Soviet delegation to the conference at Genoa. He spent most of 1929 in Germany, was extruded from the Politburo by the Zinoviev party, and resigned.

Chichester, cathedral city and municipal bor., cap. of W. Sussex, 28 m. W. of Brighton. A city rich in historical associations, it is situated on a plain between the S. Downs and the sea. The name is derived from the Saxon Cissincaester, 'Cissa's Camp,' and called so after a Saxon king who took it in 491. Originally a Rom. station, it was demolished by the S. Saxons towards the end of the fifth century. A wooden cathedral was erected at C. in 1108, and burnt down in 1114. Another cathedral was built on the same site in the twelfth and thirteenth centuries. It represents different periods of architecture, the choir above the arcade and the E. part containing excellent workmanship of the Early Eng. period. The special features of the cathedral lie in its nave with double aisles on each side, a detached campanile or bell-tower, and a number of portraits of the Eng. kings from the time of the Conquest and of many bishops. The spire is 300 ft. high. Sir Gilbert Scott and others undertook the restoration of parts of the building, such as the central tower, a portion of the N.W. tower, and the spire. Early Decorated, Norman, Perpendicular, Early Eng., and Late Norman styles are all in evidence in this cathedral. The tn. itself has a fine market cross, octagonal in structure and belonging to the ornate Perpendicular style. The bishop's palace and cloisters are not far from the cathedral. Other buildings of interest are the church of St. Olave (Rom. workmanship), the Guildhall (formerly a Grey Friars' chapel), the church of St. Andrew (the poet Wm. Collins was buried here), and St. Paul's Church (a fine modern structure). C. has a fine cattle market, and the chief trade is agric. produce and live-stock. Brewing and tanning are also engaged in. There are Rom. remains here. Pop. 15,000.

Chickadee, black-cap titmouse, *Parus atricapillus*, a native of N. America. The name is onomatopoeic, imitating the note of the bird.

Chickahominy, riv. of Virginia, U.S.A.

It is a trib. of the James R., which it joins 22 m. below City Point. In 1862 the battles of Fair Oaks, Mechanicsville, Gaines's Mill, Savage's Station, White Oak Swamp, and in 1861 Cold Harbour, took place near the riv.

Chickamauga Creek, riv. which takes its rise in Walker co., Georgia, U.S.A., and flows into the Tennessee 6 m. above Chattanooga. The Confederates under Bragg defeated the Federals under Rosecrans in Sept. 1863 on the banks of the riv.

Chickasaws, tribe of N. Amer. Indians, allied to the Cherokees. They formerly occupied the N. Mississippi and parts of Alabama, but have since settled in Oklahoma, with autonomous gov. They were a very warlike race, and supported the Eng. against the Fr. At the end of the Civil war, they agreed to liberate their slaves. Of late years they have advanced considerably in culture, and many have received degrees at Amer. univs. The tribe numbers 5000.

Chickasha, or **Chicasaw**, tn., Grady co., Oklahoma, U.S.A., on the Chicago, Rock Is., and Pacific railroad. Its industries include lumber, cotton, and cotton-seed oil. Pop. 14,000.

Chicken, see POULTRY AND POULTRY KEEPING.

Chicken-pox, mild, feverish, and infectious disease, common among children. It can be distinguished by the appearance of small vesicles which may not be very numerous; these seldom become pustular, and dry up and drop off at about the fifth day, leaving very little of the pitting or scarring which follows smallpox. It is not a dangerous disease, the fever not being very high nor lasting. The period of infection ends when all the scabs have disappeared, and when the person affected has had an antiseptic bath. A theory of C. is that it is a modification through vaccination of smallpox, but it is not universally accepted.

Chick-Pea, or **Gram**, the *Cicer arietinum*, leguminous plant cultivated in India and S. Europe for food. It is bushy in habit, grows to a height of nearly 2 ft., has the pinnate leaves common to the order, and the pods are short, oblong, and two-seeded; the flowers of this annual are solitary and are of a pale violet colour. The seeds are about the size of an ordinary pea and bear a striking resemblance to a ram's head, hence the specific name. When boiled they form a nourishing article of diet, or when ground and made into pea-soup. In summer the plant exudes little viscid drops from the stem and leaves, and on evaporation these leave behind crystals of oxalic acid, to which its grateful refrigerating qualities are due. *Cajanus indicus*, a tropical leguminous plant, is sometimes known as C., its other names being Congo, or pigeon, pea and dahl. Its seeds also form an article of food, and are frequently used in curries.

Chickweed, title shared by sev. plants, but it is applied particularly to the caryophyllaceous plant, *Stellaria media*, an ally of the stitchwort, from which it is

distinguished by the double row of hairs in each internode. The flower is well known to please the palate of cage-birds, and it is a peculiarity of *S. media* that it obligingly flowers the whole year round. Other familiar plants bearing the above name are members of different genera; thus, *Cerastium* includes the field mouse-ear *C. (C. arvense)*, and the viscid mouse-ear *C. (C. viscosum)*, and the tropical genus *Drymaria* has a species known as *C. (D. cordata)*. *Holosteum umbellatum*, yet another caryophyllaceous plant, is called in America the jagged *C.*

CHICORY

Chiclana de la Frontera, tn. in Andalusia, Spain, on the Lirio, 12 m. S.E. of Cadiz. Near by is a ruined Moorish castle, and the mineral baths are much visited by the inhab. of Cadiz. Wines are exported, and linen and earthenware goods are manufactured. Pop. 12,000.

Chilayo, most important trading tn. in N. Peru. Cap. of Lambayeque prov., with 30,000 inhab. and extensive sugar plantations.

Chiole, see under CHEWING-GUM.

Chico, city of S.W. California. Sugar growing is carried on in the dist. Pop. 10,000.

Chicopee: 1. Tn. of Hampden co., Massachusetts, U.S.A., on Connecticut R., 4 m. N. of Springfield. It has large manufs. of cotton (in the Dwight mills), bronzes, artillery, swords, tools, and motor cars. Pop. 41,500. 2. Riv., in the S. of Massachusetts, which flows in a westerly direction to join the Connecticut R. on its l. b. 4 m. N. of Springfield.

Chicory, *Succory*, or *Cichorium intybus*, is a composite plant common to the Mediterranean and Europe, and is in the same genus as the endive. The whole plant is bitter and aromatic, and the leaves as well as the root have been used in medicine, in the form of a decoction, as a tonic bitter and diuretic. The leaves are large and succulent, and are often

grown without light, when they become tender and delicate, and form a pleasant winter salad. But the cultivation of *C.* is carried on more for the sake of the roots than for the leaves, and these carrot-shaped parts of the plant are dried, roasted, and ground, and then mixed with coffee. It is much cheaper than coffee, and is sometimes used as a substitute.

Chicoutimi, tn. of Quebec, Canada, in co. of same name on R. Saguenay, 111 m. N.E. of Quebec. It has a large saw-milling industry. Pop. 9500.

Chicova, vil. and fort of Portuguese E. Africa, in a plain of the same name, on the Zambezi R., 220 m. N.W. of Senna. The plain is fertile, and there were formerly silver mines.

Chidambaram, **Chilambaram**, or **Chittambaram**, tn. of S. Arcot, Madras, India, 21 m. S.W. of Cuddalore. It is a religious centre for the whole of S. India and Ceylon, the most important among the numerous temples being that of Siva. The tn. was of some strategical importance during the wars of the Carnatic. Pop. 22,500.

Chidley, see CHUDLEIGH.

Chief, in heraldry, one of the honourable 'ordinaries,' which occupies one-third of the upper part of the field, defined by a horizontal line.

Chiemsee, lake of Upper Bavaria, Germany, 40 m. S.E. of Munich. It lies 1650 ft. above sea level, is about 12 m. long and 7 wide, and has an area of 34 sq. m. The greatest depth is rather over 500 ft. On the lake are the is. of Herrenworth, Frauenworth, and Krautinsel, fed by the Rs. Achen and Prien, and it discharges its surplus water by the Alz into the Inn.

Ch'ien-Fo-Tung, see CAVES OF A THOUSAND BUDDHAS.

Chieng-mai, or **Zimme**, tn. of Siam, in the Laos country, on the Meping R., 180 m. N.E. of Moumein (Burma). It is a centre of the trade in teak, the surrounding forests of which are, however, becoming exhausted.

Chieri, tn. of Turin prov., Piedmont, Italy, standing on a hill 9 m. S.E. of Turin. Formerly a fort. The most interesting building in the tn. is the church of Santa Maria della Scala, built in 1406. There are manufs. of textiles. Pop. 13,700.

Chieti: 1. Prov. of S. Italy, on the Adriatic. Area 1138 sq. m. The prov. is very mountainous, and was originally known as Abruzzo Citeriore. Pop. 385,300. 2. Cap. city of prov. of the same name, Abruzzi e Molise, Italy, built on a hill near the Pescara, 40 m. E. of Aquila and 8 m. from the Adriatic. It is an archiepiscopal seat, and contains a fine Gothic cathedral, a lyceum, and a theatre. It is built on the site of the anc. Rom. Teate, numerous remains of which still exist, including a large theatre and a gateway. Teate was the chief city of the Marrucini. In 1624 St. Gaetano founded here the order of the Theatines. Cloth and silk are manufactured there. Altitude 1070-80 ft. Mean temp. for year, 56.3° F.; summer, 74.8° F.; winter, 41.0° F. Pop. 30,300.

Chiffchaff, or Lesser Pettychaps (*Phylloscopus rufus*), small song-bird, one of the earliest summer visitors to Britain, and nearly allied to the willow-wren. The head, wings, and back are greenish-ash colour and the nether parts yellow-white. Pettychaps is a name sometimes given to the garden warbler (*Sylvia hortensis*).

Chigger, see CHIGOE.

Chigi, name of a distinguished It. family. Among its most famous members have been:

Agostino (1465-1520), the founder, a celebrated Rom. banker, b. at Siena; settled in Rome in 1485 and became enormously rich, his income being estimated at about £700,000 per annum. He was a patron of many famous artists, including Peruzzi, Perugino, Sebastiano del Pombo, and Raphael. See **Agostino Chigi**, *il Magnifico*, by Cugnoli (1881-83).

Fabio, pope (1652-67), better known as Alexander VII. He was prominent in the Jansenist controversy, declaring for papal infallibility. He was involved in a dispute with Louis XIV. of France, who sent an army to sack Avignon. He was responsible for the colonnade of the Square of St. Peter.

Flavio (1810-85), cardinal. Began life as an officer in the papal noble guard; in 1848 took orders and became bishop of Mira; in 1850 became papal nuncio at Munich; in 1856 was papal representative at the coronation of Alexander II. of Russia; in 1861 became papal nuncio at Paris, and in 1873 was created a cardinal.

Chigirin, or Tchigirin, tn. of Russia in the Kiev region of the Ukrainian S.S.R. It is situated on the R. Trasmin, 20 m. W. of Krilov. Pop. 11,000.

Chignecto Bay and Isthmus, inlet and neck of land which form the N. extremity of the bay of Fundy.

Chignola, tn. of Lombardy, Italy, situated 16 m. N.E. by E. of Piacenza. Pop. 5000.

Chignon (Fr. *chignon*, nape of the neck), term of hairdressing adopted by women about 1780, and again about 1870, consisting of an enormous coil of hair, folded round a pad, and worn in the nape of the neck or at the back of the head.

CHIGOE

Chigoe, Chigger, Jigger, and Sandflea are names applied to the *Sarcophylla penetrans*, a species of Aphaniptera which is native to S. America and the W. Indies, but has extended its travels to other lands through the agency of man. The female of this flea, which is smaller

and has less powerful limbs than the common flea, buries the hinder part of its body under the skin of the human body, and when this portion of its anatomy swells it discharges numerous eggs into the host. The result of this process is frequently fraught with serious and even fatal danger to mankind. *S. gallinacea*, a kindred species, attaches itself to the eyelids of the poultry of Ceylon. See also FLEA.

Chigwell, urb. dist. of Essex, England, 13 m. N.E. of London, on the borders of Hainault forest. It contains a grammar school at which Penn was a pupil, founded in 1629 by Archbishop Harpsnet of York, and enlarged in 1871. The Maypole Inn appears in Dickens's *Barnaby Rudge*. Pop. 18,000.

Chihli, or Chilli, or Pechili, prov. of China, see HOPPE.

Chihuahua: 1. The largest state of Mexico, bounded on the N. by New Mexico, on the S. by Durango, on the E. by Coahuila and Texas, and on the W. by Sinaloa and Sonora. Area 89,998 sq. m. On the W. the country is traversed by the Sierra Madre or Mexican Cordillera, and in the E. lies the Mexican plateau, and the depression known as Bolsón de Mapimi. The chief industry is stock-raising, but mining is carried on, the chief minerals found being silver, gold, and copper. The soil is fertile, the chief products being maize, wheat, beans, and recently cotton. Pop. 490,000, consisting chiefly of mestizos (half-breeds) and Indians. 2. Cap. of the above state, on the Mexican central railway, situated at an elevation of 4650 ft. The city was founded in 1539, and has become an important centre of trade and silver-mining enterprise. There are cotton and woollen mills, and some fine buildings, including a par. church, Jesuit college, a mint, and a prison. Hidalgo and Allende, leaders of the revolution of 1810, were executed here, and a monument to their memory stands in the public square. Pop. 60,000.

Chikislar, port of Turkmenia, Russia, on the E. coast of the Caspian Sea, N. of the mouth of the Atrek, 200 m. S.E. of Krasnovodsk.

Chilambaram, see CHIDAMBARAM.

Chilas, fort. tn. of N.W. Frontier Prov., Pakistan, on R. Indus, 35 m. S.W. of Gilgit. The cap. of a small state lying between the N. frontier of Kashmir and the Indus, it occupies an important military position with regard to the Kashmir-Gilgit route, and was occupied by the Brit. in 1893.

Chilblain, Frostbite, or Kibe (*Erythema pernio*), local inflammation of the skin, which appears on the hands and feet more rarely on the nose, cheeks, and ears. It chiefly affects children (girls rather than boys) and old people, and occurs in cold weather. It is due to exposure to the cold and to bad circulation. It is attended with redness and swelling, the centre of which deepens to a purplish hue. In severe cases, small vesicles rise on the surface of the skin and ulceration follows. Cs. cause intense irritation, and,

when chilled and suddenly heated again, are extremely painful. It is generally thought that they are due to deficient nutrition or bad health, and therefore tonic and outdoor exercise are often recommended as a remedy. The part of the body affected should be kept very warmly and loosely clad. The treatment is to paint the Cs. with collodion, or an ointment consisting of chlorate of calcium 3 drachms, pure vaseline 3 oz. Lactate of calcium in the form of an elixir may be taken three daily in teaspoon doses. Alcohol and excess of salt in diet should be avoided. Warm electric baths have also been urged as a cure. Broken Cs. should be kept scrupulously clean and dressed with pure ointment or lint.

Child. In structure and functioning the C.'s body is similar to that of the adult. Organs similar to those found in an adult can be found in the child, and they will be found to function in a generally similar manner. Differences can be noticed in details, and the infant shows marked differences which become less marked as childhood progresses. The infant has, in proportion to the adult, a relatively large head and abdomen, small thorax and short legs, and long arms. At birth, the head is one quarter of the height, while in the adult it is only one-eighth of the height.

The skeleton of the child differs so much from that of an adult that an anatomist can, with a great amount of accuracy, determine the age of a skeleton, up to about twenty-four years. The difference, of course, is greatest, as in all cases, in infancy. Bones consist of organic matter allied to lime salts. In the child the proportion of lime salts to organic matter is much smaller than it is in the adult. Further, the bones of a child have provisions made for growth. A familiar example of this difference between the child and the adult is the fontanelle, or 'opening in the head.' With the growth of the skull this disappears at about the eighteenth month, because the bones growing irregularly at their edges meet and fit into one another, forming what is called a suture, since the bones lock then as if they had been stitched together. Again, at birth many of the bones of the body are not formed. They consist then of long rods of cartilage, a tough substance which can be cut with a knife. Lime salts are deposited on these in definite places, forming bone, until they consist of a bony shaft connected to the bony extremities by plates of cartilage. All through childhood the bone remains in this condition, but as maturity is reached the cartilage ceases to grow as rapidly as the bone, and finally disappears, the extremities joining with the shaft, and growth of the bone in length stops. The bone grows in thickness also, by means of a surrounding tough membrane, called a periosteum. New bone is formed in the deeper portions of this, and at the same time the centre of the bone is absorbed, leaving the hollow wherein rests the bone marrow. Those differences give rise to peculiarities e.g. a

C.'s bone may partially break (greenstick fracture); whereas in the adult a break snaps the bone, in a child the bone may merely bend. Again, the extremity may be separated from the shaft by the breaking of the cartilage. This can only happen to children, and may have serious consequences, since it affects the growth of the bone. The teeth of the C. at birth are hidden in the dental sacs, which are in the depressions in the jaws.

Alimentary System.—The obvious point of difference between the infant and the adult with regard to the digestive organs is the absence of teeth. At birth the milk teeth are present in the gums, and teething usually commences at about the sixth month. The lower central incisors are the first to appear, and these are followed between the eighth and tenth month by the four upper incisors. The two remaining lower incisors and the four first pre-molars follow between the twelfth and fourteenth month. After a while the four eye-teeth appear at about the eighteenth month, and after a fairly long interval the set of twenty milk teeth is completed by the appearance of the four second pre-molars at the age of about two and a half years. This general order is not, of course, universally true, but in general it may be stated as such. In the same way the second dentition, giving rise to the permanent teeth, begins at about the sixth year, and continues at the rate of four teeth a year until the twelfth year, giving rise to twenty-eight teeth. The full set of thirty-two is usually completed some time between the seventeenth and twenty-fifth year by the appearance of the wisdom teeth (the third molars). Another point which may be noted is that the stomach lies obliquely in infancy, so causing vomiting to be easier and accompanied by less strain than it is in adults. The capacity of the stomach, and therefore the amount of milk which is required for each feeding, may be taken in general as being as follows: at birth from 1 to 1½ oz., at three months 4 oz., at six months 6 oz., at nine months 7 oz., and at twelve months 8 oz. Again, a C. at birth is unable to digest starch. This is due to the absence of saliva, and this, and the consequent power to convert starch into sugar, only comes with the arrival of the teeth. During the first nine months the child should be fed almost entirely on its mother's milk. The superiority of human milk over all other foods for infants, from the point of view of digestibility and nutritive value, is the unquestioned verdict of all authorities, and rests upon experience. Indigestion and colic are perhaps the minor disorders induced by bottle-feeding, but the results, especially in cases where bottle-feeding is injudiciously used may be taken as adding greatly to the infant mortality rates of our large towns. In those cases where artificial feeding must be resorted to, the best substitute for human milk is some modification of cow's milk, in which the constituents are brought to a nearer proportion to those of human milk. Milk

is an emulsion, owing its white colour to globules of fat. The following table shows the varying composition of human milk compared with cow's milk:

	Human Milk	Cow's Milk	Cream
Fat	4	3-4	8-20
Sugar	7	4-3	4
Proteins	1.5	4	3.4
Salts	0.2	0.7	0.6
Water	87.3	87	84-72
	100.0	100.0	100.0

Cow's milk differs in this respect, too, that the protein contained is not nearly so digestible as that in human milk, a dense curd being formed in the C.'s stomach, while when fed on human milk a flocculent, easily digestible curd is formed. To make cow's milk of the desired quality it must be diluted to reduce the proportion of protein, and cream and sugar of milk added. Cow's milk should *invariably* be boiled before being given to any child up to the age of twelve years, owing to the very serious danger of tuberculosis. At about the seventh month some additions of starch foods should be made once or twice a day. They should not result in a diminution of the quantity of milk taken because they are deficient in fat. Between the tenth and eighteenth months the chief food should still be cow's milk specially prepared with the addition of other foods, such as porridge, puddings, eggs, etc. Up to the sixth year a large amount of milk should be included in the dietary, which should consist of four meals a day. School children require abundant feeding, and sweetmeats are an excellent addition as they provide both sugar and fat.

Respiration and Circulation.—The lungs of a C. begin to expand with its first cry. The process of inflation then goes on very gradually, and the lungs do not attain their full expansion until the sixth year. Fresh air and exercise are essential for the possession of healthy lungs, and at the same time, by producing active movements of the chest and diaphragm, the action of the heart is aided. Clothes should be loose in childhood, and free exercise of the voice should not only be allowed but encouraged.

body. It is not fully developed, convulsions following as the result of sense impressions. The brain grows rapidly in size until the seventh year; the greatest

growth occurring during the first year. After this period growth in weight slowly goes on until the adult stage is reached. It is to allow for this growth that the fontanelle or 'opening in the head' occurs. The skull around the brain case consists of eight bones, partially developed at birth, but all joined up in the adult. The fontanelle on the top of the head is the last to close, and if it has not closed by the twentieth month, then either the brain is continuing growth, or rickets has intervened. Before birth the impressions reaching the brain are few in number, but as soon as the C. enters the world, it is immersed in a flood of impressions. These cause the brain to develop. The different areas of the brain are all busy storing up impressions both sensory and motor, and association fibres are laid down which bring the different areas into relation with each other. It is easy to understand, then, that the nervous system is unstable and excitable, and that the power of control is very feeble. So headaches, convulsions, screaming fits, etc., can arise from trivial causes, and it is therefore necessary to protect a C. from unnatural excitement, and that the diet should not only be simple, but should exclude all stimulants, such as alcohol, coffee, and tea. Sleep, rest, and quiet should be provided, and all possible forms of excitement as far as possible, prevented. In later childhood, both naturally nervous and rapidly growing children require very careful treatment.

The growth of the child.—At birth the C. should weigh about 7 lb., although 8 to 9 lb. is not uncommon. Then a steady increase in weight and height during childhood. This growth is not uniform. During the first few days a loss in weight

	Boys	Girls
First childhood	Up to 7 years	Up to 6 to 7 years
Later childhood	From 7 to 12 years	From 7 to 10 years
Adolescence	" 12 " 15 "	" 10 " 13 "
Puberty	" 15 " 16 "	" 13 " 14 "

Nervous System.—As has been stated before, the head is relatively very big and the face small in an infant, and this large size is due to the brain case. Its brain is enormous in proportion to the size of the

occurs which is made up by about the middle of the second week. During the first five months the daily increase should be from $\frac{1}{2}$ to 1 oz., and from $\frac{1}{2}$ to 1 oz. for the rest of the first year. At six months

the weight should be doubled, and trebled at twelve months. At birth the infant is about 20 in. in length, and at the end of the first year it should be 8 in. taller, although it takes six years to double the height at birth. The increase in height is not as useful as an index of health as the increase in weight. From the appended table it may be noticed that with both boys and girls the most rapid growth occurs during the first year. At about the sixth and eleventh years occur further periods of rapid growth. Boys are heavier and taller than girls at birth, and always, excepting the thirteenth to fifteenth years when the girls are heavier, having grown more rapidly in weight from the eleventh to the thirteenth year. Between

stage is reached an infant has a great tendency to take everything to its mouth. Again, an infant is sensitive to changes of temp. Sight is present at birth, but the C.'s eyes may move independently, as may the eyelids, and there is no power of focusing. Further, they are usually only half open for the first few days, and a bright light may cause discomfort. Whether the C. really sees or not can only be verified when he follows a slowly moving object with his eyes. When this happens, then the C. begins to watch objects and persons, and soon begins to show pleasure in certain colours, thus showing the development of the sensation of colour. A sense of distance and conception of solidity depend upon a

AGE	BOYS		GIRLS

14 "	61.0 "	99.3 "	60.3 "	100.3 "
15 "	63.0 "	110.8 "	61.4 "	108.4 "

the twelfth and fourteenth years the girls are taller, but at all other times the boys are superior in height and weight. It may further be noticed that the increase in weight takes place between the intervals of greatest increase in height. Here it may also be pointed out that generally childhood can be divided into four periods as shown in the table on p. 564.

The table above, from *The Child: his Nature and Nurture*, by W. B. Drummond (1915), shows the increase in height and weight from birth to the fifteenth year.

Mental Development.—At birth a C. is unable to interpret impressions arriving at the brain through the senses. The only way to judge as to the activity of the senses at birth is by the effects of stimulation as shown through movement. Taste is probably the first sense developed. Since smell is so closely linked up with taste it may be, and appears to be, present soon after birth. The sense of touch, however, is present almost from birth. It is present in a vague form before, and progresses rapidly. It is particularly developed in the lips and the tongue, and afterwards, of course, develops until the hand becomes the organ of touch. Until this

co-ordination of the senses of touch and sight. The sense of distance is very vague until the C. is a few years old, and while the recognition of solid forms is developed rapidly for near objects, this also remains vague for distant objects. Hearing, again, is absent at the time of birth, because there is no air in the drums of the ears. Loud sounds do not disturb, usually, until the third day or so, and, of course, this enables the C. to sleep without being disturbed. The power of localising sound may be developed by the fourteenth day, but not to any very great extent. From this and other observations it may be seen that the training of the eye should be aided by the training of the hand, and similarly it appears that speech depends on hearing. The lower senses, i.e. taste, smell, and touch, of course, enable the C. to develop sensations of hunger, thirst, warmth, the wholesomeness of food, etc. For a while after birth a C.'s movements may be classified as either random, reflexive, or instinctive. *Random movements* are common in infants and they seem to depend neither upon will nor on any sensory stimulus. Among these might be noticed the stretching of the limbs of a young

baby. Older children also indulge in these movements during sleep. *Reflex movements* arise in response to sensory stimuli and are present at birth. Swallowing, sneezing, and even the first cry at birth may be taken as examples of this class of movements. *Instinctive movements* also arise from sensory stimuli, but are more complex. They may not all be instinctive, though some are. Seizing, raising the head, and creeping may be taken as examples of this type of movement. Seizing is possible at birth, and with great force, but an infant does not desire nor seize anything at sight, but only on coming into contact with it, until the sixteenth to the eighteenth week. Similarly with the raising of the head. This is impulsively done during the first few weeks, but the will to raise the head to see things shows itself about the second month.

The Will.—From these movements which are independent of will, the C. gradually assumes control over them, and wills to do them.

Play being the natural outlet for a C.'s energy is generally regarded now as being a preparatory exercise for life as it will be. Since the human is highest in the scale of animals, the time given up to play should be a long one, and is. It must, therefore, be seriously regarded when the subject of the C. and his development is under consideration. All this leads to the fact that modern systems of education need revision, and in the light of the special study which is being made of C. life, progress in methods of education is being rapidly made. One need only point to the kindergarten and nursery schools, manual and cookery centres, and the various clinics to see that there is a spreading tendency to view the C. as distinct from the adult in many ways.

Social Services.—Nurseries, infant welfare centres, pre-natal and post-natal clinics have all been considerably developed in recent years. Free milk and midday meals are provided by education authorities. The school medical service has been expanded to include treatment as well as inspection and to cover the system of part-time education up to the age of eighteen. In Britain family allowances of 5s. per week are payable on behalf of each C. of school age in a family, except the first. See CHILD WELFARE AND LABOUR.

Education.—The Education Act of 1944 marks an important step forward in the educational system, which is now recast into three stages, primary, secondary, and further education. Facilities for technical education are being considerably increased. The school-leaving age was raised to fifteen on April 1, 1947; as soon as possible it is to be extended to sixteen. Part-time education is to be compulsory for all up to the age of eighteen. See under CHILDREN ACTS; EDUCATION.

See W. B. Drummond, *The Child: his Nature and Nurture*, 1915; H. Crichton-Miller, *The New Psychology and the Parent*, 1925; S. Isaacs, *Social Development in Young Children*, 1937, and *Intellectual*

Growth in Young Children, 1938; J. Smith and D. Paterson, *Modern Methods of feeding in Infancy*, 1938; C. Bühler, *The Child and his Family*, 1940; T. King, *Mothercraft*, 11th ed., 1943; J. Dalley, *The Gift of a Child*, 1946.

Child Adoption, see ADOPTION.

Child, Sir Francis (1642-1713), Eng. banker. Became a freeman of the Goldsmiths' Company in 1664, and, through his marriage into a family of London goldsmiths named Wheeler, he inherited the Wheeler fortune and goldsmith's business. He was the founder of the banking business of C. & C. In 1698 he was elected lord mayor of London and M.P. (Whig) for Devizes. Subsequently he was elected for a London constituency. In 1702 he became master of the Goldsmiths' Company, and in 1727 president of Christ's Hospital.

Child, Francis James (1825-96), Amer. educationist and writer; b. in Boston, Massachusetts, U.S.A., was educated at Harvard Univ., and became prof. of rhetoric there in 1851. He became prof. of Eng. there in 1870, and remained on the faculty practically up to the time of his death. He made a speciality of studies in Eng. literature, editing a monumental ed. of Spenser. But his supreme achievement was to make himself the world authority on anc. Eng. and Scottish ballads. He pub. his first collection in 1857. Continuing his researches, he gathered together the largest extant collection of MSS. on the subject and embodied the result of his studies in his famous book *The English and Scottish Popular Ballads*, pub. from 1882 to 1898, 'first in 10 parts (1882-98) and then in 5 quarto vols.' His other works include an ed. of *Four Old Plays* (1848); a treatise, *Observations on the Language of Chaucer's 'Canterbury Tales'* (1863).

Child, Harold Hannington (1869-1945), Eng. scholar and historian of literature, b. at Gloucester and educated at Winchester College and Brasenose College, Oxford. Dramatic critic of the *Observer*, 1912-20. His long connection with *The Times* began in 1902 when he became a contributor to *The Times Literary Supplement*. He was an excellent scholar in Eng. literature. To the *Cambridge History of English Literature* he contributed more than any other single writer except George Saintsbury; while for the *Cambridge Modern History* he wrote on Milton and his age, and he also contributed to the *Dictionary of National Biography*. An authority on Shakespeare he supplied the stage lists of each play for the *New Cambridge Shakespeare*. His *Thomas Hardy* (1916) is considered by some to be the best monograph on that writer. Also wrote *Phil of the Heath* (1899), a novel; *The Yellow Rock* (1939), poems; and the libretto of Vaughan Williams's opera, *Hugh the Drover*.

Childebert I., king of the Franks (511-558), son of Clovis, inherited the kingdom of Paris; defeated Amalric II., king of the Visigoths, at Narbonne in 531, and Sigismund, king of Burgundy, in 532.

Childebert II. (570-95), king of Austrasia

575-96; son of Sigbert and Brunhild. In 593 he inherited Orleans and Burgundy from his uncle Gontran.

Childebert III. (b. 683), nominal king of Franks, 694-711; succeeded his father, Clovis III., but had no real power, the kingdom being in the hands of Pépin le Gros, mayor of the palace.

Childeric I., king of the Merovingian Franks, c. 457-81; succeeded his father, Mérovée, and left the throne to his son, Clovis I.

Childeric II., king of Austrasia from 656, and of Neustria and Burgundy from 669; succeeded his father, Clovis II., and left the throne to his brother, Thierri.

Childeric III., last of the Merovingian kings of France, 743-51; deposed by Pépin le Bref, and d. at St. Omer in 754.

Childermas, festival of Holy Innocents, held on Dec. 28, to commemorate the slaughter of the children by Herod.

Childers, Hugh Culling Eardley (1827-1896). Brit. statesman, b. in London. After he left Cambridge Univ. he went to Australia, settled in Victoria, and became an inspector of schools. In 1855 he was a member of the first Victorian Cabinet as commissioner of customs and trades. He helped considerably in the foundation of Melbourne Univ. In 1857 he returned to England as agent-general for the colony. In 1860 he was returned as Liberal member for Pontefract. In 1861 he was made a civil lord of the Admiralty, and first lord of the Admiralty in 1868, and a member of Gladstone's first Cabinet. In 1880 he was in Gladstone's second administration as secretary for war, and as such was responsible for the military operations in the first Boer war in 1880, and the Egyptian expedition of 1882. At the end of 1882 he succeeded Gladstone as chancellor of the Exchequer; his proposals for a conversion of consols were not carried out, and the defeat of his budget of 1885 led to the downfall of the ministry, though the real cause was the national dissatisfaction with the delays and mismanagement which had ended in the death of Gen. Gordon. At the following general election he lost his seat, but was returned as a Home Ruler for S. Edinburgh in 1886, and joined Gladstone's third ministry as home secretary. He objected to certain of the financial clauses of the first Home Rule Bill, which were withdrawn. He retired from Parliament in 1892. See S. Childers (his son), *Life and Correspondence of the Rt. Hon. H. C. E. Childers*, 1901.

Childers, Robert Cæsar (1838-76), Oriental scholar, educated at Wadham College, Oxford; in 1860 entered the Ceylon civil service, acting as secretary to the governor, Sir Charles McCarthy; returned to England in 1861, and in 1872 became sub-librarian at the India Office, London. In 1873 he became prof. of Buddhist and Pali literature in Univ. College, London. His numerous valuable works on oriental subjects include Pali text, with trans., of *Khuddaka Patha*, and his great *Pali Dictionary* (1872-75).

Childers, Robert Erskine (1870-1922), author and rebel, son of Robert Cæsar

C. Educated at Halleybury and Trinity College, Cambridge. Junior clerk in the House of Commons, 1895-1910. Wrote an enthralling story of Ger. preparation for war, *The Riddle of the Sands* (1903), also vol. v. of *'The Times' History of the War in S. Africa* (where he had fought) (1907). Major in air force during the First World War. Republican opposed to Irish Free State, his interest in Ireland being derived from his mother—a Barton of Glendalough, co. Wicklow; where, after acts of rebellion against the new Free State, he was captured, Nov. 10, 1922. Executed at Beggar's Bush Barracks, Nov. 24.

Child-killing, see INFANTICIDE.

Children Acts, 1908, 1933. The 1908 Act, which is popularly known as the Children's Charter, was introduced into the House of Commons in Feb. 1908 by Sir Herbert (later Viscount) Samuel, then under-secretary for the Home Office, who described it as a Bill to consolidate and amend the law relating to the protection of children and young persons, reformatory and industrial schools, and juvenile offenders, and otherwise to amend the law with respect to children and young persons. The Act of 1908, or prin. Act, is in fact a codifying measure designed partly to remove the confusion and doubt consequent on the existence of a number of more or less unrelated statutes and partly to strengthen the law in a number of different directions. It was subsequently much amended by the Children and Young Persons Act, 1932 (later fused in the codifying Act of 1933), which, *inter alia*, repeals and re-enacts the provisions of reformatory and industrial schools, and strengthens the provisions on juvenile courts and offenders. That the Act was wanted was clearly indicated by the under-secretary's statements in the first reading to the effect that the Infant Life Protection Act, 1897, passed to stop the evils of baby-farming, was in many respects ineffective. The prin. Act contains valuable and necessary provisions designed to obviate the evils arising from the contaminating influences of adult offenders over children and young persons. The first part of the Act (as amended) is directed to the protection of infant life, and secures more satisfactory treatment for children placed out to nurse or adopted by foster-parents. It provides that where a person undertakes for reward to nurse and maintain an infant under the age of nine years apart from its parents or having no parents, he must give written notice of his undertaking to the local authority within a specified time which varies according to circumstances. The local authority may fix the maximum number of infants under the age of nine years who may be so maintained in any particular dwelling. If an infant dies or is removed from the foster-parents, the latter must notify the authority and the dist. coroner to that effect. For the more effective carrying out of these provisions the Act enables the poor law authority to appoint infant protection visitors, who shall have power to apply for an order of removal of

an infant kept in insanitary premises or by persons who by reason of drunkenness, immorality, or other similar cause are unfit to have charge of an infant. Offences under this part of the Act are punishable with imprisonment for a term not exceeding six months or to a fine not exceeding £25. These provisions do not extend to hospitals, convalescent homes, or institutions maintained by a gov. dept., or local or other authority constituted by Act or Charter, nor to an institution approved by the board of control. There are also analogous provisions in the Act of 1933 respecting voluntary homes for boarding, care, and maintenance of poor children or young persons (i.e. persons who have reached the age of fourteen years but who are under seventeen years). Part II. of the prin. Act (as amended) is directed to the prevention of cruelty to children and young persons, re-enacting the pre-existing law as to the punishment of cruelty, expanding the legal conception of cruelty, and strengthening the law in regard to the employment of children in begging. Besides the more obvious forms of cruelty like beating and abandonment, cruelty under the Act comprises: Exposure of children under seven to the risk of burning through not taking reasonable precautions against danger from open fire grates; allowing children and young persons to be in brothels; the death of an infant under three years of age through overlaying or suffocation caused whilst the infant was in bed with some other person under the influence of drink; the failure on the part of a parent or other person legally liable to maintain a child or young person either (i.) to provide adequate food, clothing, medical aid, or lodging, or (ii.) to take steps to procure the same to be provided under the poor law; and encouraging the seduction or prostitution of a girl under the age of sixteen. Conviction or indictment entails either a fine not exceeding £100 and, in addition or in the alternative, imprisonment for any term not exceeding two years with or without hard labour. Part III., which deals with juvenile smoking, makes it an offence to sell to a person apparently under the age of sixteen any cigarettes or cigarette papers, whether for his own use or not. It is also an offence for a tobaccoist to sell tobacco other than cigarettes to such a person if the tobaccoist has reason to believe that it is for the use of the young person. Fines are imposed varying from £5 to £10 according to the number of convictions. Constables and park-keepers are authorised by the Act to search boys under sixteen seen smoking in any public place for cigarettes or cigarette papers. The case of automatic machines is also dealt with by a provision empowering a magistrate to order the removal of any machine for the sale of cigarettes believed to be extensively used by children or young persons. Part IV. of the Act consolidated and amended the various acts relating to reformatory and industrial schools, but is now replaced by provisions in the 1933 Act as to

orders committing juveniles to 'approved schools.' This part of the 1933 Act is the corollary to the initial clauses of the Act which codify the law on juvenile courts and the procedure to be observed in such courts (see JUVENILE OFFENDERS). Provisions respecting approved schools, i.e. schools which have received certificates of approval from the Home Office, are to be found in the Act of 1933. Part V. of the prin. Act and Part II. of the Act of 1933 relate to juvenile offenders, and empower any court to remit such offenders to a juvenile court. The Act of 1933 raises the age of criminal responsibility to eight, the presumption that no child under that age can be guilty of any offence being conclusive (see also under JUVENILE OFFENDERS). Part VI. of the Act contains miscellaneous provisions, the prin. relating to the powers of the education authority to secure the cleansing of verminous children, schooling of vagrant children, prevention of the sale of intoxicants to children under five, and the duty of those who provide entertainment to make certain arrangements for the safety of children. The Act of 1933 contains provisions restricting the employment of children. No child under twelve years of age may be employed at all, save as to authorised employment by parents or guardians in light agric. or horticult. work. Also, no child under fourteen years of age may be employed before the close of school hours, nor before 6 a.m. or after 8 p.m., nor for more than 2 hrs., nor in lifting or moving anything so heavy as to be likely to cause injury. The local authorities may make by-laws on the employment of children, distinguishing between children of different ages and sexes and different localities, trades, occupations, and circumstances. There are saving clauses as to children taking part in entertainments under the provisions of licences. The Act of 1933 also contains provisions against juveniles taking part in or being trained for dangerous performances. See also CHILD WELFARE AND LABOUR.

Children, Adoption of, see ADOPTION.

Children, Employment of, see preceding article and under CHILD WELFARE AND LABOUR.

Children, Societies for Prevention of Cruelty to. The principal of these societies, which was incorporated under royal charter in 1895, is associated with the name of Benjamin Waugh, by whose exertions the London S.P.C.C. was estab. in 1884. Its object was to discover cases of ill-treated and neglected children, and to institute proceedings against offenders; and, further to secure the passing of laws for the purpose of obtaining a greater measure of protection for children. The agitation of these societies resulted in the passing of the Criminal Law Amendment Act, 1885, and the Prevention of Cruelty to Children Act, 1889. These Acts and the Children Acts, 1908, 1933 (q.v.), are a clear indication of the public recognition of existing evils, and their presence on the statute book to a large extent destroys the *raison d'être* of these societies.

Nevertheless there is unfortunately still considerable scope for their activities in supplementing the work of local governing bodies and the police, especially in the direction of removing children from the influence of drunken parents. In this latter respect the London S.P.C.C. state that practically all the cases of cruelty investigated by them have their origin in drink. Because the number of prosecutions brought into court by the S.P.C.C. is not great, there may be a tendency to overlook the magnitude of the work of the society. For instance, according to the report of the society for the year 1937 no fewer than 120,000 children in England, Wales, and Ireland, and 26,000 in Scotland were found to be suffering in some form or other, either through culpable neglect or actual malicious ill-treatment—generally by parents and guardians—necessitating intervention. Some 56,000 individual cases of maltreatment of young people came under the notice of the police or of the inspectors of societies, and there were over 1000 convictions. The address of the N.S.P.C.C. is 15 Leicester Square, London, W.C.2.

Children's Aid Society.—This society acts in collaboration with the Reformatory and Refuge Union to rescue destitute and neglected children, and those exposed to dangerous moral environment. Its officials are employed in enforcing the provisions of the Children Acts, 1908, 1933. At their instance, numerous children are placed by magistrates' orders in industrial schools.

Childrenite, rare mineral consisting of aluminium iron phosphate. It occurs in orthorhombic crystals, with hardness 4.5 and sp. gr. 3.2. It has been found in a few places in Cornwall and Devon. An allied species containing manganese is known as cosphorite, and occurs in Connecticut.

Childress, city of C. co., Texas, U.S.A. Pop. 7000.

Childs, George William (1829-94), Amer. publisher and philanthropist, b. in Baltimore. In 1842 entered U.S.A. navy; became a book-store clerk in Philadelphia, 1843; set up as an independent publisher, 1847; became a partner in the firm of C. & Peterson, 1849. In 1864 he took over the *Philadelphia Public Ledger*. He wrote *Recollections of General Grant* (1885) and *Personal Recollections* (1890). His charitable work was very large, and he is perhaps best known by his erection of public memorials to great men, including Herbert, Cowper, Leigh Hunt, Moore, Shakespeare, Milton, Ken, and Andrews in England, and Edgar Allan Poe and Richard Proctor in America.

Child Study includes now the anatomy, physiology, anthropometry, and psychology of the child as a child. Rousseau was the first to recognise the fact that a knowledge of children and their ways is essential to any one who wishes to reach them. Darwin was one of the first in England to publish observations of the development of a child, and since then the study has been carried out with great zest

both here, on the Continent, and in America. Two methods are adopted in C. S.: (1) the *individual* method which consists in as full a study as possible of a single child; and (2) the *collective* method, whereby sev. children are examined and studied for particular things, and an average or standard drawn up. Many of the results gained have been summarised under CHILP. It has been found possible to calculate the effects of the various lessons in the way of producing bodily and mental fatigue. School children in the same manner are medically inspected, and the results tabulated and conclusions drawn. The importance of all this cannot be overemphasised. As a direct result of C. S., kindergartens, and infant schools run on kindergarten lines, are now the only type of school for very young children. Play has been pressed into the service of the teacher, and freer and less-cramped movements are used from the beginning. 'Cramming' is recognised as being extremely harmful, and the deaf, the blind, and the mentally deficient are being trained in a scientific manner. A third, though not very practicable, method of C. S., is that which is given when spontaneous writings of children can be obtained. But, as the child is usually writing under the knowledge that his work is to be seen, it is very rarely of use. In studying children by the individual method, the child should be watched, much as a naturalist might watch an animal or insect, at work and at play, asleep and awake; but he should not be allowed to know he is being watched. This has been done in America by observation through glass panels, the child being unaware of the fact. Questions should be asked him, but he must not know that he is being questioned for a purpose, or he will probably become self-conscious and his replies studied. One great difficulty experienced by the child-studier is the finding of the correct motive for many of the child's actions; this is a matter of great importance, for it is only by discovering the motive that the right way in which to correct or encourage the child can be found. Sev. societies are in existence for the study of the child, chief among which are: Brit. Child Study Association, who publish three times a year a magazine called the *Paidologist*; the National Froebel Union; and the Parents' National Education Union. For list of books on this subject, see CHILP, EDUCATION, and the following. See J. M. Baldwin, *Mental Development in the Child and the Race*, 1895; E. A. Kirkpatrick, *Fundamentals of Child Study*, 1923; M. Lowenfeld, *Play in Childhood*, 1935; M. Montessori, *The Secret of Childhood*, 1936; A. Gesell, *The First Five Years of Life*, 1941; C. W. Valentine, *The Psychology of Early Childhood*, 1942; H. Edelston, *Separation Anxiety in Young Children*, 1943; S. Isaacs, *Troubles of Children and Parents*, 1948. See also bibliographies under CHILP, EDUCATION.

Child Welfare and Labour. The movement to protect children and young people from the evils that beset them in the

modern commercialised and urbanised communities received a great impetus in the first and second decades of the twentieth century. The First World War served to accelerate this humanitarian movement, which is now universal throughout the civilised world, the *impetus* of the League of Nations being given to it in 1924 when the Assembly agreed to take C. W. and L. within its purview. Many agencies, governmental and voluntary, now cover the whole period of childhood, but the chief divs. of this welfare work may be said to be as follows:

- (1) The care of infants and nursing mothers; in the United Kingdom falling to the lot of the Ministry of Health.
- (2) The care of school children from five or six years to fourteen years of age (shortly to fifteen years if proposed legislation is passed), which is primarily the concern of the Ministry of Education in Great Britain.
- (3) The protection and prohibition of juvenile labour; which is the function of the Ministry of Labour in Great Britain.
- (4) The segregation of juvenile delinquents from adult criminals in courts and reformatories.
- (5) The prevention of contaminatory influences on the character of children due to poverty and criminal associates. As all these categories except that relating to juvenile labour are included in the Children Act, 1908, and as this Act was the starting-point for much similar legislation in the Brit. dominions and other countries, its provisions should be noticed.

This Act was supplemented in 1918 by the Education Act of that year, which further extended the tendency of the education authorities to concern themselves in all that relates to child welfare. Apart from its purely educational clauses this Act provides for the care of physically and mentally defective scholars, for feeding them in necessitous cases, and for medical inspection and treatment in the schools. The Board of Education may even make grants to such societies as supplement its care of children, as, for instance, those which organise play centres.

The National Health Service Act, passed in 1946, is, together with the Education and Family Allowances Acts, which were also passed soon after the Second World War, designed to remove most of the obstacles which had theretofore impeded the development of a positive national policy for the promotion of child health. The Act removes most of the important financial and administrative barriers to the efficiency of the services, and it establishes machinery for the development of better services, but the policy which the machinery is to operate remains largely undetermined. The report of the Royal College of Physicians on the child health services to be estab. under the Act suggest some of the more important changes needed: hospital physicians should give some of their time to preventive work in clinics, nurseries, and schools; post-graduate instruction in child health needs to be improved and given a new orientation; and both for this purpose, for the promotion of research, and

for the dissemination of knowledge throughout the children's services, the services of each region should be able to look for guidance and inspiration to a univ. institute of child health. In recent years the growth of academic interest has been reflected in the estab. of univ. chairs in child health at Durham, Liverpool, Birmingham, Leeds, and Sheffield, while the estab. of institutes has also made progress. The college holds, and rightly, that there will always be need of an expert in child health with a preventive bias intermediate between the home doctor and the hospital doctor. See E. Fuller (ed.), *The International Handbook of Child Care and Protection*, 1928.

The influence on other countries of the Brit. Act of 1908 has already been referred to. Thus Belgium in 1912 enacted the law for the protection of infancy, and in the same year in U.S.A. a special dept. of State was estab. at Washington to deal with C. W. The estab. of this Federal Children's Bureau was followed by the founding of many C. W. institutes throughout the States. In 1913 the Belgian Gov. convened in Brussels the first International Congress for the Promotion of C. W. The First World War prevented the carrying out of the proposal of this congress for the estab. of an international C. W. association, but a second congress, also held in Brussels, in 1921 achieved this object. It was the action of the assembly of the League of Nations which crowned the effort for organising this work on an international footing. The fifth assembly on Sept. 26, 1924, undertook the promotion of international C. W., and subsequently the C. W. Committee of the League was estab., the first ann. meeting of the committee taking place in March 1926. In this connection, the Declaration of Geneva, pub. in 1923, setting forth in general language, the duty of humanity to childhood, was recommended by the League as a guide to the underlying ideals which should govern C. W. work. With regard to child labour the movement for restriction goes back to the beginning of the industrialisation of Great Britain, the earliest legislation on juvenile employment being passed in 1802. As to employment of children generally see under CHILDREN ACTS, 1908, 1933. Throughout the Brit. empire similar legislation restricts the employment of, at any rate white, children under the age of fourteen. In the U.S.A. the first Federal child labour law came into operation in Sept. 1917. The League of Nations International Labour Office naturally concerned itself in the matter of child labour and the general tendency in all civilised states now is to fix fourteen years as the earliest time at which a child can be employed in gainful work.

United States of America. The prevailing sentiment in the U.S.A. towards C. W. is reflected in the legislative enactments which have been passed in recent years by the different states to control child labour. In every state no child under fourteen years of age may be employed in industry, and in most states

no child may be employed on night work. Again, in most states, a child's hours are limited to a forty-eight-hour week, though in a few states forty-four hours are the maximum. As in Great Britain, so in the U.S.A., compulsory attendance at an elementary school is required until entrance into industry or until a minimum age is reached, and the full elementary course must be taken. In rather over one half of the states a child under sixteen years of age must have attained at least the sixth grade before being employed in an industry. Naturally, where there are so many state's Legislatures and varying conditions of social existence, the laws governing school attendance are by no means uniform: in the dist. of Columbia, which enjoys perhaps the most advanced child labour code in the country, the amended child labour law of 1908 provides that the director of the dept. of school attendance shall be the authority for the distribution of work permits to all children under eighteen years of age. Such permits are only to be granted on receipt from the prospective employer of evidence as to the character of the work, the age of the prospective employee and, if under sixteen, of physical fitness, and also a school certificate recording ability to read and write Eng. and the attainment of a prescribed grade. Attendance in continuation schools is now fixed by the Columbia dist. legislature at the age of seventeen. In recent years there has been a marked tendency in many states to raise the educational requirements for work permits. Again, the S. Carolina legislature has recently made attendance at school compulsory between the ages of seven and fourteen; in Virginia, in 1928, the period of attendance was raised to the ages of seven to fifteen, and the administrative machinery for securing observance was strengthened. In a large number of states penalties of varying severity are enacted against employers who contravene the child labour laws. In the dist. of Columbia, penalties of fines and imprisonment are prescribed for parents and guardians, as well as for employers; inspectors are appointed to secure the enforcement of the law and jurisdiction to that end is vested in special juvenile courts. Similarly, in Virginia, for example, there are juvenile and 'domestic relations' courts estab. for the purposes of the child labour laws. In some states illegal employment of minors, either by reason of age or the hazardous nature of the industry, is punished by levying double or even treble compensation, in the event of injury, on the employer, but in others only ordinary workmen's compensation rates are awarded.

Mothers' Assistance Acts are a feature of C. W. In a large number of states. Over two-thirds of the states now provide for such assistance, though at very different rates. The lead in this particular social reform was taken many years ago by France and Australia, and a scale of mothers' allowances has now for some time been in operation in Canada. In the U.S.A. co. funds are appropriated in

most states, for mothers' aids grants. In some S. states voluntary agencies supervise the welfare of children, either in their own homes or in institutions set up by the agencies. In New York city over \$3,000,000 is spent annually on this form of family endowment. The amount of financial assistance in the U.S.A. ranges from about \$1000 a year for a mother with three dependent children to about \$500, not all the states being in a position to subsidise an equally high standard of living.

Chile, or Chili, republic extending along the W. coast of S. America, to the S. of Bolivia, between the Pacific and the Andes; it includes also the greater part of the Fuegian Archipelago. Its existence as a republic may be said to date from 1810, when it declared its independence of the mother country, Spain, though the colonial authority was not finally broken till the battle of Chacabuco in 1817. In 1880 C. annexed Atacama and Tarapaca, including the Lobos Is., and occupied the prov. of Tacna. Four years later Tarapaca and Tacna-Arica were formally ceded to C. by Peru, the latter prov. for ten years only, after which period a plebiscite of the prov. was to be taken to decide to which country it should belong. This was never done, C. remaining in possession. For seventeen years diplomatic relations between the two countries were severed, but in July 1928 they were resumed, and before a year had passed the dispute was settled, Tacna going to Peru, Arica remaining with C. The physical features of C. are very accurately known, as a gov. survey of an exhaustive nature was begun in 1848, and carried on for many years. Since the E. boundary of C. is, broadly speaking, the main chain of the Andes, the W. section, though in fact considerably elevated in some places, is everywhere low compared to the E. portion. The portion of the Andes between 31°40' and 34° 20' S. lat. is the highest, the average height being about 16,000 ft. The two highest peaks of the Andes are Aconcagua (23,393 ft.) in 32° 39' S., and Cerro de Mercedaria (22,300 ft.) in 32° S.; other noteworthy mts. are Polleras (20,266 ft.), Tolorsa (20,140 ft.), Juncal (19,360 ft.), and Chimbo (18,645 ft.). The height of the Andes gradually diminishes from about 34° 20' S. There are a number of passes over the Andes connecting C. with the Argentine Republic, of which the best known are Bermejo (13,025 ft.), and Iglesia (13,412 ft.), on the Uspallata road; Pirras at a height of 16,962 ft.; and Valle Hermoso, 11,736 ft. There is a great difference in the breadth of the higher and lower sections of C. at different places. The land above 5000 ft. extends in some places to within 10 m. of the coast; whilst in others, notably along the chief rivs., the land under 5000 ft. extends for a distance of over 70 m. inland. In the N. the Chilean portion of the desert of Atacama lies between the coast and the mts., but to the S. of the desert there are few spaces under 1500 ft. To the S. of 35°, however, a

region which rarely reaches this height extends from the coast for an average distance of 60 m. The general formation of this region is as follows: the highest part is nearest to the sea, and, rising abruptly from the coast, sinks eastward in terraces to an interior valley, or plain. This interior plain slopes gradually from N. to S. The Andes of C. are highly volcanic in character, and earthquakes frequently occur, the average number of shocks, of varying seriousness, felt at Coquimbo being about forty every year. Perhaps the most destructive earthquake recorded in C. was that of 1751, when the former tn. of Concepción was sunk in the

at its mouth; and the deep Maullin, which drains Lake Llanquihue. Owing to the heavy rainfall of the S., many large lakes are there found, notably those of Llanquihue, Chapo, Rauco, and Lago de Todos los Santos, otherwise known as Lake Esmeralda. On account of the conformation of C., extending from 18° to 56° S. lat., the climatic conditions vary considerably though extremes of heat are seldom observed owing to the influence of the cold Humboldt current. The place in which the greatest extremes are observed is the desert of Atacama; there the temp. varies frequently from 100° in the daytime to 36° at night. On the coast

F.N.A.

THE COASTAL PLAIN OF CHILE, BETWEEN VALPARAISO AND SANTIAGO

sea, and the majority of places lying between 34° and 10° S. were destroyed; on Nov. 19, 1822, the coast near Valparaíso was permanently raised 4 ft. over 100,000 sq. m., and Valparaíso, Tuillota, Casablanca, and Limachi, were destroyed; on Feb. 20, 1835, the rebuilt Concepción was again destroyed, together with Talcahuano; in 1868 Arequipa and Iquique were ruined, whilst in 1875 Iquique was again levelled with the ground. The river of C. all flow from E. to W. across the country; even those flowing across the longitudinal interior valley mentioned above do so, which is a proof that the valley received its present slope after the river came into being. In consequence of their direction, the rivers are not of great length, and therefore of no great importance as means of transport. The most important are the quick-flowing Mapu; the Maule, which is navigable for a longer distance than any other; the Biobío, the largest of all, but not navigable for large vessels in its lower course; the Calleca, which is the most important for navigation, as it has a good harbour

the temp. rarely reaches a greater height than 90°. The mean ann. temp. of Valparaíso is about 59°, that of Santiago 55°, and that of Valdivia 53°. In the longitudinal valley there is a mild uniform climate, the Humboldt current and cool winds from the Andes serving to mitigate the heat in summer, whilst in winter the overcast skies and the winds from warmer lands serve to prevent excessive refrigeration. The rainfall is very low on the N. coast, but in the fjord region of the S. it is much heavier. At Valparaíso the mean ann. rainfall is about 15 in., whilst at Ancud, in Chiloe, it is 130 in. The Chilean part of the desert of Atacama is as destitute of vegetation as the maritime region of Bolivia, and down to lat. 30° S. the coast has no vegetation, though inland some is found at about that lat. The vegetation of C., which is in full vigour about the lat. of Valparaíso, is remarkable for the large number of peculiar forms which belong to it. A very striking feature of the vegetation of C. is the small number of deciduous trees, when the high lat.

of the region is considered. Among the more notable of the Chilean trees are the *Quillata saponaria*, or soap-tree, the bark of which is lined internally with a whitish saponaceous substance; the *Jubaea spectabilis*, a palm allied to the coco-nut, and yielding a sweet sap known as palm-honey; the *Fagus obliqua*, an excellent timber tree; the *Fitzroya patagonica*, another very good and very numerous timber tree; and the *Eucryphia condifolia*, a foliage tree which grows to a great height and blossoms most luxuriantly in Feb. The apple-tree has been introduced with great success, and bamboos extend for a long way S., being used as fodder for cattle. Numerous twining and climbing plants are found, giving something of a tropical aspect to Chilean vegetation; such are the *Mutisia*, an asteraceous plant with blue flowers, the beautiful red *Tropaeolum speciosum*, and the gorgeous *Philisia buxifolia*, which has flowers shaped like a bell and of the colour of fire. The region between Valparaíso and Valdivia which has sometimes been termed the garden of the New World, is the prin. centre of agriculture, though in other dists. great strides have been made in this science in recent years. Wheat is the prin. crop, but maize, oats, hemp, barley, beans, lentils, peas, and potatoes are also grown. All European fruit-trees flourish, and a large quantity of fruit is annually sent to U.S.A. The vine is grown, and excellent wine is made—94,000,000 gallons in 1937, of which 3,500,000 were exported, chiefly to Belgium and Germany. Tobacco and the sugar cane are also cultivated. Pastures N. of the R. Maule feed immense herds of cattle; the hogs of the is. of Chiloé have given it a reputation for hams; and in addition quantities of horses and goats are reared. Dairy farming is increasing in importance, and in the S. in Patagonia and Tierra del Fuego, are extensive sheep-farms.

Chilean fauna is not very remarkable for variety; pumas are the chief wild animal, and are very destructive of cattle. The chief of the other animals are the pudu, a small variety of deer, the coypu, or native beaver, the chinchilla, guanacos, and vicuñas in the mt. dists., and a variety of fish-otter. Many varieties of birds are found, among which may be mentioned ibises, parrots, flamingoes, herons, numerous species of small song-birds, and the Chilean swan, which has a pure white body and a black head and neck.

By far the most important mineral found in C. is nitrate of soda (or *salitre*), which is recovered from the desert of Atacama. For many years C. has been the only country to produce this mineral, which is therefore a very valuable source of revenue. The production figure was 3,162,800 tons in 1928, about 2,800,000 tons being exported. In 1937-38 only 1,544,000 tons were exported, and in 1941 1,270,000 tons (but in some years the production figure has not been pub.). In 1930 a law was passed constituting a national nitrate company (Cosach) with

a capital of £75,000,000 with State participation, to take over the whole nitrate industry, but in 1934 a new company was formed, the Nitrate Company of Tarapacá and Antofagasta, consisting of over thirty companies comprised in Cosach, the Anglo-Chilean Nitrate Corporation and the Lautaro Nitrate Company. All these together constitute the present organisation of the industry. The sales of these companies are effected through a central body called the Nitrate and Iodine Sales Corporation. The next mineral in importance is copper, of which there is a great abundance, the Tamaya mine, in the prov. of Coquimbo, being regarded as inexhaustible. C. is the world's second largest producer of this metal, and provides not far short of one-fifth of the total ann. supply (nearly 500,000 metric tons in 1943). Silver is also found in fairly large quantities, the centre of the industry being Copiapo; a large number of mines yielding both gold and silver are in operation in Tarapacá, Guanaco, and Cachinal in Atacama, and Caracoles in Antofagasta. Another mineral of importance is lignite coal, of which the prin. beds lie to the S. of the Biobío to about 37° S. lat.; about 2,000,000 metric tons are mined annually. Deposits of iron ore in Coquimbo and Atacama yield annually between 1,000,000 and 2,000,000 tons. Many other minerals are found in smaller quantities, including manganese ore, sulphur, cobalt, zinc, antimony, tin, and salt. The number of manufactories in C. is rapidly increasing; and in the last census there were some 300,000 employees in manufacturing establs. They include smelting works, breweries and distilleries, flour and saw mills, textile factories, tanneries, sugar refineries, and works for the manuf. of foodstuffs, starch, soap, paints, furniture, boots and shoes, glass-ware, biscuits, hosiery, hats, candles, matches, brushes, cordage, baskets, pottery, and cigarettes. The Chilean people are of Sp. language and physique, though there is a not inconsiderable admixture of native Indian blood. At the time of the Sp. conquest in the sixteenth century, a native race calling themselves Moluche (warriors) occupied the greater part of the present republic of C. The Spaniards called this race Araucanians, and when they conquered the Incas they left the former in possession of a state of their own, to which was given the name of Araucania. A portion of this area, along the slopes of the Andes from Copiapo to Chiloé, is still inhabited by them. Other tribes worthy of mention are the Changos in the N., an Aymara tribe; the Ailacul in the channels lying to the N. of the strait of Magellan; the Onas and the Yagans in Tierra del Fuego; and the Tehuelches, inhabiting part of the mainland of Patagonia. There is a considerable foreign element in C., chiefly Gers. in the extreme S., natives of the Argentine Republic in the N., and Fr., Eng., and N. Amers. in the middle prov. The total trade of C. in 1937 was \$34,411,000, but in 1943 only \$16,200,000 (exports, \$10,722,000; imports, \$23,689,000). The

mineral exports are by far the most considerable, and include nitrate and copper, and silver ores in large quantities, together with gold, guano, coal, iodine, borax, and manganese; wine, wool, cereals, vegetables, and fruit are among other goods exported. Exports of fresh bird guano are prohibited, but exports of fossilized guano, which began in 1934, are a valuable industry.

The chief imports of C. are machinery, oils, combustibles, textile goods, tools, and electrical equipment; most of the trade is done with Great Britain and the U.S.A., the latter being the chief importer. The prin. ports for exports are Iquique, Pisagua, and Antofagasta; Coquimbo, Valparaíso, Valdivia, and Punta Arenas. Valparaíso is by far the most important port for imports, two-thirds of the total entering there, whilst Iquique and Talcahuano come next in importance. There are 5444 m. of railway, both State and privately owned (State-owned, 3629 m.; Brit.-owned, 1815 m.), linking up the ports with the industrial centres; the railway from Valparaíso to Buenos Aires crosses the Andes at Uspallata (9843 ft.), by a tunnel having a length of over 6 m.; two other lines cross the Andes to Bolivia. A convention between C. and Argentina, signed in 1922, arranged for the construction of two more trans-Andine lines. C.'s main railway line, the Longitudinal Railway, runs from N. to S. with branches connecting with the ports. The Chilean trans-Andine line is now part of the State railway system. Aviation is highly developed between interior points and abroad. A plant for manufacturing aeroplanes was first estab. in 1930. There are six civilian and two gov. airports. There are telegraph and telephone lines, and a chain of wireless stations extends along the coast. The republic of C. is the best regulated of the republics of S. America; as an independent state it has attained a higher degree of prosperity than any of the others, notwithstanding the fact that it was one of the least important Sp. colonies in the New World. The constitution of C. dates from 1925, when that of 1833 was superseded. The president of the republic is elected by direct popular vote, his term of office is for six years. The finances of the country are in a satisfactory condition on the whole. Legislative power is in the hands of the National Congress, which consists of a Senate of forty-five members, and a Chamber of Deputies of 143 members. All voting is by ballot, and there is a universal suffrage for registered citizens over twenty-one years of age who can read and write. Until its disestablishment in 1925, the Rom. Catholic was the State Church; it is still the chief religion; there is an archbishop of Santiago, ten bishops, and four vicars apostolic. Full religious toleration has been estab. since 1865. The condition of education in the republic has been improved of late years; it is now free and compulsory for all children between the ages of seven and fifteen. There is a univ. at Santiago,

technical and secondary schools, and 4760 public and private primary schools. There are, besides, professional and agric. schools, and schools of mines. There is a national library containing about 300,000 vols. Since 1900 military service has been compulsory, and conscription obtains in both the army and the navy. Area of the republic 285,100 sq. m.; pop. (1940 census) 5,023,539; (estimated for 1947) 5,347,899. Pop. of Santiago (the cap.), 1,002,000. Other cities and tns.: Valparaíso (260,000); Concepción (86,000); Temuco (85,000); Viña del Mar (80,000); Chillan (62,000); Talca (57,000); Antofagasta (52,000); Valdivia (49,000); Talcahuano (42,000); Iquique (39,000); Magallanes (formerly Punta Arenas) (34,000). See R. P. Diego do Rosales, *Historia General del Reyno de Chile* (Valparaíso), 1877-78; A. U. Hancock, *History of Chile*, 1893; W. E. Parker, *Chileans of To-day*, 1920; W. E. Browning, *Chile*, 1930; A. Edwards, *The Dawn*, 1931; M. C. McBride, *Chile: Land and Society*, 1936; H. Michel, *Land of the Condor*, 1947; also V. Figuero, *Historical, Biographical and Bibliographical Dictionary of Chile* (5 vols.) (Santiago), 1931.

Chilecito, tn. of the Argentine Republic in the prov. of and 40 m. N.W. of the cap. of La Rioja in the Famatina valley. Mining is the chief industry, gold, silver, and copper being worked. Wines are also distilled. The tn. is connected with Córdoba by rail. Pop. 9300.

Chilli, Chihli, or Pechili, prov. of China, see HOPEI.

Chiliad (Gk. χίλις, a thousand), group of a thousand things; the numbers of one multiple of a thousand to the next; also a period of a thousand years.

Chilian, St., see KILIAN.

Chillianwala, or Chillianwalla, vil. in the W. Punjab, Pakistan, 30 m. N.W. of Gujrat. It was the scene of a battle between the Brit. and the Sikhs on Jan. 13, 1849.

Chilina, or Chilean Snail, genus of gastropod molluscs representing the family Chilinae. The species are fresh-water pulmonates with larger pulmonary apertures than are to be found in any others of their sub-order, and their visceral commissure is unusually long. They inhabit Chile, S. Brazil, and Patagonia.

Chilka, lagoon in S.W. Bengal, India, cut off from the bay of Bengal by a sandy ridge. Its usual area is about 350 sq. m. and its depth only about 6 ft., but at the height of the rains its depth and extent considerably increase. It contains some inhabited is., and the vils. on the coast are engaged in the salt-working industry.

Chilkoot Pass, pass about 28 m. long, over the Rocky Mts. in Alaska, U.S.A. This pass, on the route of an anc. Indian trail, was at one time one of the chief means of reaching the Yukon gold-fields from the coast of Alaska. Thirteen miles from its starting-point, at Dyea, it reaches a height of 3500 ft.; it terminates at Lindeman, Yukon, Canada.

Chillan, cap. of the prov. of Nuble in Chile, 112 m. by rail E.N.E. of the seaport tn. of Talcahuana. It is a thriving com-

mercial city with trade in cattle, grain, and hand-made lace, situated on the slope of an extinct volcano in the midst of rich agric. country. Pop. 62,000.

Chillicothe, name of two cities of the U.S.A.: 1. City in Missouri, the cap. of Washington co., 90 m. N.E. of Kansas City; largest tn. on the railway between Hannibal and St. Joseph. Trades in coal, limestone, live-stock, wool, and hides. Pop. 8000. 2. Co. seat of Ross co., Ohio; manufs. carriages, paper, iron, leather, farming implements, and machinery. Pop. 20,000.

Chilling, or **Chill Hardening**, the process of cooling metals rapidly, so that the skin becomes hard, leaving the inner portion soft. Molten iron poured into moulds, cools more rapidly at the surface than inside, the consequence being that a hard coating, capable of taking a polish and less liable to rust, surrounds the inner soft portion. Shot are chilled and hardened by being allowed to drop through the air and thence into water. See also **CASE-HARDENING**.

Chillingham, par. township and vil. on the R. Till in N. of Northumberland, 8 m. S.W. from Belford railway station. C. Castle, the seat of the earl of Tankerville, was built in the reign of Edward III.; its park is part of an anct. forest. In the park is preserved a herd of semi-wild cattle. Pop. 190.

Chillingworth, **William** (1602-44), famous Eng. divine of the seventeenth century, b. at Oxford. Admitted to Trinity College, Oxford, 1618; became M.A., 1623, and appointed fellow of the college, 1628. He became a convert to Rom. Catholicism under the influence of the Jesuit Fisher, and went to the Jesuit College at Douay. His godfather, Dr. Laud, bishop of London, persuaded him to leave the Rom. Church. He quitted Douay and studied the claims of Protestantism, and eventually entered into the fold of the Eng. Church. He had very conscientious scruples, and declined to accept a preferment offered to him by Sir Thomas Coventry, keeper of the great seal, in 1635, because he could not subscribe to all the Thirty-nine Articles, and was opposed to the damatory clauses in the Athanasian creed. He wrote in 1637 *The Religion of Protestants a Safe Way to Salvation*, a famous polemic characterised by clear style and logical reasoning. He finally overcame his scruples and was promoted to the chancellorship of the church of Sarum (1638), and became prebendary of Brixworth in Northamptonshire. A staunch Royalist and believer in the doctrine of divine right of kings, he took an active part in the Civil war, was taken prisoner at Arundel Castle by Sir Wm. Waller, and d. at Chichester.

Chillon, thirteenth-century castle or fortress of Switzerland at the E. extremity of Lake Geneva, canton of Vaud, 2 m. S.E. of Montreux. It stands on an isolated rock connected with the mainland by a wooden bridge. It was long a State prison, but is now an arsenal. Here François de Bonivard, a political prisoner, was incarcerated in 1530-38. See Byron, *The Prisoner of Chillon*.

Chiloé Islands. These is. off the W. coast of S. America form, with other smaller is., the insular prov. of Chiloé, with an area of 12,680 sq. m. The main is., 118 m. long by 35-40 m. wide, comprises five depts. and these are called Ancud, Chacao, Dalcahue, Castro, and Conchil. Castro, the anct. cap., is a seaport tn., and was founded by the Spaniards in 1556 under García de Mendoza. Another seaport, San Carlos, is the modern seat of gov. The climate is moist and healthy. Timber is exported. The chief products are potatoes and wheat. Pop. of prov., which includes strips of the opposite mainland, about 215,000. The cap. of the prov., Puerto Montt (pop. 20,000), on the mainland, has a wireless station.

Chilognatha, div. of the Myriapoda, is sometimes considered to be a sub-order of the Diplopoda, and sometimes coincident with it. Special characteristics are the seven-jointed antennæ, three pairs of legs on the thoracic segments, double pairs on the posterior segments, and genital organs opening usually on the seventh of these segments. Two of the genera are the *Glomeris* or pill-millipede, and *Julus*, or millipede.

Chilomo, see **CHROMO**.

Chilon, one of the seven sages, who fl. 620-550 B.C.; the reputed author of the maxim 'Know thyself.' He held the office of ephor; is said to have d. of joy when his son gained the prize for boxing at the Olympian Games.

Chilopoda, see **CENTIPEDE**.

Chilperic, name of two Frankish kings: *Chilperic I.*, assassinated in 583, was one of the four sons of Clotaire I. He tried to get possession of the whole kingdom on his father's death, but failed. *Chilperic II.*, son of Childeric II., king of Neustria; battled with Charles Martel. Reigned 715-21.

Chiltern Hills, range of chalk hills clothed with beechwoods extending partly through the cos. of Oxfordshire, Buckinghamshire, Bedfordshire, and Hertfordshire in England. The highest summit, near Wendover, lies 885 ft. above the sea. They extend some 45 m. N.E. from the Thames at Goring. Wendover Hill and Ivinghoe Beacon, both just over 900 ft., are the highest points. There is some beautiful scenery in the dist. which includes Ashridge, Hampden, Chequers, and other places of interest. See J. H. B. Peel, *Chilterns*, 1943.

Chiltern Hundreds. 'Taking the Stewardship of the Chiltern Hundreds' is a very familiar parl. phrase applied to any member who wishes to resign his seat. The hist. of this phrase has arisen in this way: An old Eng. statute declared that no member of Parliament, once chosen, could vacate his seat in Parliament. This was afterwards amended in 1707, when it was stated that a member could resign, provided he held an office of profit from the Crown. Among these offices held by members of the House of Commons were eight crown stewardships, but these did not fall within the terms of the statute 1707, for no one holding these stewardships was exempt from parl. duties. It was not till the passing of the Place Act

In 1742 that the appointment to one of these crown stewardships served as an excuse for resignation. Only two of these stewardships survived, viz. Chiltern and Northstead in Yorkshire.

Chiltera, see CHATRA.

Chilvers Coton, par. and vil. of Warwickshire, England, 1 m. from Nuneaton. Coal is mined there. It is mentioned in Domesday as Celderdestoche. The Coventry Canal passes through the par. Pop. of par. 10,500.

Chimæra (Gk. *χίμαιρα*, yearling goat), mythical animal. According to Homer (*Iliad*, bk. vi.), it was a fire-breathing monster, with the head and fore-part of a lion, the body of a goat, and the hind quarters of a dragon. According to Hesiod, it was a three-headed monster, with the heads of a lion, a goat, and a dragon. It was slain by Bellerophon, with the help of Pegasus, in Lycia, where it had wrought much havoc. The origin of the myth has been traced to the volcano of the name of C., near Phaselis, in Lycia, and it is supposed that the summit of this mt. was frequented by lions and goats, and the marshy land at its base by monstrous serpents. The C. has often been presented in ant. and modern art. It is also used as a heraldic symbol on shields. The term is often used figuratively to denote an unnatural imagining of the fancy. In Botany C. is used as a name for the plants formerly known as graft hybrids.

CHIMÆRA

Chimæra, genus of fishes which holds a disputed place among the Elasmobranchs, to which the sharks and rays belong, and with the *Callorhynchus* forms the subclass Holocephali. They are distinguished by having four gill-clefts covered by an operculum, a few large teeth, no spiracle, one anal and two dorsal fins, and a long thin tail prolonged into a filament. The species inhabit deep water in Europe and America; *Ch. collett*

of N. America is known as the sea-cat, and *Ch. monstrosa*, the king of the herrings, is an ugly Brit. species about four feet in length, which is frequently captured by herring-fishers.

Chimborazo, mt. in S. America, one of the highest peaks of the Andes in Quito. The mt. is cone-shaped, perpetually snow-clad, and rises 21,424 ft. above the sea. Many attempts have been made to climb to its summit, and Whymper succeeded in gaining the top in 1880. The mt. gives its name to a prov. of Ecuador: area 2990 sq. m.; pop. 260,000; cap. Riobamba.

Chimbote, small seaport of Peru in the dept. of Ancachs, about lat. 9° 10' S. The tn. is the starting point of the railway to Huaraz, which is 172 m. to the S.E. It possesses a good harbour in Ferrol Bay. Many remains of a very early date have been found in the neighbourhood.

Chimere (Fr. *samarre*, O.F. *chamarre*, a loose, light gown), outer robe worn by a bishop to which the lawn sleeves are usually attached. In the Eng. Church the C., which, until the reign of Elizabeth, was of scarlet silk, is now of black satin. During episcopal conventions and when the king attends Parliament the C. is scarlet. Eng. prelates of the Rom. Catholic Church wear C.'s of purple silk; cardinals wear scarlet.

Chimes, series of sounds given by a set of attuned bells in a belfry or church tower. The bells may number from five to twelve (or more) and are sounded by performers, one to each bell. Chiming, specifically, is the gentler method of sounding bells, in which the performer moves the bell just enough for the clapper to strike its side, in contradistinction to ringing, in which the bell is swung round in a circle and starts from an upside down position or mouth upwards. C. differ from a *carillon* in that the bells are swinging, whereas in a *carillon* they are fixed and struck on the outside by hammers actuated from a manual and pedal keyboard similar in principle to that of an organ. See also BELL; CARILLON MUSIC.

Chimkent, or Tchimbkend, tn. of the Kazakhstan S.S.R. It lies on one of the sub-tribs. of the Syr Daria R., about 70 m. N.N.E. of Tashkent. Strategically and commercially the tn. is very important, for it stands near the junction of three railway routes—from Ferghana, Bokhara, Tashkent, Samarkand, and Stalinabad on the S., from the Aral Sea and Chkalov on the W., and from Alma-Ata and Semipalatinsk on the N.E. This point is at the W. end of a valley which separates the Alexander range and the Ala-tau. Consumptive patients take the *koumiss* cure here. C. has lead refineries.

Chimney, see TISMNIANS.

Chimney, enclosed passage, constructed in a wall, for the escape of smoke from the fire-place or furnace, and for the purpose of producing a draught to excite the combustion of the fire. Hot air is lighter than the cool air of the atmosphere, and consequently the air, heated by the fire, rises, pushing the smoke upwards. The draught caused by the escaping current of air is in proportion to the size of the C..

a greater draught being produced by a high C. than by a small one. As the draught draws the fire and causes intense heat, the C. stacks attached to factory furnaces are built to a great height. As an example the St. Rollox shaft, Glasgow, may be mentioned, which stands 455 ft. high. The usual proportions are for the height to be ten to fourteen times the diameter at the base, and the diameter at the summit two-thirds of the lower diameter. Cs. are usually constructed so that the draught and the smoke can be regulated by dampers. In manufacturing ins. regulations have to be made for the good of the community as to the length of time a chimney may smoke. Further, Cs. exceeding 100 ft. in height must show a red light to give warning to aircraft. Cs. are comparatively modern. In Gk. and Rom. houses it was usual to have a hole in the roof for the escape of the smoke. Cs. were first introduced into England, probably from Italy, in the late twelfth century. At first they were made with wide apertures which, in practice, have proved very inconvenient, as the inlet of large currents of outer air causes the C. to smoke. Ornamental chimney-pieces were a great feature of late Gothic and Elizabethan styles. In primitive Cs. the funnel sometimes projected into the room, but later the chimney-piece, with the fireplace round it, was regarded as one of the chief ornamental features of a room. Carved wooden chimney-pieces, adorned with niches and columns, were carried up to the ceiling, the lower portion being fitted with seats. Examples of fine stone Cs. may be seen in Windsor Castle, Tattershall Castle, and the Palais du Franc at Bruges. The material now in general use for chimney-pieces is marble. The term C. is used also to describe a narrow vertical cleft in rock.

Chimney-sweeper. Formerly young boys were employed to climb up chimneys for the purpose of cleaning them. They were subjected to such fearful cruelties by their masters that the matter was brought before parliament, and Acts were passed regulating the employment of Cs. in 1840, 1864, 1875, and 1894. These laws enacted that no person under the age of twenty-one might ascend or descend a chimney or enter a flue for the purpose of cleaning it; that no child under sixteen might be apprenticed to the trade; and that every C. must buy annually a licence costing 2s. 6d. The irritation of the soot frequently caused a disease known as C.'s cancer. In 1805 George Smart invented a 'chimney-sweep' which superseded climbing boys. It was a stiff, radiating brush of rattan, fixed on to a long rod, which consists of jointed sections of cane, and this form is still used.

Chimelo, or **Chimlyou,** riv. of Portuguese E. Africa, which flows first S.W., then N.W. to N., finally emptying itself into Lake Victoria after a course of 125 m.

Chimnanthus, small genus of Calycanthaceae, contains only two species, both of which are natives of China and Japan,

and are known as Japanese allspice. *Ch. vilens* is a beautiful evergreen, but *Ch. fragrans* is a shrub which drops its leaves in Nov. The flowers come out about Christmas time or early in the New Year upon the naked branches, and yield a delicious fragrance.

Chimpanzees, popular term for the genus of anthropoid Apes, or Simiidae, known technically as *Troglodytes*, or *Anthropopithecus*. These apes are closely related to the gorillas, but they have longer limbs, and there is little difference between the sexes, except that the female is the smaller. They inhabit trees, in which they build night-shelters, and all are natives of Africa. Unlike the gorillas, they are gentle and playful, and when kept in captivity they exhibit much intelligence; unfortunately, the climate of N. lands proves too much for them after two or three years. Their diet consists chiefly of fruits and nuts, but the Cs. are also fond of animal food.

China, more accurately the Chinese Republic, is an extensive dominion of E. Asia of which C. proper constitutes the prin. portion. For centuries this dominion has been known as the Chinese Empire, and it is hereinafter referred to as such, although the form of gov. is republican. It also includes the special ter. of Tibet. Its most northerly point is about 49° N. lat., while its S. extremity, the is. of Hainan, is in lat. 18° N. From W. to E. it extends over more than 80° of long., from 74° E. to 135° E. This vast extent of ter., estimated at about 3,875,000 sq. in., is larger in area than Europe, which it approximately equals in pop. C. proper occupies the S.E. portion of the empire, and is bounded on the S. and S.W. by Cochín C., Siam, Burma, and Tibet; on the N.W. by Kazakhstan; and on the N. by Mongolia and Siberia. On the E. is the Pacific Ocean, known by different names at various parts of the coast. Mongolia, or Outer Mongolia,

seceded from C. in 1915, becoming an autonomous republic in alliance with Russia after the 1917 revolution. In 1924 the U.S.S.R. acknowledged the suzerainty of C. over Mongolia, but by the Russo-Chinese treaty of 1945 it became completely independent. The country of Korea (Chosen), on the N.E., was once a dependency of C., but the suzerainty was not much exercised during the middle of the nineteenth century, and in 1895, after the disastrous war with Japan,

360 m. of sandy coast; then 350 m. bold and rocky to the gulf of Chihli; then 450 m. low and sandy to the parallel of the Chusan Is.; then 800 m. from Chusan to the bay of Canton, mostly high, bold, and rocky. A number of low, sandy is. form the coast near Canton, westward of which there is an alternation of low and bold shores. The whole coast, counting only the larger promontories and inlets, extends over about 2250 m., though if all the indentations be accurately estimated, the

THE GREAT WALL OF CHINA, AT THE HANKOW PASS

E.N.A

the dist. fell under the control of the latter country. At the same time Formosa (Taiwan) became part of the Jap. Empire and so remained until the Jap. defeat in 1945. After the Sino-Jap. war, 1931-1933, and the Jap. invasion of C., which was resumed in 1936, Manchuria, the N. Provs., and the greater part of the coastal regions of C. fell under Jap. control (*see under HISTORY infra*). The Chinese Empire has been characterised by exclusiveness from the beginning, and the practice of this feeling has been rendered easy by the geographical situation. The empire is cut off from the rest of Asia by high mt. ranges and tablelands. Except by the sea, it was difficult for foreigners to penetrate. The coastline is almost all that of C. proper, though near the borders of Korea Manchuria has a short coastline. From the borders of Korea, about 240 m. of the coast are bold and rocky. Then come

distance would be doubled. A considerable portion of C. proper is covered with mts., and the whole surface may be divided into the mountainous country, the hilly country, and the great plain. The mountainous country comprehends more than half of the whole, and the meridian of 112° E. may be considered its E. boundary, but to the N. of the Hwang Ho (Yellow R.) and it extends as far as 114°. The hilly country lies to the E. of 112° E. and extends N. to the Yangtze-kiang. The Great Plain occupies the N.E. part of C. It extends in length some 700 m., from the Great Wall, N. of Peiping (Peking), to the confluence of the rivs. Yangtze-kiang and Kankiang. Its width varies from 150 to 250 m. in the N. half, and from 300 to 500 m. in the S. half; the total area is about 210,000 sq. m. The W. end is the more fertile part, and it was to protect this from the inroads of nomadic Tartars that the Great Wall

was erected about 200 years B.C. This marvellous work extends over mts. and rvs. for over 1400 m. The main substance of the wall is earth or rubbish, retained on each side by a strong casing of stone and brick, and terraced by a platform of square tiles. It commences at the gulf of Liaotung, whence it extends westward to the Chiayu barrier gates, the workmanship gradually deteriorating. The thickness of the wall at the base is often as much as 25 ft. The mt. system must be considered in relation to the surrounding dependencies. The N. of C. proper is bounded by the Alanshan and the In Shan which are a continuation of the Tianshan Mts. of Siberia and Sinkiang. The same range then extends N.E. as the Khingan Mts., entering Manchuria and ending at the Amur R. The Altyn Tagh Mts. traverse the S. of Sinkiang, bound Tibet on the N. for a short distance, and continue in C. proper as the Nan Shan. Still further S. comes the continuation of the great range of N. Tibet, the Kunlun. This extension stretches right across C. separating the two rvs. the Hwang Ho and the Yangtze-kiang, under the names of the Peilingshan, the Tsilinglingshan, and the Funiushan. All these mts. gradually diminish in height as they move eastward, and become covered with the loess, which forms so conspicuous a feature of N. China, and which contributes so greatly to its fertility. Almost parallel to the Kunlun, and forming a branch thereof, comes the Tangle range, which extends E. as the Tapashan. A S. branch of the Funiushan is the Hwaiyangshan. Offshoots from the Tangle range, itself a branch of the Himalayas, and from the continuation of the main Himalayan range, run almost due N. and S. along the S.W. boundary, chiefly through the provs. of Szechwan and Yunnan. However, the most extensive range of S. C. is the Nanlin or S. range, a spur of the Himalayas. It commences in the prov. of Yunnan and runs N.E. in sev. parallel ranges to the Pacific, where it ends at the mouth of the Yangtze-kiang. These ranges run through most of the S. coast provs.

The rvs. form one of C.'s conspicuous features. In the N., they usually bear the name *Ho*, in the S. that of *kiang*. There are numerous small independent rvs., but most of them fall into the Hwang Ho and the Yangtze-kiang, two of the largest rvs. of the globe. They rise in close proximity in offshoots of the Kunlun range in Tibet. The Hwang Ho flows for a time parallel to the mts., and then makes a large sweep to the N.E., through the prov. of Kansu. Its curve then follows the Alanshan range into Mongolia. Turning due S., it then forms the boundary between the provs. of Shensi and Shansi. At the S. of the latter it turns due E. again, and runs through Honan. It then inclines to the N.E. before entering Shantung, and enters the gulf of Chihli, N. of Lanchow Bay, by sev. mouths. Its chief trib. is the Wei Ho, which rises in Kansu. The Hwang Ho is 2600 m. long, but it is of little use to navigation. Chinese tradition tells of

the part of the riv. in Shantung having changed its course no less than nine times, and the surrounding country is in continual danger of inundation. As a result there are no large tns. on this part of the coast. The Yangtze-kiang (Takiang, or Great R.) also rises in Tibet where it is known as the Ulan-Muran, and flows in a S.E. direction as the W. boundary of Szechwan. It makes a semicircular bend at the S. of this prov., and, after a tortuous course into Hupeh it turns to the S.E., then to the N.E., then S.E. again, and finally runs in a N.E. direction, to empty itself by an estuary into the Eastern Sea. This riv. is the chief waterway of C. Its total length is 3400 m., and along its banks are many flourishing cities, among which may be named Hankow, Wuchang, Chungking, and Nanking. The riv. is navigable by large steamers to Ipin and for junks, to the border of Szechwan-Sikang-Yunnan. Its chief tribs. on the l. b. are Min Ho, the Chialing, and the Han, on the r. b. the Yuan and the Kan. The West R. (Sikiang) begins at Hsuanwei in N. Yunnan and flows through Kweichow, Kwangsi, and Kwangtung. At Samshui its southward arm the Canton R. enters the S. China Sea at the port of Canton. The Grand Canal, or Yun Ho, is the oldest and longest in existence. It was commenced in 540 B.C., and is 1300 m. long. This great waterway commences at Hangchow, in the prov. of the Chekiang, and extends to Tientsin in Hopei, where it joins the Pai, and thus gives direct communication with Tung and Peiping. When the canal was in good condition it well fulfilled the purpose of its maker Kublai, the first sovereign of the Yuan dynasty, in forming a communication between N. and S. China. It has now been largely superseded by steamer routes along the coast and has been allowed to fall into disrepair. The rest of C. is also intersected with many canals, which connect various rvs. and lakes. Parts of the country indeed, are a veritable network of waterways. There are many lakes, but these are not on so large a scale as the rvs. Three only need be mentioned: (1) The Tungting, on the Yun R., about 250 m. in circumference. Two canals connect it with the Yangtze. (2) The Poyang at the N. of the prov. of Kiangsi, is smaller than the Tungting, and about the same size as (3) the Tai, to the S. of Kiangsu.

Provinces.—Mention has already been made of sev. of the provs. of C. proper. They are twenty-two in number, and may now be briefly enumerated. The first seven extend wholly or partly over the great plain; the next two comprehend the hilly dists., two others the mountainous country along the sea, and the remaining eleven include the mountainous country in the interior and W.: (1) Hopei extends over the most N. and less fertile part of the plain. In it are situated the important tns. of Peiping and Pao-ting. (2) Shantung comprehends part of the plain and the peninsula of Shantung. Chief tns., Tsinan, Yenchow, and the ports of Weihaiwei, Tsingtao, and Chefoo. (3)

Kiangsu includes the low and swampy country on both sides of the Imperial Canal. It contains the cities and tns. of Chinkiang, Soochow, Nanking, and Shanghai. (4) Anhwei, on both sides of the Yangtze, has for its chief tn. Hwai-ning (Anking). (5) Honan, on the W. margin of the plain. Chief tns., Kaifeng and Honan. (6) Hupeh, in the centre of the plain, is one of the most fertile provs. Chief tns., Wuchang, Hankow, Hanyang, Siangyang, and Kingchow. (7) Chekiang, in the S.E. of the plain, is the chief green tea prov. Chief tns., Hanchow, Wenchow, and the port of Ningpo. (8) Kiangsi, to the N.W. of the Nan'ang range, is the great porcelain prov. Chief tns., Nanchang, Kiukiang, and Kingan. (9) Hunan, in the hilly country, is rich in cereals. Wolfram is mined there. Chief tns., Changsha, Yunchow, and Hengchow. (10) Fukien, on the shores of the sea opposite Taiwan (Formosa), is the chief black tea dist., and one of the most fertile and flourishing of the Chinese provs. The chief tns. are Fuchow, Chuanchow, and the port of Amoy. (11) Kwangtung, or Canton, the southernmost prov., contains the celebrated city of the same name, Swatow, and Luchow. Not far from Canton is the Brit. crown colony port of Hong Kong and the Portuguese Macao. The Is. of Hainan, to the S. of the Leitchow peninsula, forms part of this prov. (12) Kwangsi, occupying both banks of the Si-kiang R., is a mountainous prov., of which the chief tn. is Kweilin. (13) Kweichow is a very mountainous prov. to the N. of Kwangsi, and is especially rich in minerals. Its chief tn. is Kweiyang. Like Kwangsi, it contains aboriginal tribes, different from, and hostile to, the Chinese. (14) Yunnan, the most south-westerly prov., is an irregular table-land, and is rich in minerals; the two chief tns., Yunnan and Yunchang, carry on a considerable trade with Burma and Siam. (15) Szechwan is a succession of hills and valleys, rich both in mineral and in vegetable produce. Its chief tns., Chengtu and Tungchwan, are places of great pop. and trade. Chungking, the Chinese cap. during the Second World War, stands on the Yangtze. (16) Shensi is a rugged country with wide fertile valleys; its chief tn., Sian, is very large, and was once the cap. of C. (17) Shansi, adjoining the Great Wall, is a mountainous but fertile prov. Its chief tns. are Taiyuan and Ta-tung. (18) Kansu, in the N., is sterile and thinly peopled. Its chief tn. is Lanchow. (19) Sikang lies between Szechwan and Tibet and is watered by the Yangtze. The cap. is Kanking. (20) Chinghai, N.E. of Tibet, is sparsely populated. The prov. is mountainous and the terrain in the valleys is generally unsuited for crops, being loess or shifting sand. The chief tn. is Sining. (21) Sinkiang, comprising the greater part of the area known formerly as E. or Chinese Turkistan, is the most easterly and largest prov. of C., cap. Tihwa. (22) Taiwan, or Formosa, now has the status of prov. The Is. has gold and coal mines, but the chief industry is

agriculture, tea and sugar being exported. The cap. is Taipei. The N. area of C., stretching from the E. of Sinkiang to Manchuria in the N.W., is known as Inner Mongolia and contains the provs. of Ningia, Suinyan, Chahar, and Jehol. The provs. of Antung, Hellungkiang, Hokiang, Hsingan, Kirin, Liaoning, Liaopeh, Nunkian and Sunkiang, and the municipalities of Harbin and Shenyang (Mukden), comprise Manchuria (*q.v.*). The Special Ter. of Tibet is nominally a dependency of C., but preserves a great measure of independence. In 1914 a conference of delegates of C., Tibet, and Great Britain considered a Convention recognising the autonomy of Tibet proper (outer Tibet) and created a zone (inner Tibet) under Chinese authority subject to existing Tibetan rights. The Chinese Gov. did not ratify the Convention though they accepted its terms in all respects save the boundaries between inner and outer Tibet. C. administers Inner Tibet through the Mongolian and Tibetan Affairs Commission of the Executive Yuan and maintains a representative at Lhasa, the cap. (*see* TIBET).

Climate.—The climatic conditions naturally vary considerably over so large a stretch of country. In the lofty Tibetan plateau and the less elevated plains of Mongolia the climate is exceedingly dry, and is marked by great extremes of hot and cold. The basins of the two great rivs., being nearer the Pacific, are moister and more equable. In this part of C. proper the dry season lasts from Nov. to Feb., the remaining months, particularly May, being extremely wet. The rainfall is of a copious tropical nature. Generally speaking, C. is a cold country in comparison with European ters. in the same lat. From July to Sept., however, the weather is intensely hot, and the heat is accompanied by typhoons, which are much dreaded for their violent and devastating effects.

Area and Population.—The area and estimated pops. (1947) of the provs. and municipalities of C. are given in the table opposite.

Communications.—C. is intersected in all directions by roads and canals. Before and during the Second World War two great motor roads were built to connect China with the outside world. From Chungking the Sinkiang Road runs N.W. to the Turkestan railway in Russian Turkmenia, and the famous Burma Road through Yunnan to the railroad at Lashio in Burma. A motor road to the N.W., connecting Szechwan with Sinkiang and running through that prov. to the Turkestan-Siberian railway is under construction. The distance is 2500 m. from Chungking, to the nearest point on the Soviet line. A railway and a motor road now connect C. with Fr. Indo-C. For the rest the roads are mostly mere tracks, but such as they are they have been used for centuries. Twelve of the anct. trade routes have been used from time immemorial. There is an important trade route from Peking to Lhasa, from which tn. there are further

extensions to India and N. Tibet. The whole length of the Himalayas is crossed by numerous passes, which make the transit from Tibet to India easy. The two most convenient are those by the Parlyong and Karkangla Passes. The chief ant. trade route from C. to Russia runs from Peiping through Mongolia, near Kiakhta on the Siberian frontier. Another route runs from Hankow through

the N. of Kansu, ultimately reaching Chkalov. The great central Asian trade route, with a total length of nearly 3500 m., runs from Peiping to Kashgar in Sinkiang. The Chinese portion passes through the provs. of Shansi, Shensi, Kansu, and thence to Hami, Urumtai, and Kashgar. In 1921 a Good Roads movement was started, and met with considerable support. Two roads were

advocated from Shanghai, one to Nanking and the other to Hangchow. The Peiping to Tien-Tsin road was completed, and Peiping and sev. other tns. have macadamised thoroughfares. The laying down of railways was started about 1870, the first line to be opened being from Shanghai to Wusung (12 m.). But the opening of this line in 1876 caused such trouble that no work was resumed until the nineties. Then a N. line was constructed through Manchuria to join the Russian trans-Siberian line. The prin. railways are the Peiping-Hankow railway (814 m.); Tientsin-Pukow railway (686 m.); Canton-Hankow railway (768 m.); Peiping-Mukden (Shenyang) railway (832 m.); Nanking-Shanghai railway (247 m.); Shanghai-Hangchow-Ningpo railway (179 m.); Lung-Hai railway (687 m.); Kiaochow-Tsinan railway (285 m.); Peiping-Suiyuan railway (540 m.); Chekiang-Kiangsi railway (400 m.); Tatung-Puchow railway (390 m.); Yunnan railway (Tonkin frontier to Kunming, 290 m.); S. Manchuria railway, from Chungchun to Dairen (696 m.); the Chinese E. railway, running eastwards from Manchuli through N. Manchuria to Suifenho, at which latter place it joins the Ussuri railway and then runs E. to Vladivostok and thence S. from Harbin to Changchun to join the S. Manchuria railway. This line was constructed by the Russians and, under agreements made in 1896-98, was operated by Russians and Chinese. It runs for nearly 1500 m. in Chinese ter. In 1935 the Soviet Gov. sold the Chinese E. railway to the Jap.-controlled gov. of Manchukuo, in spite of the Chinese Gov.'s protest against the sale. C. has a fairly well developed telegraph service. Telegraphs connect all the prin. cities in the country, and there are lines to all the neighbouring countries. The telegraph lines have a total length of over 60,000 m. In 1896 a postal service throughout the empire was estab., and serves all the ports and important tns. Wireless telegraphy is also estab., and many broadcasting stations on the short-wave system have been estab. for the past ten years or more. Civil war held up the development of commercial aviation, but in 1929 a Sino-Amer. enterprise was set on foot to provide a daily air-mail service. The total length of the air-mail lines at the beginning of 1936 was 8250 m. The Saigon-Marseilles, Bandoeng-Amsterdam, and Imperial Air Lines have been used for forwarding mails from C. to countries in Europe, Africa, and S. Asia.

Cultivation, Fauna, etc.—The Chinese are essentially an agric. people, and the fertile nature of the country aids their own assiduous efforts. Wheat, barley, millet, and other cereals are cultivated mainly in the N., while in the S. attention is chiefly given to rice. The flora and fauna are both that of the temperate zone, so most of the common European vegetables are everywhere produced and used. In the S. regions, the S. fruits, such as oranges, pomegranates, peaches, plantains, pineapples, grapes, and the sugarcane, flourish well. The tea plant is ex-

tensively cultivated in the S. and W. provs. The use of tea as a beverage was once little known, but it is now universally used throughout the country. The larger and more ferocious descriptions of carnivorous quadrupeds are not common in a country so well peopled and cultivated. The Bengal tiger sometimes appears in the forests of Yunnan, but this is rare, while the lion only occurs in sculpture. Old writers also speak of the rhinoceros, tapir, and elephant as common in C. Cattle, sheep, and horses are comparatively rare, but the yak and the goat are bred extensively in Tibet, where also

Paul Popper

A FARMER OF HUPEH PROVINCE

the panda bear is found. An animal peculiar to this region is the dzo, a cross between the yak and the zebu, which, however, reverts to the original types after the fourth generation. The cultivation of opium is an industry which the Chinese Gov. has attempted to eradicate. Up to the outbreak of civil war in 1917 these efforts were successful. War, however, led to a neglect of the opium regulations. In 1913 the Indian Gov. prohibited the export of Indian opium into C. The normal wheat harvest of C. is officially reckoned at 3,000,000 tons, while 40,000,000 tons of rice are grown for home consumption. In 1927 the soya-bean harvest in Manchuria reached over 4,000,000 tons. Famine, however, has of late years been rife in C.: in Honan the grain and rice harvest failed in 1942 through drought and locusts, affecting 20,000,000 people.

Minerals.—War and the consequent interruption of transport have impeded the development of the mining industry,

but a movement is now on foot to nationalise the mines. The coal reserve of C. is estimated at about 30,000,000,000 tons. The richest fields lie in Shansi (E.) and Hunan (S.). The former of these, an anthracite field, has an area of nearly 15,000 sq. m., and the W. half of the same prov. has even richer stores of bituminous coal. Almost the whole of the S.E. Hunan has coal beneath the surface, but in parts it lies too deep to be mined. The provs. of Szechwan, Kansu, Hopei, and Shantung also contain vast stores of this precious mineral. The average export of coal is 3,000,000 tons a year. Iron-mining has been carried on for thousands of years, but only those ores which could easily be extracted and smelted by primitive methods have as yet been utilised. The reserve of iron ore is estimated at 1,200,000,000 tons, and the average ann. export is about 600,000 tons, most of which has either gone to Japan or, in more recent years, has been seized by that country. In Manchuria, coal and iron lie close together, and here the industry has been rapidly developed. There is much iron in Shansi, and some in Hunan; in the latter prov. some silver and lead are found. Gold is obtained chiefly from the streams in Szechwan, and it is also in this prov. that copper is mined. Yunnan is a rich mining prov., and produces tin, copper, iron, lead, and silver. Tungsten was discovered in 1915, and C. is now the second largest producer in the world, while about 70 per cent of the world's antimony also comes from C. The ann. output of antimony is 1600-1900 tons. Of manganese the production is about 100,000 tons a year. Molybdenum, mercury, soda, and saltpetre deposits are also found, but the copper mines are closing up. Szechwan is rich in petroleum, and the Geological Survey, 1921, placed C.'s resources of petroleum next after iron and coal, but they await development. The total output of salt is some 3,000,000 metric tons annually.

Industry.—The Chinese, having behind them more centuries of continuous development and civilisation than any European power, naturally show many of the inventions upon which we most pride ourselves at an early date. Printing by means of movable type was known in C. centuries ago, and there are still Chinese books of this kind extant which were printed long before the time of Gutenberg. However, this system of setting up type, which is found so useful in languages where the number of letters is strictly limited, is less so in such a language as Chinese, where there are some thousands of characters, and printing from carved blocks has been much more favoured. The making of paper also goes back some centuries before the Christian era. The Chinese excel especially in routine work requiring great patience and technical skill but no originality. Their carvings and engravings on wood, metal, stone, ivory, and crystal, their gold and silver work, lacquer work, and bronze casting are deservedly world-famous. Foreign methods have

now been introduced into their manufactures, and much is done by machinery. Iron works of all kinds, wool and cotton factories, flour mills, match factories, etc., have all been introduced. Tea was originally the prin. Chinese export, but owing to the competition of Indian and Ceylon teas it fell rapidly. An improvement is noted from 1905 onwards. Tea is especially cultivated in the S. and W. provs., in Fukien, Hupeh, Hunan, Kiangsi, Chekiang, Kwangtung, and Szechwan. More important is the silk industry, though it is not yet in as prosperous a condition as it might well be. However, before the Second World War a quarter of the world's supply of silk came from China. Total export of raw silk amounted to nearly 4,000,000 lb. in 1937 and over 2,500,000 lb. in 1938. In the provs. of Hopei (Chili), Kiangsu, and Hupeh, cotton is grown, and C.'s ann. export (1927) was just under 239,000,000 lb. In 1937 C.'s raw cotton exports were valued at 36,000,000 standard dollars, and in 1938 at 101,000,000. C. ranks next after the U.S.A. and India as a cotton country, but owing to the growth of her manuifs. C. receives supplies of raw cotton from both these countries. Since there are about 20,000,000 sheep in C., wool is an important product both for the rug industry and for export. The total export of wool, made from sheep, goat, and camel hair, has been as high as 50,000,000 lb. The flour-milling industry flourishes, having been first introduced by the Russians in Harbin. Including match factories, tanneries, etc., there were, in 1931, about 1500 modern factories in C., besides a great number which were less up to date, but many have been destroyed by the Jap. invaders. A number of the cotton mills were owned by the Jap., and of the 2,025,000 bales of cotton yarn produced in 1935, 1,438,000 bales were produced in Chinese. 547,000 in Jap., and the residue in Brit.-owned mills. Some parts of the W. provs. during the Second World War became centres of industrial activity; Szechwan received many factories transported bodily from the E. and central provs. as the Jap. advanced along the railways and rvs. of pre-war industrial dists. Egg products provide a large export industry. C.'s foreign trade is a development of the last century. The Portuguese estab. a trading port as early as 1522, but in the course of centuries there was no sign of change in the gov.'s attitude of suspicion and hostility to foreigners. All official recognition and protection were refused to traders until 1842, the year of the treaty of Nanking. Since that time the number of treaty ports, through which commerce is permitted, has been gradually growing. The figures* on the next page (from *The Statesman's Year Book* for 1939) give C.'s foreign trade, exclusive of bullion, in recent years.

In 1938 the tea export was 239,000 quintals to Hong Kong, 2410 piculs to Russia, 21,000 to the U.S.A., 9023 to Great Britain, and 3284 to France.

Shipping and Navigation.—In 1927 the carrying trade was much harassed by

	1934	1935	1936	1937	1938
Net Imports	Dollars 1,029,695,000	Dollars 919,211,000	Dollars 941,545,000	Dollars 953,386,000	Dollars 886,197,000
Exports	535,214,000	575,809,000	705,741,000	838,256,000	762,641,000

Trade by prin. countries in 1937 and 1938 in thousands of standard dollars (net total values) was as follows:

	Imports		Exports	
	1937	1938	1937	1938
	1000 standard dollars	1000 standard dollars	1000 standard dollars	1000 standard dollars
Great Britain	111,695	70,606	80,380	59,769
Hong Kong	19,078	24,589	162,901	243,395
India (excluding Burma)	12,467	16,214	11,791	19,720
Russia	704	5,491	4,591	613
France	15,106	18,304	32,643	20,402
Singapore	10,362	7,312	19,213	17,545
Italy	9,906	17,465	6,840	1,260
U.S.A.	188,859	151,254	231,449	86,850
Japan	150,432	209,864	84,306	116,554
Germany	146,374	112,939	72,447	56,430

The chief imports and exports for 1937-38 were as follows, in standard dollars:

Imports	1937	1938	Exports	1937	1938
	1000 standard dollars	1000 standard dollars		1000 standard dollars	1000 standard dollars
Raw cotton, yarn, and thread	20,550	17,461	Animal products	121,494	117,903
Cotton piece goods	14,669	22,540	Oils, tallow, and wax	127,040	53,053
Wool and woollen goods	35,604	18,889	Seeds	35,881	19,499
Metals and ores	131,638	65,118	Raw cotton	31,301	101,033
Fishery products	13,258	9,941	Raw silk	45,866	33,604

Chemicals	61,282	57,117	Tea	30,787	33,054
Dyes and paints	37,105	31,116	Chemicals	7,621	7,979
Coal, coke, etc.	5,995	21,502	Metals and minerals	102,453	106,571
Machinery	65,013	56,399	Piece goods	22,426	24,450
			Paper	7,000	7,758
			Cereals, etc.	15,170	4,851
			Beans and peas	6,465	3,137

piracy. Normal conditions did not return until March 1928. Conditions were again disturbed in 1931 during the Sino-Jap. war of that year; and later, in 1936, when the Jap. invaded the country, conditions became chaotic. C. is peculiar in that its inland navigation is open to foreign vessels by various treaties. The vessels which entered and cleared Chinese ports during 1938 numbered 74,890, with an aggregate tonnage of 29,430,000. The percentages of this tonnage were Brit., 48; Jap., 24; Chinese, 8; Fr. Ger., Nether-

lands, Norwegian, and Portuguese between 3 and 4.

Currency, Measures, etc.—The coinage of C. has varied considerably during the ages. At one time the sole official monetary unit was the copper cash, of which 1000 (or in practice 1220) equalled one *halkwan* (or customs) *tael*. The *tael* is not a coin, but a weight of silver, and its value fluctuates with the value of silver. In 1928 the Hong Kong *tael* was equal in value to 2s. 11½d. A convention treaty with Great Britain in 1902 pledged C. to

inaugurate a standard national coinage. In 1908 an Imperial decree was issued, which made the silver tael coin of 0.98 touch, weighing one treasure-scale tael, the unit. In 1910 this decree was cancelled, and a further edict estab. the silver dollar of 0.90 touch, weighing 0.72 treasury-weight tael, as the new unit. In 1928 the National Gov. decided that the tael should cease to be current after July, when it was proposed to mint a new uniform dollar as legal tender. The foreign dollar has had a successful career in C., and the first Chinese dollar had appeared in 1889. In 1914 a republican dollar was coined, and in 1927 this was replaced by the Sun Yat-sen dollar. The tael, as the commercial unit of exchange, has been abolished since early in 1933, and the present unit of currency is the silver dollar, the rate of exchange being fixed as 1 dollar to 0.715 tael. In 1930 the Brit. Gov. announced its decision to assist in establishing a £10,000,000 Chinese exchange stabilisation fund. (The exchange rate is now fixed by the Foreign Exchange Equalization Fund Committee, which was set up on Aug. 17, 1947. The exchange rate as at the end of 1947 was C. N. \$225,000 = £1 and C. N. \$73,000 = U.S. \$1.) In 1935 the gov. adopted a scheme of monetary and banking reforms, including the following provisions: The bank-notes issued by the Central Bank of China, the Bank of China, and the Bank of Communications to be full legal tender; no use of silver dollars or silver bullion for currency purposes to be permitted; bank-notes issued by banks (other than those mentioned above) to be gradually retired and exchanged for Central bank-notes; a Currency Reserve Board to be formed to control the issue and retirement of legal tender notes and to keep custody of reserves against the outstanding bank-notes. Early in 1936 the gov. promulgated the Subsidiary Currency Act, after which a new series of subsidiary coins were to be coined by the Central Mint (estab. in Shanghai) and issued by the Central Bank. This new coinage consists of pure nickel coins of three denominations—5, 10, and 20 cents. There are also copper coins of 1½ cent each. The prin. weight measures are the liang or tael (1½ oz. avoirdupois), of which sixteen make one chin or catty (1½ lb. avoirdupois); 100 chin make one tan or picul = 133½ lb. These measures are also used for liquids. Though, in C., standards of weights, measures, and lengths vary all over the country, generally speaking two kinds of standards, the old and the new, are in use. The old standard was formulated from a law promulgated in 1914, establishing a double system, the standard metric unit and that based on *ying tao ch'ih*, or 'builder's foot', for length, and keeping tael or liang for weight. The law governing the new standard was promulgated in 1929 and was intended to be the legal standard of weights and measures throughout C. For convenience' sake and customary usage it also estab. a double system; one is the standard metric unit, which came into operation in the Chinese

customs service in 1934. Kung Lee equals the millimetre; K. Fen, centimetre; K. Tsou, decimetre; K. Chih, metre; K. Chang, dekametre; K. Yin, hectometre; K. Li, kilometre. The other, which is temporary in character, is designed only for market use and is to be abolished as soon as the people grow accustomed to the new system.

Finances.—C. has issued five budgets since the estab. of the republic, but after 1923 budgeting was interrupted by civil strife. In 1928, however, a budget committee was formed under the National Gov., but no results have yet been forthcoming. In 1937-38 the revenue amounted to \$879,000,000 and expenditure to \$950,000,000. Military expenses figured the most heavily at \$362,000,000. The chief sources of revenue are the land tax and the customs, the produce of the gov. lands, and the salt, kerosene, wine, and tobacco taxes. Following the example of the U.S.A. in returning to C. her share of the 1900 Boxer indemnity, Great Britain in 1930 agreed also to return her share of that indemnity, as from 1922, to the control of the Chinese Gov., stipulating that the bulk of the funds thus remitted be applied to railway construction and education. All C.'s foreign loans were contracted before 1925. In recent years the only indebtedness incurred by C. has been in the shape of credits granted by the U.S. Gov. on the purchase of cotton and wheat. Foreign loans secured on customs revenue have been regularly amortised with interest paid by the National Gov. The obligations of those secured on salt revenue have also been regularly met in principal and interest, including arrears of interest. At Jan. 1, 1937, the outstanding foreign debts owed by the Chinese Gov. were the following (omnuerated in the currencies in which they were contracted): £46,424,000; (U.S.) \$58,403,000; 100,000,000 francs; 45,478,000 yen; railway loans: £16,373,000; 44,750,000 francs; 50,000,000 yen; 137,743,000 (Belgian) francs; 28,000,000 florins.

Government.—The constitution of the National Gov. of the republic came into legal force on Oct. 15, 1928. The National Gov. is the creation of the Kuomintang (People's National Party), and after the unification of C. under the Kuomintang flag, a central political council was set up, and in 1929 this was reconstituted to consist of twenty-four members and eight reserve members. This council formulates the policy of the National Gov., which consists of a president and from twelve to sixteen state councillors. The National Gov. comprises five *guan*, and the presidents and vice-presidents of these are elected from among the state councillors. The *Executive Guan* supervises the work of the various executive ministries and commissions. These are Ministry of (1) Interior; (2) Foreign Affairs; (3) National Defence; (4) Finance; (5) Economic Affairs; (6) Education; (7) Communications; (8) Agriculture and Forestry; (9) Food; (10) Justice. The executive *guan* includes also the

following commissions; Mongolian and Tibetan Affairs; Overseas Affairs; National Conservancy; and the National Relief and Rehabilitation Administration, National Resources Administration, National Health Administration, and National Land Administration. The *Legislative Yuan* is the highest legislative organ with power to decide matters concerning legislation, budgets, amnesties, war and peace, and the conclusion of treaties. The *Judicial Yuan* comprises the Ministry of Justice, the Supreme Court, the Commission for the Disciplining of Officials, and the Administrative Court. The *Examination Yuan* has charge of the examinations for the civil service and other related matters. Its members are appointed by the President with the consent of the *Control Yuan*, which comprises the Ministry of Audit and also conducts the impeachment of officials. The provs. excluding Mongolia and Tibet, are administered under a prov. gov., consisting of a chairman and thirteen members. The municipal gov. under a mayor is responsible to the provincial gov., but there is also a special municipal gov., if the pop. of the tn. exceeds a million, which is directly responsible to the National Gov. Administration is further subdivided into a local gov. for each dist. or *hsien*, which consists of a number of sections and vils., each with its chief or elder. (By a recent republican ordinance the *hsien* now includes co. cities). See also under *History*.

A new constitution, 'Constitution of the Chinese Republic,' was adopted by the National Assembly on 25 Dec. 1946 and became effective on 25 Dec. 1947. This constitution contains 175 Articles and was first formally pub. by the National Gov. on May 5, 1936. According to the original scheme, the Constituent National Assembly was to be convened at the end of 1937, but this was prevented by the war with Japan. This new constitution is permeated with the principles and teachings of Sun Yat-sen especially his *San-Min-Chu-I*—the purpose of which is to make C. a free and independent state, free from the control of any other nation, a democratic state in which the sovereignty is vested in the body of its citizens. Besides the liberty of the person, the constitution (or constitution *in potentia*) provides that every citizen has freedom of domicile, freedom to change his residence, freedom of speech, writing, and publication, freedom of assembly and association, freedom of religious beliefs, the right to private property, the right to present petitions, lodge complaints, and institute legal proceedings, the right to exercise the powers of election, recall, initiative, and referendum, the right to compete in state examinations, and all other liberties and rights not detrimental to public peace and public welfare. Article 8 is important in that it provides that all citizens of the republic of China shall be equal before the law—hence the equality of women with men is by implication constitutionally guaranteed. The political powers (*i.e.*

election, recall, initiative, and referendum) in the dists. and other local units of self-gov. are to be exercised directly by the people. As to the central gov., they are to be exercised by the National Assembly for the people of the whole of C. The governmental powers (as in the previous constitution) are executive, legislative, judicial, control, and examination. Hence the so-called five-power constitution, as against the ordinary three-power constitution of the W. These governmental powers, being really functions, are entrusted by the nation to the hands of the National (Central) Gov. The National Assembly is constituted of delegates selected directly by the citizens of the *hsien*, the prin. self-governing units, and the municipalities. The election of delegates from Mongolia, Tibet, and the overseas Chinese are determined by special laws. The Assembly numbers approximately 2000 delegates and the term of office of the delegates is six years. The Congress is to meet every three years and its session to last one month, or at most two. According to Sun Yat-sen's theory, the five governmental powers should be exercised by the five *yuan* of the Central Gov. In this constitution it is provided that the executive, legislative, judicial, control, and examination are the highest organs through which the Central Gov. exercises its executive, legislative, judicial, and other powers respectively. But over and above them is the President, who, besides being the head of the state and the representative of the republic in foreign relations, is also the chief of the executive and the co-ordinator of the five *yuan*. He holds some measure of check or supervision over all the *yuan*, but has complete control over none except the executive *yuan*, whose president is to be appointed by and directly responsible to him. The presidents and members of the legislative and control *yuan* are to be appointed directly by the assembly, and, with the exception of the president of the executive *yuan*, the presidents of all the *yuan* are directly responsible to the National Assembly. Complicated as it might seem at first sight, the system is conceived to secure a certain degree of independence for each of the governmental depts., and provides a kind of check and balance among them. For fuller information consult the speeches of Sun Fo (son of Sun Yat-sen), collected and pub. under the title *China Looks Forward*, 1944.

Army and Navy.—The military profession is despised among the Chinese, and hitherto the mercenary system has prevailed. In 1928 the reorganisation of the army was one of the first problems facing the National Gov. On July 11, Chiang Kai-shek, the president, summoned the military commanders to a conference at Tangshan. A memorandum was drawn up and submitted to the Central Executive Committee. The more detailed memorandum which the committee adopted laid down that from sixty to seventy divs. of 15,000 men each should be organised out of the best existing units.

A gendarmerie of sixty battalions of 500 men each was also to be formed. On Jan. 1, 1929, a commission was set up to undertake the work of reorganising and disbanding the then existing army of over 1,500,000 men. At the outbreak of the war with Japan the organised forces at the disposal of the Central Gov. were estimated to be about 1,600,000, consisting of 135 infantry and 11 cavalry divs., but much of this organisation was on paper only. At the end of 1938 it was estimated that the Chinese forces in the field numbered about 900,000 men. In 1898, four years after the Chino-Jap. war, C. purchased five of her best cruisers, the largest of which, the *Hai Chi*, is 4300 tons. Further foreign purchases included two training-ships from Great Britain in 1911. In 1929 the gov. requested and received the services of a Brit. naval mission to reorganise the training of the fleet. As a result of hostilities with Japan most of the ships comprising the Chinese Navy have ceased to exist, including all the cruisers and a large proportion of the gunboats. There are no important naval bases. Existing dockyards are Taku, Foochow, Kiangnan (Shanghai) and Amoy (Fukien). Chinese military aviation commenced in 1919 with the purchase of six Handley-Page machines, forty Vickers Vimys, and sixty-five Avros, originally intended for commercial use only. An air dept. was subsequently estab. for the reorganisation of the air force.

Education.—For many centuries there has been a national system of education, dealing only with the study of Chinese literature and hist., but this was abolished in 1905, when the system of examinations giving entrance to state employments, to which this training was preparatory, was also abolished. There was, however, no attempt at reform until the 1911 revolution, which in its beginning was largely the work of the Chinese students returned from abroad. In 1910 roughly 30,000 students studied in Japan, but owing to a subsequent reaction against Jap. imperialism these numbers dropped to about 5000 in 1927. In that year there were about 2000 students in the U.S.A. and 600 in Europe. There has always been a genuine desire among educated Chinese to acquire what is best in W. culture, at the same time allowing for its defects. A scheme to co-ordinate the national system of education accompanied the political reconstruction of C., and a national conference was held in 1928. It was decided that the Three People's Principles laid down by Sun Yat-sen, the late leader of the Kuomintang, should be taught in all schools. Elementary, secondary, and higher education are provided for, while there are also vocational and technical schools. Primary education is the function of prov. and dist. authorities. Secondary education is a function of the Ministry of Education. Each prov. is in the hands of an education commissioner, but in three provs. the univ. dist. system prevails. These are the Central Univ. dist. (Kiangsu, Peiping Univ., and Hang-

chow Univ. (Chekiang), where the head of the univ. governs the affairs of each prov. Foreign and missionary education is mostly influenced by America. As a result of America's generous remission of a large part of the Boxer indemnity, the Hsing Hua College was built in 1911 for the purpose of training students who are eventually to continue their studies in the U.S.A. Another Amer. foundation is the Rockefeller Hospital, to which is attached the Peiping Union Medical College. The former literacy average of 1 per cent of the whole pop. had risen to 15 per cent by 1930, being much higher in some provs. In the three years 1939-41 some 4,000,000 persons were taught to read and write. It was estimated that this number would exceed 19,000,000 by the end of 1945.

Religion.—Three religions, Confucianism (if it may be called a religion), Buddhism, and Taoism, are officially recognised by the Chinese Gov. Confucianism is a moral system which definitely refuses intercourse with the unknown, and emphasises the duties of the present life. Confucius (K'ung Fu-tzu) encouraged ancestor-worship as a part of filial piety, but he himself is not worshipped as a god. At the present time there is a reaction against his teachings, which uphold feudalism and the family, as being unprogressive. Confucianism makes for extreme courtesy. Taoism, taught by Lao-tze, an older contemporary of Confucius in the sixth century B.C., is a refreshing rationalistic philosophy. Later it degenerated into magic, concerned with the search for the elixir of life. Buddhism entered C. in the first century A.D., and thence spread into Tibet, where in the form of Lamaism it now has its stronghold. Mohammedanism was introduced in the seventh century A.D., and spread with such success that there are now 50,000,000 adherents of this faith in C. (including Manchuria). A large native literature has grown up around it. Christianity was introduced by the Nestorians at the beginning of the sixth century, but died out after flourishing for a short time. In 1247 the first Catholic missionary, Friar John of Carpini, entered C., and in 1581 the Jesuit Friar Ricci made many converts. The Rom. Catholic faith has now 1,250,000 adherents, while Protestantism has about 400,000. Christianity suffers in the eyes of the Chinese owing to the variety of sects which have missionary headquarters in C. The Chinese do not tolerate a paid priesthood. Most of the aboriginal hill tribes are still nature worshippers, and ethnically are distinct from the prevailing Mongoloid pop.

HISTORY.—No trace is found in anct. Chinese literature of any tradition on which a theory might be founded as to the original source of the race. The Chinese have their own traditions as to the hist. of the human race, and this shows no signs of any migration. After the time of P'an-ku, the first man, they tell of ten periods of sovereigns, to the reigns of whom most of the great advances in civilisation and culture are assigned. The first emperor of whom a detailed

account is given is Fu-hsi, whose lifetime tradition fixes as 2852-2738 B.C., but he is regarded by many as a supernatural and semi-human being. Following him, and forming with him the group known as the Three Emperors, come Shun-nung and Huang-ti, carrying the story down to the twenty-fourth century B.C. Immediately following come Yao and Shun, who are regarded by popular Chinese hist. as types of perfect emperors. On their heads are heaped up piles of virtues, all, apparently, of late origin. In 2205 B.C. begins the Hsia dynasty, of which the first emperor, Yu, came to the throne as successor to Shun on account of his engineering ability. This dynasty is supposed to continue till 1766 B.C., when Kie, the eighteenth emperor, a type of the bad king, was overthrown, and the Shang dynasty commenced. This also began well with its first sovereign, Ch'ang-Tang, but gradually degenerated until it ended with the contemptible tyrant Chou-hsin in 1122 B.C. With the next dynasty we begin to reach the grounds of true hist. The period of the Chou dynasty forms, indeed, one of the classical epochs of Chinese hist. Wu-wang, the first emperor, aided by his brother, Chou-kung, set to work to weld the disunited members of the country into a solid whole. In doing this he made use of a system which we must describe as feudal. He brought peace and prosperity to the whole land. Agriculture improved, everywhere great public works were constructed, the nomadic life came to an end, and the foundation of the political system was laid. Literature and the arts flourished during the whole Chou period. The emperor was regarded as the son of heaven, and became the mediator whom the people revered as representative of heaven, and who at the same time sacrificed and acted as high priest for the nation. The outlines, at any rate, of the reigns of the thirty-five sovereigns of the Chou dynasty are correct, and it is probable that the details are also mostly trustworthy. One, at any rate, has been tested. The record is given of an eclipse which occurred in the reign of Yu-wang, and astronomers have calculated that the date given for this is perfectly accurate. The date of the eclipse, Aug. 29, 776 B.C., is, however, generally considered as the first certain historical point in Chinese hist. During the century immediately following, disintegration set in, and the kingdom fell into five states, the period being known as that of the Five Leaders. The fortunes of each state varied considerably year by year, but the state of Ts'in, on the W. border, generally remains the most prominent. This was followed by a period of still greater anarchy and internecine strife known as that of the Contending States. In the midst of this disordered time come the three great Chinese sages, within a century or two of each other. First comes Confucius, b. 551 B.C., the first historian of his country. It was he who united all the traditions of gov. and conduct handed down through the ages, and welded them into the system

of morality which his country has preserved since. He lays particular emphasis on the centralisation of authority, that being a particular need of his age. The father has absolute authority over his family, and the emperor is the father of the State. Lao-Tsze (Laocius) (*q.v.*) and Mencius also belong to this period. The Chou dynasty was now very weak, and the influence of Confucianism was not strong enough to secure unity. The king of Ts'in made war upon the Emperor Nan-wang, and with him the Chou dynasty ended in 256 B.C. For a time there was no emperor, but in 249 B.C. the Ts'in dynasty, from which the name of C. is derived, had its beginning. Chwang-siang-wang, the nominal founder of this dynasty, d. in 246 B.C., and was succeeded by Shi Hwang-ti, the first of the 'universal emperors.' This emperor set himself to do away with the feudal system, and to do this he beheaded some hundreds of the scholars, among whose ranks the system found its chief supporters. To him is attributed the building of the Great Wall, and he is also said to have made many canals, etc. For many centuries the Chinese had been engaged in warfare with the Hsiao-nu, probably connected with the Huns, and Shi Hwang-ti led a successful expedition against this tribe, driving them into Mongolia. He also extended the empire southward as far as the Yangtze-kiang. On the failure of the Ts'in dynasty, war broke out between Liu Pang and Hsiang-Yu, two leaders of the successful rebellion which had brought this about, and the former prince came to the imperial throne under the title of Kao Ti (*c.* 206 B.C.). He was the founder of the Han dynasty. After this period the Chinese political system never acquired any stability, and during the centuries that follow no less than thirty-five dynasties are chronicled, not one of which lasted for more than three centuries. The period of the Hans was one of great progress. Shi Hwang-ti, in his enmity against the literate classes, had ordered the destruction of all the books, except those on ordinary sciences, and an effort was made to repair the effects of this wholesale destruction. The system of competitive examinations, which lasted until the nineteenth century, was now instituted. Except for successful campaigns with the Hsiao-nu, the empire remained at peace.

In the reign of Wu-ti (140-86 B.C.) the power of the Tartar marauders was broken, and E. Turkestan was made subject to the emperor. Many states on all sides were also absorbed, and the Han period ranks as one of the greatest epochs of Chinese national prosperity and expansion. The Chinese—especially those of the N.—still rejoice to call themselves the 'sons of Han.' To this dynasty, which ended in A.D. 220, succeeded an epoch of misrule and disturbance, that of the Three Kingdoms, which lasted for forty-five years. Then the dynasty of the W. Tsiu was estab. by Sz-ma Yen, who took the title of Wu-ti. To this succeeded a chaotic period under the E. Tsiu, which family lost power in 419. This period is

notable for the reception at the Chinese court of an embassy from the Rom. empire, which was then sharing with the Chinese the menace of the Tartar hordes. For two hundred years after 419 almost all trace of ordered gov. was lost. No less than fifteen dynasties succeeded to the throne during this period. In 618 Li Yuen, taking the name of Kao-Tsu, made himself the first emperor of the great

960, the Sung dynasty, was far greater. Between these two (907-60) come five minor dynasties. This is, above all, the period of C.'s literary activity. Book-making, printing, and the formation of libraries were actively carried on throughout the country. The chief adversaries of the empire during this period were the N. Khitán Tartars. The first three kings, T'ai-tsu, T'ai-tsung, and Chou-tsung,

New York Times Photos

THE KIULING OR NINE DRAGON WALL IN PEIPING

This wall of coloured tiles was built during the Liao era (916-1125) by a member of the Manchu dynasty from Jehol who seized the throne. The relief work in five bright colours shows nine dragons leaping energetically over waves to catch a bouncing ball. The dragon was the symbol of Chinese dynasts, the ball, the sun, signifying the reins of power

T'ang dynasty. The three hundred years which followed, to its fall in 907, were years of great expansion and progress. At first the power of the Turks on the W. was so great that they had to be propitiated, but it was not long before aggressive measures could be taken, and the frontier was greatly extended in their direction as far as E. Persia and the Caspian Sea. From every part of Asia ambas. were received at the Chinese court. Later the frontier was also extended on the N. to the borders of Korea by the defeats inflicted on the Khitán. At the end of the eighth century the T'ang dynasty began to decline, but that which succeeded it in

carried on a campaign against them with gradually declining success, and the Chinese were finally compelled to call in the aid of the Nüchih Tartars to expel the Khitán from Liaotung. This the Nüchih did, but they then refused to leave the country they had thus occupied. They took the offensive against the Chinese and ultimately possessed themselves of the whole of N.C., over which they estab. the Kín dynasty, leaving only the S. half to the Sung. Meanwhile, the power of the Mongols in E. Asia was increasing, and it was the N. kingdom that first felt the approach of the new danger. In alliance with the Khitán, Genghis Khan, the great

Mongol leader, invaded Liaotung and captured the cap. city, Liaoyang, in 1212-13. The war continued with Mongol victories until the death of Genghis in 1227. He was succeeded by his son, Ogdai, who made an alliance with the Sung of S. C. against the Kins. This alliance was successful, and the Kin dynasty was entirely swept away. Quarrels, however, then arose between the allies, and the Mongols swept over most of S. C. The whole of the country was in their hands when, in 1259, Kublai Khan ascended the Imperial throne. At no period did C. attain such greatness as now, under the Mongol dynasty. Its ters. extended from the Dnieper to the Pacific Ocean, and from the Arctic Ocean to the Straits of Malacca. Commerce flourished even with Europe, and it was during this period that Marco Polo, the first European to give the W. races an accurate idea of C., was in the service of the Great Khan. In 1368 this great dynasty was succeeded by the native Ming dynasty, famous rather for the arts of peace than for their conquests. They, also, strove to encourage intercourse with foreign nations, and many Portuguese and Sp. traders entered the country. Christianity was also introduced more extensively by the exertions of the Jesuit, Father Ricci. Canton became the chief port for foreign intercourse. But new foes, the Manchu Tartars, were now coming into prominence. In 1616 a force of these people, who had suffered much from Chinese oppression, entered the country and defeated the forces sent against them. In 1619 they took complete possession of Liaotung, and in the following year T'ien-ming, the Manchu king, declared himself independent. Meanwhile, C. itself was in a state of disunion. There were various rebel forces under different leaders, in arms against the emperor, who finally committed suicide. None knew where to turn for help, and the general on the Manchu frontier invited the Manchus to enter and subdue one of the rebel leaders. They willingly did so, but refused to retire when their work was done. They took possession of the cap. without a struggle, and in 1644, the last dynasty of C., the Ta-t'ing, or 'Great Pure,' was estab. It is interesting to note that the pig-tail, the plaited queue of hair worn at the back, so often considered a special mark of the Chinese, dates its introduction from this time. It was imposed on them by the Manchu conquerors, whose fashion of head-dress it was, and at first was received most unwillingly. However, the Manchus were in the minority, and most of their customs, etc., were replaced by those of the conquered race. Perhaps the greatest of the Manchu emperors was the second, K'ang-hi (1662-1722), who is famous both for learning and for generalship. He devoted himself to study under the guidance of the Jesuits, and it is to him that the country owes the great dictionary of the Chinese language. His successor, Yung Cheng, was a monarch of a very different type, and it is from his reign that the policy of 'exclusion' clearly begins. He

inaugurated a persecution of Christians, and did his best to undo the work which the Mongol emperors had started. The change was not, however, due to him alone. The conduct of Portuguese traders, and the quarrels of the religious orders had not impressed the Chinese favourably. Moreover, the ideas of civilisation entertained by the E. and W. races thus brought into contact were diametrically opposed on many points. Collision followed, as it was bound to do. From the seventeenth to the nineteenth century the attempt of C. to retire within herself and exclude the 'barbarians' marks her hist.

It is time now to turn to England, for to her is due the opening of C. to Europe. Eng. trading with C. began in 1635, and for nearly two centuries the Eng. trade was in the hands of the E. India Company. The Chinese objected especially to the importation of opium, and the bringing in of this drug was made illegal in 1796. Mutual distrust between gov. and traders had long been growing, and in 1837 the Chinese Gov. resolved on finally exterminating the opium trade. A governor, Lin, was sent to Canton, with orders to compel the merchants there to give up all the opium in their possession. The Eng. were in a weak and precarious position, and the demand was complied with, but Elliott, the Brit. governor, refused to take the further step of signing a bond authorising the confiscation of all ships afterwards engaged in the trade. Negotiations continued for some time, which terminated with the Brit. Gov.'s declaration of war in 1840. The Brit. captured Chusan, stormed sev. cities, and finally threatened Nanking. A treaty was then made at the latter place by which five ports, Canton, Amoy, Foo-chow, Ningpo, and Shanghai, were opened to Brit. trade; Hong Kong was ceded to Britain, and a large war indemnity was paid. Various other questions were also settled, but not that of the opium trade.

In 1856 fresh complications arose, over the 'Arrow' affair, and a fresh war arose. In this France joined, and after some victories by the allies the war closed in 1858 with the treaty of Tientsin. The Brit. then aided the Chinese to put down the famous Tai-ping rebellion. Till the end of the century the Chinese were engaged in resisting the encroachments of the Russians in H. of the Jap. in Formosa and the Liukiu Is., and of the Fr. in the S. Meanwhile Korea, nominally under the suzerainty of C., was threatening to prove the cause of a war with Japan, owing to the encroachments of the latter power, and in 1894 this actually came. After a year of conflict the Chinese signed a treaty at Chifu (1895), in which the independence of Korea was recognised by C., and Formosa and part of the Liukiu archipelago ceded to the conquerors. At this period many new treaty ports were opened to the W. powers, who aided the Chinese in return to eject the Jap. from Liaotung. C. then set to work vigorously to reorganise her military system. In 1897 Germany seized the port of Kiaochow, and in the following year C. granted the

Gers. a lease of this dist. for ninety-nine years. In the same year (1898) Russia also received the lease of Port Arthur and its dist., while Britain received Weihaiwei, and a ninety years' lease of part of Kwangtung. France received the lease for a similar time of the bay of Kwangchowwan and of the is. near the bay. These predatory proceedings brought in their train a natural reaction against foreigners, a reaction which culminated in the Boxer rising (1900) (see BOXERS, THE). In Feb. 1904 Russia and Japan came into collision over the question of Korea, and in a series of engagements, all of which occurred in Manchuria, Korea, or on the Chinese seas, Russia was severely beaten (for details see RUSSIA). Throughout this war C. remained a passive spectator. The terms of the treaty of Portsmouth, U.S.A., which was signed on Aug. 29, 1905, in so far as they affected C., included the conveyance of the lease of Port Arthur and Dairen (Dalny) to Japan and the recognition by Russia of Korea and S. Manchuria as being within Japan's "sphere of influence." Korea was finally annexed to Japan on Aug. 23, 1910, and the annexation was not questioned by the powers. In estimating the factors which led up to the revolution of 1911-12 (perhaps the greatest revolution the world has yet seen if the number of people it affected be taken into account), the weakness of the Manchu court must be borne in mind. The weak and youthful emperor, Kwang-su, made an abortive attempt in 1898 to introduce administrative reforms. This at once led to the reins of gov. being seized by his aunt, the reactionary and aged dowager empress, the emperor being made a prisoner in everything but name. There is little doubt as to the complicity of the dowager empress in the Boxer rising, but even she was forced to make some concession to the forces of progress within the empire. Edicts were issued in which constitutional reforms were promised, such reforms to be effected gradually, the whole to be completed by 1917. On Nov. 14, 1908, the Emperor Kwang-su died, and strangely enough on the following day the dowager empress also died. The emperor, who had died childless, was succeeded by his infant nephew, Pu-yi (b. Feb. 11, 1906), who was not quite three years of age, Prince Chun, his father, being appointed regent. Prince Chun was a man of enlightened character, but even he was not able to withstand the court influences working against progress, so that before the new monarch had reigned two months Yuan Shih-kai, the able and reforming viceroy of Chih-li, was dismissed. With Yuan's departure went possibly the only man who could have stayed off the impending revolution. The storm burst on Oct. 10, 1911, on the banks of the Yangtze, a dist. in which insurrections seem to be endemic. The rising in Hankow in the prov. of Hupeh was joined by the modern-drilled troops at Wuchang, near Hankow. The neighbouring arsenal of Hanyang was captured and with it funds to the extent of £400,000. The movement, which was more anti-

dynastic (i.e. anti-Manchu) than republican, rapidly spread, and soon embraced most of the S. provs. of C. The leader of the revolt at Hankow was the able general, Li Yuan-hung, but the inspirer of the revolution was Dr. Sun Yat-sen, at that moment in America. The distraught Central Gov. on Oct. 14 sent for Yuan Shih-kai, who at first refused to come to its aid, but eventually did so on the court conferring on him dictatorial powers. He dispatched Adm. Sa Chen-ping up the Yangtze with a squadron of gunboats, and proceeded to quell the rebellion at the head of the still remaining (mostly N.) loyal troops. On Oct. 13 the rebels proclaimed a republic in the prov. of Hupeh, with Li Yuan-hung as president, and notified the foreign consuls that the property and persons of foreigners would be respected. After some indecisive fighting around Hankow in which the advantage lay first with the rebels and then with the imperialists (Hankow being recaptured and burned on Oct. 29), a truce was arranged. In the meantime a rebel gov. was estab. at the old cap. of C., Nanking, and a convention representative of all the S. provs. was assembled first at Shanghai and later at Nanking. Dr. Sun Yat-sen duly arrived in C., and Yuan Shih-kai secured from the royal house in the closing days of 1911 an edict pledging itself to abide by the decision of a national convention as to whether it should abdicate or not. The revolutionaries now demanded that the Manchu dynasty should abdicate and a republic be estab., but Yuan strove hard to bring about a constitutional monarchy only. He sent Tang Shao-yi to negotiate with Wu Ting-fang (formerly Chinese ambas. at Washington), and Tang was apparently won over to the republican point of view. On the other hand, Dr. Sun Yat-sen, who had been elected president of the republic by the Nanking Convention, by an act of patriotic self-effacement which saved much bloodshed, refused to accept the position, and urged that Yuan Shih-kai be appointed. Seeing that further resistance was useless, Yuan set himself to the task of making the change from the old regime to the new with as little friction as possible, and sought to procure the most face-saving conditions for the retiring dynasty. On Feb. 12, 1912, the throne issued three edicts, in which it announced its will to abide by the decision of the National Convention and accept the republic, entrusting Yuan with the task of bringing about the new constitution in conjunction with the Nanking gov., and, after exhorting all to peaceably accept the new order, announced the abdication of the dynasty. A constitution of seventy clauses was promulgated; the emperor was to retain his title and receive a pension, and be accorded the civility due to a foreign sovereign. On Feb. 27 the Nanking Assembly endorsed this decision by electing Yuan as president, and he was formally installed on March 10, but for a long while there was a deadlock over the question whether Peking or Nanking should be the cap. of the republic, the

question not being settled in favour of Peking until April. Tang Shao-yi, who subsequently resigned, was appointed premier, Li Yuan-hung vice-president, and a Cabinet drawn from both govts. was constructed. The National Assembly met in Peking in April 1913, and censured Yuan Shih-kai for negotiating a foreign reorganisation loan. Foreign capital in C. has led to the system of extra-territoriality, granting of concessions, etc. Conflict between Yuan and Sun Yat-sen resulted in the second revolution in July. Sun fled to Japan, and in Oct. Yuan was elected full president for five years. His first act was to dissolve the Kuomintang and expel its members from Parliament. The Kuomintang originated with the youth movement. In 1894 Sun founded the Shing Chung Hwei (C. Revival Society), which gained many supporters owing to the feeling aroused by the 'unequal treaties' contracted between the powers and the enfeebled Manchu Gov. In 1905 the society was reorganised, and in 1911 was called the Kuomintang (People's National Party). From 1913 to 1916 the party showed no activity beyond secret propaganda against Yuan's monarchical ambitions. In 1914 America proposed an agreement to neutralise the Far E. Japan took exception and, following an ultimatum to Germany, attacked the Ger. leased ter. of Kiaochow and, on Nov. 7, 1914, captured Tsingtau. Japan also occupied Chinese dists. in Shantung, thus violating Chinese neutrality. Protests were met by the notorious Twenty-One Demands, which meant the control of C. by Japan. Contrary to Japan's wishes, Yuan pub. the negotiations, raising such protest, especially in America, that Japan modified the demands. An ultimatum forcing acceptance of these was delivered to C. on May 7, 1915. Yuan attempted to restore the monarchy, with himself as emperor, but widespread revolt caused him to abandon his ambition. On June 6 he died and Li Yuan-hung became president. In a dispute with the premier, Tuan Chi-jui, over C.'s participation in the First World War, Li called in Gen. Chang Tsun as mediator. Chang's first act was to dissolve Parliament, and many members left Peking to form a constitutional gov. at Canton under Sun Yat-sen. On July 1, 1915, Chang restored the Manchu ex-emperor, but was defeated by Tuan Chi-jui at the head of the N. army, and the emperor was again deposed. Li Yuan-hung resigned, and Feng Kuo-chang became president. Tuan Chi-jui was again premier, and war was declared on Germany and Austria on Aug. 14, 1917. The revolutionary gov. at Canton also declared war. In Aug. 1918 the war-lords or *tuchuns* assembled the 'bogus' Parliament and elected Hsu Shih-chang as president. At the Versailles peace conference C. was represented by delegates from both the Peking and Canton Govs. France and England were bound by secret treaty to support Japan's claims to the former Ger. ters., and Shantung was accordingly awarded to Japan by the Council of Three, April 30,

1919. Thereupon the Chinese delegates refused to sign the treaty of Versailles. Anti-Jap. riots broke out in C., and the militaristic party, supposedly subsidised by Japan, became so unpopular that Tuan Chi-jui formed the Anfu party to consolidate his position. He was opposed by Tsao Kun, the Chihli *tuchun*, and Wu Pei-fu, the Fengtien *tuchun*. The president, prompted by the 'Anfu party, dismissed Wu on July 9, 1920, and censured Tsao Kun. Joining forces with Chang Tso-lin, the military governor of Manchuria, they moved against Peking. Meanwhile in April the Canton Gov. had split, and Sun Yat-sen with two other leaders negotiated from Shanghai with Tuan Chi-jui at Peking for the unification of the country. In July Tuan was decisively defeated by Wu Pei-fu, and retired to a Buddhist monastery. Power in the N. now belonged to the super-*tuchuns*, Chang Tso-lin and Tsao Kun. The year 1920 ended with a famine which reduced 15,000,000 to starvation. In 1921 Sun Yat-sen returned to Canton, and in April was unconstitutionally elected president.

On Nov. 11, 1921, the Washington Conference met to discuss the limitation of armaments and incidentally the question of Shantung and the Far E. A compromise was reached over the management of the Shantung railway, and it was agreed to restore to C. all public property in Tsingtau. By 1923 C. was in possession of all former leased ters. at Kiaochow. Other Chinese demands for tariff autonomy and the abolition of extra-territoriality were favourably received. England proposed to restore Weihaiwei, and the agreement was eventually signed on April 18, 1930. A commission, empowered at Washington to investigate extra-territoriality, suggested in their report (1926) a progressive scheme for the elimination of foreign jurisdiction in C. In 1929 an exchange of notes took place between the Nationalist Gov. of C. and the interested powers re extra-territoriality. In April 1922, Sun Yat-sen, president of the Canton Gov., and Chang Tso-lin, dictator in Peking, made an alliance to suppress Wu Pei-fu. Wu, aided by the 'Christian' general, Feng Yu-hsiang, defeated Chang and, forcing Hsu Shih-chang to retire, he reinstated the former president, Li Yuan-hung. At this time Russia tried to restore diplomatic relations with C., but Joffe, the Soviet envoy, agreed to mutual co-operation with Sun Yat-sen. Sun was in exile at Shanghai owing to conflict between the Kuomintang and the Kwangsi military party, but on Feb. 21, 1923, he returned to Canton and formed a military gov. The constitutional Parliament, however, in force in Peking, should have had Sun's co-operation. Karakhan, who was in Peking in Sept., restored relations between Russia and C., relinquishing all Russian extra-territorial rights. Sun reorganised the Kuomintang and at the first national congress, held in Jan. 1924, issued the celebrated manifesto which became the foundation of the National Gov. Sun had based his constitution on that of

Great Britain and the U.S.A., hoping for their support, but after the Hong Kong strike in 1922 none was forthcoming, and in 1924 he turned to Russia. Borodin came to Canton as Soviet representative. The Kuomintang was a revolutionary, not a communist, party, but after the 1924 reorganisation members of the Chinese Communist party were admitted. The Chinese Communist party, beginning as a secret society in 1920, consisting of students and intellectuals, intensely idealistic, had grown rapidly, but Sun in advocating co-operation with the Communists did not subscribe to their principles. Meanwhile the N. militarists were plotting for the overthrow of Tsao Kun, the president. Wu Pei-fu undertook a campaign against Chang Tso-lin, but he was deserted by Feng Yu-hsiang. Feng entered Peking on Oct. 22, 1924, and imprisoned Tso Kun. In Nov. Chang and Feng persuaded Tuan Chi-jui to return to Peking as chief executive. Sun was invited to a conference, but arrived in Peking an ill man. On March 12, 1925, he died and his death caused a split in the Kuomintang. One section, the W. Hills group, estab. separate headquarters at Shanghai, whereas the Canton section became more communistic. Various disturbances in S. C. culminated in the Shameen incident, when the Canton foreign concessions were fired on by Chinese students. This incident put Wang Ching-wei, left wing leader of the Kuomintang, in control of Canton. Meanwhile a Kuomin army had been formed by Chiang Kai-shek, head of the Whampoa Military Academy. Forty Russian instructors, ex-officers of the Red Army, had been engaged by Sun to teach in the academy. Borodin continued as adviser to the Central Executive Committee of the Kuomintang, but during his absence in March 1926 Chiang succeeded in expelling the Russians and other Communists, including Wang Ching-wei, from Canton. On Borodin's return in April, however, Chiang drove his anti-communist colleagues from office. On June 11 he became commander-in-chief of the Nationalist Army, and began his campaign against the N. By July Changsha was taken, and by Aug. the borders of Hupeh were reached. The N. war lords Sun Chuanfang and Wu Pei-fu failed to unite, owing to jealousy, and Wu was defeated. Hankow was captured and renamed Wuhan. On Dec. 6 the Nationalist Gov. arrived there from Canton. The Communist party was still predominant, with Borodin as adviser, but the most outstanding man was Eugene Chen, the minister of foreign affairs, a man held in respect by all parties. Chiang Kai-shek was not anti-Communist, and after the defeat of Sun Chuanfang he estab. a rival gov. at Nanchang. The march of the Nationalist armies had been prepared by propaganda, and on Jan. 3, 1927, anti-foreign feeling culminated in the attempt to seize the Brit. concession at Hankow. The concession was defended by marines, but no shot was fired and no lives were lost. Negotiations followed between Eugene

Chen and O'Malley, the Brit. representative. The Brit. Gov. had adopted a new conciliatory policy towards C., and it was proposed to put the concessions at Hankow and Kiukiang under Chinese administration. Negotiations went forward favourably, but on Jan. 24 a Brit. expeditionary force of 20,000 men, with tanks, aeroplanes, and artillery arrived in Shanghai. Shanghai was in danger from the fighting between Chiang and Sun Chuanfang, but this precautionary measure to protect Brit. nationals so exasperated the Chinese that Eugene Chen broke off negotiations. They were resumed later, and on Feb. 19 the Chen-O'Malley agreement was signed. The S. armies took Shanghai on March 22, and two days later entered Nanking. Although Chiang's armies had a reputation for orderly behaviour, a body of armed men began systematic looting of foreigners' houses. Seven foreigners were shot, and others, including the Brit. consul-general, were wounded. A party of 150 were eventually rescued under cover of a barrage from Brit. and Amer. warships. These Nanking outrages were the result of a Communist plot to discredit Chiang Kai-shek with the foreign powers. Chiang referred the powers to Nanking for their indemnities, and on April 15 himself ordered a clean-up of Communists in Canton with 2000 arrests and 20 executions. Previous to this the Hankow Gov. had tried to undermine his command in the army, and Chiang set up the rival Nanking Gov. He started the so-called purification movement and prosecuted the trades unions of Shanghai, with whose aid he had taken that city. In Peking Chang Tso-lin, who had maintained his authority since 1926, also started a Communist prosecution. The Hankow Gov. then began a military drive northward, hoping to take Peking in three months with the help of Feng Yu-hsiang, who had declared for the Nationalist cause. A three-cornered contest ensued, in which the Nanking and Hankow Govs., although both nominally Nationalist, were divided on the issue of Communism, but were allied against Peking. At the same time, Chiang in Nanking and Chang in Peking were both anti-Communist. With Chiang hostile on the right flank and Chang and Wu Pei-fu with armies to the N., the Hankow Gov. was practically isolated. Tang Shen-chih began the march against Peking on April 22, hoping to join with Feng, who was in Shensi with the Kuo-min Chun or People's Army, drilled with the fanaticism of a Cromwell. Hankow was itself beset by a Nationalist general of Chiang Kai-shek's faction. The gov. would have fallen had not its troops gained a victory at Chumatiien and taken Chenchau. Feng controlled Honan, while Tang returned to defend Hankow. The severe losses at Chumatiien, however, indefinitely delayed the attack on Peking. Meanwhile Chiang was conducting his own campaign against Peking, and in June invaded Shantung. Fifteen hundred Jap. troops suddenly occupied Tsinaifu, and Tsingtao was similarly garrisoned. The

pretext was the protection of nationals, but Japan was interested in maintaining the supremacy of Chang Tso-lin. On June 18 Chang counter-attacked Chiang Kai-shek, who was also harassed by Sun Chuan-fang's renovated army. Being defeated, he retreated to the Yangtze, narrowly avoiding being outflanked by the Hankow troops. Hankow had declared war on Nanking in July 9. Chiang was hemmed in on three fronts, as Feng, who had been keeping the balance between Nanking and Hankow, joined with Hankow. However, the difference between the two govts. was beginning to disappear. Members of the Kuomintang at Hankow became dissatisfied, as it appeared that Borodin was pledged to betray the gov. into a more violently communistic regime, presided over by the Chinese Communist party. On July 17 Ho Chien, a Nationalist general, taking advantage of the Hankow forces being engaged against Nanking, descended on and effected a *coup d'état*. Eugene Chen was expelled, and later left C. for Moscow. There was a general exodus of Chinese and Russian Communists. Mme Sun publicly proclaimed at Moscow that Sun Yat-sen's work was betrayed into the hands of the militarists, and that the revolution was finished. The only obstacle now hindering the reunion of Hankow and Nanking was the person of Chiang Kai-shek, and he resigned on Aug. 12, 1927. The Hankow and Nanking forces were then free to make a combined attack on Sun Chuan-fang, who was decisively defeated. Nationalist control was estab. S. of the Yangtze, and the Sept. Nanking Gov. was organised by the reunited Kuomintang. Nanking became cap., having no foreign concessions and being near Shanghai. The gov. in renouncing the workers' and peasants' associations looked to the Shanghai bankers for support. Union did not last long. The left wing leader, Wang Ching-wei, refused to co-operate, and set up a gov. at Canton. Chiang Kai-shek returned to Shanghai from Japan in Nov., and acted as mediator between the left and right wings of the Kuomintang, which it was hoped to unite for the fourth plenary session. In Dec. Canton was sacked during a Communist insurrection. A reaction followed. Wang Ching-wei, becoming discredited, left for Europe, but the Kuomintang was no nearer reunion. In Jan. 1928 the Nanking gov. again offered Chiang the command of the army and the leadership of the revolution. He tried to stabilise the gov. in order to continue the N. campaign, and on Jan. 7, 1928, the Third Nanking Gov. was organised. Its manifesto was based on Sun's Three People's Principles, but all connection with Soviet Russia was severed. T. V. Soong was appointed minister of finance. He had the confidence of the Shanghai bankers, and a loan was floated to subsidise the N. campaign. In March the expedition started. Chiang was allied with Feng Yu-hsing and Yen Hsi-shan, and the common enemy, Chang Tso-lin, was routed. The Jap. again rushed troops to Tsinanfu. Chiang's ad-

vance was checked, and skirmishes between Jap. and Chinese were inevitable, but more serious consequences were avoided by Chiang's prudence. The implication that Chang Tso-lin was being indirectly aided by Japan broke the morale of the N. resistance. Chang evacuated Peking, and, while en route for Manchuria, was blown up and killed.

The Peking Gov. was at an end. Peking, which means N. cap., was renamed Peiping, which means N. Peace. According to his promise, Chiang resigned his command, but received it back again. Personal animosity existed between the three generals of the S. armies, but the military problem was really a financial one, which T. V. Soong endeavoured to solve at the important economic and financial conference, held in June. Chiang arrived in Peiping on July 3 to attend the memorial service of Sun Yat-sen, and at a meeting of military commanders he pressed for disbandment. Later in July Chiang and Feng were in Nanking for the fifth plenary session. Feng was disaffected, but he accepted the Ministry of War, a post which held him in Nanking. The party dictatorship of the Kuomintang inaugurated the period of political tutelage which was to succeed militarism. At the fifth plenary session the Organic Law of the National Gov. was drawn up. This was the basis of the ensuing Five-Power Gov., with its decentralised authority, a system familiar to the Chinese, and therefore more stable than the Soviet system. The old mandarin was replaced by a civil servant trained in W. methods. The chief problem confronting the National Gov. was now a military one, which in its financial aspect meant a burden of taxation. Chiang wished to create a strong national army out of the existing troops, and to disband and industrialise the remainder. He sought the help and personal advice of Bauer, a Ger. colonel. This man earned Chiang the jealousy of other commanders, notably Feng, who issued manifestoes criticising the gov. and ridiculing his colleagues. Chiang Hsueh-liang, governor of Manchuria, acceded to the central authority, and this gave Chiang the opportunity to call a disbandment conference in Jan. 1929. He met with no support, and the failure of disbandment brought renewed civil war. In Feb. Feng left Nanking to join his army, wishing to control Shantung as soon as the Jap. evacuated. At the same time the Kwangsi party, the Fourth Army group at Hankow, became disaffected towards Chiang, and made war on Nanking. Feng failed to co-operate, and Chiang's alertness destroyed the Kwangsi forces. Chiang had made overtures to Feng, promising him Shantung, but at the conclusion of the Wuhan or Hankow campaign the Nationalist control of Shantung proceeded. Feng was now openly hostile to Chiang, who, in asserting the authority of Nanking, was virtually dictator. In March the Kuomintang convened the Third Party Congress, but although it strengthened the administration of the

gov., it failed to find a sound financial policy. In the N. dissatisfaction with the gov. was aggravated by famine. Feng declared a revolt of the Kuomintang, and being deprived of his offices and dismissed the gov., he was in the position of an independent militarist. Two of his generals, however, maintained their allegiance to the National Gov., while Yen Hsi-shan, who had been the third of the former triumvirate, with Feng and Chiang, came forward as Feng's champion. No actual fighting occurred until after the state funeral of Sun Yat-sen in Nanking. At this function the representatives of foreign powers gave the Kuomintang an international prestige. In June Feng retired to Shansi, where Yen was governor. Yen advised him to go abroad, and offered to go with him. Chiang could not accept Yen's resignation, as the N. would have become disorganised. He himself went to Peiping, thus asserting the authority of the Gov. throughout C., but he found the N. 'reorganised' in sympathy. Wang Chiang-wei, Chang Fat-kwei, and Feng had formed an anti-government faction, called the Reorganisationist party, after the Third Party Congress, which they declared illegal. Yen was claimed as an ally by both sides. On Sept. 22 Chang Fat-kwei began a march on Canton, and in Oct. Feng sent a 'punitive expedition' against Nanking. Meanwhile in Manchuria trouble was developing over a dispute which began in July, when the Russian manager of the Chinese E. railway was dismissed by the Chinese, following a police raid on the Soviet consulate. A state of war existed for some months, until on Dec. 22 the Chinese acceded to the Russian demand for a restoration of the *status quo ante*. While the Manchurian trouble was at its height, Chiang was forced to compound with Feng, who retired, leaving the Nationalist forces to occupy Loyang. Chang Fat-kwei was still threatening Canton, but was repulsed on Dec. 9. The year closed with a mandate issued by the Nanking Gov., abolishing extra-territoriality as from Jan. 1, 1930. In the N. the hegemony of Nanking was resented, and in March Yen Hsi-shan allied himself with Feng and seized control of Peiping. Wang Chiang-wei, the left wing advocate of reform, was expelled from the Kuomintang. In May civil war broke out between the N. and S. and in July resulted in a stalemate.

Events in China in the Decade before the Second World War.—Chang, ostensibly neutral, had seized the occasion to extend his gains southward to the Yellow R. and to sell munitions to both the Nationalist Gov. and its opponents of the N. coalition. Chiang Kai-shek, whose occupation of Hopei and Shansi had enabled him to defeat the coalition leaders, found it expedient to acquiesce in Chang's usurpations and indeed to entrust him with the pacification of the country N. of the Yellow R. But in 1931 came the Jap. military offensive in Manchuria, an event which prompted an overwhelming wave of nationalism, compelling the resignation of Chiang Kai-shek. His political

difficulties had been aggravated by the Communists, against whom he was forced to launch a heavy offensive from Nanchang in Kiangsi at the very moment when a minor revolt against him and Chang had broken out under the N. generals, who thereby exemplified the characteristic tendency of Chinese military and civil leaders constantly to intrigue against each other for their own private gain. But towards the end of 1931 the reorganised Nanking Gov. recognised that their chief problem was to alleviate the condition of a hard-pressed peasantry in a bandit-infested country. Chiang Kai-shek retained his military power by means of alliances with loyal generals of sev. provs., while effective authority in the coalition gov. was vested in Sun Fo, only son of Sun Yat-sen, who became head of the executive *guan*, a post comparable to that of Prime Minister, the foreign minister being Eugene Chen. In this way some semblance of national solidarity against foreign aggression was brought about, though, as later years showed, it was far from effective.

The Sino-Jap. war of 1931-33 apparently arose out of disputes over Jap. interests in the Manchurian railway and, later, in the Shanghai area. Having overrun Manchuria in the autumn of 1931, the Jap. disembarked troops in the Shanghai area, alleging that there had been an organised Chinese boycott of Jap. imports. The League of Nations and the Amer. and Brit. Govs. tried to stop the conflict by reminding Japan of her obligations under the Nine Power Treaty of 1922. This treaty guaranteed Chinese sovereignty over Manchuria and the 'open door' for international trade. Japan was a signatory of this treaty, but she also had treaty rights over certain areas, which included that of maintaining garrisons in a defined railway zone. Moreover, Jap. investments in Manchuria were large, and for years the country, as an economic hinterland, had been regarded by Japan as vital to her interests. There was severe fighting early in 1932 in the Shanghai area. The Nanking forts were also fired on and a great attack launched at Chapel, while Jap. destroyers bombarded Woosung. In reply to the League of Nations, the Jap. Gov. refused to recognise C. as an organised people in the sense of the League Covenant, but averred that Japan had no territorial or political aspirations in C. Negotiations for an armistice, however, broke down. A puppet state called Manchukuo was set up under Jap. control, C. ineffectually protesting against its estab. as a breach of her sovereignty. Then the Brit. and Amer. Govs. made a joint proposal for the cessation of hostilities, which Japan accepted, while rejecting the offices of neutrals in the settlement of the Manchurian dispute. A League commission under Lord Lytton went out, however, to Manchuria to investigate the position, and issued a report suggesting the creation of a special regime there which would maintain the sovereignty of C. while safeguarding Jap. rights.

But in spite of an overwhelming vote of the League in favour of the report, Japan rejected it, holding herself to be the chief power responsible for keeping peace in the Far E. She then resumed the struggle, which ended, so far as this phase of Sino-Jap. relations was concerned, by Japan placing P'u-yi, ex-emperor of C., on the throne of Manchukuo.

By the close of 1932, a large Chinese army under Chang Hsueh-lung, the

gov. forces retook Foochow and gradually crushed the rising.

Although an armistice had been signed with Japan, later events were to show that that power was very far from staying her hand in C. The salient feature in the hist. of C. in the twenty-five years before the Second World War was the gradual development of Jap. influence, and each step in the consolidation of that influence did but mark the culmination of a policy

PRESIDENT OF MANCHUKUO

The leader of the commission, Lord Lytton, is on the president's right.

young Manchurian war-lord, was concentrated in Jehol to repel the further advance of the Jap. from Manchuria. But Jehol soon fell, and by May 1933 the Jap. armies had crossed the Great Wall and were standing outside Peiping. An armistice was now signed creating a demilitarised zone, and a political council was formed at Peiping with delegated authority from the executive *yuan* to negotiate with the Jap. for the restoration of the public services. In other parts of the country, however, there was much internecine strife. Disaffected elements from the Shanghai army were endeavouring to form a provisional gov. in Fukien with Eugene Chen as foreign secretary. Large Communist forces had begun a bitter struggle in Kiangsi, and, before all other factions had combined to repel them, had even menaced Amoy. But early in 1934 the

which was initiated as long previously as 1915, when Japan, taking advantage of favouring circumstances during the First World War, presented some twenty-one demands on C., acceptance of which would have reduced the country to the status of a Jap. protectorate. Their partial acceptance, however, gave Japan a strong hold in N. C., especially in Manchuria. After the First World War Jap. policy seemed to grow more conciliatory, and by the Nine Power Treaty, signed in Washington, Japan pledged herself to respect the sovereignty and territorial integrity of C., and even to seek no exclusive privileges there. The growth of Chinese nationalism, however, soon gave rise to friction with Japan. After the occupation of Peiping by the Nationalist armies, the autonomous gov. of Manchuria began to look to Nanking rather than to Tokyo for advice and tried to

undermine the position of the Jap. as lessees of the S. Manchurian railway, and it was this that led directly to the Sino-Jap. war of 1931-33 (described above) and the eventual estab. of the puppet state of Manchukuo. The Jap. armies actually marched on Peiping in 1933, but the city was saved by an armistice known as the Tangku truce, by which the Nanking Gov. agreed to prevent all anti-Jap. activities in N. C. The next significant event in C. was the pseudo-secessionist movement of the N. provs.—Shansi, Shantung, Hupeh, Honan, Shensi, and others. This movement was ostensibly a Chinese revolt against an oppressive gov. led by Chinese generals, and it might have been regarded as a natural movement of reaction against Communist or Bolshevik influences but for the cloven hoof of Jap. 'co-operation' in the movement at the time of its announcement.

Utter lack of political cohesion characterised C. in 1935-36. The Nanking Gov., under the leadership of Chiang Kai-shek, claimed to be the lawful Chinese gov. to speak for all C. But, although it was unquestionably the Central Gov. *de facto*, its political influence was by no means commensurate with the geographical area of the country. In the N. Manchukuo and Jehol, as well as those provs. under the control of the Hopedi-Chahar Political Council, passed virtually under Jap. control. Outer Mongolia adopted a Soviet form of gov., and seemed, politically speaking, to be regarded to all intents as a protégé of the U.S.S.R. 'Soviet China,' in addition, comprised many areas in the interior and in Fukien which also adopted Communist regimes, and their presence inspired a series of military operations against them on the part of the Nanking Gov. with varying degrees of success. In the S. the S.W. Political Council—the so-called Canton Gov.—was for some time practically independent of Nanking, and it was only after July 1936 that the Central Gov. estab. any considerable measure of control in the S. provs. It was from those provs., and especially from Kwangtung and Kwangsi, that the greatest opposition to Jap. penetration, and to foreign penetration, had come. Sino-Jap. tension grew acute at the end of 1936, when a delegation of students of the univs. of N. C. pressed the Nanking Gov. to adopt a strong anti-Jap. policy. They demanded an alliance between the Kuomintang, Chiang Kai-shek's Nationalist party, the Communists, and all other organisations, in resisting Jap. aggression. Tension with Japan suddenly became acute in July 1937 with the outbreak of fighting between Chinese and Jap. troops at Lukouchiao. The whole situation in N. C. assumed a particularly grave character, and the possibility of any settlement became more and more remote, and, on July 28, Peiping was bombed by Jap. aircraft, and the unabashed invasion of further areas of C., without any declaration of war, began. At the close of one year (July 1938) the Jap. armies were in control

of one-third of C.—300,000 sq. m., with an estimated pop. of 130,000,000—after more than 1,000,000 Chinese and Jap. lives had been lost and the greatest misery suffered by the Chinese civilian pop. Probably the Chinese casualties were over 400,000 soldiers killed and twice as many wounded, while the Jap. had 100,000 killed and as many wounded. The total number of refugees was not fewer than 1,000,000, but the final toll of the war in famine, flood, and disease is not known. In the middle of 1938 Jap. armies of 1,000,000 were mobilised against 2,000,000 Chinese on fronts 1500 m. long, spread over an area more than half the size of Europe. Neither country showed any sign of yielding. In a statement from Hankow Gen. Chiang Kai-shek declared that 'China would continue to fight until she had driven the invader out,' while Prince Konoye declared that Japan would never consider peace with 'the Chinese war lord' and that foreign efforts to change her policy were useless. The Jap. war minister (Itagaki) even went so far as to say that Japan must face the possibility of ten years of warfare before Chinese resistance was crushed. The results of the campaign in the first year of the conflict showed that Japan had obtained nominal control over all the ter. bounded by a line running from Hangchow through Wuhu along the Yangtse to Hukow, N. eastward to the flood area, and all the country bounded by the bend of the Yellow R. northward into Inner Mongolia. They also occupied Amoy and controlled nearly the whole of N. C., the provs. of Shantung, Shansi, Hopedi, Kiangsu, parts of Honan and Anhwei being also in their occupation. Peking and Tientsin were entered almost immediately after the outbreak of the conflict, and in the former city a Jap.-created provisional gov. was inaugurated. Further S. the Jap. captured Shanghai after a prolonged resistance, and, following a rapid advance inland, stormed Nanking, the Nationalist cap. (Dec. 1937). The National Chinese seat of gov. had previously moved to Chungking (Szechwan), far in the interior, but the conduct of operations continued to be directed from Hankow by Chiang Kai-shek. As at Peiping, a Jap.-sponsored puppet gov. was estab. at Nanking. It was early evident that Japan's mechanised troops and modern equipment altogether outweighed the numerically superior masses of Chinese troops, whose lack of tanks, aeroplanes, and heavy mobile artillery found but little compensation in tenacity and bravery. But quantities of arms were constantly finding their way into C., particularly from the Soviet Gov., via Kansu, over the frontier from Fr. Indo-C. and via Hong Kong. Necessarily the conflict had repercussions on those countries which had commercial and business interests in the Far E. Moreover, the Jap. press began to criticise Britain, on account of the arms traffic through Hong Kong; there were incidents at Shanghai, and the wounding of the Brit. ambas. in Aug. 1937 by

machine-gun fire during a Jap. air reconnaissance led to a temporary deterioration of Anglo-Jap. relations. There was also some tension between Japan and the U.S.A., particularly after the sinking of the Amer. gunboat *Panay* on the Yangtse (Dec. 1937). With Germany and Italy, Japan's partners in the Anti-Comintern Pact (q.v.), however, Japan's relations continued to be cordial—a state of things which was destined in the following year to undergo a remarkable change when Germany, by signing a so-called non-aggression pact with Russia, revealed a cynical contempt for the fundamental basis of the Anti-Comintern Pact hardly greater than that of Stalin. At the end of June 1938 Japan stated that she proposed to occupy Hainan, the large is. near Fr. Indo-C., but the prompt action of the Fr. Gov. in occupying the Paracel Is., a series of coral reefs to the S.E. of Hainan, coupled with a warning from the Brit. Gov., deferred Japan from carrying out her intention. It has been estimated that the twelve months' campaign had cost Japan £430,000,000—the figures for authorised expenditure in the special C. estimates. This huge demand was met by increasing taxation and internal indebtedness, an issue of no less than 6,800,000,000 yen in bonds being authorised.

By the end of the second year of the conflict neither C. nor Japan was within sight of ultimate victory, and both countries recognised that the struggle would be prolonged indefinitely. Both govts. announced their determination to pursue the conflict to a victorious close. Marshal Chiang Kai-shek's manifesto emphasised C.'s determination to resist 'slavery and subjugation' with all her force; while Baron Hiranuma, for Japan, announced that the Jap. armies would remain semi-permanently in C. to preserve order and 'defend C. against the Comintern' until a new central regime which Japan was preparing for C. was firmly estab. In this second year of the war the Jap. took many important cities and considerably extended the already vast area under their control; yet no decisive military triumph could be recorded. It was evident that the Chinese tactics were to abstain from giving battle on a large scale but to maintain mobility of action and to keep on striking on all sections of the front with comparatively small forces. Hence, though the area in Jap. occupation had increased, this very increase involved the dispersal of their troops over an ever wider area, both for patrol purposes and to preserve essential communications. In the autumn of 1938 the Jap. pursued a vigorous drive up the Yangtse, and soon occupied Kiukiang (Aug.). In Oct. they captured Hankow and Canton. After the fall of Hankow there was a lull in operations for some months, although the Chinese continued their guerrilla tactics unabatedly. In Feb. 1939 the Jap. descended on the Is. of Hainan, a move which caused uneasiness to the Fr. Gov. but led to no action by them. In the spring of 1939 there was a

resumption of military activity with the launching of a Chinese offensive on all fronts; but apart from local successes in central C. and near Canton, the military situation was little altered. Later (May) the Jap. intensified their grip on the Chinese coast by landing at the international settlement of Kulangsu (off Amoy), and by occupying Swatow (June). In the N., near Shanghai, and in the Canton area, the Chinese carried on a well-organised guerrilla warfare, and, indeed, these tactics were pursued throughout the occupied areas. The general position then was that while the Jap. nominally controlled vast areas of C., their actual control was limited to key cities, ports, waterways, and railways, while outside the main lines of communication they had little or no hold on the countryside. But, necessarily, the effective control of the coast, especially after the fall of Canton, made it practically impossible for C. to import war materials by sea, and in 1940 her main arteries of communication with the outside world were the 'back doors'—the long caravan route from Lanchow (Kansu) in the N.W. to Asiatic Russia, and the new road linking Yunnan (Kunming) with Burma. This remarkable piece of road construction was completed in Dec. 1938 in spite of the greatest difficulties. Apart from military operations, the methods of passive defence adopted by the Chinese were the systematic devastation of the country before the Jap. advance, and the destruction of all roads, paths, and bridges—tactics which greatly retarded Jap. progress into the interior. The Jap. Air Force made frequent raids on all the chief centres of pop. under the control of the Chinese National Gov. The attacks on Canton in Oct. 1938 and on Chungking in May 1939 were especially destructive, the losses in killed and wounded amounting to thousands.

In the occupied areas the Jap. Gov. made strong efforts to exploit the economic resources of the country, and in 1938 a 'China Board' was formed in Tokyo for this purpose, and, later, development companies were formed with Jap. capital. A Supreme Council of N. C. was formed about the same time, in which were incorporated the Jap.-controlled Nanking and Peiping provisional govts.

Considerable friction developed in 1938–1939 between Japan and the W. powers, and protests were made by the Amer., Brit., and Fr. Govs. at the closing of the Yangtse to foreign shipping, a step which was contrary to the 'open door' policy which the W. powers had consistently upheld in C. The grant of an Amer. credit of \$25,000,000 to C. for the purchase of Amer. manufs. and primary produce also strained Jap.-Amer. relations, while the action of the Brit. Gov., in 1939, in deciding to assist C. by the creation of a £10,000,000 exchange stabilisation fund (see *Currency Measures*, etc.) evoked bitter protest from Japan. Tension also grew with France over the occupation of Hainan and the annexation of the Spratly Is., a small group in the

S. C. Sea, sovereignty over which was claimed by France. Tension grew still more acute with the Jap. landing at Kulangsu, the occupation of Swatow, and the blockade of the Brit. and Fr. concessions at Tientsin, with the consequent infliction of humiliations on Brit. subjects by Jap. soldiers.

China in the Second World War.—C. was rapidly changing before the Second World War. In the decade 1928-37 the W.-trained Chinese had their opportunity to secure administrative control within C. and to modernize the country. Under a strong gov. C. made great advances in industry, mining, education, and social services generally. Yet at the same time the nation was aware that Japan would thwart their development and resist the unification of the country. The Chinese Nationalists in 1928 held Shanghai and the Yangtse. Japan at once tried to prevent them from controlling N. C., and this brought on a crisis. The Nationalists realised that the other Treaty powers might support the Jap. against them. Hence they deliberately favoured Amer. and Brit. interests, estranged themselves from Soviet Russia, and broke with their own Communists, thereby effectually preventing a united front among the Treaty powers. Civil war between the gov. and the Communists logically followed the rupture with Russia; for the Chungking Gov. was increasingly representative of the growing Chinese capitalist class of merchants, bankers, insurance companies, factory owners, and shipping interests. Within the country, the National Gov. had to struggle against strong survivals of provincial separatism and varying degrees of resistance on the part of regional war lords. But gradually these latter began to rely on Nationalist military aid against Communist forces and finally to accept the administrative supervision of the Central Gov. New railways played their part in Nationalist progress, meeting both strategic and economic needs. The gov. now began to build lines to open up the hinterland, the two most important lines being one from Canton to the Yangtse at Wuchang and another, in N. C., which crossed the existing lines from Nanking to Peiping and from Hankow to Peiping into Shensi. It was largely with the aid of these new railways that C. withstood the Jap. offensives in 1937-38. In this same decade C.'s heavy and light industries expanded with unprecedented rapidity, and in all kinds of enterprises which had formerly been possible only under foreign ownership or management the Chinese manifested ever more enterprise and competence. The National Gov. also showed skill in dealing with foreign countries, whose conservative interests were calculated to resent any attempt by the Chinese Gov. to compel them to respect the national interests of C. The primary problem was the old desire of the foreign interests for a strong man to rule C. in their behalf, and they naturally favoured the idea of making Chiang Kai-shek their strong man. But Chiang

Kai-shek gradually succeeded in committing America and Great Britain, among the great powers, not only to support of the Chinese Gov., but to gradual relinquishment of their privileges; and this reacted against Japan, which stood alone in supporting territorial and political imperialism in C. and in doing so against the interests of the great W. democracies. C. in 1937 was well on the way to attaining the rank for which her pop. and resources qualified her, but which her prolonged repudiation of W. civilisation and the ensuing period of civil strife and confusion denied her. The turning-point was the Leith-Ross mission to C. in the winter of 1935-36; this, and the Chinese currency reform then successfully carried out with the co-operation of Brit. banks, constituted in Jap. opinion the abandonment by Britain of her traditional pro-Jap. policy. The prospect that C. would soon be receiving large credits for industrialisation on the basis of her new financial stability was one that alarmed the rulers of Japan. Brit. financial support was a factor of vital importance in enabling C. to withstand the Jap. invasion; hence the Jap. now believed that the only way to win the war against C. was to drive Britain by pressure and threats into withdrawing this support. The primary motive of Japan in the war which began in 1937 with the clash at Lukouchiao, S.W. of Peiping, was to prevent C. from becoming a great power. Hence arose a great struggle, involving directly 500,000,000 people in the two warring states, a conflict which would have been continually absorbing the attention of the world were it not for the war of even wider scope which was threatening to break out in Europe and involve all the great powers of the W. The conclusion of the Matsuoka Pact between Japan and Russia (April 1941) dismayed the Chinese Gov. of Chungking, although Chiang Kai-shek himself never lost confidence in the W. powers. Despite the pact it soon became evident that C. had no cause for apprehension. Moscow intended to continue assistance to C., and Britain and the U.S.A. announced new currency credits. Although relations between the Chungking Gov. and the Chinese Communists could best be described as merely an armed truce, the higher leaders on both sides appeared determined to prevent the dispute from interfering with C.'s resistance to the invaders. In her struggle for survival, C.'s progress towards a more representative gov. might be slower than liberal elements could wish, but she had seen in totalitarian states what an armed party within the state could mean, and, moreover, if the Chinese, like the Brit., had a genius for compromise, they also knew when to say 'Thus far and no farther.' The Matsuoka Pact did nothing to help the Communist cause in C. and the internal dispute was as far from an early climax as ever.

After repeated raids, with large numbers of war planes, the Jap. had, by mid 1941, still failed to realise that

they could bomb Chungking for years without much effect. The city had the finest passive air defences. Dug-outs were built in solid rock capable of sustaining direct hits by the heaviest bombs. Although scarcely a building had remained undamaged in the whole of Chungking the city rose again as fast as the Jap. could knock it down. No matter how long the bombing was maintained, it could not affect the war of resistance. Similarly, the bombing of the Burma Road (q.v.) might hamper, but could not stop, the flow of supplies into 'Free China.' Handicapped in some of their theatres of war through lack of equipment, the Chinese were still largely unable to resist major Jap. attacks in the field. With the vast number of troops at their disposal, however, they could constantly form new concentrations in different parts of the country, which the Japs. were compelled to break up in order to prevent threats to the bigger cities in their hands, and even at this period the will of the Chinese to carry on the war in spite of many a set-back remained unimpaired. The rebound from the Matsuoaka Pact came quickly in the Brit. and Amer. credits, the arrival of an Amer. air mission in Chungking, and the Brit. ambas.'s assurance that the Burma Road would be kept open.

The Communists were, however, considerably increasing their power, especially in the later years of the Second World War. They had no confidence in many of the Kuomintang leaders, who, they averred, had been at least as interested in fighting them as in fighting Japan. In the later stages of the war in C. guerrilla activity rather than regular warfare contained the larger part of the Jap. forces. In early 1944 some twenty-two divs., or 64 per cent of the Jap. forces in C., were operating against Communist troops behind the regular front. The Jap. began an offensive in Honan just before this time, but even then the forces withdrawn from those operating against the guerrillas were small. In addition to these Jap. forces, the puppet army of 750,000 men under Wang Ching-wei was engaged against the Communists. Yet in this struggle behind the regular fronts there were few large battles. The Communist forces claimed, however, that in the twelve months between June 1943 and June 1944 they accounted for nearly 200,000 Jap. and Chinese puppet forces, besides taking 75,000 prisoners. During 1911 and 1942 the Jap. gained some ground, but from 1943 were losing. The pop. paying taxes to the Chinese Gov. rose from 50,000,000 to 80,000,000, the Jap. lost or abandoned 13,000 forts, involving a consequent loss of motor roads and blockade ditches, and in the first half of 1944 the Chinese recaptured twenty-four *hsien* (co.) cities and retained control of at least a third of them. With some justification the Communists claimed that only their forces, at this time, had been able to carry on effectively this war behind the enemy lines, even though they had received no supplies from outside, even from Russia;

and they maintained that in 1941 there were nearly 1,000,000 Central Gov. troops fighting behind the Jap. lines, but that by 1944 their number was no more than 30,000, many having deserted to the enemy. By this time the main Communist forces behind the Jap. regular front were the Eighth Route Army, with 320,000 men serving in an area extending from the Lunghai railway up to S. Jehol and Liaoning in Manchuria; the new Fourth Army of 150,000 operating S. of the Lunghai railway in Kiangsu and parts of Anhwei, Hupeh, and Chekiang; and small forces operating near Hong Kong and on Hainan Is. These regular troops were equipped with rifles, light machine guns, and Jap.-pattern grenade-throwers. They also had some heavy machine-gun and trench mortar units and a few captured Jap. guns. Co-operating with them was a Home Guard organisation of 2,000,000 men. But the limiting factor of the operations of these Communist armies was shortage of ammunition. They had nothing but what was captured from the enemy or made in small local arsenals. This shortage enforced close-range fighting and often made it impossible to liquidate a Jap. force after it had been surrounded. Moreover, the shortage prevented them from bringing about any serious dislocation of Jap. railway communications or damage to industrial installations. With reasonable ammunition supplies, the Chinese forces would have been able to weaken the whole Jap. position in N. and central C., and it was a situation which clearly offered a great opportunity in the allied war effort against Japan. Unfortunately the Kuomintang had for some years enforced a strict blockade of the Communist areas. The Communist party considered that it was impossible to overcome C.'s military and economic difficulties without the introduction of democratic reforms and they could certainly make political capital out of the comparative success of their armies operating under logistic difficulties, but with full popular support, as against the rapid collapse of the Kuomintang armies in Honan and their severe defeats in Hunan. It was generally believed in Yenan, the Communist centre, that the widespread desertion of Kuomintang forces to the puppet armies was the result of a deliberate policy to build up a force which could preserve N. C. for the Kuomintang after the collapse of Japan. Failing an agreement between Yenan and Chungking, indications in 1944 were that the collapse of Japan would leave N. C. in the hands of the Communist forces and that it would be extremely difficult for the Kuomintang to dislodge them.

After the downfall of Japan civil war supervened on a large scale in N. C., the provs. principally affected being Shantung, Shansi, and Suiyuan. Most of the fighting in Oct. (1945) was around Changchih, in S.E. Shansi. The Chungking Gov. made an offer to Yenan to respect the *status quo* in Communist areas if the Communist troops ceased attacking the

railways; but this offer was rejected because the Communists feared that the gov. might then gain control of Communist areas. Fighting was also in progress in Hopel, Shensi, Honan, Anhwei, Hupeh, Chekiang and Kwangtung. In the midst of this confused situation Central Gov. forces were landed at Chingwangtao from Amer. transports. Some of the Communist troops were under the leadership of Chang Hsueh-shih, son of the war lord Chang Tso-lin and brother of the 'young marshal' Chang Hsueh-liang who had been under Central Gov. detention since he helped to organise the kidnapping of Gen. Chiang Kai-shek in Dec. 1936. Meanwhile the Russian forces in Manchuria had announced that they were withdrawing from Manchuria (under the terms of a Sino-Soviet treaty concluded since the war) and that Central Gov. troops were due to take over Manchuria. These latter, however, were arriving only to find themselves faced by considerable armies of well-armed Chinese Communist forces. All these developments caused serious concern in Washington, particularly as there was a danger of Amer. troops becoming involved. On Nov. 4, 1945, an overwhelming force of Communists captured Kweisui, cap. of the prov. of Suiyuan. Ten days later powerful gov. forces landed at Tientsin in a determined effort to clear Shantung of the Communists. After these events a military and political truce was arranged between Chungking and the Communist leader Gen. Chou-en-lai; but in Feb. 1946 civil war began in Manchuria, where it was suspected that Russian influence was frustrating the Chungking Gov.'s efforts against the Communists. Following close upon the successful advance of the gov. troops in Manchuria in the summer of 1946, a 15-day truce was arranged, during which the Amer. Gen. Marshall made an effort to find a basis for a permanent settlement of the Chinese civil war, but evidently with no real hope of success. The grim fact was that C. was on the brink of a most disastrous civil war at a time when sev. million innocent peasants were on the verge of starvation, C.'s export trade was at a standstill and her post-war reconstruction had not even begun. The 'unofficial war' between the Communist and gov. or Nationalist forces, which had been dragging on for a year or more, flared up in July (1946) into what seemed to be a full-scale test to decide who should be master. The situation was the more confused from the fact that the Communists frequently asserted their faith in Gen. Chiang Kai-shek personally, while it was still open to them to enter the coalition gov. agreed upon at the Chungking conference of all parties in Feb. (1946). The gov., for its part, also protested that it still earnestly desired to end the conflict by agreement through the peace envoys of Gen. Marshall. Meanwhile Nationalist forces were launching an attack on the Communist front in Kiangsu, N. of the Yangtze, and developing an offensive in the Kirin

prov. of Manchuria, employing in these general attacks quantities of lend-lease Amer. weapons, including destroyer escorts, minesweepers, and aircraft. Early in Aug. Nationalist aircraft made a strong attack on the Communist cap., Yen-an. A week later Gen. Marshall (Amer. ambas. to C.) and Dr. Leighton Stuart issued a statement in Nanking indicating that a peaceful settlement was impossible at the moment and there were persistent rumours that the general was convinced that the mission on which President Truman had sent him was a failure. A desire for a peaceful settlement of the political problem appeared to be almost unanimous on the part of the Chinese people; while the economic situation called for a prompt solution if disastrous collapse were to be avoided. But the internecine strife was daily growing more widespread and it now threatened to engulf the country and pass beyond the control of the responsible leaders on both sides. The country was exhausted after years of intermittent civil war, the last eight of which had been combined with the war against Japan; the rise in the cost of living was enormous and the Chinese dollar which, before 1936, was worth about .30 Amer. cents was, in July 1946, valued at 3000 to one Amer. dollar, but, inasmuch as the Amer. dollar was greatly undervalued in C., financial experts put the true valuation at more than 10,000 to one. Such inflation might seem to threaten a complete and absolute collapse, but, with 85 per cent. of her people engaged in agriculture, C. does not react to inflation in the normal way. Again, while millions of peasants were starving in the countryside, many of C.'s larger cities were reasonably well supplied with both essential goods and luxuries. National disasters in C. occur so often that they come to be accepted and do not entail widespread social upheavals. The national inclination to hoard, so common in the E., was one of the many difficulties, too, that confronted the United Nations Relief and Rehabilitation Association's operations in C. The U.N.R.R.A.'s supplies were, in fact, not consumed because the Chinese knew that sooner or later conditions might get worse. That fear was justified in view of the fact that the protracted warfare kept an unusually large number of men in the unproductive occupation of killing one another. Bombings, burnings, and pillage had reduced the food stocks and the area of land under cultivation; while droughts, floods, plagues, broken riv. dikes and sea walls had added to the destruction. Late in Aug. (1946) in Manchuria, Communist forces struck a blow at the railway between Mukden and Changchun and in C. proper fighting was in progress in Shansi prov., but Nationalist reinforcements were quickly sent to save the railway. Although the fighting had now increased in both strength and bitterness, neither side was prepared to acknowledge that a full-scale civil war had begun. The efforts of the

Amer. mediators were still politely welcomed. Gen. Marshall and Dr. Stuart had obtained the assent of both sides to the appointment of a committee, under Dr. Stuart's chairmanship, to discuss the formation of the State Council which was to be the mainspring of the projected Coalition Gov. According to the Chungking agreement the council was to consist of 40 members, half from the Kuomintang and half from the other parties, and its constitution was designed to mark the formal ending of the Kuomintang dictatorship and the dawn of a democratic system. But the efforts of the mediators were now being frustrated by the rapid march of military events. Gen. Chiang Kai-shek, in reply to the Communist attacks upon gov. communications and garrisons in violation of existing agreements, now launched vigorous drives N. of the Yangtze, in Shantung, in Jehol, and in Chahar, and the Communists were unable to resist the better equipped Nationalist troops. An advance on the Communist centre of Kalgan threatened to undermine the entire position of the Yen'an administration in N. C. The Communists had now also suffered equally serious reverses in Manchuria; Harbin and Kirin were now threatened. Yet there always seemed to be the hope of an understanding on the foundation of the Feb. agreement, while the Communists, though so jealous of the enhanced political prestige and military power of the Central Gov. as to be determined to maintain a separate regime, yet refrained from taking the step of summoning a rival assembly under their own auspices. This last possibility, indeed, underlay the strong opposition of Gen. Chiang Kai-shek to any attempt by the Kuomintang to modify the constitution drafted by the all-party conference, a constitution more liberal than the earlier drafts based directly on the ideas of Sun-yat-sen. The efforts of President Truman to mediate were not due to an intention to interfere with Chinese domestic politics, but throughout the Second World War America had counted on C., almost as her protégée, to take over the leadership of Asia and, furthermore, President Truman insisted that C. had an obligation to United Nations to eliminate armed conflicts inside her ter. But at the end of Jan. (1947) the U.S. Gov. formally abandoned its long sustained effort to mediate in the quarrel, criticising extremist elements in both Chinese camps and suggesting that the salvation of C. lay in the assumption of leadership by the Liberals in the Kuomintang and the minor political parties. Economic conditions in C. at the opening of 1947 were such as would in any other country inevitably lead to revolution; but the evils affecting C. at this time were nothing novel. From the overthrow of the Manchus in 1911 right down to 1937 some kind of civil war had gone on year by year. Merchants and peasants had complained about over-taxation, corrupt administration, and lack of communications. The Yangtze had repeatedly

broken its banks and caused disaster. The troubles affecting C. were now so numerous and so closely interlocked that to unravel them would be the task of a number of years. Meanwhile in the political field relations between the Kuomintang and gov. and the Chinese Communist party, after endless negotiations and the desperate efforts of Amer. mediators, were now definitely worse than they were in the spring of 1946. One of the main demands of the Communists was that they should retain control over what they called the 'liberated areas,' which they wished to run on Communist principles. But such an ideological division could hardly help in restoring the Chinese economy. The passing of the constitution drafted by the Political Consultative Council in Nanking was hailed in some quarters as a great step forward. But the holding of the National Assembly was premature in view of the absence of the Communist party and the Democratic league. The constitution was passed in its original form by personal intervention of Chiang Kai-shek and it left many vital points unsettled—the numbers and divs. of the electorate; the relations of the executive to the legislative *quan*; the powers of the prov. councils in relation to the Central Gov.; and the divided economic interests of the N. and S. provs. The passing of the constitution had not answered the questions: What would happen if President Chiang Kai-shek were to retire? Could C. hope to remain united under some form of democratic gov.? The severity of the Chinese Gov.'s remedial measures in Feb. matched the seriousness of the country's economic plight. Her currency was pegged at a realistic level, and stringent war-time controls were reintroduced. The rate of exchange was now 12,000 Chinese dollars for one Amer. dollar. Trade in gold and foreign currencies was prohibited and private fortunes abroad were ordered home. The announcement of these measures was made in Nanking (Feb. 17) with a frank statement by Gen. Chiang Kai-shek that C.'s survival as a nation was at stake.

Nanking Government loses Manchuria and North China to the Communists.—The refusal of the gov. to carry into effect the political accord embodied in the resolutions adopted by the People's Political Conference in April 1946 gave the Communists legitimate ground for complaint, though the incurable suspicion in which they held (and hold) the Kuomintang was the primary cause of their failure to accept the army reorganisation upon which Gen. Chiang Kai-shek insisted. Hence the continuance of the civil war, which now dragged on into 1947 in the indecisive manner so characteristic of Chinese internecine conflict. The position in the early months of 1947 was that Gen. Chiang Kai-shek was directing his operations to the restoration of communications on the Tientsin-Pukow and Lung-Hai railways in N. C., and to the recovery of the ter. N. of Changchun up to the N. Sungari R.

and including Harbin. The Nanking Gov.'s forces numbered at this time about 2,750,000 men with garrison troops; while in Manchuria they numbered some 250,000. The Communists, in order to interfere with the gov.'s advance against Harbin, mounted a drive (spring 1947) against Changchun with over 200,000 men, the largest force they had put in the field at any one time. This drive was only held by the gov.'s forces after it had reached to within a few miles of Harbin; but, though the Communists were driven

they feared extermination by force, but that they would resist with a tenacity which could easily bring administrative and economic ruin upon any gov. imprudent enough to embark upon such an undertaking. The strength of the Communists in C. depended and still depends upon the contrast existing in public opinion between certain meritorious features of the system they practise and the many evils which the gov. still tolerated within its own ters., and in the eyes of foreign observers it seemed evident

IN THE VILLAGE OF LISON, FIVE MILES NORTH-EAST OF TSINGTAO,
SHANTUNG PROVINCE

back, the gov. forces were also compelled to turn back. In the Shantung operations the gov. were now employing some 500,000 men in groups operating along the railways mentioned above. The mountainous country N. of Tientsin to Tsinan, the cap. of Shantung and junction of the two railways, was strongly held by the Communists, who were now threatening Tsinan. The recovery of these railway communications by operations constantly harassed by Communist guerrilla attacks was to prove a much harder task than the Nanking Gov. had calculated. In March (1947) the gov. had announced their occupation of Yenan, the remote Communist cap. in Shensi. But that stronghold had been stripped and deserted so that its seizure had no great strategical effect on the anti-Communist campaign. Experience seemed to show that the Communists were formidable only when

that the attraction of Chinese Communism would diminish in exact proportion to the success with which the Nanking Gov. set its house in order.

In July the Chinese State Council decreed 'total mobilisation,' an indication of the serious crisis facing the Nanking Gov., which ascribed its misfortunes to Russian intervention. But there was no convincing evidence that such intervention was really responsible either for the friction between the Outer Mongolian Republic and the Chinese prov. of Sinkiang or for the military reverses which the gov. had at this time suffered in its ill-advised attempt to suppress the Communists by force of arms instead of effecting salutary reforms while permitting the Communists to exist in a separate state N. of the Yellow R. The significance of the crisis lay in the gov.'s frank acknowledgment of its dependence upon Amer. aid to

enable it to carry the civil war to a successful conclusion. The task of reconstructing war-ravaged C. could be accomplished only by a planned national effort on a comprehensive scale, of which the condition precedent was a coalition administration supported by progressive as well as conservative opinion. After the Second World War political reorganisation left the Kuomintang in effective control behind a democratic façade, but was not an honest attempt to carry out the proposals of the Joint Political Consultative Council of 1946, on which many hopes were based by C.'s friends abroad. The Communists and the Democratic League had held aloof, while the Kuomintang and its offshoots, the Youth party and the Democratic Socialists, had abandoned all pretence of conciliation. President Chiang Kai-shek, relying upon his Amer.-trained and equipped troops, was confident of speedy victory earlier in 1947 when he launched an all-out offensive against the Communist-held areas; but following the Pyrrhic victory of the capture of Yanan, the tide of war turned. The Communists, with the support of the rural pop., concentrated on attacking communications and, keeping their own forces intact, inflicted great losses on the gov. forces. Heavy fighting continued in the summer (1947) in Manchuria, where gov. forces were still struggling to reopen the railways. The military misfortunes of the gov. served to aggravate its economic plight, which in turn made the prosecution of the war more difficult without foreign aid.

Towards the late autumn of 1947 the situation of the Nanking Gov. had deteriorated markedly. In Shantung their forces had recovered the Tsingtao-Taiwan railway and the ports of Chefoo and Weihaiwei; but large Communist forces had escaped into Kiangsu; others had overrun Honan, Anhwei, and E. Hupeh, and reached the N. bank of the Yangtze; while those driven out of N. Shensi in March had seized fresh areas of hitherto unoccupied ter. in the neighbouring prov. of Shansi. Another group of Communist forces had crossed the Yellow R. from S. Shansi and spread into W. Honan. In Hopei the N. section of the Tientsin-Pukow railway and the Peiping-Paoing corridor along the Peiping-Hankow railway had been lost by the gov. and the Peiping-Paoing-Tientsin triangle, which they had cleared in Sept., had now been reoccupied by the Communists. In Manchuria the situation was even worse: the narrow corridor along the main railway, held by gov. forces, had now been reduced to a few isolated areas, and the whole forward area N. of Changchun to the Sungari R. had been abandoned. In the midst of these military preoccupations certain sections of the Kuomintang had severely criticised the gov. for its weak-kneed attitude towards the U.S.A. over that country's alleged lenient treatment of Japan and towards Russia mainly over the question of the recoupation of Dairen. The points of dispute, however,

between C. and Russia were neither numerous nor serious, and Dairen was not an insoluble problem were it not for the presence of Communists in S. Manchuria. But Chinese business circles had observed with growing envy and alarm the rapid recovery—with Amer. assistance—of Jap. economy. Following the visit of an Amer. mission under Gen. Wedemeyer, there was deep disappointment in C. when it became evident that there was no prospect of any immediate or unconditional financial assistance from that quarter. The question of Amer. assistance had been the subject of much dispute behind the scenes in C. Some, chiefly the military leaders, were opposed to the acceptance of any aid on a conditional basis; others, representing financial and business interests, recommended acceptance on almost any terms; others, representing the moderates of the Kuomintang, held that C. should accept aid provided that Amer. conditions did not affect the prestige of the Nanking Gov. or infringe Chinese sovereign rights. In fact, however, these sev. viewpoints were immaterial except in so far as that of the military leaders prevailed over the others.

By March (1948) the whole of Shansi was in the hands of the Communists. Honan was almost completely overrun, except for a large patch with Chengchow at the centre. The Communists had strengthened their grip over Manchuria and N. C., while the S. Manchurian railway was largely destroyed. The Peiping-Mukden line had been out of commission for sev. weeks, and large portions wrecked. With the loss of Liaoyang and Panshan two important ports to the S.E., Mukden was still further isolated. Communist efforts to break into Chahar and Suiyuan from Jehol were, however, decisively thwarted. But the whole N.E. of Hupeh was in the hands of the Communists, who had now cut the Hankow-Ichang railway, and were pushing westwards. The strength of the Communist party, which had enabled it to hold its own against the numerically stronger and better equipped forces of the gov., was due to the enthusiasm and fanaticism of its leaders; to the discipline and able command of its military forces, some of whose generals had been through a thorough military course of instruction in Russia; to its able conduct of guerrilla warfare; and to the growing discontent towards the Kuomintang, coupled with chaotic economic conditions.

The gov. of the liberated areas—as the Communists style the regions under their control—is a dictatorship under their leader, Mao Tse-tung, assisted by a small committee. The local administration of the areas is carried on by commissioners and propagandists—generally educated men and women who have been specially trained at the Univ. for Oriental Peoples in Moscow. The main item of the Communist platform is agrarian reform. Apparently neither communalisation nor state ownership is contemplated, but rather confiscation and a redistribution of land so as to ruin the wealthy class of

peasants—much indeed as the kulaks of the Russian agric. community were destroyed under Stalin's reforms—a process which was to be accelerated by a great increase of workers' wages, the cancellation of their debts, and the reduction of their rents. But, in the eyes of the Communists, the more important aspect of their policy is the inculcation of Marxist principles, and they envisage establishing the domination of the party over the whole life of the people, and their leaders interfere even in the most private details of family life. Their attitude towards religion is hostile on principle. Buddhist and Taoist temples have been despoiled, and the younger monks compelled to join the forces. The relations of the Chinese Communists with Russia, however, are wrapped in mystery, and all that can be stated with certainty is that the Soviet Gov., in accordance with its familiar policy in Europe, is well content to see the Kuomintang in difficulties while it favours a pro-Amer. policy. Communist tactics, aimed at producing such chaos in the country as might conduce to the collapse of the existing regime, have met with much success, but there is still a great way to go, for C. is a vast country. Huge regions in the W. and S. still remained outside the war, and even though the Kuomintang might now be compelled to abandon Manchuria and N. C., it would still have large resources to fall back upon. Moreover, the Communists, in spite of their territorial gains, had so far failed to set up any stable administration, and were repeatedly driven by counter-attacks out of captured towns, or areas, so that both sides seemed by the late autumn of 1948 to be as far as ever from ultimate and decisive military success. With a few notable exceptions, too, most of the actions of the war were by no means as fierce and desperate as the propagandist estimates of enemy casualties issued by each side might lead one to suppose; and indeed the loss of life among civilians was probably much higher than that of the military forces. The Communists had proclaimed long previously that their strategy was to destroy communications, mines, and industrial plant, and to create such economic havoc as must involve the downfall of the Nanking Gov. Yet by this time it might seem that all they had succeeded in doing was to inflict terrible misery on the common people without vitally injuring the gov. or the wealthy classes; and if the civil war were to continue much longer, in its present manner, the Communists, even if successful in N. C., would find themselves embarrassed with the control of a completely ruined country.

For the interminable war was inflicting grievous misery on a third of C. Inflation was followed by a tremendous increase in the cost of living and flight of capital. There were serious rice riots in W. and central C.; the provs. were proving insubordinate towards the central gov.; there was indiscipline in schools and univs. and general unrest among all classes. Furthermore it now seemed that the

administration of N. C. might be abandoned by the Nanking Gov. which, on account of the menacing military situation there, had been compelled to appoint the one successful general, Fu Tso-yi, as local dictator over a huge area comprising Jehol, Hopei, the N. part of Shansi, Chahar, and Suiyuan, with his cap. at Taiyuanfu. Fu had created a purely N. administration, from which he had excluded all Nanking personnel, a course to which Nanking had offered no resistance lest worst might befall. Fu's chief weakness was a lack of arms and equipment wherewith to hold his vast front. Whether he would obtain the necessary arms seemed to depend on whether the Nanking Gov. preferred to hold a semi-independent N. C. or forfeit it altogether to the Communists. At this time the three N.W. provs., Kansu, Chinghai, and Ninghsia, presented a difficult problem for both sides; for though collaborating with Nanking against the Communist threat, they were in fact petty independent states organised somewhat on Fascist lines, with small disciplined armies of Muslims, which had been instrumental in driving the Communists out of Shensi.

The over-all picture in C. towards the end of 1948 was that the Nanking Gov. had made no attempt to check the corruption that prevailed in higher official circles. No attempt had been made to tax the wealthy to pay for the war. None of the chief Nationalist generals had been superseded or punished for inefficiency. Little use had been made of the gov.'s numerous air force to assist the land forces, even though the Communist rebels had no air force; foreign trade was dwindling, gov. monopolies were increasing, and the gov. had formulated no definite economic plans, such as might be expected of any realist gov. which was determined to exorcise the spectre of popular discontent, and to defeat a rebellion which owed its success less to victories over ill-led Nationalist armies than to the gov.'s administrative sins of omission. Meanwhile there was a rapid debacle in Manchuria, which indicated the complete collapse of the morale of the Nationalist armies. Whether Amer. aid could have saved them might be disputed. Behind the Amer. Democratic administration's policy, based since the spring of 1947 on Mr. George Marshall's refusal to come to the help of either side, was always implicit the belief that, although withholding of Amer. aid would probably make it impossible for Gen. Chiang Kai-shek to defeat the Communists, it would not put his regime in danger, and a long period of stalemate was the worst that might be expected. But the culminating point of the Nanking Gov.'s ineptitude came at the end of Oct. (1948) when Communist troops broke into Mukden. This irruption, which in effect marked the turning-point of the civil war, was soon followed by the fall of the city and the surrender of its once-powerful Nationalist garrison. This crack armoured div. had been transported early in the summer by sea from Shantung in a vain effort to keep

open the corridor leading to the Manchurian cap. Had the garrison been able to withdraw safely before the Communist armies closed round the city, the balance of military power between the two sides might not have been seriously affected, for Mukden had become a salient which was difficult and costly to defend; but the garrison of Mukden had lost its fighting spirit and evidently had little confidence in its local commanders and believed that the Nanking Gov. was powerless to relieve it, especially as President Chiang Kai-shek was still relying on more Amer. aid. This, Mr. Dewey, Republican candidate for the presidency, had promised to give if he should succeed President Truman, though Amers. were becoming more dissatisfied at the Nanking Gov.'s inefficient use of the aid already given. The elimination of the garrison of Mukden meant that the Communists, now masters of Manchuria, could concentrate against the few remaining strongholds of the gov. in N. C., and the fall of Taiyuan, cap. of Shansi, was expected at any moment. For Gen. Fu Tso-yi had insufficient troops and arms to hold out against Communist forces who were superior in numbers and well armed—with Nationalist captured arms and equipment—and contemplated withdrawal into Chahar and Suiyuan. The effect of these disastrous blows was, moreover, likely to have repercussions throughout S. C., adding to the sense of fear, frustration, and despair at the central gov.'s lack of leadership.

The immediate reason for the disastrous turn in the military situation—which lost the gov. in succession Chefoo, Kaifeng, Chinchow, Changchun, and now Mukden—apart from faulty generalship, was the poor morale of the Nationalist forces. This was assignable to many causes: dissatisfaction of the common soldiers and junior officers with conditions of pay, food, and clothing—especially when these conditions were compared with the high living of the senior officers; the appointment of officers with no military training or experience; general war weariness, many of the Nationalist divs., especially in Manchuria, fighting what they realised was a losing battle for over two years without relief; and lack of interest in the cause for which they were fighting, the greater from the fact that many of the divs. were composed of men from distant provs., whereas the Communist divs. were recruited entirely from the local pop., which had long been separatist in sentiment. The news of the surrender of the Changchun garrison of 80,000 men which refused to continue fighting, had a further depressing effect on the spirit of the other gov. forces and in fact was followed by the surrender of seven divs. in the corridor (a small strip including Peking and Tientsin), thus sealing the fate of Mukden and Manchuria. Gen. Fu was now in a hazardous situation. With a force of no more than 300,000—two-thirds of which were Nationalist divs. of problematical quality, the remaining third being his own well-seasoned troops—his task was to hold a

front reaching in a vast arc from Paotow, in the N.W., to Shanhaikwan, in the E.; while some of his divs. were strung out along the Peking-Hankow line well S. of Paotow. The Communist armies, flushed with victory, had above all been enormously reinforced with captured arms, artillery, munitions, and other equipment.

It was not long before the Communists followed up these successes by thrusting southward along the Suchow defence line protecting Nanking—the gov.'s plight being aggravated by food riots in Nanking and Shanghai which only ended with the imposition of martial law (Nov. 11). Then for the first time in many months, however, gov. forces seemed to have rallied at a strategic point. Yet it was never certain that the Communist forces of Gen. Chu Teh would try to storm Suchow; for usually Communist tactics consisted in surrounding a town, and, while waiting for it to fall from within, pushing on through the countryside. At most this promised only a single check after months of gains which had tilted the scales—military, industrial, and ideological—to the Communists. Their broadening grip on large areas of N. and central C. had a much deeper implication than the Jap. invasion of ten years previously; for the Communists—decisively helped by Russia and avowedly Marxist—were organising native revolutionary forces wherever they advanced. In its vast scope and probable consequences the present upheaval was rather assimilated to the Russian Oct. Revolution—from which it directly and obviously sprang. The capture of Mukden, followed so closely by reports of a threat to Nanking (over 700 m. farther S.), suggested a swift war of movement. What in fact happened in each case was that the Communists built up their strength in a broad area of the countryside and at a given moment extended the area to press against the chief tns. Their first and main area was Mukden, which, however, they largely took over while Soviet troops were in occupation. They received Jap. arms and arms factories, especially in Dairen; and they obtained more arms from the gov. troops with the fall of Changchun and Mukden. Their second area—separated from the first by only a small Nationalist strip which included Peking and Tientsin—stretched from Yenai to the coast almost engulfing Suchow. It was the possession of these areas that gave them their strength.

The next area of decisive fighting was that around Suchow, which city was the Communists' most important objective since the capture of Mukden in view of its relation to Nanking. At the end of Nov. the 250,000 troops making up the Nationalist garrison of Suchow, following some weeks of confused fighting, abandoned the stronghold on orders from Nanking to hasten to the relief of the 140,000 troops of the 12th Army Group now encircled S.W. of Suhsien. This latter group had, not long previously, marched eastwards through Anhwei prov. to the support of their outnumbered comrades

in the Suhsien area. The Suchow garrison, having abandoned that city, was now fighting its way southwards to Pengpu, but encountered stiff resistance at Kuehng which it was captured by the Communists. The garrison and other troops comprising three Nationalist army groups had failed to relieve the 12th Army Group and, in their abortive efforts to do so, had sustained 30,000 casualties. In the rapidly deteriorating situation President Chiang Kai-shek on Dec. 10 ordered the extension of martial law to the whole of C. under Nationalist control except the W. provs. and Formosa. About the middle of Dec. the situation around Peking suddenly took a serious turn for the worse from the gov.'s standpoint: for Gen. Lin Piao's well-trained Manchurian troops, having driven back Gen. Fu Tso-yi's best gov. troops on a front 30 m. E. of the line Peking-Tientsin-Tanku, had advanced to within 10 m. N. of Peking, and the W. airfield only 3 m. outside the city was evacuated. The gov. forces, which had abandoned Suchow and withdrawn 100 m. southwards to Pengpu from where it estab. a new line of defence for Nanking along the Hwai R., now made a further withdrawal, this time to Chuhsien, only 30 m. N.W. of the cap. Early in 1949 the Nationalist Gov. decided to open peace talks with the Communists, but on conditions which the latter rejected out of hand and Chiang Kai-shek then resigned.

Chinese Literature.—The Chinese reverence literature above all things. The writing brush or pencil was invented under the Ch'ins, and the Chinese were producing some of the greatest literature before Rome was founded, and sending emissaries to collect literary texts in India at a time when Saxon pirates were raiding the coasts of Britain. War was and is anathema to them; and though, under the Ch'ins, the sword was mightier than the pen, notably when Shi Hwang Ti, the conqueror of China, tried to blot out the past by burning all the Confucian books and executing some 460 of the *literati*, there was a revival of learning under the Han dynasty when the classics were, though only with difficulty, recovered from the walls of houses or restored from the capacious memories of men. The literary output of the Chinese has always been on a vast scale, a fact which is due to the early invention of block printing in China, and though a great number of Chinese works have disappeared in the waste of war and fire, much has survived. It was during the sixth century that the art of taking impressions on paper from wooden blocks was invented, mainly for religious pictures and tracts; but this art was only generally applied to the production of books in the tenth century A.D. when the Confucian Canon was so printed for the first time. Movable types of baked clay were invented about A.D. 1050, and some centuries later were fashioned of wood and copper or lead, though they never ousted block printing from favour, and most of C.'s great literary works have been produced in this latter way.

As early as the sixth century B.C., the Chinese had a written language adequate to express any and all human ideas, a language practically identical with the present script. The founder of Chinese literature was Confucius, and the best authorities think that it cannot be asserted that there was anything in the nature of general literature before his time. Confucius, however, was a diligent collector of the utterances of earlier and often legendary rulers, and in this respect a kind of Chinese Homer. His great collection now known as the *Shu Ching* or *Book of History*, compiled from a hundred sources, is the beginning of Chinese literature. From the book, a small portion of which is in verse, we can reconstruct the story of the Chinese from the twenty-eighth to the eighth century B.C., and in particular the reigns of Yao and Shun, the so-called 'golden age' of China. Two of the documents in this book are homilies against luxury, while another contains an allocation to an assembly of nobles by Wu Wang, the first monarch of the Chou dynasty, condemning the Shang dynasty, which he overthrew. Confucius also preserved the *Shih Ching* or *Book of Odes*, containing some 300 poems, lyrical and historical, many of which treat of warfare and marital fidelity, and others of agriculture, hunting and feasting, and official tyranny. They are a valuable record of the manners

and customs of the Chinese before the time of Confucius. The idea of a Supreme Being is emphasised in the odes, and it appears that the Chinese conception of it was anthropomorphic. But the most famous and perhaps the oldest of all Chinese works before Confucius is the *I Ching* or *Book of Changes*, ascribed to Wen Wang, known as the Western Chief, and virtual founder of the Chou dynasty. It is a system of philosophical speculations based on the sixty-four hexagrams, and expresses enigmatically and symbolically, with commentaries, the philosopher's deductions from the diagrams. The *Li Chi*, or *Book of Rites*, a classic of ceremonial, also belongs to the earlier time (c. second century), and is ascribed to the elder and younger Tai. The fifth of the classics of Confucius (known as the *Five Ching*) is the *Ch'un Ch'iu* or *Spring and Autumn Annals*, being a chronology of events of the state of Lu, which was the state of Confucius. This book, which is somewhat dull, is notable for the inclusion of the *Tso Chuan*, a document which is described by a high authority as one of the most precious heirlooms of the Chinese people. Its value lies in the life and perhaps impudence with which Tso, its author, invested the raw material of the Annals. The most valuable works from which to reconstruct pre-Confucian culture are the surviving treatises on religion, rites, and ceremonial: the *Chou Li* (or *Rites of the Chou Dynasty*), the *Li Chi*, and the *I Li*, all most important sources which have not yet received the investigation they merit from students of history. Included in the Confucian Classics, besides the *Five Ching*, are also the *Four Shu*: the *Lun Yu* or the *Analects*, a compendium of the small talk of the sage, with dialogues of himself and disciples on gov., virtue, and similar topics; the *Chung Yung* or *Doctrine of the Mean*, by the grandson of the sage, being a eulogium of the tenets of Confucius; the *Ta-Hsueh*, or the *Great Learning*, a primer of Confucian ethics which has had a remarkable effect in shaping the Chinese national character; and *Mencius*, a treatise in four books on political economy. This last collection contains the sayings of Mencius, the greatest of the disciples of Confucius, and is remarkable for the writer's power of Socratic irony in refuting the Chun sophists of his day.

Between 600 and 200 B.C. there are numerous authors on a wide range of subjects, but even the expert may find it difficult to disentangle the forgery from the authentic work. Some of the most notable are the *Ping Fa* or *Art of War* of Sun Tzu; the work of Haun Tzu, the anti-Confucian philosopher; and the *Chia Yu* or *Family Sayings of Confucius*, generally ascribed to Wang Su, an official who died 258 B.C. The poetry of this period is of great interest. It is sonorous like so much of Chinese poetry, and has been described as 'prose run mad' (Giles). Its characteristics are its allegorical style and an excessive use of allusion; and, indeed, but for commentaries, more or less unintelligible; but, when interpreted, is a

good guide to the Chinese view of the poet's art. Opposed to Confucius at this early period is the complex but important literature of Taoism, or that which accumulated round the Tao or 'Way' of Lao Tsze (or Lao-Tzu) (i.e. Old Philosopher), whose biography is to be found in the hist. of Szu-ma Ch'ien, 'the Herodotus of China.' Much is merely legendary in the existence of Lao and in the identity of his work with the well-known *Tao Teh Ching*. Lao, or Laozius to give the Latinised version of his name, is, indeed, so opposed to Confucius that some have believed the whole story of this religious

W. F. Mansell

LAO-TSZE AND HIS DISCIPLES

By Huang Shao-ming, 16th century

teacher to be merely a distorted version of the Buddhist legend. Some think that the *Tao Teh* or *Classic of the Way of Virtue* is a work of the second century, and that it really contains also many of the sayings of Confucius himself. More authenticated is the work of Ta Lao's disciple, Chuang Tsze, a writer who in a turgid style emphasises the idealistic character of Lao's doctrines with the unintended effect of enhancing the practical nature of the teaching of Confucius. Other Taoist philosophers are Lieh Tzu, whose works may be had from any Chinese bookseller to-day, Hunan Tzu, an alchemist, and Han Fei Tzu, a lawyer, whose essays are valuable in that they divorce the genuine sayings of Lao from the rest of the *Tao Teh*.

The literature of the Han dynasty (200 B.C. to A.D. 200) throws much light on Chinese national history of that period. It covers all branches from the poetry of Li Ling, a Han general known to every Chinese schoolboy, to history,

lexicography, and parables on Buddhism, which religion was then beginning to make its way into C. Poetry greatly flourished under the Han dynasty. The farewell poem of Su Wu, a military adventurer, to his wife on leaving for the wars, is well known in C. to-day; and there is an equally well-known poem, *White Owl Ode*, by Chia I., which bears a strong resemblance to Poe's *The Raven*. Among other writers of this period were Li Szu, known as the inventor of the 'Lesser Seal' style of script, so called because the characters were suitable for engraving on seals; Yang Hsiung, the author of *T'ai Hsuan Ching*, an apotheosis of the *Book of Changes*; Wang Ch'ung, whose essays *Lun Heng* give him the position of a Chinese Juvenal; Ching Hsuan, the most learned and voluminous of the commentators of the Confucian classics; and the poet Mai Cheng, who is notable as the father of modern poetry in the sense that his verse exemplifies for the first time the beauty of the five-word metre. The chief historian of the period was Szu-ma Ch'ien, the so-called father of hist. (b. 145 B.C., whose work, known as the *Historical Record*, is a hist. of C. from the earliest times to a century before the Christian era. Most subsequent dynastic records of C. have been based on his model. Another notable historian was P'an Chao, sister of the court historiographer, and 'ornament of her age,' who was made mistress of poetry and hist. by the empress in recognition of her *Book of Han*. Lexicography was raised to a science by Hsu Shen, a scholar who compiled the celebrated *Shuo Wen*, a collection of comments and expositions of some 10,000 Chinese characters, being a work of considerable importance in the study of ideographs. In the next period, that of the minor Han dynasty, the period of C.'s greatest romance, literature was lost in the fog of civil war, but the material was there for the most exciting narratives. The period, with its amazing generals, its quaint women, its almost incredible military exploits, is perpetuated in the celebrated *Story of the Three Kingdoms*, one of the most popular novels of the country. The names of sev. bards have survived, notably those of T'ao Ch'ien (A.D. 365-427), a poet of the school of Omar Khayyâm, whose *Peach-blossom-fountain* allegory, on the futility of trying to rediscover the scenes of youth, is known to all Chinese students of poetry; and of T'ao Chih, a kind of Chinese Horace, who figures in the favourite Chinese story of *The Beans and the Beanstalk*.

Li Po (A.D. 705-762), of the T'ang period, is generally regarded as C.'s greatest poet. His life of gaiety, dissipation, and court intrigue is in itself a theme for verse; but his chief title to fame lies in the use he made of 'suggestion,' or the 'stop-short,' a literary device which is considered by the Chinese as of the very essence of true poetry. His muse is of the pensive vein and 'many of his Baochanallan verses are tinged with melancholy.' Another distinguished name of the time was that of Han Yu, the writer of

the celebrated *Memorial on the Bone of Buddha*, a statesman as well as a poet and scholar, and a most venerated name in Chinese literature. He wrote on a great variety of subjects, lifting the commonplace into something of interest by sheer wit. His poetry is not, however, of the first order, and it is through his prose that he lives, and his funeral orations are famous in Chinese literature, as is his allegory of a crocodile. Another poet of this period was Po Chu-I (772-846) a governor of Soochow and war president, whose poems were collected by imperial edict and engraved on stone tablets. Of this period, too, was Ssu-K'ung T'u, a court official of ceremonies who turned hermit; his chief work was a philosophical poem in the form of a scholarly exegesis of pure Taoism. The next or Sung period (A.D. 900-1200) is the period of speculative philosophy, and has also been called the period of neo-Confucianism. The cardinal feature of the literature of the Sung writers is a tendency to work Confucianism into the theory of gov. The chief names are Chao, Chu Hsi Chang, and the two Chengs. Chu Hsi is also known as the writer of a summary of some thirty-six centuries of Chinese hist. based on the work of Szu-ma Kuang. The latter, who flourished between 1019 and 1086, is famous alike as poet, historian, and statesman, and is said to have spent twenty years over his *General Mirror Aid in Governing*, and is also known for his poem *Garden*, of which a famous account is given in the pages of Abbé Huc, the ingenious Fr. missionary who wrote a famous work on his travels with Gabet in Tibet. With the Sung period came the invention of block printing which gave a great impetus to the production of hist., and general literature and poetry, besides the compilation of dictionaries and medical works; and among the other prin. names of the times are those of Wang An-Shih, an economist and educationist; Shao Yung, a Chinese Lucretius who deduced his explanations of natural phenomena from the groundwork of the *Book of Changes*; Wu Shu (947-1000), whose *Shih Lei Fu* on celestial and terrestrial phenomena, botany, and mineralogy is the parent of all the voluminous works of that type which have since figured so largely in Chinese literature; and Sung Tzu, a Chinese judge who wrote a book on *Medical Jurisprudence* which, though full of ludicrous absurdities, is the vade-mecum of Chinese coroners.

The Mongol dynasty (1300-68) added but little of lasting value to the vast accumulation of general literature, poetry, and commentaries theretofore written; but it is notable for the rise in Chinese literature of the drama and of the novel. Most Chinese plays are simple in construction and poor in plot; they are classified into plays 'military' and 'civil,' the former comprising historical or heroic episodes and the latter farces on everyday life. Most are unexceptionable in tone, but 'gagging' metamorphoses them into the gross. The nearest approach in

Chinese drama to tragedy is the well-known five-act play *The Orphan of the Chao Family*, by Chi Chun-Hsiang. The origin of the Chinese novel is not known, but it may be traced to Central Asian sources, whence have emanated stories current the world over. *The Hsi Yu Chi* or *Record of Travels in the West* is a favourite Chinese novel, written in a popular style, and treating of a journey in quest of books and images to illustrate Buddhism. Novels were written in considerable numbers at this period, but the names of the authors are buried in oblivion, no doubt because, generally speaking, the Chinese do not rate novels as true literature. Apart from the historical *genre*, Chinese novels comprise one really remarkable work, *Ch'in P'ing Mei*, attributed to Wang Shi-Cheng, a statesman, notable mainly for its recurrent use of the *double entente* throughout the story, which is concerned with three female characters whose names form the title. In drama, the *P'u Pa Chi*, or *Story of the Guitar*, is regarded as the very finest of Chinese plays. First performed in 1704, it was written by Kao Tso Cheng, and, according to Chinese critics, its chief beauty is in its praise of duty to the sovereign, of filial piety, and of wifely forbearance. The poetry of Hsieh Chin (1368-1415) is well known in C.; he may be regarded as the Chinese Chatterton, for his precociousness of genius and of character, and, in his time, presided over the bodies which produced C.'s largest encyclopaedia. It was in Yung Lo's reign that the *Great Encyclopedia* was produced; it is the bulkiest literary collection ever made, and is said to have required the unceasing labours of more than two thousand writers for three years. It was never printed, but copies were circulated in MS., and though most appear to have been lost in the Boxer outrages, MS. vols. are frequently being found, and the Library of Congress, Washington, now holds the largest number of them. Another notable work of reference of this time is the *Complete Geographical Record of the Empire*, in ninety vols. *Liao Chai*, or *Pastimes of the Study*, by P'u Sung-Ling (b. 1622), is admired by cultivated Chinese readers of to-day, despite the fact that it is of the order of novels. For years it was pub. only in MS., the author being too poor to have it printed. The stories in themselves are in no way remarkable, but 'all the elements of form which make for beauty in Chinese composition are there in overwhelming force,' and the work is proverbial for its commendable Tacitean conciseness, while the wealth of its allusions seem to point to the author as a man who had covered the whole range of Chinese literature. The love-story *Hung Lou Meng*, or *Dream of the Red Chamber*, also belongs to the Manchu period; this work reaches the zenith of development of the Chinese novel. Its author is unknown, but it is assigned to the latter part of the seventeenth century. It is voluminous both in size and in the number of its characters, and the characterisation is on a par with

that of the novels of any age or country. It gives a picture of Chinese social life which for comprehensiveness is quite unrivalled (a fairly complete account of it is to be found in H. A. Giles's *History of Chinese Literature*). The poetry of this period is commonplace, but the emperors of the time were good patrons.

Coming to more recent years, Yuan Mei (1715-1797) is C.'s most popular writer of modern times, his letters being witty and diverting, though often coarse; like so many Chinese works, they lose much by trans. Yuan Mei's work is replete with epigrams and aphorisms, and much commonsense philosophy. Other names of the Manchu period (ending 1900) are those of Ku Chiang (d. 1681), a writer on political economy and general literature; Chang Ting Yu, author of a *History of the Ming Dynasty*; and Yuan Yuan, a most notable scholar (d. 1849), and a governor of Chekiang, who wrote copiously on astronomy and archaeology and classics, and compiled a biographical dictionary of the mathematicians of all ages. A feature in the life of any Chinese city is the wall-literature, which has strong affinities with Journalism of the more utilitarian kind, including, as it does, official notices, specifics for diseases, and other notices. The existence of this wall-literature from the very earliest times was exceedingly fortunate, in that it proved the medium of rescuing the classics from permanent loss. Journalism proper is a late development, due to the influence of the foreigner, and by no means popular with the Chinese rulers. The first Chinese news sheet was pub. in Shanghai in the seventies by a syndicate of Brit. journalists and an Amer. Local officials tried in vain to suppress the sheets, and ultimately had to start their own papers in sheer self-defence. *The Peking Gazette*, sometimes said to be the oldest newspaper in the world, is not really a newspaper, any more than were the old Rom. *acta diurna*; it does not contain news in the common acceptance of the term, but only records of court movements, promotions, and some notices of edicts, etc., and is therefore very like the *London Gazette*. It began in the fifteenth century and is pub. daily.

It remains to add that interest in Chinese poetry has been enormously quickened in recent years by translations such as those of Arthur Waley (England), Amy Lowell (U.S.A.), Soulié de Morant (France), and Klabund (Germany), and that it is to Herbert A. Giles, Prof. of Chinese in the Univ. of Cambridge, that we owe the first attempt made in any language, including Chinese, to produce a hist. of Chinese literature (1900).

Chinese Art.—In painting the Chinese long ago attained a degree of excellence reached only by the greatest masters of the art. Chinese art was on a lofty plane centuries before the modern W. nations had learned even the elements of painting. The landscape painting founded by the Sung artists, in which mts. figure so conspicuously, is ranked as the greatest school of landscape painting the world has seen, its merit lying in the imaginative portrayal of the elemental and sublime in nature, while its 'visions of storm and peace among abrupt peaks and of plunging torrents,' though often fantastic, are never tame. It is a commonplace that great Chinese artists have no regard for outline as opposed to the spirit of the subject depicted, and Chinese art has languished in later centuries only because popular favour has veered to the productions of the studio artist as opposed to the artist of the plain air school. As in poetry (see *Chinese Literature*) so in pictorial art, the Chinese delight in 'suggestion' or leaving something to the imagination of the beholder, and Chinese artists found scope in 'impressionism' centuries before that term became current in the Eng. language. Time-honoured stories, like that of the fruit painted so realistically by Zeuxis that the birds pecked at it, are paralleled in the literature of Chinese art; and exhibitions of Chinese pictures held in the present century show that the amazing stories of the power and originality of Chinese painting are justified.

Many examples of T'ang art are to be seen in the Brit. Museum to-day, mostly dealing with Buddhist subjects. In this, the 'golden age' of Chinese art, two schools of painting were founded; the N. by Li Shu-hsun, and the S. by Wang Wei. Robust sternness is the feature of the N., and exquisite refinement of the S. Besides the above painters, the greatest painter of the T'ang period was Wu Tao-tzu, the most revered figure in Chinese art, and celebrated as the father of modern Jap. painting. Apparently no paintings of his are extant, but 'The Death of Buddha,' in the Brit. Museum, founded on one of his reputed masterpieces, affords a clue to his powers. Chinese painting in these earlier periods owes much to Chinese poetry, the religion of Taoism, and the Zen form of Buddhism, to all of which influences may be attributed its predominantly symbolic or suggestive

spirit. Among other notable Sung artists were the Emperor Hui-tsung, famous for his pictures of white falcons, and Li Lung-mien.

Ming art, too, is of the highest merit, especially the bronze work of the fifteenth century, which produced the incense-burners known as 'Jisu Lu.' Ming lacquer work and porcelain are also known the world over, the latter being remarkable for the device of coloured glazes and painting beneath the glaze.

W. Mansel

'GODDESS OF THE DEW'

By Wan Shou-ch'ü, 17th century
(British Museum).

'The Kaolin Hills, indeed, are named from the clays from which the famous porcelain is made. As regards porcelain, the Ch'ien Lung era was the most prolific in the hist. of Chinese art, and modern W. collections consist largely of specimens of that period. The celebrated imperial potteries of Chingtehchen and Kiukiang, estab. under the experts T'ang kung and Nien, maintained their reputation until the time of the Tai-ping rebellion in the nineteenth century, when they were closed, but there has since been a revival of the art. The Chinese have also excelled in the carving of jade, a light or dark green stone into vases and other objects for ornamental purposes. See J. C. Ferguson, *Outlines of Chinese Art*, 1920, and *Chinese Painting*, 1927; U. Pope-Hennessy, *Early Chinese Jades*, 1923;

A. J. Coop, *Early Chinese Bronzes*, 1924; W. G. Gulland, *Chinese Porcelain*, 1928-1929; L. Binyon, *Paintings in the Far East*, 1934; G. Rowley, *The Principles of Chinese Painting*, 1947; W. Cohn, *Chinese Painting*, 1948.

China Aster, ann. herb of the Compositae order; botanical name, *Callistephus chinensis*. It originates in China, being introduced to Great Britain in 1731, and has lilac flower-heads.

China Bark, one of the names applied to the bark which yields the drug cinchona.

China Clay, see KAOLIN.

China Grass, see BOEHMERIA.

China Ink, see INK.

Chinandega, in Nicaragua, tn. consisting of two contiguous tns., Old C. and New C., important as being the centre of a corn-producing dist. owing to its situation on the Corinto-Managua railway. Trade in cloth, pottery, cotton, Indian feather ornaments, sugar-cane, bananas. Pop. 12,000.

Chinan, see TSINAN.

China Root, name given to the root of the tropical vine, *Vitis sicyoides*, and also to that of the lilaceous plant, *Smilax China*. The latter plant is used medicinally, and others of its genus yield sarsaparilla.

China Sea, South (Chinese Nan Hai, or South Sea), that portion of the Pacific Ocean lying to the E. of China and Slam, being bounded by China and Formosa on the N. and N.W., the Philippine Is. on the E., Borneo on the S., and the Malay Peninsula and Fr. Indo-China on the S. and S.W. It forms the great gulfs of Slam and Tongking. Its chief affluents are the Rs. Meinan, Cambodia, Canton, Mekong, Songkoi and Sikiang. The chief ports are Canton, Manila, Bangkok, Singapore, Hong Kong, and Saigon. Greatest depth, 14,250 ft.

Chinaware, a porcelain, a kind of fine earthenware, made by mixing china clay with undecomposed felspar (petunite), and some sand or silica. The resultant porcelain is pure white when fired because china clay contains no iron. The art of making C. was introduced into Europe by Venetian travellers from China in the fifteenth century, and for three centuries thereafter Italy was the centre for its manu. The famous Sèvres factory was founded in the middle of the eighteenth century, and about the same period factories were set up at Chelsea and Worcester in England. See further under PORCELAIN.

Chincha Islands, three small rocky is. in the Pacific, off Peru, and about 14 m. from the coast. Total area $\frac{1}{4}$ m. The is. rise to about 200 ft., and were formerly noted for guano, but have now been worked out. Lat. $13^{\circ}38'S$; long. $76^{\circ}28'W$.

Chinohay-cocha, lake of Peru, lying to the S. of Cerro de Pasco. Altitude, 13,800 ft.; length, 18 m.; breadth, 6 m. Discharges its surplus waters at the N.W. corner by the Mantaro R.

Chinshew see CHUANCIOWFU.

Chinchilla, tn. of Spain, in the prov. of Murcia, with industries of lead mining and cloth manu. Pop. 7320.

Chinchillidae, family of rodent mammals estab. by Bennett, consists of sev. genera of S. Amer. animals allied to the agouti (q.v.). All the species have long limbs, bushy tails, very soft hair, and resemble squirrels to some degree. *Chinchilla laniger* is the true chinchilla, a little creature with large eyes and ears, and its fur is so much sought after that it is diminishing in numbers. In habit it is gregarious and subterranean, and in disposition it is mild. *Lagidium* is another genus which has its habitat in the higher Andes, and the third genus consists of one species, *Lagotomus trichodactylus*, the vizcacha.

Chinchon, tn. of Spain, situated 25 m. to the S.E. of Madrid. Pop. 5000.

Chinde: 1. Riv. of Portuguese E. Africa, in reality the chief of the estuarine branches of the Zambesi, which empties into the Indian Ocean about lat. $18^{\circ}30'S$. The mouth is more or less blocked with sand. 2. Seaport of Portuguese E. Africa, at the mouth of the Chinde R. It is the chief port for the Zambesi Valley, though large steamers cannot cross the sand-bar at the riv. mouth, over which there is only a depth of 10 to 18 ft. of water. The tn. has only come into being since 1889. In 1891 the Brit. leased from the Portuguese five (later twenty-five) ac. of land known as the Brit. Concession, on which goods in transit to Brit. possessions may be stored duty free. Pop. 1500 natives and 200 Europeans.

Chindwara, see CHINDWARA.

Chindwin, or Kyendwin: 1. Riv. of Upper Burma. Rises in the Patkoi Mts. near the Assam frontier, and flows in a southerly direction for about 500 m., joining the Irawadi on the r. b. between Mandalay and Pagan. It is navigable by steamers up to Kindat, and by native boats for about 300 m. in the wet season and about 150 m. in the dry, but navigation is rendered difficult by the sandbanks and the swiftness of the current. In the operations in Burma in 1943-44, Gen. Slim had available the 4th Indian Corps for an offensive, if necessary, up to and beyond the Chindwin R. and the Chin Hills. On March 16 (1944) the Jap. gen. Mutaguchi's Fifteenth Army crossed the riv. with the intention of reaching Imphal and Kohima before allied reinforcements could arrive and then to break into the Brahmaputra Valley. But the 5th Indian Div. was flown up from Chittagong and two brigades were landed at Imphal, where they formed the necessary reserve. The Jap. were heavily defeated at Kohima and Imphal and the remnants of their 31st and 15th Divs. were driven back across the Chindwin R. by the 33rd Corps. By summer the Allies reached the junction of that riv. with the Irawadi and the advance on Mandalay was begun. See further under BURMA, SECOND WORLD WAR CAMPAIGNS IN. 2. Name given to two dists. in Sagaing, Upper Burma. The upper dist. is mountainous and covered with forest. Area 16,037 sq. m. Cap., Kinday. Pop. 200,000. The lower dist. is partly wild and wooded and partly a fertile rice-producing plain. Area

3480 sq. m. The cap. is Monywa. Pop. 345,000.

Chinese Eastern Railway, The, is a railway of about 1100 m. in length, running S.E. across the N. part of Manchuria. It enters Manchuria on the W. at Manchuli, and on the E. it joins the Ussuri railway, running to Vladivostok, at Pogranichnaya, or Sulfenho. It has a branch running S. from Harbin and joining the S. Manchuria line at Changshun. The line, which is of the standard Russian gauge of 5 ft., was built mainly by Russian and Fr. capital, though the Chinese Gov. have a small holding in its stock. With the possible exception of the Bagdad railway, no other railway has been such a bone of contention among diplomats. The weakness of the Russian Gov. after the First World War emboldened the Manchurian Gov. to make claims which would not have been put forward against the gov. of the tsar. This dispute came to a head in 1929 and led to military conflict at each end of the line. In 1935 the Russian Gov. sold the entire system to the Jap.-controlled Gov. of Manchuria, or Manchukuo.

Chinese Labour Question, The. Hist. of the C. L. Q. which so agitated the public mind in S. Africa and Great Britain during the first decade of the present century may be traced back to the pre-Boer days. The gold-mine owners of the Rand (Transvaal), in giving evidence before a commission appointed by the Boer Gov. (1897), had demanded cheaper coloured labour to work their mines. They pointed out that certain low-grade ores could be profitably mined if the gov. would increase the native hut tax and consent to the estab. of locations in order to compel the Kafir to work at reduced wages. They further argued that with an increased supply of native labour more white labour would be employed. On the commission reporting adversely on these suggestions, the mine owners talked of the importation of Asiatic labour and of closing down the mines if their demands were refused. President Kruger replied by passing a law which provided that if the mines were not worked by the mine owners, the gov. would confiscate them and work them itself. Then came the war (1899-1902) in which the Kruger Gov. was swept away and the Milner regime estab. One of the first acts of Lord Milner was to double the hut tax. At the close of the war the mine owners reduced native wages from 47s. a month to 27s., with the result that at that time only 42,000 natives were working, as against 90,000 at the beginning of the war. On their raising wages next year to their former level, the natives flocked back until their numbers were the same as before the war. In 1903 Lord Milner appointed a commission to inquire into the adequacy or otherwise of the sources of supply of labour for the mines. This commission reported that an additional 129,000 labourers were necessary, and that Central and S. Africa were unable to meet this demand. In the following year an ordinance was carried in the Transvaal

Legislative Council for the introduction of indentured labour 'from outside Africa S. of 12° N. of the equator.' This ordinance, which received the royal assent, was strenuously opposed by the Liberal party in Great Britain and by the Boers and white labourers in the Transvaal. On the other hand, it was claimed that a petition in favour of Chinese labour was signed by a little over half of the white adult pop. The opinion of Cape Colony may be gauged by the fact that in May 1904 a Bill was passed in the legislature excluding Chinese labour from that colony. The first shipload of Chinese coolies arrived at Durban on June 20, 1904, and ultimately as many as 60,000 coolies were employed on the Rand. The strong feeling raised in Great Britain against the employment of Chinese labour, freely characterised by opponents as 'Chinese slavery,' was, it is generally conceded, mainly responsible for the overwhelming defeat of the Conservative party at the general election in January 1906. On the granting of a constitution to the Transvaal the Het Volk (or Boer) party obtained a majority in the new chamber, and this party proceeded to redeem its pledge to repatriate the Chinese speedily. Thus 17,000 left in 1907, 28,000 in 1908, and the remainder in 1909. The many parl. debates on the subject of Chinese labour gave rise to two or three phrases that will probably be remembered when the occurrence on which they were uttered has been forgotten. Thus we have the archbishop of Canterbury's defence of the ordinance as a 'regrettable necessity,' and Mr. Winston Churchill's characterisation of the term 'Chinese slavery' as a 'terminological inexactitude.'

Apart from the C. L. Q., no large number of Chinese have entered the Brit. Empire, though some thousands, lured by the gold-fields, went to Australia and increased the total by the middle of the century to about 50,000. Political trouble ensued, and the numbers went down steadily, and by 1930 were less than half what they were, a result chiefly due to the Australian immigration tests. A high head tax excludes them from Canada and a poll-tax has the same effect in New Zealand.

Chinese White, condensed form of the pigment known as zinc white. This is an oxide of zinc (ZnO) which is manufactured by combining vaporised metallic zinc with air, when the pigment is deposited as a white powder. C. W. is not liable to chemical or physical change, and is practically inert with regard to other pigments. It forms an excellent water-colour, but lacks toughness with oil.

Chingalpat, Chengalpat, or Chingleput, chief tn. and stronghold of the dist. of that name in Madras, India, and of historical importance since one of its forts was taken by Olive in 1752. The dist. comprises 2842 sq. m., and has a pop. of 1,500,000, the tn. 36 m. from Madras and noted for its pottery, 15,000.

Chingchu, or Tsinchow: 1. Tn. of Shantung prov. in N.E. China, 80 m. E. of

Tsinan. The former cap. of the prov. and a centre of the silk trade. 2. Tn. of Hupeh prov., China, near Shashi.

Chingford, suburb of London in Essex, England, situated between the R. Lea and Epping Forest. 10 m. from London. Pop. 22,000.

Chingsha, or **Kinshakiang** (riv. of golden sand), Chinese name for the upper course of the Yangtzekiang, rising in the mts. of the Kunlun system, dividing the prov. of Sikang. It is separated by mts. from the Rs. Hwang Ho and Mekong.

Chingtzukuan, tn. of Honan, China, on Tan R. Of considerable commercial importance, being at the head of winter navigation on the riv. and on the Hankow to Sianfu trade route.

Ch'ingwangtao, port of N. China in the prov. of Hopei. It owes its existence as a port to the Chinese Engineering and Mining Co. Ltd., now known as the Keilan Mining Administration. As a seaside health resort it is almost without rival in China. The glass factory is one of the largest in existence. Pop. 5,000.

Chingyangfu, tn. of Kansu, China, on Matien R.

Chini, tn. of Bashahr, W. Punjab, India, near R. Sutlej, 69 m. N.E. of Simla. Vines are largely grown. Pop. about 5,000.

Chiniot, tn. of Jhang dist., E. Punjab, Pakistan, near R. Chenab, 80 m. N.W. of Lahore. Noted for wood-carving and masonry. Pop. 13,500.

Chinkiang, port in the Kiangsu prov. of China on the S. bank of the Yangtze, about 150 m. from its mouth. Its existence as a port is gravely threatened by the deterioration of the harbour. There is an Amer. Presbyterian Mission station. Pop. 200,000.

Chinlin Mountains, branch of the Kunlun Mts. in China, dividing the Wei and Han Rs. in their upper courses. Its highest peaks are in the Tapaishan and Kwangtangshan, both upwards of 12,000 ft. high. This range has sev. important passes, of which the chief are those connecting Sian and Shangchow with Lunchow and Fengsiang with Kuang-yuan.

Chinnampo, port in Korea, 40 m. from Pinyang, has a pop. of 30,000. Rice, beans, wheat, cow-hides, and timber are exported.

Chin-India, see INDO-CHINA.

Chinan, see TSINAN.

Chino-Japanese War (1891-95). Jap. interest in the integrity of Korea, which country her commercial enterprise had opened up to the world, was the real cause of this war. Its immediate cause, however, was the violation of an agreement made between Li Hung Chang (q.v.) and Count Ito (q.v.) for maintaining the *status quo*, by the despatch of Chinese troops to Korea without due notice to the Jap. Gov. Other and contributory causes were: the murder of Kim Okkuin, the Korean statesman, in Shanghai, whither he had been inveigled by Korean delegates; Jap. commercial grievances of ten years' standing; and the prevailing unrest in Japan, whose statesmen saw in such a war a practical solution of their difficulties.

But whatever the causes, the resulting and thorough defeat of the Chinese was a startling revelation of the rise of new world power in the Far E., although the promulgation of the enlightened Jap. constitution of 1889 should of itself have shown that Jap. progress in W. ideals was no transient phase. Japan's first opportunity of interference in Korean affairs was the earlier embroilment of China with great foreign govts. through disorders in Korea, of which country China was the nominal suzerain; and Japan then secured a treaty with China involving the independence of the principality. The Chinese Gov. then sought to retrieve the position by intrigues, which soon brought the two countries to the brink of war, troops from both being already in Korea. Then followed a number of tragic incidents, which compelled Li Hung Chang to arrange a *modus vivendi* with Count Ito, under which the troops on both sides were withdrawn; but the agreement was broken in the manner above indicated, and war was declared by Japan on Aug. 1, 1894, actual hostilities having begun a week previously with the sinking of the transport *Koeshing*, an Eng. vessel carrying Chinese troops. In the battle of P'yung (Sept. 15), a Chinese army was routed with heavy loss. Chinese methods of generalship being grotesque in the extreme. On Sept. 17, however, the Chinese navy fought stoutly at the battle of the Yalu, but lost sev. ships. Late in Oct., a Jap. army under Count Oyama (q.v.) invaded Manchuria. The fortress of Port Arthur was taken by storm on Nov. 21, with only slight loss to the Jap. who, however, marred the previous record of their humane advance by an unwarranted massacre. But the advance was so successfully prosecuted that the Chinese Gov. sent one Detring, an Eng. employe in the Chinese customs service, to open peace negotiations. Like many other emissaries in the course of the war, he was not recognised. Haicheng and Kaiping then fell to the Jap., these victories giving them complete control of the Liaoting peninsula; and in Feb. 1895, at the decisive battle of Weihaiwei, the Chinese land and sea forces were utterly defeated, the Chinese admiral Ting, committing suicide in his ship. The Jap., continuing to advance, now closed on Peking, with the result that Li Hung Chang himself departed for Tokyo to conclude peace. A treaty was signed at Shimonoseki in April and ratified in May at Chifu, under which Korean independence was recognised, and Liaoting, Formosa, and the Pescadores were ceded to Japan. Other terms included the opening of ports in Szechuan, Hoopoh, and other provs., and a large indemnity to Japan. Later, however, Japan was induced by France, Germany, and Russia to give back Liaoting in exchange for an increased indemnity.

Chino-Japanese War, 1931-33. See CHINA, History: Events in the decade before the Second World War.

Chinon, anc. tn. in the dept. of Indre-et-Loire, France, on the R. Vienne. On

the hill which overlooks it are the remains of three castles or of three separate strongholds constituting one castle: the Château de St. George's, built by Henry II. of England, very little of which is extant; the Château du Milieu (or middle stronghold), twelfth to fifteenth centuries, where Charles VII. first gave audience to Joan of Arc; and the Château du Coudray, tenth to thirteenth centuries, the chief remains of which are the Moulin and two later towers. There are three remarkable churches, of which one dates in part from 1025 to 1050. Clovis wrested C. from the Visigoths. From 1044 it belonged to the counts of Anjou, the Plantagenets, who became kings of England, but Philip Augustus gained it from Henry II.—who d. at C.—and it remained thenceforth with the kings of France. Rubelais was b. at the farmhouse of La Devinière in the vicinity, his own house being in the Rue de la Lamproie. Pop. 5500.

Chinook, warm dry wind blowing over the slopes of the Rocky Mts. It is a local wind similar to the *Föhn* of the Alpine valleys, and is due to a cyclone passing northwards and lasting from a few hours to sev. days. The dynamic pressure to which the air is subjected in passing to a lower level is the cause of its dryness and warmth. It is felt as a cool wind in summer, and in winter it causes the snow to disappear from the E. Rockies.

Chinooks, aboriginal tribe of Amer. Indians living in the extreme N.W. of the U.S.A. The tribe is now nearly extinct, numbering only about 600 persons, and inhabiting a small area on the Columbia R. in Washington. The C. were formerly great traders, bartering with the interior tribes the articles they obtained from the white skippers. The useful 'Chinook jargon' came into being as a means of communication rendered necessary by this commerce.

Chinquapin, or *Castanea pumila*, Amer. species of Fagaceae closely allied to the chestnut. The plant is smaller than the common chestnut, and the fruit is also edible.

Chinsura (Chinsurah), formerly a tn. of India, Bengal Presidency, on R. Hugli, now forming one municipality with Hugli, 24 m. from Calcutta. It is the seat of Hugli College. From 1656 to 1824 the chief Dutch settlement in Bengal, ceded to the Eng. with other places in exchange for possessions in Sumatra Is. Pop. with Hugli 30,000.

Chintz (Hindu *chint*, Beng. *chit*, from Sans. *chitra*, spotted, variegated), originally the name of pieces of printed calico or cotton fabric from India, each piece being a 'chint.' The name was later applied to a highly glazed, printed calico of home manuf., with a many-coloured pattern of flowers or birds on a light background. C. is used for curtains, furniture coverings, etc. Dust does not adhere to its calendered surface. See also CRETONE.

Chinu, tn. of Colombia, dept. Bolívar, 95 m. from Cartagena. Valuable treasure was found here by Heredia in the tombs of the Indians. Pop. (dist.) 10,000.

Chinwangtao, modern treaty port of China on the gulf of Pechili. It is still administered by the Kailan mining administration. The port, which is ice free, has a tidy and busy appearance. Since Dairen is still under Russian control and closed to foreign and Chinese shipping, C. has become the chief port for Manchurian products, especially soya beans. Some 11,000 persons are employed by the port administration. Pop. 20,000.

Chiococca, genus of Rubiaceae which consists of seven species, all occurring in tropical America. The root of sev. of these plants is possessed of emetic properties, and *C. anguifuga* is used by the natives as a remedy for snake-bites.

Chioggia (Chiozza), episcopal city and fortified port of Italy, 18 m. from Venice, 63 from Padua. It is built on piles on an is. in the S. of the Venetian lagoon, surrounded by the Lombard Ship Canal, cut in two by the Vena Canal. A stone bridge of 800 ft. with forty-three arches connects it with the mainland, and a mole, built 1774-82, protects it from the Adriatic. Internal trade is carried on by means of the Rs. Adige, Po, Brenta, and by canals. The Board of Trade building (medieval corn-hall) dates from 1322, the cathedral from 1633. Fisheries are important, flax-spinning and shipbuilding are carried on, and sail, lace, candles, and bricks manufactured. The Lat. name was Fossa Clodia, medieval Clugia. In 1379 Venice conquered the Genoese fleet off C. C. fell to the Allies in April 1945. Pop. 33,000.

Chionea, genus of Diptera in the family Tipulidae, has sev. peculiar features, and the species are destitute of wings. *C. araneoides* has been found in the woods of Sweden and the mts. of Austria when both were covered with snow, the insect showing itself only in cold weather.

Chios, Gk. is. and port in the Aegean Sea, 8 m. off the W. coast of Asia Minor at the entrance to the gulf of Smyrna. It is 32 m. long, varies in length from 8 to 15 m. and has an area of 320 sq. m. Pop. 75,000. The scenery is very striking and the soil fertile—grapes, oranges, and lemons, figs, olives, and other fruits growing in abundance. Mastic or gum resin is a noted product. Antimony is mined and marble quarried. C. claimed to be the bp. of Homer. In literature the chief glory of the is. was the school of epic poets called Homeridae, whose task it was to hand down the Homeric text. Vollos (formerly Bolissus), the tn. in which these poets lived, is still extant. C. is famed for its sculptors and the long succession of Chian sculptors in marble from Melas to Bupalus and Athenis testifies to the fame of Chian art in the seventh to sixth centuries B.C. Six m. N. of the tn. of C. is a curious monument of antiquity called 'the school of Homer'; it is an anct. sanctuary and altar built to the goddess Cybele, whose statue, with two lions, is chiselled in the rock. At Cape Phanae, the S. extremity of the is., is a harbour and the remains of a temple of Apollo. C., the cap. of the is., is on the E. coast. It

has always borne the name of the is. It has a harbour, a cathedral, and the ruins of a citadel. It is a thriving tn. and manufs. silk and woollen goods. Pop. 26,000.

The hist. of C. is most obscure and the early relations of the is. with other states conjectural. According to Pausanias the is.'s king, Hector, united it to the Ionian confederacy, but from Strabo it might be inferred that it was conquered by Ionian colonists. The Chians seem, however, to have been allies of Miletus and hostile to the Phocæo-Samian alliance, to which the neighbouring is. Erythræ belonged. The Chians took part in the Ionian rebellion against the Persians (500-495 B.C.) and supplied 100 ships. After the Persian victory at the battle of Lade, C. was unmercifully treated, the tns. and temples rased and many inhab. sent into slavery. After the battle of Mycale (479 B.C.) the is. became free with a democratic form of gov., in place of the tyranny. C. was the strongest state after Athens in the Delian confederacy and it was an ally, on an equal footing, of the Athenian empire, tribute-free but supplying ships in time of war. Later the Chians joined the Lacedæmonians but, though their fleet was defeated at Solissus and in two other battles, the Athenians could not conquer the is. In the Mithridatic wars C. leaned to alliance with Rome but, following defeat, a large number of the Chians were carried to slavery in Pontus. C. had, however, many centuries of peace and prosperity under both Rom. and Byzantine rule. The Genoese held the is. from the fourteenth century to 1566 when the Turks took it and, except for a brief occupation by the Venetians in 1694, it remained in Turkish possession until the First World War when it became a Gk. is. During the Turkish occupation there were sev. massacres, notably one in 1822 as a reprisal for a revolt of some of the inhab. In 1881 the is. was devastated by an earthquake, in which some 50,000 people perished.

Chiozza, see **CHIOGGIA**.

Chippiez, Charles (1835-1901), Fr. architect. His architectural productions are comparatively few, but include one of the five monuments (1872) commemorating the siege of Paris (1871), and the École Nationale d'Armentières (Nord), 1885-88. He is chiefly noted for his writings on the hist. of art. *Histoire critique des origines et de la formation des ordres grecs* appeared in 1876. Joint author with Perrot of *L'Histoire de l'art dans l'antiquité* (8 vols.), (1881-1904), a most valuable work; and of *Le Temple de Jérusalem et la maison du Bois-Liban* (1889).

Chiplun, small tn. of India in the Bombay Prov. situated about 20 m. inland, and 75 m. S. of Bombay.

Chipmunk, or *Tamias striatus*, species of ground squirrel common to N. America, and belongs to the family Sciuridae. It is a pretty creature, differing from the common squirrel chiefly in having large cheek-pouches and a shorter tail. Its diet is strictly vegetarian.

Chippendale, Thomas (c. 1718-79),

famous cabinet-maker and upholsterer of the eighteenth century. He came to London from Worcester with his father, a well-known cabinet-maker and wood-carver, and ultimately estab. himself with his factory in St. Martin's Lane. C.'s work is characterised first of all by solidity without heaviness; his ribbon-backed chairs are perhaps his most successful work, and next to these his settees of two or three conjoined chairs. He pub. *The Gentleman and Cabinet Makers' Director*, containing his own designs and descriptions. See R. W. Symonds, *Chippendale Furniture Designs*, 1948.

Chippendale, tn. on the l. b. of the Avon in Wiltshire, 22 m. from Bristol. One of its bridges across the riv. has twenty-one arches. It has a weekly corn market and an ann. cattle show. It has bacon-curing factories, and its manufs. include condensed milk and broadcloth. There is a causeway 4½ m. long which since 1474 has commemorated Maud Heath, a benefactress. The founder of the Muggletonians was born here. This tn. is of historical interest, because it was occupied by the Saxon kings in Wessex, and King Alfred was forced to flee from the city when surprised by the Danes. Pop. 8500.

Chippewa Falls, city of Wisconsin, U.S.A., co. seat of C. co., on R. C., 85 m. from St. Paul (Minnesota), 12 m. from Eau Claire. It is on the Wisconsin Central and other railways. There are many foundries and mills (for flour, wool, lumber, etc.), worked by the waters of the riv. Tone Rock battle-ground is near, and the city is noted for its pure spring waters. Chartered as a city 1870, it has its own mayor and tn. council. The State Home for the Feeble-minded and the Co. Insane Asylum are situated here. Pop. 10,300.

Chippewayans, numerous tribe of Amer. Indians of the great Algonquin stock, now settled in almost equal numbers in Minnesota and in Canada, but formerly inhabiting Wisconsin. Their name is written also Ojibway, Otchipwe, and Ojibbeway, a term which may possibly refer to the 'puckered up' appearance of the front seam of their mocassins. They were the hereditary and inveterate foes of the Sioux and the Foxes, whom, with the help of guns purchased from Fr. traders, they drove out of their habitat, and themselves became masters of an extensive ter. They now number about 28,000, of whom about 12,000 are in Canada. In person they are tall, active, and well formed. They fish, hunt, gather wild rice and cranberries, manuf. maple sugar, weave baskets and mats, and prepare birch bark for canoes, etc.

Chipping Campden, mrkt. tn. in Gloucestershire, England, 9 m. from Evesham. Formerly a thriving centre of the woollen industry. Has a fine Perpendicular church. Pop. 1800.

Chipping Norton, anct. **Chepyngnorton**, a municipal bor. and mrkt. tn., 25 m. by rail N.N.W. of Oxford. It consists of one large street with a fine Gothic church. Woollen and glove factories brewing and agric. trade. Pop. 3500.

Chipping Sodbury, small mkt. tn., 11 m. N.E. of Bristol. Pop. (tn.), 1100; (rural dist.), 25,500.

Chipping Wycombe, see WYCOMBE.

Chiquichiqui Palm, or *Leopoldinia Passaba*, Brazilian palm noted for the good fibre obtained from its bast. The *passaba* fibre is used in brush-making and the leaves in thatching.

Chiquimula: 1. E. dept. of Guatemala. Pop. 95,000. 2. Cap. of above, anct. city, 65 m. from Guatemala. The ruins of C. Antigua, destroyed by earthquake in 1773, are near. It has an active trade. Pop. about 25,000. 3. Isthmus of Central America on Caribbean Sea, between mouth of the Motagua and the corner of Honduras Bay.

Chiquinquirá, city of S. America, in dept. of Boyacá, Colombia, 44 m. from Tunja, 80 m. from Bogotá. Noted for its chapel with a miraculous picture of the Virgin, annually visited by thousands of pilgrims. Every seventh year there is a special public celebration. Has cattle-grazing and trade. Pop. 22,500.

Chiquitos, group of Amer. Indian tribes dwelling in the prov. of Santa Cruz de la Sierra, Bolivia, and about the head-waters of the Rs. Mamore and Itenez. They are well built, powerful, and of middle height, with bronze complexions, low foreheads, large round heads, and small bright eyes; they are hospitable, kindly, cheerful, and fond of music and dancing. They live in vils. founded by Jesuit missionaries, whom they willingly received in 1691, and who rapidly converted and civilised them. Since the expulsion of the Jesuits in 1767 they have degenerated considerably. They number about 20,000, and live in adobe houses thatched with grass; they are principally engaged in weaving ponchos (a kind of blanket cloak) and hammocks, manufacturing copper boilers for sugar making, and straw hats.

Chira, or *Cheera*, tn. of Sinkiang, China, 50 m. E. of Khotan. The Gobi Desert skirts it about 3 m. to the N. Pop. about 40,000.

Chirála, tn. of Madras, India, Kistna dist., 70 m. from Masulipatam. Pop. 10,500 (chiefly Hindus).

Chirayta, or *Chiretta*, *Ophelia* (or *Agalholes*) *Chirayta*, Indian species of *Gentianaceae*. The plant is extremely bitter, and when at its best it is gathered, dried, and the drug C. is extracted from it. It acts as a stimulant and tonic, and in India it serves as a febrifuge.

Chiriquí, prov., riv., lagoon, and archipelago of Central America. In W. Panama, Colombia. The riv. flows into the lagoon, which is situated in the Mosquito Gulf, and separated from the Caribbean Sea by C. Archipelago. The lagoon has three entrances, Boca del Drago, del Toro (on each side of Isla del Drago) in N.W., Boca del Tigre on E., and is navigable for the largest ships. It extends 90 m. along the coast, and 40 to 50 m. inland. The prov. has lofty volcanic peaks (C., about 12,000 ft.) and a fertile soil. Tobacco, sugarcane, and bananas are grown. Cap., David. Pop. about 77,000.

Chirk, par. and vil. in Denbighshire,

9 m. from Wrexham, on the W. Region railway. Has a famous castle, the seat of Lord Howard de Walden and, previously, the home of the Myddelton family. The original castle was built in the eleventh century, the later, a fourteenth-century building, being restored in the seventeenth century. In the vicinity are slate quarries and collieries. Pop. 2000.

Chiromancy, see PALMISTRY.

Chiromo, or *Chilomo*, vil. and trading-port of Nyasaland Protectorate, at confluence of Rs. Shire and Ruvo, 55 m. from Blantyre. The Shire Highlands railway here crosses the Shire.

Chiromys Madagascariensis, see AYE-AYE.

Chiron, or *Cheiron*, one of the Centaurs, son of Cronos and Philyra, a sea nymph. C. was wise and just, while the other centaurs were uncivilised and fierce. He was the instructor of Actæon, Jason, Castor, Achilles, and other celebrated (ik. heroes; he taught Asclepius the art of healing. He was accidentally wounded by a poisoned arrow shot by his friend Heracles. To free himself from the pain caused by the wound he renounced his immortality in favour of Prometheus, and was set among the stars as the constellation Sagittarius.

Chironectes, water opossum, a genus of marsupials, is represented by one species which inhabits S. and Central America. It is about the size of a rat, has webbed hind feet, and feeds upon fish.

Chironomus, chief genus of the midge and gnat family or Chironomidae, contains over two hundred Brit. species. The perfect fly is two-winged, and the blood-red larva is often called a blood-worm by anglers, who use it when fishing. It dwells in mud and forms food for birds and fishes. The swarms of little grey flies which dance actively above water on summer evenings belong to this genus.

Chiroptera, see BAT.

Chirotes ocellatus, worm-like lizard of the family Amphisbenedæ, forms in itself a genus, and bears the proud distinction, wanting in all its relations, of possessing two small anterior limbs each with two toes. The C. is to be found in Mexico, and in length it varies from about 8 in. to 1 foot.

Chiru, or *Pantholops*, Tibetan genus of antelope comprising two species. The animal is pale fawn in colour with woolly hair; the male alone has horns, and these are long, straight, ringed, and gazelle-like. It is nearly 3 ft. in height, and is so swift and alert that great difficulty is experienced in its capture.

Chirus, genus of acanthopterygious fishes, is common to the seas of Kamchatka. They are shore fishes with sev. lateral lines, and belong to the family Heterolepidotidae or Hexagrammidae.

Chisel (Middle Eng. *chisel* or *chesil*, from O.F. *cisel*), tool used in carpentry and metal work, consisting of a blade with a bevelled or sloped cutting edge at one end and a handle at the other, which is prepared either for the grip of the craftsman's hands or to receive the blows of a hammer.

Cs. differ widely in shape and purpose, and receive their name according to their use or shape. Thus, there is the *cold chisel*, which is used for cutting unheated metal and stone. It has its cutting edge sharpened on both sides, and is formed of highly tempered steel. It is driven by a hammer. Carpenters' Cs. are driven by hand or by blows from a mallet. The ordinary implement is wooden-handled, and the blade is bevelled on one side only, the bevelled face meeting the flat side at an angle of about 20 degrees. Stone-masons' Cs. are bevelled on both sides and vary considerably in shape, the *boasting chisel* is used for roughly dressing the surfaces of stones. The *carring chisel* is one of the most delicate of these instruments. It is bevelled on both sides, and the two faces meet at an extremely acute angle, that it may lightly cut the wood without crushing it out of shape. The *spoon-chisel* is a bent instrument, bevelled on both sides, used by sculptors. Among other

CHISELS

varieties may be named the dental C., the turning C., the mortise C., and the ripping C. Certain Cs., with semi-circular blades used for gouging, are generally known as 'gouges.'

Chishima (Thousand Isles), Jap. name of the Kurile Is. (q.v.), U.S.S.R. extending from Kamchatka to Yezo.

Chisholm, mining tn. of St. Louis co., Minnesota, U.S.A. Pop. 10,000.

Chisholm, Alexander (c. 1792-1847). Scottish painter, early apprenticed to a weaver, went to Edinburgh about 1812, becoming teacher at the Royal Scottish Academy, under the patronage of the earls of Elgin and Buchan. He moved to London, 1818, exhibiting at Royal Academy, 1822; associate exhibitor of Water Colour Society, 1829. His chief works were historical groups and portraits. He also did illustrations for the Waverley novels. Among his works are 'Boys with a Burning Glass' (1822); 'Shakespeare before Sir Thomas Lucy' (1834); 'The Cotter's Saturday Night'; and 'Baptism of Ben Jonson's Daughter' (1837); 'The Pedlar' (S. Kensington Museum); 'Signaling of the Covenant in Greyfriars' Churchyard' (1847); 'Minister and his Wife Concealing the Scottish Regalia in the Church' (1846).

Chisholm, Hugh (1866-1924), editor of the tenth, eleventh, and twelfth eds. of the *Encyc. Brit.*, was b. in London, son of Henry Williams C., authority on public finance, and grandson of Henry C., private sec. to Lord Grenville, the Prime Minister. He was educated at Felsted, and at Corpus Christi, Oxford; and, intending to practise at the Bar, he was called at the Middle Temple in 1892; but was already in journalism—as assistant editor of the *St. James's Gazette*,

of which he became editor in 1897. In 1900 he was engaged by the proprietors of *The Times* as joint editor, with Sir Donald Mackenzie Wallace and President Hadley of Yale, of the supplementary vols. of the *Encyc. Brit.*, constituting the tenth ed. In 1903 he became editor-in-chief of the eleventh ed.; he travelled all over the world in the performance of his duties. From 1911 till March 1920 he was financial editor of *The Times*, resigning to edit the additional post-war vols. of the *Encyclopaedia*.

Chisinau, see KISHINEV.

Chislehurst, forms, with Sideup, an urban dist. of Kent, England, 11½ m. S.E. of London by rail. It is delightfully situated on a common. At Camden Place, in the vicinity, Napoleon III. d. in 1873, and the Empress Eugénie lived here for some years with the prince imperial, to whose memory a cross has been erected on the common. There is a chain of interesting subterranean caves whose origin and use have not been fixed with certainty, but they are believed to be ant. storehouses and hiding-places. Pop. 10,000.

Chistopol, dist. and tn. of the Tatar Republic of the R.S.F.S.R., Russia. Port on R. Kama, 70 m. from Kazan. Has considerable corn trade. Pop. 20,000.

Chiswick, par. and tn. of Middlesex, England (London suburb), Ealing div. 7 m. from St. Paul's, on l. b. of R. Thames. The name was apparently formerly *Ceswic*, meaning 'cheese farm.' 'C. and Grove Park' is on the S. Region railway; 'C. Park and Acton Green' on Dist. railway. The duke of Devonshire's villa, C. House, is here; also gardens of the Horticultural Society, and many large market gardens. It contains Hogarth's house, and his grave in the churchyard. Pop. 41,000. Eccles. par. (with Turnham Green) about 5000 (with Brentford), 63,000.

Chita: 1. Tn. of Boyacá, Colombia, 74 m. from Tunja, 150 from Bogotá. On W. of snow-covered sierras, with important mine of rock-salt, 'salina,' on the other side. The saline springs are also noted. Pop. 10,000. 2. Tn. and region of the U.S.S.R., E. Siberia, on the R. Chita, near its junction with R. Ingoda. It was founded in 1851, and is on the Trans-Siberian railway, 370 m. from Irkutsk. C. is on the routes from Barguzin and the Mongolian frontier (Kiaikhta). It is an engineering, iron and steel, and machine-tool centre. About 65 per cent of the Soviet production of tin is believed to be in the C. region. The resources of the coal mines at C. (and Sretinsk) are supplemented by coal transported by rail from the Kuznetsk basin of W. Siberia. The pop. of the C. region in 1939 was 1,160,000. C. itself is a tn. of more than 100,000 inhab.

Chita (animal), see CHESTRIL.

Chitaldrug, or **Chitaldroog**: 1. Dist. of Mysore, India, very unhealthy, hence the least populous in Mysore. Area 4470 sq. m. In 1876-78 it suffered greatly from famine. Pop. about 574,000. 2.

Cap. of above, tn. and fortress of Nagar, 73 m. from Bellary, 128 m. from Seringapatam, at the base of a cluster of hills. Noted for a wonderful rock-fortress. Cantonments are abandoned because unhealthy. Manufs. cotton cloth and coarse blankets. Anct. name Sitala Durga (spotted castle). Pop. 9000.

Chitambo, vil. of N. Rhodesia, situated about 10 m. to the S.E. of the S. shore of Lake Bangweulu. It is noted as the place where Livingstone died in May 1873.

Chitin, skeletal substance found in all arthropods, forming most of their hard parts, and also in some other animals, e.g. the brachiopod *Lingula anatina*. It is a white, amorphous substance containing nitrogen, yields glucosamide in acids, and is insoluble in alkalis.

Chitonidæ, family of molluscs usually classed among the Gastropoda, consists of marine animals ranging in size from half an inch to half a foot; some are littoral and others have been dredged from a depth of 2300 fathoms. All the species are bilaterally symmetrical, have eight shell-plates embedded partially or entirely in the mantle, are covered with spicules, have an anterior mouth and a median posterior anus. They live on vegetable matter, and in habit are like limpets; they usually attach themselves to rocks, but can crawl by means of their long foot, and are capable of rolling themselves up.

Chitral, name of a native state in the N.W. Frontier Prov., Pakistan, and of its cap. The state has an area of about 1500 sq. m., and a pop. of 60,000. In 1885 the Lockhart mission visited C., and in 1889, and again in 1891, the British Gov. agreed to pay the reigning *mehtar* a subsidy on condition that he accepted its advice as to the foreign policy and defence. From 1895 to 1917 Great Britain exercised a protectorship over the state, and maintained a small force there, as it was an important Brit. outpost. The region is fertile and the climate cold; the chief crops are wheat, barley, maize, and rice. C. tn. is actually a group of vils. with a pop. of about 2500.

Chittagong, maritime dist. in Lower Bengal, India, bounded on the E. by Tipperah, on the S. by Arakan, and on the W. by the bay of Bengal. The country is very hilly, with many deep ravines. The hills are densely covered with creeper jungles and with thick forests of trees. There is elephant hunting in the forests. C. comprises an area of 6812 sq. m., and is divided into four valleys by the Rs. Pheni, Karnaphuli, Sangu, and Matamuri. Many different kinds of tribes inhabit the hills, but the religion observed is chiefly Buddhism. C. was ceded to the E. India Company in 1760. The port of C. is situated some miles distant from the mouth of the Karnaphuli, and exports rice, tea, and jute. C. was a valuable base of operations in 1943-44 against the threatened invasion of India through Burma by the Jap. armies of Gen. Mutaguchi. Pop. 40,000.

Chittagong Wood, product of *Chukrasia*

tubularis, an Indian species of Meliaceæ, also known as red wood, bastard cedar, and white cedar. It is largely used in cabinet making.

Chittambaram, see CHUDAMBARAM.

Chittoor, tn. of Madras Presidency, India, cap. of dist. of same name. Pop. 17,941; dist. 1,209,117.

Chittore, tn. of Rajputana, India, situated in the native state of Udaipur; Chitorgarh is the fort. Ruined palaces and temples are in the neighbourhood. Pop. 7000.

Chitty, Joseph (1776-1841), eminent special pleader and writer of *Treatise on Pleading* (1809), and *The Laws of Commerce and Manufactures and the Controls relating thereto* (1820), and other books on law. His three sons, Thomas, Joseph the younger, and Tompison, were also well-known lawyers and writers.

Chitty, Sir Joseph William (1829-99), son of Thomas C., was for sixteen years a very popular judge. He became master of the rolls in 1881, and was promoted to the court of appeal in 1897; he wrote legal text-books.

Chiusa, or La Chiusa (Lat. *clausa*, shut in): 1. Com. and tn. of Piedmont, Italy, 8 m. from Cuneo, on the Ellero. Also a defile of N. Italy. Pop. 5240. 2. Com. of Sicily (Chiusa Sciafani), 30 m. from Palermo. Pop. 5800.

Chiusi, in Italy, important tn. in the prov. of Siena, Tuscany. It is the anct. Clusium, one of the twelve cities of the Etruscan Confederation. C. is celebrated chiefly in connection with the discovery of Etruscan antiquities; vestiges of fortresses are to be seen, as well as grottoes or catacombs, which served as tombs and where were found the sun-dried black earthenware vases, ornaments, etc., now in the museums of Florence and C. Dante describes the 'pestilential pool' the tn. was in the Middle Ages, but draining in the eighteenth century restored it to wholesomeness. In the campaign of 1943 slight damage was sustained by the cathedral, but the Museo Etrusco was severely damaged, none of the contents having been evacuated, and cases containing the finest Etr. and Etruscan clay and metal vases were smashed. Pop. 8000.

Chivalry, or the system of knighthood, is closely bound up with the feudal system of Norman times. It has its roots, however, right back in Germanic times, as Tacitus shows in his account of the manners and customs of this race. But C. became further developed in the eleventh century, and the order of knighthood involved many duties and responsibilities. The king himself had to train for knighthood when he had to serve first as page, then as esquire, before being presented with the golden spurs which were one of the symbols of knighthood. Before a knight was admitted into his order, a vigil or night-watch was held by him in some gloomy chapel aisle where he gave himself up to solemn meditation before assuming his new duties and privileges. C. was eminently social in its relations to feudalism, and

assumed a deep spiritual significance in its relations to the crusade movement where the knight had to perform military service for the cause of Christianity against the infidel in Palestine. The favourite sport of C. was the tournament or joust, in which the knight sought to win his lady's favour. A tournament would occupy some two or three days. There would be a trial of combat between two knights, often with lances, and the victor, besides winning the armour and horses of the vanquished, would be permitted to name some lady who would preside over the remaining sports, and who was called the Queen of Love and Beauty. The idea of a love both spiritual and chivalrous became associated with the word C. in the Middle Ages. Here the love of a lady implied a deep and reverent attachment to the whole of womanhood; at the same time one woman could be the particular object of the knight's thoughts, when the relationship was purely platonic. C. under these conditions gave rise to a vast library of literature, in which all kinds of romances, adventures, and poems were written. See also KNIGHTHOOD.

Chivalry, Court of, military court estab. under Edward III., regulated by Richard II., 1390, of which the earl marshal and lord high constable were joint judges. Replaced now by the common law courts and courts-martial, it sat for the last time in 1737. Now represented only by the earl marshal of the Herald's College to decide questions relating to armorial bearings. See Sir W. Blackstone, *Commentaries on the Laws of England*, 1765-68; H. J. Stephen, *Commentaries on the Laws of England*, ed. of 1883.

Chivasso, com., tn., and episcopal see of Piedmont, Italy, on R. Po, 15 m. from Turin. Fortress of the counts of Montferrat till destroyed by the Fr., 1804. Remains of their palace are left. There is a fine cathedral, and the sulphur baths of San Gesezio are near. Noted for lampreys and silk industries; has markets for grain and cattle. Pop. 11,000.

Chive, *Cive*, or *Allium Schoenoprasum*, a liliaceous plant related to such well-known plants in culinary use as the leek, onion, and garlic. Like them, it grows in Britain, and the leaves are considered to be edible, their chief use being to flavour soups and stews. The Cs. grow from bulbs, the leaves are long and narrow, and the flowers are bright purple or pinky in colour.

Chivilcoy, tn. of the Argentine Republic, situated 110 m. W. of Buenos Aires, with which it has railway communication. There are manufs. of brandy and iron goods. Pop. 45,000.

Chizerots, or **Burins**, name given in France to the debris of one of those despised races known under the general name of *Cagots*. The C. are found in sev. of the coms. of Bourg, in the dept. of Ain. They were mostly field-labourers, butchers, and cattle-dealers, living laborious lives apart from the rest of the community. Opinion is divided as to their origin, but they are supposed to be of mixed Goth and Saracen blood. In the

Middle Ages they were the object of all kinds of persecution and restrictions. During the eighteenth century sev. attempts were made to rehabilitate them, but only with the revolution were they allowed ordinary civil rights. See F. Michel, *Histoire des races maudites de la France et de l'Espagne*, 1947.

Chkalov (formerly Orenburg), frontier region of the R.S.F.S.R., between Bashkirla on the N. and Kazakhstan on the S. Area, 22,000 sq. m. Pop. (1935) 680,000. It comprises, chiefly, the former Orenburg and Orsk dists. of the considerably larger prov. of the same name as constituted before the First World War. It is elevated, except for the valleys of the Ural and other riva. Topographically it is part of the dry and desert region of the steppe, but there is fertile land in the valleys. Rock salt and coal are mined in the vicinity of Ilets, in the S. There are oil refineries at Orsk. C. is the chief tn. on the Ural R. and lies on the Moscow-Tashkent railway. Its chief industries are metal goods, saw-milling, bricks, and brewing, and it is a market for the cattle and horses of the steppes. Produces frozen meat, hides, and tallow. Pop. 125,000 (includes Russians, Khirghiz, Tatars, and Bashkirs).

Chladni, Ernst Florens Friedrich (1756-1827), Ger. philosopher, founder of the science of acoustics. He was b. at Wittenberg, became doctor of laws and prof. of jurisprudence at Leipzig, but after some time abandoned law and gave himself up to the study of natural science, investigating chiefly the laws of sound. During the years 1802-12 he travelled and lectured with great success in Germany, Holland, Italy, Russia, and Denmark. Among his writings are treatises on acoustics and meteors. See his life by Meide, 1866.

Chlamaceae, small natural order of dicotyledonous plants, consists of about two dozen handsome trees or shrubs of no known use. They all grow wild in Madagascar, and the order is closely allied to Theaceae.

Chlœnius, genus of Carabidae, belongs to the Coleoptera. There are many species dwelling in Europe, Africa, Asia, and N. America; *C. sericeus* and *C. tomentosus*, two medium-sized purple or green-bronze beetles, are found in the U.S.A.

Chlamyphorus, or **Pichyelego**, edentate quadruped of the armadillo family, or Dasypodidae. The species, of which only two are in existence, are small animals covered over with four-sided, horny plates which are thin in the front and strong in the hinder region. The external ears are very small, and the small eyes are buried in long silky hair; under the bony plates and over the whole body the straw-coloured hair also prevails. The limbs are short and there are five digits on the fore limbs. *C. truncatus*, a native of Mendoza, Argentina, is the more common species; it is about five inches in length, has strong burrowing habits, and is insectivorous in diet.

Chlamydosaurus Kingi, or **Friiled lizard** of Australia, represents a genus of the

family Agamidae. It is noted for the expanse of skin, in the shape of two large disks, which forms an ample frill to the sides of the neck and throat, and can be unfolded when the lizard is angry and folded again at will. In length it is about 3 ft., and when running it presents a curious spectacle, for it accomplishes the feat with its fore limbs in the air. The creature is allied to the iguana and in habit is arboreal. The general colour is yellowish-brown variegated with black.

(CHAMYDOSAURUS KINGI: FRILLED LIZARD)

Chloasma, deposit of pigment in the skin, forming yellowish-brown patches, due to irritation, the use of skin drugs, or certain specific diseases, or abnormal conditions. Liver-spots follow dyspepsia, and are usually associated with liver disturbances. Patches appear on the forehead, cheeks, nipples, and the middle of the abdomen in connection with certain conditions of the uterus; they are more marked during pregnancy and sometimes during menstruation. Tuberculous patients sometimes exhibit brown patches on the forehead and cheeks. The causal connections are somewhat obscure, and in most cases nothing can be done to mitigate the conditions except treatment of the predisposing disease.

Chlodowech, or **Chlodwig**, see **CLOVIS**.

Chlopicki (pron. *Chlopitzki*), **Gregorz Jozef** (1772-1854), Polish general and patriot. He took part in the first Polish insurrection, then served under Napoleon in the Grande Armée. After the taking of Paris in 1814 he led back to Poland the remnant of the Polish troops and was made general of div. by the Emperor Alexander. After the second Polish insurrection (1830) C. became, though most unwillingly, dictator. He soon resigned in order to re-enter the army and fight as a simple soldier. He was wounded at Grochow.

Chlora, genus of Gentianaceae, contains only three species, and of these *C.*, or *Blackstonia perfoliata*, the yellow-wort, is a native of Britain. It grows wild on chalky hills and banks of England and Ireland, but does not occur in Scotland. It possesses

a bitter principle which renders its action on the system tonic. The other two species are to be found in various parts of Europe and in N. Africa.

Chloral (trichloroacetaldehyde, CCl_3CHO), formed by the action of chlorine on anhydrous alcohol. It is an oily, colourless liquid with a penetrating odour. Combined with water it forms *C. hydrate* (q.v.), while with alkalis it forms chloroform and a formate. It was discovered in 1831 by Liebig. It is used as a drug to produce sleep, when from 15 to 30 grains are sufficient. It is also used to alleviate pain, and to check excitement and convulsions, etc. Since it tends to reduce the heart's action and lower the temp. of the body its use is dangerous.

Chloral Hydrate, commonly but erroneously called chloral, is chloral combined with water, and is a white crystalline substance with a pungent smell and a bitter taste. *C. H.* treated with caustic potash gives pure chloroform. It has anæsthetic properties, and is a drug.

Chloranthaceae, small natural order of tropical or sub-tropical dicotyledonous plants, consists of herbs, shrubs, and trees allied to the peppers, and having an aromatic fragrant odour. The hermaphrodite or unisexual flowers are small, with a rudimentary or sepaloïd perianth, one to three united stamens, an inferior ovary consisting of a single carpel, and a few seeds with oily endosperm and no perisperm.

Chlorargyrite, see **CERARGYRITE**.

Chlorate, see **CHLORIC ACID**.

Chloric Acid (HClO_3) is obtained by decomposing barium chlorate with its exact equivalent of dilute sulphuric acid. It is a clear, unstable liquid, and the strongest acid contains 80 per cent of water. It has powerful oxidising properties, and if wood or paper be dropped in it, the oxidation is so rapid that they will char, and even take fire. It further has strong bleaching powers. It is a monobasic acid, and forms stable salts called *chlorates*. The most important of these is *potassium chlorate* (KClO_3). The chlorates are usually formed indirectly by passing chlorine into a hot solution of the hydroxide of the metal, and then crystallising out the chlorate. Chlorides are formed at the same time, but they are much more soluble and remain in solution. Potassium chlorate is manufactured by the electrolysis of a hot concentrated solution of potassium chloride. Since chlorates contain a large amount of oxygen, they are used as oxidising agents, potassium chlorate being used in the manuf. of matches, and in pyrotechny, especially where coloured effects are required; it is also used in tabloid form for the alleviation and cure of sore throat. Sodium chlorate is a very efficient and widely used weed killer.

Chloride, Ethyl, see **ETHYL CHLORIDE**.

Chloride of Lime, see **BLEACHING POWDER, BLEACHING**.

Chlorimetry, term applied to the estimation of the proportion of available chlorine in bleaching powder (q.v.). It varies from 20 to 43 per cent. The

process is one of volumetric analysis. It is usual to make a definite solution of arsenious acid or some other substance which can be oxidised. The solution of bleaching powder is then carefully run into a measured quantity of the arsenious acid, and by the aid of an indicator—a paper moistened with potassium iodide and starch—sufficient is added until oxidation is quite complete. The quantities of both liquids being known, the available chlorine can easily be found by calculation from the formula: $\text{H}_3\text{AsO}_3 + \text{CaOCl}_2 = \text{H}_3\text{AsO}_4 + \text{CaCl}_2$.

Chlorine (symbol Cl; atomic weight 35.4; atomic number 17) was discovered by Scheele in 1774. He called it *dephlogisticated muriatic acid air*, and regarded it as a compound. In 1810 Davy proved it to be an element, and gave it its present name, because of its greenish-yellow colour. It does not occur free in nature, but it is very common in combination with metals, the commonest chloride being sodium chloride (common salt). As such it occurs in all natural waters; in beds as rock salt, in animal secretions, and in plants. In combination with hydrogen, as hydrochloric acid, it is found in volcanic gases and in the gastric juice. C. can be obtained in various ways: (1) by heating gently manganese dioxide and hydrochloric acid, water, manganese chloride, and C. being formed; (2) by heating manganese dioxide with a mixture of the substances from which hydrochloric acid is made, e.g. common salt and sulphuric acid. This results in the formation of sodium sulphate, magnesium sulphate, water, and C. A comparison of these two methods shows that whereas the second process results in the obtaining of all the C. from the common salt, the first process leaves half of it in the form of manganese chloride; (3) many highly oxidised compounds, together with hydrochloric acid, give us C., and among these substances may be named potassium dichromate and potassium chlorate.

Manufacturing Processes: 1. *Weldon's process* is really a process by which the manganese chloride mentioned above can be turned again into manganese dioxide, and re-used to act upon further supplies of hydrochloric acid, giving further quantities of C. 2. *Deacon's process* depends upon catalysis (q.v.); air, or oxygen and hydrochloric acid, are passed over pumice impregnated with cuprous chloride (a salt of copper), which has been heated to a dull-red heat. Then water is formed and C. evolved. But Weldon's process is now obsolete, and Deacon's is rarely used. Most of the chlorine now manufactured is obtained by the electrolysis of a solution of common salt.

Properties.—It is a greenish-yellow gas, which has a suffocating smell. If inhaled in the pure state it would cause death. It acts very rapidly on the mucous membranes even when largely diluted in the air. Very dilute in the air, however, it imparts a pleasant odour to a room. It is twenty-four times as heavy as air, but when heated its density is considerably less than it should be. So while at lower

temps. its molecular formula is Cl_2 , i.e. has two atoms in the molecule, at higher temps. it must dissociate into single atoms. It is fairly soluble in water, although it may be collected over warm water, or over brine. It has such powerful chemical affinities that it will enter into combination with a large number of elements at the ordinary temp.: in many cases so violent is the combination that the other body takes fire, e.g. phosphorus, arsenic, antimony. It is remarkable to notice that if the C. be dry it will not unite with these substances. It has a strong affinity for hydrogen. If the two gases be mixed and heated, or even exposed to sunlight, they will unite with an explosion to form hydrochloric acid gas. C. possesses strong bleaching powers by virtue of this great affinity for hydrogen, for it will unite with the hydrogen in water, displacing the oxygen, and this nascent oxygen acts on colouring matter, bleaching it. It is this bleaching power which makes it valuable commercially, and for this purpose it is combined with lime to form bleaching powder (q.v.). C. gas can be liquefied by lowering its temp. to -31°C ., when it has a golden colour. At -104° it freezes into a yellow crystalline mass. As a liquid it is packed in lead-lined iron bottles and exported to be used in the extraction of gold by the *chlorination process*. Liquid C. enters into combination with the gold in the ore and forms a soluble chloride which can be separated from the insoluble residues. Then by suitable means the gold can be obtained. C. is one of the *halogen* group of elements, which are fluorine, C., bromine, and iodine, all of which possess similar properties. See HYDROCHLORIC ACID, FLUORINE, BROMINE, IODINE.

Chlorine in Warfare. The introduction of C. as a weapon in modern warfare dates from April 22, 1915, when the Gers. discharged it from cylinders opposite a sector held by the Fr., while another attack was made on the Canadian front on April 24. The gas was a complete surprise to the unprotected troops, and it removed all resistance on the front affected to a considerable depth. Crude respirators were soon supplied to the troops, and later much improved upon. The first gas attack by the Brit. was made at Loos on Sept. 25, 1915, using cylinders of chlorine. It is noteworthy that conditions of wind were more frequently favourable to the Allies than to the Gers. The gas shell was eventually substituted for the cloud method, and found to possess many advantages. It is relatively independent of wind, and enables many more toxic substances to be used. C., phosgene, chloropierin, and others were classed as asphyxiating gases, and produced their effect by causing lesions and congestion in the pulmonary system while death frequently resulted from suffocation. C. was not used in the Second World War.

Chlorite, mineral of a green colour and composed of silicate of alumina, iron, magnesia, and a certain amount of water. It is soft, and when crystallised in small green hexagonal crystals is scaly in

texture. It forms the prin. part of C. schist in the region of the metamorphic rocks and is also an alteration product of hornblende and other minerals in many crystalline rocks. There are many varieties, and for convenience these may be divided into orthochlorites, which are crystalline, and leptochlorites, which are not.

Chlorite Schist, variety of schist chloritic material such as clinocllore, together with quartz, mica, talc, felspar, and other bodies.

Chloritic Marl, name given to what is really glauconite marl. It is a chalky marl of a white or yellow colour and situated at the base of the chalk. The name 'chloritic' was given owing to the presence of grains of glauconite scattered through it, which was wrongly supposed to be chlorite. It also contains phosphatic nodules. The C. M., together with the two beds above it, namely, the chalk marl and the grey chalk, form the div. called the Lower Chalk of the Upper Cretaceous Period. The prin. fossils are varieties of *Ammonites* or *Schlenbachia*. Beds vary in depth up to 15 ft.

Chlorocinnose ($C_{11}H_7ClO_2$), compound produced by the action of chlorine upon oil of cinnamon. When pure it exists as brilliant crystals, which are colourless. It volatilises by heat without change.

Chloroacetic Acid, or **Cyanuric Chloride** (CCl_3N), is obtained when anhydrous hydrocyanic acid and chlorine are together exposed to the action of sunlight. It is a crystalline, forming needles, and has a disagreeable smell. Heated with water it is decomposed, and gives cyanuric and hydrochloric acids.

Chlorodyne, popular patent medicine, first compounded by Dr. Collis Browne. Owing to its dangerous nature and variability of composition, the latter was fixed by the Brit. pharmacopoeia of 1885 as chloroform, morphine, prussic acid, ether, and, in addition, peppermint and a syrup. It is useful for diarrhoea and coughs, but must be used carefully.

Chloroform, or **Trichloromethane** ($CHCl_3$), volatile liquid widely used as an anæsthetic. It has a pleasant odour, boils at 61° , has a melting point of 62° , and a sp. gr. of 1.5 at 15° . It is not inflammable at ordinary temps., but burns with a green-edged flame when heated. It is formed when methane, methyl chloride, or methylene dichloride is treated with chlorine in sunlight, but is commonly prepared by distilling alcohol or acetone with bleaching powder, or by warming chloral or chloral hydrate with a solution of sodium hydroxide. C. quickly decomposes in air, especially in the presence of sunlight, carbonyl chloride and hydrochloric acid being produced. As carbonyl chloride is a dangerous impurity when the C. is used for anæsthetic purposes, it is customary to keep the liquid in the dark, and the addition of a small percentage of alcohol serves to effect the decomposition of any carbonyl chloride which may be formed. A good test of the purity of C. is provided by the addition of silver nitrate when no

precipitate should form; it also should not darken when agitated with strong sulphuric acid. C. was introduced as an anæsthetic by Sir James Simpson in 1847, and it quickly superseded ether for long operations. It is administered by means of a loose-fitting mask which allows mixture of air, and the strength of the vapour is gradually increased. The effect of the inhalation is to produce first a state of disordered consciousness, which leads to complete unconsciousness. The reflexes persist for some time, and there are energetic movements of the muscles. In the next stage the muscles relax, and many of the reflexes disappear, though the vital centres in the medulla are still sensitive, and the heart muscle is active; this is the stage suitable for surgical operation. Later, the vital centres in the medulla may become paralysed, in which case respiration stops and life is endangered. C. under skilled management is a safe anæsthetic, the mortality being about 1 in 2500, and the after-effects in favourable cases rarely include painful vomiting. C. is also administered internally as a stimulant, anodyne, and as an antidote to strychnine poisoning. Externally, it is used to dilate the superficial blood-vessels, and as a local anæsthetic in cases of toothache.

Chloro-nitrous Gas, or **Nitrosyl Chloride** ($NOCl$), orange-coloured gas obtained by the direct union of chlorine and nitric oxide. It is easily liquefied at about 5° C. and atmospheric pressure, and is readily decomposed in the presence of water and hydroxides of sodium, potassium, or ammonium.

Chloropal, massive mineral resembling opal. It is green in colour, and consists of a hydrous silicate of iron.

Chlorophyll, green colouring matter of plants, in which it is accompanied by two other substances, carotin ($C_{40}H_{56}$) and xanthophyle ($C_{40}H_{34}O_2$). C. is not a single compound, but, as was shown by Willstätter, a mixture of the bluish-green chlorophyll-a with about one-third of its weight of the yellowish-green chlorophyll-b. Chlorophyll-a has the formula $C_{55}H_{70}ON_4Mg$ ($COOCH_3$) ($COOC_2H_5$), and chlorophyll-b a similar constitution except that it contains one atom of oxygen more and two atoms of hydrogen less. C. is insoluble in water, but dissolves in alcohol, benzene, and chloroform, and when extracted by the aid of one of these solvents, appears as a green amorphous mass. It is dichromatic, that is to say, when a thin layer is viewed by transmitted light, it appears green; but when the layer is of considerable thickness, it is dark red in colour. This is explained by the fact that whereas both red and green rays are transmitted, the green rays predominate in a thin layer, but are absorbed with greater facility than the red if the layer be thick. The development of C. in plants appears to depend on certain conditions of temp. and light, for if parts of a plant are hidden from sunlight, they quickly become blanched. The function of C. is to aid in the nourishment of the plant by absorbing carbon dioxide from

the atmosphere and producing carbohydrates. The nature of the process (photosynthesis) is obscure, but sunlight is an important factor, and the C. cells appear to possess the power of absorbing radiant energy from the sun's rays, by means of which the necessary chemical changes are brought about. Viewed microscopically, the C. of plants is seen to consist of granules or corpuscles called chloroplasts, which are embedded in the protoplasmic substance of certain cells. The chloroplasts of the algae frequently exhibit a complicated appearance; in *Spirogyra*, for instance, they are spiral in shape. It is associated with other pigments in the plant economy, and the changing colours of spring and autumn are probably due to changes in the relative amounts of C. and other pigments (anthocyanins, and also the xanthophyll constituent of the C. itself). The existence of C. is sometimes taken as the distinguishing characteristic of the plant as compared with the animal, but some plants seem to build up their tissues without the aid of C., and some animals, such as certain Infusoria, hydra, etc., possess C., but this is due to symbiotic algae. Molluscs and crustacea frequently exhibit C. as the result of absorption from food.

Chlorophyllite, mineral consisting of quartz, chlorite, and muscovite, occurring usually in scales or laminae. It is a variety of the larger group of the phyllites, minerals intermediate in character between the clay-slates and the mica-schists.

Chlorosis, or **Green Sickness**, form of anemia peculiar to the female sex, and particularly associated with the period of the attainment of puberty. The patient has a peculiar greenish pallor, is afflicted with palpitations, faintness, and gastric disturbances, and suffers from general languor and debility. The cause is a diminution of the proportion of hæmoglobin, or red colouring matter of the blood, due to the system badly accommodating itself to the new activities of the genital organs. It is therefore found chiefly amongst girls of sedentary occupation, pursuing exhausting work under bad hygienic conditions in ill-ventilated offices and factories, without a due proportion of leisure and healthy exercise, and often without suitable nourishment in the way of wholesome food regularly taken. The supply of hæmoglobin is furnished by the bone-marrow, and under normal healthy conditions the red corpuscles increase in number to replenish waste caused by any undue strain upon the system. The frequency of amenorrhœa in cases of chlorosis indicates that the organism resists any further drain of red corpuscles, and the other painful symptoms, such as faintness and dizziness, indicate that the blood is too poor in hæmoglobin to carry out its nutritive functions in an efficient manner. The treatment should include rest, abundance of suitable food, and general observance of hygienic principles. If possible a complete change of surroundings

and occupations should be effected. Iron preparations should be assiduously administered and continued for a long period if necessary. The condition is not dangerous in itself, and ceases when the patient has progressed further into womanhood, but the long-continued debility may diminish the resisting power to other diseases, such as tuberculosis. Great care must be taken to avoid relapses which are very apt to occur. It is doubtful whether there is any hereditary tendency towards the disease, which is much less common at present than formerly.

Chlorovaleric Acid, chlorine substitution product of valeric acid. When the anhydrous valeric acid is mixed with red phosphorus and dry chlorine passed into the mixture in the presence of sunlight, an atom of chlorine is substituted for an atom of hydrogen.

Chlumetz, tn. of Czechoslovakia, situated on the R. Cidlina, 46 m. N.E. by E. of Prague. Pop. 4000.

Chmielnik (or **Khmielnik**), tn. of W. Ukraine, Russia, on the R. Bug, 93 m. N.W. of Kamenets-Podolsk. Pop. 11,000. 2. Tn. of Poland, in the prov. of Kielce, 18 m. from Kielce. Woollen-cloth manufs., dyeworks. Battle against Tatars, 1241. Pop. 9000.

Choanites, or **Petrified Anemone**, name of a fossilised zoophyte found in the chalk. The popular name is given to it on account of its radiating appearance.

Choate, Joseph Hodges (1832-1917), Amer. lawyer and diplomat, b. at Salem, Massachusetts. His father, George C., was a doctor of some reputation and brother of Rufus C., a lawyer, congressman, and senator; he was educated at Harvard, 1852-54; admitted to the New York Bar, 1856. He practised with brilliant success, being specially noted for his powers of cross-examination. In 1871 he became a member of the Committee of Seventy which broke up the corrupt Tweed Ring that ruled New York municipal politics. In 1891 he was president of the New York State Constitution convention, and in 1899 he was appointed by President McKinley as ambas. to Great Britain. He was very popular and assisted greatly in the growth of a good feeling between the two countries; he was succeeded in 1905 by Mr. Whitelaw Reid. In 1907 he was the representative of the U.S.A. at the second peace conference at The Hague. He was anxious for the early entry of America into the First World War, and his exertions in this regard hastened his death, at New York.

Chobe, trib. of the R. Zambesi, S. Africa. It was discovered by David Livingstone, 1851.

Cho-Bo, tn. Tong-king, Fr. Indo-China, situated on the Song Ho (Black R.) at the point where the riv. bends N. before it enters the Song Koi (Red R.). It is an important trading centre, and gold is worked in the neighbourhood.

Chocolate, see COCOA AND CHOCOLATE. **Choctaws**, **Chattas**, or **Chacatos**, tribe of N. Amer. Indians of the Muskogean family, now largely intermarried with white and negro stock. They are

citizens of the U.S.A., numbering about 18,000. Their original hunting grounds were the S. part of the Mississippi valley, but they are now settled in Oklahoma. They sided with the Confederates in the Civil war, and suffered the loss of all their rights. Their slaves were set free. They are included among the more highly civilised tribes of N. America. Their custom of compressing the heads of male infants earned the name of 'flatheads' for them. The C., like all the Muskogean stock, were among the most warlike and fierce of all the Amer. Indians.

Chodkiewicz, Jan Karol (1560-1621), Polish soldier, and most famous member of a famous family. Served under Alva in the Low Countries and, later, under Zamoyski in the Turco-Moldavian campaign, where he obtained high command. Played a prominent part in resisting repeated Swedish invasions of the Baltic provs. Made a hetman of Lithuania in 1605 and won a remarkable victory with 4000 men against a Swedish army of nearly 20,000. In 1619, however, he was forced to sue for peace, his position having been undermined by revolts. Subsequently, when the Turks and Moldavians attacked Poland and defeated Zolkiewski, C. counter-attacked and completely defeated the invaders, but died soon afterwards.

Chodowiecki, Daniel Nicolas (1726-1801), Polish painter and engraver, b. at Danzig. He produced the famous set of miniatures, 'The History of the Life of Christ,' but of the 3000 works catalogued in his name only a few are worthy of mention, such as 'Jean Calas and his Family,' 'Hunt the Slipper,' and sev. engravings illustrating incidents in the Seven Years war. He has occasionally been known as the Ger. Hogarth, possibly because of his truthful representation of actual life and the skilful arrangement of his drawings. He became the director of the Berlin Academy in 1797.

Chodzko, Alexander (1804-91), Polish poet and oriental and Slavic scholar. He was appointed Russian consul to Persia, 1829, and made a special study of the language and literature of that country and also of other oriental languages. In 1842 he went to Paris, and in 1858 succeeded Mickiewicz as prof. of Slavonic literature at the Collège de France. He was the translator of many Persian poems, among others fifty-two lamentations or miracle-plays concerned with the deaths of Hassan and Husein. He pub. *Popular Poetry of Persia* (1842), *Fairy Tales of the Slav Peasants* and *Herdsman*, trans. into Eng. (1895), a Persian grammar, and many other works.

Chorilus: 1. Athenian tragic poet, competed with Æschylus 499 B.C. Said to have written more than a hundred plays, but none is extant. 2. Poet of Samos (fl. c. 480 B.C.). Fragments of an epic *The Persæid*, written at the court of Archelais of Macedonia, have been preserved.

Choropotamus, fossil genus of artiodactylous mammals, belongs to the family

Suidæ, and is a near ally of the wild boars. This genus of hogs was estab. by Cuvier, and the species have been found in the Upper Eocene.

Choropus castanotis, the pig-footed bandicoot, an Australian marsupial of the family Peramelidæ. It is an omnivorous, burrowing animal with long ears and tail, and the two well-developed digits on its fore limbs give them a pig-like appearance.

Choga, or Kioga, one of the chain of lakes in Uganda, E. Africa, forming a kind of extensive backwater in the headwaters of the Nile. It is marshy and shallow, 20 ft. being its average depth; length 85 m.; breadth 13 m. It receives two rivs., Mpologoma and Seziwa, in addition to the White Nile which flows through it.

Choir, formerly spelled *quire*, as it is pronounced (from O.F. *cur*, modern *chœur*; Lat. *chorus*), the name of the trained or organised body of singers who take part and lead in the musical portions of a church service, or perform portions of the service alone, where the congregation do not join, as in the singing of anthems. The term is also applied to a body of male and female singers who perform the choral portions of a musical composition; and to the part of the church used by them. In the Anglican Church, the C. usually consists of male voices only, boys taking the treble or soprano parts, and boys or one or two rare male voices, the alto or contralto parts, and men the tenor and bass. They usually are surpliced. In cathedrals they are divided into two portions, *cantoris*, i. e. on the precentor's or N. side of the chancel, and *decani*, on the dean's or S. side. The men form a special body attached to the cathedral and are termed vicars-choral or lay clerks.

Choiseul, César, Duc de, Sieur du Plessis-Praslin (1598-1675), Fr. general who distinguished himself at the siege of La Rochelle, 1628, and in Piedmont, 1636-1643; at the end of which campaign he was made a marshal. Gained a decisive victory over the Spaniards at Trancheron in 1648, and, soon afterwards, having been given the command of the royal forces in the war of the Fronde, he defeated Turenne at Ithel, 1650. Created duke in 1665, also known as the Marshal du Plessis.

Choiseul, Etienne François, Duc de (1719-85), Fr. statesman, eldest son of François Joseph de C. marquis de Stainville (1700-70), b. in Lorraine on June 28. He entered the army and fought in the war of the Austrian Succession. He became lieutenant-general after seeing service in Italy and Bohemia, and in 1750 he married Louise Honorine, the wealthy daughter of Louis François Crozat, marquis du Châtel. In 1753 he was ambas. to Rome and in 1757 was transferred to Vienna through the assistance of Mme de Pompadour. His skill and energy brought him to the position of minister for foreign affairs in 1758, and he controlled the French foreign policy through the Seven Years war. He became minister of war and marine, and

again minister of foreign affairs in 1766. Having failed in his Austrian policy he strove to retrieve the situation by an alliance with Spain, known as the Family Compact, but it was too late to save Canada or the Fr. possessions in India, from Great Britain, and he turned his energies to fresh colonies in the Antilles and San Domingo. In 1768 he annexed Corsica with the hope of its future use in the colonisation of Africa. His ruin was caused by his assisting Mme de Pompadour to expel the Jesuits from France, for at her death the Chancellor Maupeou, aided by Mme du Barry, persuaded Louis XV. to dismiss him, and he then retired to Chanteloup. In 1774, Louis XVI. recalled him, but did not restore him to favour. C. was a man of great ability, but without perseverance. He has been accused of exciting the war between Russia and Turkey (1768) from motives of revenge. He died in Paris on May 8, leaving huge debts, which his widow paid for him. See H. Walpole. *Memoirs of the Reign of George III.*, ed. by G. T. R. Barker, 1894, and F. Calvettes (ed.), *Mémoires du duc de Choiseul*, 1904.

Choisy-le-Roi, tn. of France, in dept. of Seine, situated on the l. b. of the Seine, 7 m. S. of Paris. Its manufs. are soap, chemicals, glass, morocco leather, earthenware and porcelain goods. In the cemetery is buried Rouget de l'Isle, the writer and composer of the *Marseillaise*. Pop. 27,500.

Choke-cherry, name given to sev. species of roseaceous plants in the genus *Prunus*, which are all natives of N. America and have astringent fruit. *P. virginiana*, the common C., is shrubby in habit and bears its small drupes in racemes.

Choke Damp, miners' term for carbon dioxide. Under ordinary circumstances it may be found in recesses or badly ventilated places in the mine, but is formed in huge quantity when an explosion of coal-gas mixed with air occurs, owing to the combination of the carbon of the gas and the oxygen of the air. When formed in this way it is known as *after-damp*. When the atmosphere is charged with a large amount of carbon dioxide, symptoms of suffocation occur through deficient oxidation of the blood.

Choking, suffocation by obstruction or compression of the windpipe. Any object indrawn into the windpipe when swallowing food is usually the cause of C.; such objects, fishbone, piece of bread, etc., become impacted in the glottis, at the top of the windpipe, blocking the passage. Childreu, also, often get buttons, small coins, etc., lodged in the same place. The natural response of nature is to cause a fit of violent coughing which removes the obstruction. Failing this, where cases threaten to prove fatal by asphyxiation, tracheotomy must be performed i.e. an incision is made into the trachea from the front of the neck, so that a tube can be inserted; the operation was formerly often necessary in the treatment of diphtheria. In cases of external compression of the windpipe, such as in strangling, hanging, or garrotting, the

heart and lungs are paralysed, breathing ceases, and death occurs in a few seconds. It should be noticed that in execution by hanging, C. does not occur, death being produced by dislocation of the neck vertebrae.

Chola, name of an anct. div. and dynasty of the Tamil country, India, between the Cauvery R. and the S. Pennar, Madras. The whole S. peninsula of India was once ruled by the C. dynasty. Its hist. began in A.D. 860, but gradually declined, and was extinguished in the eleventh century.

Cholecystitis, see under GALL-STONES.
Cholelithiasis, see GALL-STONES.

Cholera, name given to a number of diseases characterised by the discharge of a watery fluid from the bowel. Such a disease, under the name *χολέρα*, is alluded to by Hippocrates, Galen, and other anct. writers on medicine, who probably referred to what is now known as *cholera nostras* or summer C. The more malignant disease, Asiatic C., has its home in India, particularly in the lowlands of Bengal, and was confined to E. countries until the nineteenth century. In 1817 an epidemic of C. spread from India to Japan in one direction and in the other reached Astrakhan in 1823. Another epidemic started in India in 1826, reached Astrakhan in 1830, Moscow and Berlin in 1831, Paris and the Brit. Isles in 1832; it was carried by emigrants to Canada in the same year, and raged with varying virulence until 1838. The next great epidemic reached Europe in 1847 and lasted until 1855. In 1865 the disease again appeared in Europe, travelling from India to Mecca, whence it was disseminated by pilgrims to Egypt and other parts. In 1884 it reached Europe again by the same pilgrim route and was carried to S. America by an It. ship. In 1892 a severe epidemic appeared in Paris and subsequently in Germany and Russia. In Hamburg there were 16,956 cases and 8665 deaths. By 1895 the disease had exhausted its energies in Europe, though it still prevailed in Arabia, Persia, China, and Japan as well as in India. The specific cause of Asiatic C. is a micro-organism which invades the intestines and develops there. R. Koch found in the stools of C. patients a microbe of the genus *Spirillum*, which he called the 'comma' bacillus (actually bacterial vibrios) from its shape, and asserted it was the cause of the disease. It is a very motile organism, possessing a single long flagellum, and appears only in the intestinal tract. Cultures of this microbe show it to be a somewhat weakly organism, unable to live at a temp. above 60° C. or in the presence of any acid, being at once killed by drying, and readily overgrown by other bacteria. When these facts were estab., scientists found it difficult to believe that the comma bacillus could be responsible for such widespread and obstinate outbreaks of disease, and many attempts were made to account for its virulent nature under certain conditions. The outcome of the investigations seems to credit the microbe with two or more

stages of development. Like many other parasites, when it emerges from the human body, it has to develop under certain other conditions of temp., moisture, and food, before it regains its virulence. This accounts for the fact that direct contact with a *C.* patient, or even the swallowing of ejected germs is not highly dangerous, though the exposure of the smallest quantity of the dejecta of a patient may subsequently lead to a serious extension of the epidemic. The disease may be both air- and water-borne. In Hamburg the drinking of unfiltered riv. water was undoubtedly the cause of the outbreak of 1892, as in Altona, where the water was filtered, the pop. escaped except for cases imported from Hamburg. The symptoms are usually classified in three stages. There is first of all a preliminary diarrhoea which may not occasion alarm; the characteristic *C.* attack follows, including vomiting and profuse liquid evacuations. These are very frequent, and soon become of the colour and consistency of rice-water or thin gruel. Owing to the great loss of water, other secretions are lessened, the urine becomes totally suppressed, the skin shrinks and assumes a grey tinge, the calves and other muscles are cramped, and the patient suffers from an unquenchable thirst. The third stage may be asphyxia or reaction. In the asphyxial stage the skin becomes dark grey and the circulation of the blood becomes more and more sluggish, until the cutting of a vein fails to produce any outflow of blood. If the patient survives he proceeds to the stage of reaction, when cyanosis vanishes, the evacuations resume their yellow colour, the urinary secretion returns, and the circulation improves. There is always danger of a relapse, and the occurrence, the so-called *C.* typhoid, may lead to death. The average rate of mortality in an epidemic is about 50 per cent. Curative treatment should commence with the preliminary diarrhoea. When *C.* is threatened, all cases of diarrhoea should be suspected. The patient should take to bed and endeavour to produce a mild perspiration. Transfusions of hypertonic alkaline saline should be given; a suitable solution is 180 grains of sodium bicarbonate and 90 grains of sodium chloride in one pint of sterile water. Opium, morphia, and alcohol are to be avoided. Potassium permanganate should be administered *per anum* in all cases of *C.*, to oxidise and so destroy the toxins produced by the germ in the intestine; Kaolin is also useful for the same purpose. Barley water can be given to combat the dehydration, even if vomiting occurs. Preventive measures are of the utmost importance when *C.* is threatened. There should be the utmost cleanliness in everything concerning the water supply and the disposal of sewage. Travellers should be kept under inspection, and public authorities should thoroughly disinfect all dustbins, water-closets, etc., whether owned privately or not. The individual should practise personal cleanliness, boil all water and milk before drinking,

avoid uncooked fruit and excess in alcoholic liquors, but should endeavour to make as little change in his habitual diet as possible. It should be remembered that any gastric disturbance acts as a predisposing factor, and even undue alarm may therefore indirectly cause an attack. Vigorous people of middle age are seldom attacked, and the number of cases seldom exceeds 2 per cent of the pop. Owing to the difficulty of completely safeguarding food and drinking-water in India, persons living in *C.* dists. are best protected by inoculations of the dead *C.* germ.

Cholera nostras, European *C.*, or summer *C.*, is a disease which occurs in scattered cases and in its symptoms provides a mild parallel to Asiatic *C.* It generally occurs in summer, and should be treated by frequent doses of tincture of opium. See J. S. Chambers, *Conquest of Cholera*, 1938.

Cholesterin, alcohol occurring as a constituent of bile, gall-stones, egg-yolk, nervous tissues, and blood. It is a white crystalline substance, soapy to the touch, insoluble in water, but soluble in hot alcohol or chloroform. It is said to neutralise snake-poison.

Cholet, tn., France, in the dept. Maine-et-Loire, situated on the r. b. of the Maine, 30 m. S.W. of Angers. Cotton and woollen goods, flannels, handkerchiefs, etc., are manufactured and there are bleaching and dye works, and tanneries. A dark granite is obtained in the neighbourhood. *C.* possesses large cattle markets. Pop. 20,500.

Choliambic, name of an iambic trimeter, which had a spondee or trochee instead of the normal iamb in the sixth and last foot. It was called the lumpy iambus and was used by Gk. and Rom. poets to give a satiric or ludicrous effect.

Cholm (Chelm or Kholm), tn. in Poland, important railway junction from which lines radiate N. to Brest-Litovsk, S. to Lvov, E. to Kovel, and W. to Lublin. Sev. actions were fought in this dist. during Aug. and Sept. 1914 as a result of which the Russians swept over it into E. Prussia, only to be driven beyond it again by the autumn of 1915.

Cholmondeley, Mary (d. 1925), Eng. novelist, granddaughter of Mary Heber, sister of Bishop Heber, the hymn-writer. Her *Red Pottage* (1899), won considerable success. She had previously written three other novels: *The Duncovers Jewels* (1887), *Sir Charles Duncovers* (1889), and *Diana Tempest* (1893). Her later novels included *Moth and Rust* (1902) and *The Lowest Ring* (1908), which, however, although excellent for their craftsmanship, did not attain the popularity of her earlier books.

Cholon, prin. commercial tn. of Cochlin China, 30 m. from Saigon. Great trade in the rice of Cochlin China. Pop. 145,000, chiefly Chinese.

Cholula, tn. 8 m. from Puebla, Mexico, with an anct. Indian pyramid crowned by a Sp. church. Here the Mexican god Quetzalcoatl passed twenty years in teaching the Toltecs the arts of civilisation. The pyramid was erected in his

honour, and crowned with his temple and image. 8000 human victims are said to have been sacrificed annually at this and the other sanguinary shrines in C. It was claimed by Cortés the Conqueror that the sacred city contained 40,000 houses. In 1519 he massacred some thousands of the inhab. Pop. 9000.

Choluteca, dept. and tn. of S. Honduras, with gulf of Fonseca on S., Goascorán R. on W. The tn. is 70 m. from Tegucigalpa, and has large public buildings. Mining is carried on. Pop. 45,000; tn. about 8,000.

Chomatodus, name given by Agassiz to some fossil fish of the group Elasmobranchii, is now replaced by the term *Petalodus*. These fishes are typical of the family Petalodontidae, and are found in the int. limestone of Great Britain, Europe, and N. America.

Chomolungmar, see EVEREST, MOUNT.

Chomutov, or Komotau, tn. of Czechoslovakia, 21 m. S.W. of Teplitz, on a trib. of the R. Eger, at the foot of the Erzgebirge. Prior to the Ger. seizure of Czechoslovakia, it had the country's main factory for making railway plant; brewing, milling, weaving, and dyeing were also carried on. In the vicinity are oil mines, and an alum lake. Pop. 33,000.

Chondracanthus, curious genus of parasitic copepod crustacean in which the large females attach themselves to the gills of living fish, and the small males attach themselves to their feminine counterparts.

Chondrites, genus of supposed fossil seaweeds of tucoid form. The species range from the Cambrian to the Tertiary. The specimens on which the genus is based may be simply surface markings which happen to resemble seaweeds.

Chonos Archipelago, group of a thousand rocks, is., and reefs off the W. coast of Chile between lat. 44° and 46° S. They are mostly uninhabited, and are separated from the mainland by the Moraleda Channel.

Chontals, or Lencas, widespread race belonging to Central America. Their domain was formerly in the E. parts of Honduras and Nicaragua, and a few straggling settlements in Guatemala, Chiapas (S. Mexico), and Costa Rica. A good number of these people are still to be seen in parts of Nicaragua, and surrounding dists. of Honduras. The Aztecs look down upon the C. and call them aliens or barbarians, but as a matter of fact they are more or less civilised, as proved by ruins and objects found in the graves in dists. where they once dwelt. There are no temples left, or inscriptions on anything, but monoliths 6 or 7 ft. high, stone figures of animals, idols, gold ornaments, and earthenware pots have been found in large quantities.

Chopds, see CHOPRA.

Chopin (O. F. *chopine*, a liquid measure), O. E. liquid measure equal to half a pint; old Scottish measure equal to nearly a quart; Fr. measure, before the introduction of the metric system, equivalent approximately to a *demi-litre*.

Chopin, Frédéric François (1810-49),

Polish composer and pianist, b. at Zelazowa Wola, a vil. 30 m. from Warsaw, of Polish-Fr. parentage. His father was a book-keeper and subsequently a teacher. Although he spent half his life in Paris, C. became the greatest exponent of Slavonic, or, more especially, Polish nationality in music. He showed early genius in music and, at the age of nine, began his musical training under Złówny, a Bohemian and teacher of Złówny. Through the liberality of Prince Antoine Radziwill he was sent to a Warsaw college, where his genius began to assert

CHOPIN

After a drawing by A. Duval.

itself, and while there he received instruction in composition from Joseph Elsner, a Silesian and director of the conservatoire at Warsaw. Later he became a pupil at the Warsaw Conservatoire, but notwithstanding these successive periods of training C. was largely self-taught. His fellow students at Warsaw introduced him into the best circles of Polish society, and these early impressions of cultured life were of enduring influence on C.'s development, both as a man and as an artist. His début as a pianist was in Vienna in 1829, and his first appearance in public was marked by considerable success. Two years later he proposed to visit London, but, on reaching Paris settled there. Here too he soon became a favourite of society and was the friend of Bellini and of Liszt. Here too began his friendship with Mme Dudevant, otherwise George Sand, who exercised an important influence on his life. When in 1837 his pulmonary trouble began, George Sand, with her children, accom-

panied him to Majorca; but though she nursed him with solicitude, he made no permanent recovery. The last ten years of his life were a continual struggle with the disease to which he succumbed. The revolution of 1848 drove him out of Paris to Britain, where he was a centre of attraction in the chief cities, but eventually he became so weak that when he was to play at some great house he had to be carried upstairs. He went back hysterically to Paris, but only to die on Oct. 17, 1849, and was buried in Père Lachaise cemetery beside Bellini and Cherubini.

C.'s compositions embrace the imaginative melancholy of the Slavonic peasant as well as the grace and culture of the Polish aristocrat, and his character shines out through much of his work. His compositions stand alone owing to the peculiar nature of his genius; they are extremely individualist and of a pronounced style and full of poetic imagery. He employed dance forms and rhythms—particularly the mazurka—round which to weave many of his melodies. He has been well described as the poet of the piano—a lyric poet for the most part, though sometimes a dramatic poet. The list of his compositions is so prolific in mazurkas, waltzes, polonaises, and other forms of national dance music that it is sometimes difficult to believe that they are so often the expression of a deeply melancholy nature—a seeming paradox, yet explained by the type of C.'s nationality, a nationality which has been justly described as sadness personified. What music C. composed for other media than the piano is negligible, for even when he associated other instruments with the piano they were obviously subordinated to it. The piano was to C. as much a means of natural expression as if it were a part of him (Scholes). Among his compositions are 27 études, 24 preludes, 19 nocturnes—the style and name of the pianoforte nocturne he owed to the Irish composer, John Field (1782–1837)—52 mazurkas, 3 impromptus, 3 sonatas, and 2 concertos. Some of these are to-day the most popular of all recital items. Excepting a collection of Polish songs, the 2 concertos above mentioned, and a few concerted pieces of chamber music, almost all the works of C. are written for pianoforte solo; the symphony, the oratorio, and the opera he never attempted. He was among the finest executants as a pianist, and in this art first alone approached him. He was among the first to use the thumb freely on black keys. Many of his pieces, with *cerie* effects or echo effects or fairy-like accompaniments, depend for their adequate rendering on the use of a particularly subtle kind of finger technique, and are indeed a good test of the varied resources of the skilled pianist. (See on this Tobias Matthay, *The Visible and Invisible in Piano Technique*, 1932.)

The house in which C. was born was taken over by the Polish nation in 1934 and extensive gardens laid out. In the Second World War the Gers. stripped it

of all its furniture and things of value; but after the war the Poles gradually collected various pieces of furniture, pictures, etc., which had been saved by the composer's admirers, with a view to furnishing the house at Zelazowa Wola as a worthy place of pilgrimage. The Poles see C.'s music as the noblest expression of the romanticism in their soul; his whole life, his patriotism, his death, and his request that his heart be brought back to Poland all made the strongest appeal to Poland's imagination. The return of C.'s heart to its former resting-place in the Church of the Holy Cross in Warsaw, from where it was removed and hidden from the Gers. during the war, was the occasion of a great national demonstration in which the Polish president and the leading members of the regime took part. Efforts were made to have the remains brought back from France not later than 1949, in time for the centenary celebrations, to be marked also by the pub. of a revised ed. of his works, collected and ed. by Paderewski, and the holding of an international C. congress in Warsaw. Sev. years before the war the C. Institute arranged for Paderewski to edit the revised ed. and to add his own interpretations. Paderewski collected all the various eds., including 19 nocturnes, 14 waltzes, and 7 items which had first been pub. by the Oxford Univ. Press. He found that in the course of a century many errors called for correction and he devoted the last years of his life to completing the task (1939). The new ed. was actually started in 1939 and all the proofs and annotations had to be hidden in a cellar in Warsaw. Because of a lack of printing facilities the proofs were, after the war, sent to America for pub. there in time for the centenary. See G. Hadden, *Chopin*, 1934; W. Murdoch, *Chopin: his Life*, 1938; G. Abraham, *Chopin's Musical Style*, 1939; P. A. Scholes, *The Oxford Companion to Music*, 1941.

Chopine (Sp. *chapin*), very high clog or patten, sometimes half a yard high, of oriental origin, introduced into England from Venice in the reign of Elizabeth.

Chopra, or **Chopda**, tn. in Khandesh dist., Bombay, India, 105 m. from Indore. Exports linseed and cotton. Pop. 18,000.

Chop-sticks, implements used by the Chinese and Jap. to pick up their food with—a substitute for our knife and fork. They are made of either ivory or wood, and held between the fingers and thumb of the right hand in much the same way as sugar-tongs.

Choragus, or **Choregus**, in anct. Greece, the name given to the citizens who bore the expense of the chorus furnished by each tribe for public festivals, and also to the musician who directed the tribal chorus. The most successful C. in competitions was rewarded with an engraved tripod, which he consecrated and set upon a monument. The choragic monuments of Thrasylus and Lysicrates still exist at Ath.-ns.

Chorale (Ger. *Choral*), name applied to a particular form of musical composition

for voices which was introduced by Luther into the services of the Ger. Reformed Church. The words were often in the vernacular and in the form of hymns. The music was not always original, being sometimes secular and sometimes adapted from hymn tunes of the Rom. Church. Luther and his friends, Walther and Senfl, pub. the first important set of chorales at Wittenburg in 1524.

Choral Service, services in the Eng. and Rom. churches where the psalms, responses, etc., are sung, not said.

Chord, in music, the simultaneous sounding of notes of different pitch. The common C. consists of a note with its third and fifth. In geometry, a C. is a straight line joining two points on the circumference or curve of a circle, ellipse, parabola, etc. In a circle, the greatest C. is a diameter, and the length diminishes as it recedes from the centre. The perpendicular drawn from the centre bisects the C.

Chordata, term used in speaking of all animals which have at some period of their life the organ which functions as a supporting rod, the *notochord*. In some of the lowest members of the group this elastic rod is present only in the earliest stages of their life, while in the highest members it is eventually replaced in the adult by the spinal column. Other universal features are the presence of gill-slits and a central nervous system. Zoologists are by no means agreed upon the creatures which may be included in the C., and though the Amphioxus and all vertebrates have an assured position, opinions vary as to the claims of such lower forms as the Tunicata and Enteropneusta.

Chorea, or St. Vitus's Dance, nerve disorder which attacks both children and adults, but most cases occur in the former between about eight and fifteen years of age. That occurring in childhood is called 'common C.' and is met with much more frequently among girls than among boys. Its presence is shown by nervous twitchings of the head, face, or limbs, due to great want of control over the muscles of the affected part, but unaccompanied either by pain or rigidity. The muscles of the face are most frequently affected, then the extremities of one side of the body, and after them come those of the body, and in very severe cases all at once. The disease has probably a connection with rheumatism, since it occurs generally in children with a rheumatic tendency, and sometimes is accompanied by acute rheumatism, or there is even danger of rheumatic fever. Also there are symptoms of heart disease, which may be brought on in its lower stages. A child which suffers from C. has probably been subjected to some shock or fright, and the remedy is complete rest; or there has been malnutrition, when a course of nutritious feeding would be necessary. The patient should be confined to her own room and in bed, and in order that she shall suffer from no excitement, contact with friends or relatives forbidden. Nutritious diet and a metallic tonic, such

as zinc, iron, or arsenic, may be given, but the most efficacious drug is aspirin. The attack generally lasts about two months, but as it is liable to return, the child should be given plenty of open-air exercise, gymnastics, and good feeding.

Choreography, art of dancing notation, i.e. a system of signs whereby movements in dancing is shown, the same as notes in music represent certain sounds. Beauchamps, the dancing master of Louis XIV., developed this art. Saint-Léon wrote one of the best works on this subject entitled *Sténochoregraphie* (1852). The term now connotes the whole invention, design, and stage management in a ballet.

Choriambus, in classical prosody, a foot consisting of four syllables, of which the first and last are long, the second and third short (— ◡ ◡ —). It takes its name from its supposed composition from the union of a trochee (choree) and an iambus.

Chorion, term which has been used in sev. confused senses by embryologists in connection with the early development of mammalian young. It was applied particularly to the union of the false amnion with the allantois or with the yolk-sac, but it is now generally eliminated from the vocabulary of scientists.

Chorley, municipal bor. and tn. of Lancashire, England, situated on the R. Chor, 20 m. N.W. of Manchester. The manuf. of cotton yarn and goods is largely carried on, and there are calico printing, bleaching, and iron works. Coal, iron, lead, and slate are found in the neighbourhood. Pop. 31,000.

Chorlu, or Tchörliu, tn. and riv. in Turkey. 60 m. W. by N. of Istanbul. Scene of much sanguinary fighting between the Turks and Bulgarians in 1912.

Chorokh, or Zhorokh, riv. of Transcaucasia. It rises on the side of Kazan Mt. N. of Erzerum. It is about 215 m. long, and drains 10,500 sq. m. of country. It flows into the Black Sea near Batumi. Its chief trib. is the Olti-chai.

Chorostkov, tn. formerly of Poland in W. Ukraine, 25 m. E.S.E. of Tarnopol. Pop. 6500.

Chorotegans, one of the cultured races of Central America. Their land extended from Fonseca Bay to the E. side of Lake Nicaragua. At present they have nearly all become swallowed up in the Sp.-Amer. communities of Honduras and Nicaragua, and as a matter of fact they now form the main constituent element. They acquired a fairly large amount of culture under Aztec and Maya influence, but the early missionaries who came over from Spain had their temples destroyed, their idols broken, and their graves despoiled. On the is. of Lake Nicaragua are some colossal basaltic monoliths which are supposed to be of Chorotegan origin. They are for the most part in the form of human figures, but very rudely carved.

Chorrera, tn. near the Pacific coast of Panama, 15 m. from Panama. Pop. 6200.

Chorum, or Corum, tn. in Asiatic Turkey, 100 m. N.E. of Ankara. It is

situated on the road which runs between the seaport of Samsun and Kaisarieh. This makes it a place of some commercial standing. The manufs. are earthenware and leather. Pop. 12,500.

Chorus, word which originally in Gk. meant a dance ($\chi\omicron\rho\omicron\varsigma$) accompanied by singing, employed at festivals in honour of the gods, especially of Dionysus, and thus developed into the songs accompanied by rhythmic movement forming the lyric parts of the Gk. tragic and older comic drama. It is thus applied to the body of singers in opera, oratorio, cantatas, etc., who sing the music written for large groups of voices in parts for each type of voice, soprano or treble, contralto or alto, tenor, and bass. A C. may be distinguished from a glee which is properly written for single voices to each part. Hence when a portion of a song is to be sung, not by a single singer but by a number of singers, it is styled a C. In the Elizabethan drama, the word is applied to a single character who spoke the epilogue and prologue.

Chorzow (Ger. *Königshutte*), tn. in Polish Silesia. It has rich coal mines, and also iron and zinc works. Pop. 111,000.

Chose in Action, in its general significance, means all rights over property which, in contradistinction to those which can be asserted by taking physical possession of the property, can only be enforced by action. It is, however, a term of many shades of meaning, all of which have been the subject of much legal controversy. In its other but related senses it may mean the property itself which is the subject of personal rights or the instrument which evidences those rights. In the sense of the property itself the term has been held to comprise, *inter alia*, shares and stock in companies, insurance policies, patents, debentures, titles, negotiable instruments, debts of all kinds, annuities, trusts, legacies, reversionary interests, and advowsons. In contradistinction to choses in possession (a thing of which a person has physical possession), Cs. in A. were not transferable at common law, but by the custom of merchants, the rules of equity and statute law, certain Cs. in A. became assignable, and hence it was that prior to the Judicature Act, 1873, Cs. in A. were commonly classified according to the mode of assigning them. Cs. in A. not being assignable at common law, the result was that a person who purported to assign could not maintain an action in his own name against the debtor. But by the Judicature Act, 1873, all Cs. in A. are made assignable by agreement in writing signed by the assignor, provided written notice is given to the debtor or trustee, and the assignment is absolute and not by way of charge. See L. A. Goode, *The Modern Law of Personal Property*.

Cho-Sen, see KOREA.

Choshi, tn. in Japan on the E. coast of Nippon, 72 m. from Tokyo. The chief industry is fishing, and fish oil is manufactured. Pop. 36,500.

Chos-Malal, cap. of the Neuquen ter.,

Argentina, at the junction of the Neuquen and Leubu, 465 m. from Bahía Blanco. Altitude 2590 ft.

Chosroes I., reigned over Persia A.D. 531 to 579. His name C., or rather Khosrau, means 'with a good title,' and his wise and beneficent rule earned him the appellation of Blessed (Anushirvan). In 540 he broke his peace with the Emperor Justinian, invaded Syria, and carried off the inhabs. of Antioch to a new city called Khosrau-Antioch. In 562, after successive warfare against the Roms. in Lazica (Colchis) and Mesopotamia, he made a peace whereby the Roms. agreed to pay subsidies but kept Lazica, whilst C. agreed not to persecute the Christians. Uniting later with the Hephthalites against the Turks, C. proceeded to conquer Bactria, and in 570 he made Yemen a Persian dependency. This ruler was therefore a great conqueror, but he was also a great statesman; for he introduced a land basis for taxation, built canals in Babylonia, was tolerant towards Christian and other sects though a convinced Zoroastrian, and patronised literature.

Chosroes II. (A.D. 590-628), was far inferior both in statesmanship and strategy to his grandfather, C. I. Prone to luxury, he succeeded finally, by his haughty bearing and heedless avarice and cruelty, in alienating the affections of all his people and in reducing the mighty Persian empire to a state of miserable and desperate chaos. With the help of the Emperor Maurice he defeated the usurper Bahram Chobin in 591. Three years later he began war against the Christians and Rome, ostensibly to avenge the murder of his ally, Maurice. His predatory armie overran Syria and Asia Minor, and his general, Shahrbaraz, captured Damascus and Jerusalem (614). Even Egypt fell a victim to Persian rule. But between 622 and 629 the Emperor Heraclius recovered all the recent conquests and restored the Holy Cross to Jerusalem. C. was assassinated, his eldest son being proclaimed king in his stead.

Chota Nagpur, div. of Bihar prov., India. It includes, besides the Brit. dists., sev. small native trib. states between the valleys of the Rs. Mahanadi and Son. The country is ill-watered and liable to drought, its highlands are thinly peopled and contain a large aboriginal pop. Everywhere are jungles and forests. Lac, rice, tea, silk, and timber are produced. At Jherria and in other places coal and iron are mined. Many of the hillmen are now Protestants. Pop. nearly 5,000,000. Consult Bradley-Birt, *Chota-Nagpore*, 1910.

Chota Udaipur, hilly native state in the Gujarat States Agency, India, with a cap. of the same name. Area, 900 sq. m. Pop. 145,000.

Chou Carabe, see BRAZIL CARBAGE.

Chouans, lower Breton word, meaning 'screech-owls.' This name was given to a company of smugglers, who revolted during the F. Revolution and joined the Royalists in La Vendée. They were led by a man called Jean Cottoreau (1767-94),

a dealer in contraband salt, whose trade was ruined by the destruction of the inland customs. Under his leadership the C. carried on a guerrilla warfare against the Republicans; his company soon grew into an army which was known as *La Petite Vendée*. Cottureau was killed in an ambush, and his place was taken by Georges Cadoudal (1771-1804). The insurrection then spread through Brittany and the W. of France. The devotion of the Bretons and the energetic skill of Cadoudal made this revolt a menace to the republic. The little army had grown

F. Full

CHOW-CHOW

to 10,000 men, who regarded the revolt almost as a holy war; they were finally beaten by La Hoche at Quiberon (July 20, 1795). Cadoudal was imprisoned but escaped, and though open warfare was now impossible, he continued plotting; he was arrested and executed in Paris, June 1804, with sev. others. This ended any serious attempt at a fresh revolt. See also *VENDÉE, LA*.

Choudard, Pierre Jean Baptiste, see DESFORGES.

Choughs (*Pyrrhocorax*), group of the crow family or Corvidae. It includes sev. species, of which the rare Cornish C. (*Pyrrhocorax graculus*) is an example. They are allied to the magpies and jays; the name is given to them in imitation of their cry. The species are usually black, with red feet, and a long, powerful yellow or red beak; the claws are long and hooked. In diet the C. are frugivorous and insectivorous. The Alpine C. (genus *P. pyrrhocorax*—Linn.) differs from the true C. in its shorter bill, and in having the cheeks bare, not feathered as in the genus *Graculus*. Only one species of this genus is known.

Chouquet, Adolphe Gustave (1819-1886), Fr. musical writer, b. at Havre. He composed sev. light works, but is best known as a writer on musical hist. In 1871 he became keeper of the collection of musical instruments at the Paris Conservatoire of Music, and he issued an illustrated catalogue of that collection

in 1875. His chief work is *L'Histoire de la Musique dramatique en France* (1873).

Chow-chow, or Chow, Chinese dog, popular in Great Britain as a pet dog. In China it is killed and hung up for sale in the meat-shops. It has a piquant expression, is an intelligent companion, and a good house dog. Its chief peculiarity is that it has a black tongue. Occasionally the roof of the mouth is also black. Its coat should be all of one colour—black, red, yellow, blue, or white—but not in patches. White spots on the coat are a disqualifying point. The hair under the tail and under the thighs is frequently of a lighter shade in the same colour. Other points to notice are: Head broad and flat; nose moderate in length, but short tipped; nose and mouth black; eyes small and dark; ears alert and carried erect and well over the eyes; neck broad and firmly set; legs strong, bony, and perfectly straight; feet round and cat-like; chest broad and deep. The C. has a deep ruff round the neck, and a hairy, full tail, curled over the back. It weighs from 46 to 55 lb.

Chree, Charles (1860-1928), Scottish scientist, b. in Forfarshire and educated at Aberdeen and Cambridge Univs., gaining the highest honours in both. In 1890 he was appointed a fellow in research at Cambridge. He soon achieved great distinction in the study of terrestrial magnetism and atmospheric electricity, in which he became a recognised authority. Was superintendent at Kew Observatory from 1893 till 1925, during which period that observatory was developed into one of the best in the world. Among his many honours and awards were the James Watt medal in 1905, the Hughes medal in 1919, awarded by the Institution of Civil Engineers and the Royal Society respectively. Pub. *Terrestrial Magnetism* (1912) besides numerous papers on that and allied subjects.

Chrestien, Florent (1541-96) Fr. satirical poet, b. at Orleans. One of the co-authors of the *Satyre Ménippée* (1594), directed against the League. A composer of Lat. verse and a good Hellenist, he was chosen as tutor to the prince de Béarn, afterwards Henry IV.

Chrestomathy (Gk., good learning) collection of the best extracts from any author or authors, with notes. The term is especially applied to such a compilation in a foreign language, viz. a Hebrew C. The best one of modern times is G. Paris's *Chrestomathie du moyen âge* (1908).

Chrétien (or Chrestien) de Troyes, most famous of Fr. medieval poets. He was b. at Champagne, but unfortunately there are but few exact details with regard to his life. There is also a difference of opinion as to the dates of his poems. At the command of Marie, countess of Champagne, he wrote *Le Chevalier de la Charette*, and he wrote *Le Conte du Graal*, or *Perceval*, for Philip, count of Flanders. This prince was regent for the young king Philip Augustus from 1180 to 1182, and as C. says the story of the Graal was the best tale told *au cort royal*, we have reason to believe that it was written during the

regency. It is thought that the probable time of his literary activity was between the years 1150 and 1182, when his patron, Count Philip, fell into disgrace at court. There are a few of C.'s poems extant, most of them dealing with Arthurian legends. There also exists a poem entitled *Guillaume d'Angleterre* which is supposed to have been written by him, but it is a matter of debate. Prof. Förster claims it as a genuine article, but Gaston Paris does not accept the statement. His poems enjoyed great popularity, and the three favourites were *Erec*, *Ivain*, and *Perceval*. His style of writing is easy and graceful, and he is also analytic and dramatic, but he has no great depth of thought or power of characterisation. His MSS. are the earliest Arthurian romances that we possess. See A. C. L. Brown, *Ivain*, 1903; T. P. Cross and W. A. Nitzze, *Lancelot and Guinevere*, 1930; F. W. Thompson, *The Elucidation. A Prologue to the Conte del Graal*, 1931; A. Micha, *La Tradition manuscrite des romans de Chrétien de Troyes*, 1939.

Chrism (Gk. *χρίσμα*, a substance used in anointing, from *χρίω*, to anoint), and consecrated olive oil mixed with balm, used by the Rom. Catholic Church for anointing in certain sacraments; in the Orthodox Church it is mixed with spices. Children were anointed before being baptised.

Chrisome, robe presented to infants when baptised in the Rom. Catholic faith, to symbolise innocence. It represents the original C. cloth which used to be placed on the head to prevent the chrism oil being rubbed off. A C. child is one who dies within a month after baptism, in which case the C. is used as a shroud.

Christ, transliteration of the Gk. *χριστός*, anointed, from *χρίω*, to anoint, usually with the definite article 'the anointed one, the Christ,' and used in the Septuagint version of the O.T. to translate the Heb. *Mashiach*, Messiah, the anointed one, a word which to the Jews of latter times implied the great earthly King who would restore their kingdom and free them from the subjection in which they were held (see **MESSIAH**). While in the O.T. the word is used in the LXX. not always with this significance of a Messianic coming, in the N.T. it always refers to the claim of Jesus, to fulfill the Messianic prophecies, but in a spiritual sense as the bringer to mankind of a spiritual kingdom and of freedom from the subjection not to earthly rulers, but to sin. C. is thus properly a title of Jesus, the Lord, (*Κύριος*) Jesus, the Christ (*ὁ Χριστός*). When He asks His disciple, 'Whom think ye that I am?' Peter answers, 'The Christ.' The high priest asks Him if He is 'the Christ.' In the beginning of the earliest certain Christian document that we possess, the first epistle of St. Paul to the Thessalonians, most probably not later than A.D. 52, the Church is addressed as in 'the Lord Jesus Christ.' It may be noted that 'Christ,' alone with 'Jesus' or 'Lord Jesus,' is far more frequent in the Epistles

and Acts than in the Gospels. From the earliest time it is the spiritual Messianic side of Jesus' mission that is stressed, and it is plain how the name of His followers should have been from the first 'Christians' (*Χριστιανοί*). The first letters of the name in Gk. $\chi\rho\iota$ formed the monogram of Constantine's *labarum*, and have always remained a favourite symbol in Christian art. See also **JESUS CHRIST** and **MESSIAH**.

Christ, Disciples of, or Campbellites. religious sect founded by Alexander Campbell (1788-1866). They do not have any creeds or confessions, they take their religious ideas direct from the N.T., and baptise by total immersion. In the U.S.A. they have grown into an influential body.

Christadelphians (Gk. 'brethren of Christ'). A religious community founded by Dr. John Thomas (b. in London in 1804) but claiming to hold the doctrines of primitive Christianity. They believe in the unity of God; in Jesus Christ the son of God, who died as a sacrifice that men might have life; in immortality as a conditional gift to be bestowed at the resurrection of the dead at the return of Christ to establish a universal kingdom upon earth. They believe the centre of gov. will be in Palestine with Jerusalem as cap. See J. Thomas, *Elpis Israel*, 1850; R. Roberts, *Christendom Astray*, 1881; J. Carter, *God's Way*, 1947.

Christ Church (Lat. *Aedes Christi*, popularly called 'The House'), college of Oxford Univ., England, and the largest collegiate foundation in Oxford. It was commenced by Cardinal Wolsey in 1525, on the site of the priory of St. Frideswide, which Wolsey had suppressed on Pope Clement VII.'s authority, for the purpose of founding a college. The church of St. Frideswide became both the cathedral of the diocese of Oxford and the college chapel. The college was first called Cardinal College, and on the fall of Wolsey, Henry VIII. suppressed the name and called it Henry VIII.'s College. In 1546 the foundation was estab. as it now exists, consisting of a dean, who is head of the college and dean of the cathedral, six canons, the cathedral staff, and the 'students,' the fellows (senior students), and scholars. Five of the canons are univ. profs.; the duties of a college dean are performed by two of the fellows called censors. Wolsey began the buildings and in 1665 Dr. John Fell completed many of them, though the cloisters Wolsey had designed were never built. The great gateway begun by Wolsey was finished by Dr. Fell and designed by Wren; it contains the great bell called 'Big Tom' (St. Thomas of Canterbury), which came originally from Osney Abbey. The first quadrangle, the largest in Oxford, is called the 'Tom Quad.' The Peckwater Quadrangle is named from a hall that once occupied the site, and the small Canterbury Quadrangle is called after the Canterbury College, built in 1363, which vanished in Wolsey's foundation. The staircase leading to the hall is roofed with one of the most beautiful examples

of fan vaulting, interesting for its late date, 1640. The hall is the finest in Oxford, and boasts some splendid portraits; among them are Holbein's 'Henry VIII., 'Wolsey,' and others of the many distinguished former members of the college. The library contains a very valuable collection of books, also Wolsey's cardinal's hat. The cathedral is small and cruciform. There are traces of Saxon work, but in 1160 it was restored and made Norman. Wolsey altered it considerably, and Sir Gilbert Scott restored the E. end

John H. Stone

THE CATHEDRAL OF CHRIST CHURCH

in the nineteenth century. The building contains specimens of every Eng. style. There is a fine Jacobean pulpit. The nave roof is woodwork, and the choir is raved with fan tracery in stone. There are some beautiful windows by Sir E. Burne Jones, some fourteenth-century glass, and a curious Dutch window by Abraham van Ling, 1630. The cathedral contains many interesting tombs, and the shrine of St. Frideswide has been discovered and reconstructed. Between the college and the meadows runs the famous Broad Walk planted and laid out by Dr. John Fell in 1670.

Christchurch, tn., Hampshire, England, situated at the junction of the Avon and Stour, on the edge of the New Forest, close to Bournemouth. It possesses a beautiful church, the priory church of the Holy Trinity, a cruciform edifice, without the central tower, and having a Perpendicular tower at the W. end. The nave and transepts are mainly Norman. The priory of C. is mentioned in Saxon documents as Twineham, and in 901 it was

seized by Ethelwold (A.-S. Chron.). About 1095 it was partially rebuilt and endowed by Ranulph Flambard, bishop of Durham. It contains the poet Shelley's monument and many others of interest. The ruins, of a Norman castle, built by Richard de Redvers in Henry I.'s reign, are close to the church. The bor. was first summoned to send representatives to Parliament in 1307. Pop. 9000.

Christchurch, largest city of the Is. of New Zealand, was intended from the outset to be the cap. of the prov. dist. of Canterbury. It is situated on the Avon and Heathcote Rs. and extends from the hills of Banks Peninsula to the sea. While the industrial and business areas and most of the residential dists. are on level land, there are many hillside suburbs and seaside resorts. The Avon and Heathcote Rs. are small slow-flowing streams, ideal for rowing in the upper reaches and for small pleasure craft by the sea. C. is known as the 'Garden City' of New Zealand, being celebrated for the many fine parks and open spaces, boulevards and riverside reserves. Canterbury Univ. College includes an engineering school with a world famous reputation. The Anglican cathedral in the centre of the city (Cathedral Square) is one of the finest buildings of the kind in the S. hemisphere. The museum contains many exhibits of interest, including the bones of the moa (q.v.). The largest of the many parks, known as Hagley Park, comprises just under 500 ac. The city, as the commercial centre of the rich Canterbury Plains, is highly industrialised and contains many industries connected with both primary and secondary production. It is rapidly becoming the chief manufacturing centre of New Zealand because of the unlimited facilities for expansion, the wide streets and highways radiating in all directions, and the fine municipally owned aerodrome on the outskirts of the city. Lyttelton, the port of C., is approached by road and rail, the latter being a direct route through the tunnel in the hills to the port only 7 m. from the heart of the city. A tunnel road is planned to give the city additional access to the port. Pop. of the city (metropolitan area) 164,000.

Christening, see BAPTISM.

Christian, term applied to a follower of Christ. According to Acts xi. 26, 'the disciples were called Christians first in Antioch,' that is about the year 43. The word only occurs in two other places in the Bible (Acts xxvi. 28, and 1 Peter iv. 16). It is probable that it was not used by the disciples themselves, but was a contemptuous nickname given by their enemies (cf. Tacitus, *Annal.* xv. 44). According to Baur, the name must, by its derivation in *ianus*, have sprung up first among the Romans, not among the Gks. The name could not have originated among the Jews, who called the disciples Nazarenes and Galileans and would not have given them a name which meant 'followers of the Anointed.' The early Cs. were sometimes called *Chrestiani*, by a mistaken derivation of the word

from *χρηστός*, good, instead of *χρίσιν*, to anoint.

Christian, name of sev. kings of Denmark and Norway:

Christian I. (1448-81), *b.* 1426. He was also king of Sweden (1457-71), and was elected duke of Schleswig-Holstein (1460). He founded the univ. of Copenhagen in 1478.

Christian II. (1513-59), *b.* 1481, king of Denmark, Norway, and Sweden, son of King John of Norway and Denmark and Christina of Saxony, married Isabella of Burgundy. On his accession the Swedes refused him as king, and headed by Sten Sture held out against him for some time, but were finally defeated at Upsala, 1520. After the heads of the nation had sworn fealty, he gave a banquet and had most of his guests seized and imprisoned. About eighty-two persons were executed or drowned by his order the following day (the Stockholm massacre). Sweden revolted successfully, while his system of taxation made him hated in Norway and Denmark. Jutland revolted and gave the Danish crown to Duke Frederick of Holstein in 1523. After a long struggle C. was compelled to surrender to King Frederick in 1532, and was kept in solitary confinement for twenty-seven years. His passion for his mistress, a Dutch girl of the people named Dyveke, has added greatly to his unpopularity, but he was possessed of great energy, courage, and patriotism. He died in 1559.

Christian III. (1535-59), *b.* 1503. During his reign he witnessed the completion of the Lutheran Reformation.

Christian IV. (1588-1648), *b.* in Fredriksborg, Zealand, in 1577. In 1611-13 he waged war with Gustavus Adolphus of Sweden, which terminated in the peace of Knärd. During the Thirty Years war he suffered defeat in 1626 from Tilly at Lutter-am-Barenberge and Jutland was raided by the enemy's troops. He again fought with Sweden from 1643 to 1645, and by the peace of Brömsebro was obliged to yield a great part of his ter. around the Sound. C. IV. was, however, a just and broad-minded king, and won great popularity among his subjects for his attempts to emancipate the peasantry. He was energetic in promoting commercial enterprise and encouraged science and industry. He founded Christiania, the present cap. of Norway, in 1624 (now named Oslo).

Christian V. (1670-99), *b.* 1646, was the first king of the Oldenburg dynasty. During his reign Denmark acquired the is. of St. Thomas and St. John in the W. Indies.

Christian VI. (1730-46), *b.* about 1699. *Christian VII.* (1766-1808), *b.* 1699, son of Frederick V. He was a man of weak intellect, and rule was exercised by his ministers, Struensee and Bernstorff. His wife, Caroline Matilda, sister of George III. of England, and his son, Frederick, acted as regents from 1784 till his death.

Christian VIII. (1839-48), *b.* 1786.

Christian IX. (1863-1906), *b.* 1818. He is closely connected by marriage with

many of the thrones of Europe. His daughter, Alexandra, married King Edward VII. of England; another, Dagmar, married Tsar Alexander III.; while his second son, George, became king of Greece (1863). In 1864 C. lost Schleswig-Holstein in war with Austria and Prussia. He has been succeeded by Frederick VIII.

Christian X (1870-1947), baptised with the additional names Carl Frederik Albert Alexander Vilhelm, king of Denmark and Iceland, was *b.* at Charlottenlund Sept. 26, 1870; son of Prince Frederik, later Frederik VIII., and of Princess Louise of Sweden and Norway. He matriculated in 1889, joined the army, and rose to be major-general. He married Alexandrine, duchess of Mecklenburg-Schwerin, in 1898; in 1906 he became crown prince; and he succeeded to the throne of Denmark and its dependencies on the death of his father, May 14, 1912. The chief features of his reign have been: the co-operation (beginning with the meeting at Malmö in Sweden, Dec. 18, 1914) of Sweden, Norway, and Denmark, as neutrals during the First World War, the enfranchisement of women as part of a new constitution granted in 1915; the erection of Iceland into a separate kingdom under the same head on Dec. 1, 1919; and the re-acquisition of N. Slesvig from Germany at the end of the war. During his reign he made a number of visits to his other kingdom of Iceland, and he also went to Greenland, being the first Danish monarch to do so. It was a cause of grief to him that the Althing and Gov. of Iceland should have decided to sever the bonds between the Icelandic people and Denmark. When, however, an Icelandic republic was declared in 1944, he sent the Icelandic Gov. a generous message of goodwill. C. will be remembered by the Danish people for the courage with which he upheld his people's rights during the perilous years of the Ger. occupation. On April 9, 1940, in face of the Ger. ultimatum stating that if Denmark resisted Ger. invasion, Danish cities would be bombed, he gave way on the advice of his Prime Minister (Dr. Stauning) and of his foreign minister (Dr. Munch) and no resistance was made. So far as he was able he maintained a show of independence in his relations with the Ger., but he continued on the throne on sufferance. Nevertheless he provided in his person a rallying point for Danish patriotism and sentiment, and the fervour with which he was acclaimed when he appeared in public bore witness to his popularity with his subjects, which never waned.

Christian, Prince, Frederick Christian Charles Augustus (1831-1917), prince of Schleswig-Holstein-Sonderburg, was *b.* Jan. 22, 1831, son of Duke Christian August. After his marriage, Prince C. became a general of the Brit. Army, and high steward of Windsor Park, where he had his residence, Cumberland Lodge. In 1866 he married Princess Helena Augusta Victoria, *b.* 1846 and *d.* June 9, 1923, the third daughter of the late Queen

Victoria, renowned for her philanthropic work with regard to hospitals and charitable institutions. Their eldest son, Prince Christian Victor, was killed during the Boer war, 1900. He d. at Schomberg House, Pall Mall, Oct. 23, 1917.

Christian Brothers. Rom. Catholic institute, founded at Waterford, co. Kilkenny, Ireland, in 1802, by Edmund Ignatius Rice. Rice had resided in that city as a merchant since 1780, and his pity had been excited by the deplorable state of ignorance and vice in which the poor lived. In 1803 a monastery was built for the school by the citizens of Waterford. Rice received the support of the bishop of Waterford, and was before long asked to open houses of the institute in many tns. of Ireland. There are now 200 schools of the C. B. in Ireland, England, Australia, India, and N. America. In 1820 they were granted a constitution by the Holy See, and confirmed as a religious institute of the Rom. Catholic Church. When the Irish national system of education was estab. (1831), the C. B. for a time accepted the grant by placing their schools under the Board, but they later withdrew from the connection as they could not separate secular from religious teaching. The title has erroneously been given to the Brothers of the Christian Schools, a brotherhood of laymen bound by three religious vows, founded by the Abbé J. B. de la Salle for the education of the poor, in France (1684). The training college estab. at Rhelms in 1685 was the first of its kind in the world. There are now, in all parts of the world, about 300,000 pupils of the brotherhood. The system of elementary education given by these Fr. schools was adopted by Rice in drawing up the rules for his Irish institute.

Christian Catholic Church. see under DOWIE, JOHN ALEXANDER.

Christian Connection. sect for banding together Christians who have no definite creed. They take the Bible as the foundation of their belief and conduct. They were founded in America in the early part of the nineteenth century. Their views are much the same as those set out by Chillingworth in his *The Religion of Protestants a Safe Way to Salvation*, 1638.

Christian Endeavour. The Christian Endeavour (C. E.) movement originated in Williston Congregational Church, Portland, Maine, U.S.A. in 1881. It was formed by Dr. Francis K. Clark, who later became the first world president. The movement was formed to hold and train young Christians in and for the Church. Its motto 'For Christ and the Church' indicates its supreme purpose. The success of the first society led to the extension of the movement in other churches, not only in America but throughout the world. While its emphasis is upon the devotional life, it seeks to train young people to apply their faith to every aspect of life; thus, through its weekly topics, it focuses attention upon the missionary spheres and Christian citizenship. Its work is interdenominational, not undenominational, and is found in all the evangelical denominations

of the Church, where it enjoys full recognition. It is international, having been estab. in Canada (1863), India (1883), China (1885), Great Britain (1887), S. Africa (1887), Australia (1888), France, Spain, Burma (1888), Turkey (1889), Sweden (1890), Jamaica, New Zealand (1891), Japan (1893), Germany, Switzerland (1894), etc. In each country the work is controlled by a national C. E. union, which has local unions to cover its constituency. The whole is co-ordinated in the world's C. E. Union. While the local society is pledged in its first loyalty to the church with which it is attached, its fellowship extends to all similar societies. Societies are graded according to age groups, thus its membership reaches from childhood to riper years. As the pioneer of Christian youth work it is still virile and active throughout the world.

Christian Knowledge, Society for Promoting. founded in 1693 by four laymen, Lord Guilford, Sir Humphrey Mackworth, Mr. Justice Hook, and Col. Colchester, and one parson, Dr. Thomas Bray (*q.v.*), who met, probably in Hook's chambers in Lincoln's Inn, to discuss the provision of church schools in London par., the catechising of the children of the poor, the conversion of Quakers, and Dr. Bray's scheme for promoting religion in the plantations (colonies). The directing mind was that of Bray (1658-1730), rector of Sheldon, near Birmingham, one of the most far-sighted churchmen of his age. Appointed commissary to Maryland by Compton, bishop of Birmingham, he estab. lending libraries in that settlement and, later, at home. As a result of his preoccupation with the eccles. affairs of Maryland, he drafted *A General Plan of the Constitution of a Protestant Congregation or Society for Propagating Christian Knowledge*. This document is preserved in the library of St. John's College. Bray's original scheme contemplated a 'congregation *pro Propaganda Fide*,' a society incorporated by royal charter, consisting of clergy and laymen who 'should meet and consult upon the best means and methods of promoting religion and learning in any part of His Majesty's plantations abroad'; to supply and support a missionary clergy; and to estab. parochial libraries throughout the plantations; and further, in order to arrest 'the terrible decay of religion in this kingdom,' they were to provide clerical lending libraries in mkt. tns. and 'set up catechetical schools for the education of poor children in reading and writing and especially in the principles of the Christian religion.' This was an ambitious project and, after Bray's return from Maryland, it was evident that the work was more than a single society could cope with; and the result was that, while the S.P.C.K. continued to work with no restrictive charter, a separate society for the propagation of the gospel in foreign parts was founded in 1701, with a royal charter. To both societies, founded by Bray, the Anglican Communion owes a great debt. As a church publishing society the S.P.C.K. exercised great influence in

moulding clerical opinion in the period when Convocation was suppressed, for in this activity it stood alone, though it was not at that time engaged in publishing in the modern sense, but in selecting small pub. books and pamphlets of proved worth and buying up large stocks for distribution to members and for sale to the public and also in acquiring the rights of publication. Among the earliest works thus circulated were Bray's *A Discourse upon the Baptismal Covenant* and the controversial pamphlets of George Keith, a convert from Quakerism. The society also pub. tracts addressed to particular classes of the pop.: *The Husbandman's Spiritual Companion*, *The Christian Soldier*, *Serious Advice and Warning to Servants*, more especially those of the *Nobility and Gentry*. But its prin. publications were cheap reprints of standard works by Anglican divines—Burnet, Hopkins, Lowth, and others—particularly those bearing upon the prayer-book and catechism, the primary purpose of the society being didactic. To this day the S.P.C.K. is regarded primarily in terms of its publishing dept. for it publishes, over not only its own imprint but that of the Church Historical Society, books of first-rate theological and historical scholarship; it also supplies vernacular prayer books for the church overseas; and it operates fifty bookshops in all parts of the world. But this limited viewpoint ignores much of the society's hist. It was the originator of the charity school movement in the eighteenth, and of the National Society for Promoting Religious Education in the early nineteenth century. It was a pioneer in the foundation of church training colleges at home and overseas. It endows scholarships, studentships, and bursaries in many lands. Under the regis. of the society are the School of Eng. Church Music, the Religious Drama Society, and the Church of England Films Commission. It sponsored missionary work in S. India (taken over by the S.P.C.K. in 1825). Has financed the training of medical missionaries for all the missionary societies of the Church of England; and it has helped to endow oversea bishoprics.

Christian Science, name given by Mrs. Mary Baker Eddy (1821-1910) to a system of metaphysical healing based on the Scriptures, the divine Principle of which Mrs. Eddy declares she discovered in 1866, and later elucidated and gave to the world in the textbook of the C. S. movement, *Science and Health with Key to the Scriptures*. This remarkable vol., which is Mrs. Eddy's prin. work, was first pub. in 1875. *Science and Health* is said so to illuminate the Scriptures as to enable those who understand it to repeat in a degree at least the healing and regenerating works of the prophets and of Jesus and the apostles. C. S. accepts the first chapter and the first five verses of the second chapter of Genesis as representing the true account of creation, the account beginning at the sixth verse of the second chapter being regarded as untrue. C. S. accepts Christ Jesus as the Saviour of

the world from sin, sickness, and death, and the Way-shower to eternal life. It distinguishes between Jesus of Nazareth, the son of Mary, and the Christ, the spiritual Son of God. In her *Message to The Mother Church* for 1901, Mrs. Eddy wrote: 'The Christ was Jesus' spiritual selfhood; therefore Christ existed prior to Jesus, who said, "Before Abraham was, I am."' Jesus, the only immaculate, was born of a virgin mother, and Christian Science explains that mystic saying of the Master as to his dual personality, or the spiritual and material Christ Jesus, called in Scripture the Son of God and the Son of man—explains it as referring to his eternal spiritual selfhood and his temporal manhood. In the first chapter of Genesis it is declared that man is made in the image and likeness of God. Christ Jesus' statement, "that which is born of the Spirit is spirit" (John iii. 6) conforms to this. The world in general, however, has accepted the second or false account of the creation of man from the dust of the ground. Christian Science claims to teach men how to overcome the false sense and replace it with the truth which Christ Jesus said would make men free.' C. S. declares that God is Spirit, that He is good, and that He is the only creator. This being the case, only the spiritual and the good are real and eternal. The spiritual and good being all, there is in reality no place for evil, sin, disease, and death. Therefore the latter have only a supposititious existence. C. S. does not deny that evil seems real, but maintains that this seeming disappears in the proportion that the truth, which destroys error, is apprehended. The application and effect of this exact, spiritual thinking C. S. declares to be that which Jesus meant when He said, 'Ye shall know the truth, and the truth shall make you free.' C. S. healing, according to its adherents, is brought about by the operation of Truth in human consciousness and not, as some believe, by mental suggestion, psychotherapy, or other form of human will-power.

The first C. S. church was organised in Boston, Massachusetts in 1879. From this beginning, C. S. has circled the globe with a chain of churches numbering over 3000 branch churches and societies as well as 99 univ. organisations. C. S. organisations may now be found in every country of the civilised world. At the head of these is The Mother Church in Boston, of which Mrs. Eddy was the first pastor, and in later years the pastor emeritus. All C. S. churches are branches of this Mother Church, officially known as The First Church of Christ, Scientist. The affairs of The Mother Church are administered by a board of directors of five members. The duty of the directors is to administer the affairs of the denomination under the by-laws framed by Mrs. Eddy. This authority is vested in them by section 8 of Articl. 1 of the Church Manual as follows: 'The business of The Mother Church shall be transacted by its Christian Science Board of Directors.' No adequate

estimate of the number of Christian Scientists in the world to-day is obtainable, but in 1936 there were 2113 churches and 269,000 communicants in the U.S.A., and to-day The First Church of Christ, Scientist, in Boston, claims to have 333 branch churches and societies in Great Britain and Ireland. There are over 8000 practitioners throughout the world who give their entire time to C. S. healing. Many remarkable cures have been attributed by its adherents to C. S. who claim that these cures have included diseases and deformities considered by the medical profession to be incurable.

The pubs. of the movement issued by the C. S. Publishing Society, Boston, Massachusetts, include periodicals in various languages besides *The Christian Science Monitor* (daily). See Sybil Wilbur, *The Life of Mary Baker Eddy*, 1907; L. Powell, *Mary Baker Eddy: A Life-size Portrait*, 1930; I. Tomlinson, *Twelve Years with Mary Baker Eddy*, 1945; C. Smith, *Historical Sketches from the Life of Mary Baker Eddy and the History of Christian Science*, 1st series, 1934, 2nd series, 1936, and *The Story of Christian Science War-time Activities 1939-1946*, 1947; books by Mary Baker Eddy (q.v.); and H. A. L. Fisher, *Our New Religion*, 1929, containing a bibliography.

Christiania. See OSLO.

Christianity. The whole system of C. may be regarded as having its foundation in the doctrine of the Existence of one God. (See THEISM.) Next to this may be placed the doctrines of the Fall of Man. Man is represented as involved in misery by sin (q.v.)—original and actual—and every individual of the human race as incapacitated for the service and fellowship of God, obnoxious to the displeasure of God, and liable to punishment in a future and eternal state of being. And here we may regard the doctrine of the Atonement (q.v.) as next claiming our attention—a doctrine taught in all the sacrifices (see SACRIFICE) of the patriarchal and Jewish dispensations, as well as by the words of inspired teachers. Man being utterly incapable of effecting his own deliverance from sin and misery, God sent His Son to save sinners, to deliver them from hell, to make them holy, and partakers of the eternal joy and glory of heaven.

By those who regard Christ as merely human, *atonement* or *reconciliation* with God is made to depend on the repentance of man as its immediate cause, whilst the life and death of Christ are represented as merely an example to us of obedience, virtue, and piety in the most trying circumstances; the doctrines of a propitiatory sacrifice, a substitutionary obedience, and an imputed righteousness, with all that form part of the same system falling completely and even necessarily to the ground. These doctrines, however, are all consistently maintained in connection with the doctrine of the Trinity and the generally received doctrine as to the person of Christ. The very incarnation of the Son of God is regarded as a glorious display of the divine condescen-

sion, and a wonderful exaltation of human nature: whilst a personal enjoyment of the highest dignity and bliss of which humanity is capable in the favour and fellowship of God for ever, is to be attained by faith in Jesus Christ.

The indissoluble connection between faith and salvation arises from the divine appointment, but secures a moral harmony, as it provides for bringing into operation—in accordance with the intellectual and moral nature of man—of most powerful and excellent motives for all that is morally good, the partakers of salvation being thus fitted for the fellowship of Him into whose favour they are received; and as it prevents the possibility of any of them taking to themselves, or giving to others, the glory of that salvation, which they really owe to Christ, and which they must therefore ascribe to Christ, as God is a God of truth, and truth must reign in the kingdom of heaven.

Salvation is ascribed by all Christians to the grace of God. The mission of Christ was an act of supreme grace; and all must be ascribed to grace for which we are indebted to Christ. The doctrine of grace is a part of the system of C. on which important differences subsist. But by Christians generally, the personal relation of the believer to Christ, and his faith in Christ, are ascribed to the Holy Ghost or Spirit of God, the third person of the God-head, and so to the grace of God.

Christiansborg, former Danish fort and settlement on the Gold Coast near Accra (q.v.). It was ceded to Great Britain by the Danes in 1840. The fort is the official residence of the governor of the Gold Coast.

Christiansfeld, tn. in Jutland, Denmark, Pop. 770.

Christiansted, cap. of the formerly Dan. W. Indian Is. of St. Croix which was sold to the U.S.A. in 1917. Pop. 6000.

Christiansund, seaport on W. coast of Norway.

Christie, Alexander (1807-80), Scottish painter. He was b. in Edinburgh, and studied painting under Sir Wm. Allan. He was made director of the ornamental dept. of the school of Art in 1845, and an associate of the Royal Academy in 1848. His best-known picture is 'An Incident

in the History of the Great Plague,' and he also illustrated the Abbotsford ed. of Scott's *Bride of Lammermoor*.

Christie, James Elder (1847-1914), artist of the Glasgow school. He was b. in Kyleshore, Scotland, and studied at the Paisley Art School and also at the Royal Academy. In 1874 he journeyed to London, and in 1877 won a gold medal at the Royal Academy for historical painting. His best-known pictures are 'Pied Piper of Hamelin' (1881), 'Blind Grannie' (1886), 'The Four Maries' (1889), 'Hallowe'en' (1892), 'Bonnie Kilmeny' (1900), and 'Cupid's Bower' (1904).

Christie, James, the Elder (1730-1803), auctioneer of London. Dec. 5, 1766, is the date of his first sale, and the exhibitions of the Royal Academy used to be held on his premises in Pall Mall until 1779. He subsequently moved next door to Gainsborough at Schomberg House.

Christie, James, the Younger (1773-1831), auctioneer and antiquary. He carried on the business of his father, and moved to 8 King Street, St. James's Square, London, in 1824. Present (post-war) premises are at Spencer House, St. James's Place, St. James's Street, S.W.1. The full title of the firm is now Christie, Manson, & Woods Ltd. (see CHRISTIE'S). C. wrote sev. works, among which are: *An Inquiry into the Antient Greek Game* (i.e. chess) (1801), *Etruscan Vases* (1806), and *Greek Vases* (1825).

Christie, Samuel Hunter (1784-1865) Eng. mathematician. He was the son of James C. the Elder, and was b. in London. He took his B.A. degree at Cambridge in 1805, and was second wrangler. In 1806 he was made third mathematical assistant at Woolwich Military Academy, and in 1838 became prof. of mathematics. He wrote many articles for the Royal Society on the effects of temp. and the solar rays on the magnetic needle, and also on the conductivity of certain metals.

Christie's, world-famed art auction room in London. The full title of the firm, founded by James Christie (1730-1803), is Christie, Manson, & Woods, of Spencer House, Stratford Place, St. James's, London, W.1. The most celebrated sale that ever took place there was that of the Hamilton Palace collection in 1882. It lasted for seventeen days, and the amount of money realised was £397,562. All along the hist. of this house there has been a succession of interesting sales. There was the Bernal collection in 1855, with a result of £70,954; the Bicknell pictures in 1863, with £58,639; the Manley Hall collection, 1875-78, with £150,000; the Fountaine collection of 1884 with £96,200. In 1892 the Dudley collection of ninety-one pictures realised £99,564. Also in 1892 there was the Magniac collection of works of art which brought in £103,040. Sir Julian Goldsmid's pictures, furniture, and china in 1896 resulted in £101,727. Sir John Pender's pictures sold in 1897 brought in £81,913; Sir T. G. Carmichael's works of art in 1902 realised £49,373; and the Huth collection of pictures in 1905 realised £50,452. At the Blyth sale of mezzotint engravings in

1901, a 'first state' of the 'Duchess of Rutland,' by Valentine Green after Sir Joshua Reynolds, realised 1000 guineas. The duke of Cambridge's pictures, jewels, etc., realised £89,734 in 1904; the Orrock collection of pictures the same year fetched £65,946; and Lord Tweedmouth's collection in June 1905 brought in £49,548. In May 1905, 15,000 guineas was paid for a reputed 16th-century *bibéron* in rock crystal. The value of Turner pictures much increased in later years, as in 1906 his 'Rape of Europa' realised 6400 guineas, while in 1909 his 'Mortlake Terrace' realised 12,600 guineas. The jewels of Mrs. Lewis Hill were sold in 1907, and fetched nearly £95,000, while 1650 guineas was paid for Sir Luke Fildes's 'Venetian Flower Girl' in her collection. This was for some years the largest price paid in modern times for a picture by a living artist—though this figure was considerably less than the £4567 10s. paid for W. P. Frith's 'Dinner Party at Boswell's Lodgings,' sold during the life of that artist many years ago. In 1926, however, Orpen's portrait of President Wilson was sold for 2730 guineas. In considering the records of prices realised at C.'s sales after the First World War, the depreciated purchasing power of the pound must be borne in mind. During the war art sales were naturally restricted, but a twelve-day sale by this firm in 1915 of objects of art realised over £37,000 for the Red Cross Society. The year following the war, 1919, was a boom year in art sales, and C.'s sales exceeded £3,000,000. This was in part due to the postponing of sales during the war, and in part to the 'new poor' selling to the *nouveaux riches*. This high figure has not since been exceeded, but in 1929 the money realised by the sale of pictures and drawings alone was the highest in C.'s annals. The largest amount received for one day's sale was on Nov. 6, 1919, when a second collection from Hamilton Palace was sold (see *above*). This fetched nearly £169,000, thus exceeding the record sale of £150,000 for two days made earlier in the same year, the Drummond collection being disposed of on that occasion. One of the highest bids made for a single picture at C.'s was that made in Nov. 1919 for Romney's portrait of the Beckford children, which formed part of the Hamilton Palace collection: this realised £54,600, and it was then the highest price for a picture sold in the public market; 52,000 guineas was the sum bid earlier in the same year for Sir Joshua Reynolds's 'Mrs. Siddons as the Tragic Muse.' At this figure the picture was bought in, and it was disposed of privately in 1921, going with Gainsborough's 'Blue Boy' to an Amer. purchaser for £200,000. In 1926 a portrait of the family of Sir Wm. Bromley-Davenport realised £60,900 at C.'s. One of the most interesting sales at C.'s in recent years for an *objet d'art* other than a picture was the offering for sale in 1929 of the Portland Vase, which for a hundred years had been lent by the dukes of Portland to

the Brit. Museum. The £34,450 bid was the highest bid of that season, but the vase was bought in at that figure and returned to the museum. The auction rooms of C.'s in St. James's were totally destroyed through enemy action in April 1941, and the firm moved later to Derby House. Good sales went on throughout the Second World War, though no sensational prices were realised. A pair of *capricci* by Canaletto fetched 480 guineas (1942). Lawrence's portrait of 'Miss Juliana Copley' was sold for £4200 in 1943. J. Pierpont Morgan's collection from his

her minority the chancellor, Axel Oxenstjerna, directed the regency and instructed her in politics. Johannes Matthiae educated her more as a boy than a girl, and every one held the highest opinions of her understanding and courage. In 1644 she assumed the sceptre, and impressed every one with her cleverness and good sense. Unfortunately she allowed her pride to rule her judgment and showed herself capricious and reckless. Her treatment of the chancellor was unpardonable, and in her efforts to thwart him and his policy she caused considerable harm and

Christie, Manson, & Woods

A SALE AT CHRISTIE'S

The painting which is being auctioned is Constable's 'Stratford Mill on the Stour'

Hertfordshire residence was sold in 1944 and L. W. Neeld's collection about the same time. Constable's 'Vale of Dedham' was bought for £20,000 before the sale by the trustees of the National Gallery of Scotland. In 1945 a large water-colour of 'Vauxhall Gardens' by Rowlandson was sold for £2730; it had been lost sight of since its exhibition at the Royal Academy in 1784, having been bought in the meantime at an antique dealer's in the suburbs for twenty shillings. Constable's 'Stratford Mill on the Stour,' owned by Lord Swaythling, was sold at C.'s in 1946 for £43,050. The story of the house is told at great length in W. Roberts's *Memorials of Christie's* (1897). See also ART, *Art Sales*.

Christina (1632-89), queen of Sweden, only daughter of Gustavus Adolphus and Maria Eleonora of Brandenburg, b. 1626. Her father died in her sixth year. During

diminished materially the gains that Sweden should have obtained from the Thirty Years war. She founded a national school of literature, and encouraged science and learning with great energy. She collected men of learning about her, but allowed her admiration of them to become too extravagant; thus at the death of Descartes, the Fr. philosopher, in 1650, she wished him to be buried at the feet of the Swedish kings and to build a magnificent mausoleum to his memory, which, however, was not permitted. She refused to marry, and the persistent importunities of the Senate, who were anxious about the succession to the throne, caused her to escape the difficulty by appointing Charles Gustavus, her cousin, as her successor. In 1654 she was persuaded to abdicate in favour of her cousin. The idea appealed to her imagination, that a queen in the prime of her

life should voluntarily give up her throne, so a great ceremony took place at the castle of Upsala. She retired from Sweden, dressed as a man, and at Innsbruck she adopted the Catholic faith, having always held the Protestant religion in contempt. In 1655 she entered Rome, again dressed as a man, and astonished the people by her extraordinary behaviour. The rest of her life was a series of adventures and scandals. She twice returned to Sweden in the vain hope of being received as queen again. She d. in Rome in 1689, quite poor and neglected. She is accused of ordering the assassination of Monaldeschi, her majordomo, in 1657. Her valuable library of MSS. was presented to the Vatican by Pope Alexander VIII. See lives by F. W. Bain, 1890; J. A. Taylor, 1909.

Christine de Pisan (c. 1363-1430), Fr. poet of It. parentage. She married the secretary of Charles V. of France, her father being his astrologer. On the death of her husband in 1389 she had recourse to writing as a means of support for herself and three children. She refused invitations from Henry IV. of England and Visconti of Milan, who offered her a home at their courts; for she already enjoyed the patronage of Charles VI. and the dukes of Berry and Burgundy. Her *Le Livre des faits et des mœurs du sage roi Charles* (1405) gives an interesting contemporary picture of Charles V. and his court, whilst in her *Les trois vertus* (1407) will be found a unique description of the domestic life of the time. In *La Vision* (1405) she tells her own story, and her *La Cité des dames* (1407) contains a valuable series of contemporary portraits. She was versed in the Lat. poets, and assumed the championship of her sex in *Épître au dieu d'amour* (1399), as also in *Dit de la rose* (1402).

Christinehamn, or **Kristinehamn**, commercial tn. on the N.E. shore of Lake Vener, 25 m. E. of Karlstad in Vermeland, Sweden. Pop. 12,000.

Christison, Sir **Robert** (1797-1882), Scottish physician and toxicologist, graduated at Edinburgh and studied toxicology in Paris under the famous Orfila. From 1822 to 1832 he held the chair of medical jurisprudence in Edinburgh, and from 1829, when he pub. his *Treatise on Poisons*, still a standard work, and was appointed medical officer to the Crown, he frequently gave professional evidence in notorious criminal cases. In 1832 he was promoted to the professorship of medicine and therapeutics, and in 1848 became physician to the queen. C. wrote also on the pathology of the kidneys (1839).

Christlieb, **Theodor** (1833-89), Ger. theologian, was a native of Birkenfeld, Württemberg. He gave up his ministry at the Ger. Protestant Church in Islington, London, in order to take charge of a par. in Friedrichshafen by Lake Constance. Finally in 1868 he accepted a professorship at Bonn. *Modern Doubt and Christian Belief* (1868 in the original) is the most widely read of his numerous writings.

Christmas (*Cristes masse*, the mass of Christ), the season in which the birth of Jesus is commemorated, the central point of the celebrations being C. Day, the supposed actual anniversary of the nativity of Christ, which is generally celebrated in Europe on Dec. 25. The beginning of the celebration of C. as a Christian anniversary cannot be exactly dated. Though some references are made to it as flourishing in the time of Telesphorus (A.D. 138-61), these are probably spurious, and the first certain mention of the festival is in the reign of the Emperor Commodus (A.D. 180-92); it is also spoken of in the third century by Clement of Alexandria. Diocletian, learning that a number of Christians were gathered together in a certain building celebrating the anniversary of the founder of their religion, caused the church to be ignited, and all the worshippers perished in the flames. The early Church had no fixed time to celebrate C.; by some branches it was observed in May, by some in Jan., and by others concurrently with Epiphany. It is, however, certain that the time now fixed could not by any possibility have been the period of Jesus' birth, as Dec. is the rainy season in Judea. The choice of this season was probably due to the general recognition that the winter solstice was the turning-point of the year; all things seem to prepare then for a fresh period of life and activity after the winter sleep of death. Such a belief was general among all nations; the one which especially influenced the Christian Church was probably the Rom. festival of the winter solstice, celebrated on Dec. 25 (*dies natalis solis invicti*). The Celtic and Germanic tribes held the season of C. in veneration from the earliest times, and the Norsemen believed that personal evidence could be obtained of the existence and work of their deities at that time, as they were supposed to be present and active on earth from Dec. 25 to Jan. 6. Many other ant. beliefs and customs about this period have been handed down to our times, and have crept into Christian usage. The lighting of the Yule log, a custom once widely prevalent but now fallen into desuetude, is an inheritance from Lithuanian mythological lore. The practice of decorating churches is pagan in its origin, and the mistletoe so widely used for that purpose was the sacred plant of the Druids. The custom of presenting friends with gifts at C. dates back to the time of the ant. Roms. In Scotland, in the fifteenth century, the Yule celebrations lasted from Dec. 18 to Jan. 7. The latter date was termed U-hale Day, and within the period of the celebrations 'Yule Girth' was proclaimed over all the country, and the worst of miscreants enjoyed sanctuary, as no court had the right to punish them. The 'Up-hellya' of the Shetland Isles is a relic of this ant. custom. It was, however, the aim of the Christian Church to ennoble and lift above their heathen associations all the customs that survived fr. in bygone ages, and with this end their noble liturgy was framed, and many dramatic representations of the

birth and early events in the life of Christ were instituted. Hence the so-called manger-songs, C. carols, special dishes for C., etc. During the Middle Ages and later, the various customs which were practised at C. time, and the legends associated therewith, were exceedingly numerous; most of them have now become obsolete, though the writings of Dickens revived the interest in them for a short time. There are sev. distinctive features still associated with C. The C. tree, a young spruce-tree, still survives; some trace its origin to the Rom. saturnalia as indicated by Virgil's supposed allusion in the line 'Oscilla ex alta suspendunt mollia pinu' (*Georgics*, ii. 389); but the general belief is that the first C. tree dates from the time of St. Boniface, the apostle of Germany (b.c. 680), who is said to have substituted for the sacrifices to Odin's sacred oak a fir tree adorned in tribute to the Christ child. It is also said that Luther introduced the C. tree lighted with candles. It was introduced into England from Germany in the reign of Queen Victoria. Father C., or Santa Claus, who is supposed to come down the chimney and place gifts in the children's stockings that are suspended by the fireplace, has a parallel in every European country. He is identified with St. Nicholas (the Amer. name), Robin Goodfellow, Knecht Ruprecht, and the Fr. Bonhomme Noël. St. Nicholas's Day is properly on Dec. 6. C. as a social festival is undoubtedly observed with much less whole-heartedness than formerly. The festivities of the season were formerly kept up uninterruptedly for over a week; now C. Day and Boxing Day only are general holidays. The custom of giving gratuities to servants, etc., at C. is also Rom. in its origin. The Roms. named such gifts *strenæ*, and they were called boxes from the fact that boxes were hung up in church at C. time by the priests for offerings to be dropped therein for the poor and needy of the par. These boxes were opened on the day after C. Day and their contents distributed; hence the day was known as boxing day, and by a common metonymy the gifts themselves came to be known as C. boxes. Public servants formerly received C. boxes, but this was discontinued about 1840, and now tradespeople's employees are the only people to solicit such gifts. C. cards, now so universally used, were instituted in 1846, and the industry has grown enormously. Much advance has been made in the production of cards, and some really artistic productions can now be obtained. The Rom. gladiatorial games at seasons of rejoicing have a modern parallel in football matches, which vast multitudes attend at C. time. From a religious point of view great importance is naturally attached to the commemoration of the birth of the founder of the Christian religion. The day is celebrated by special services in the Rom. Catholic Church, and the priest is allowed to celebrate three masses on the same day, the first at midnight, the second at dawn, and the third in the morning. In the Anglican Church,

there is a special service, special psalms are sung, and the Athanasian Creed is recited. Most of the nonconformist bodies also celebrate the day by special services, etc. In Scotland, C. is not kept as a universal special holiday, New Year's Day taking its place; the Presbyterian Church, therefore, has no special services for C. day. Hansel Monday, the first Monday of the New Year, is the equivalent of Boxing Day in Scotland, and in the more northerly parts of England. Consult Brand, *Popular Antiquities*, 1870; A. Tille, *Yule and Christmas*, 1899; W. F. Dawson, *Christmas and its Associations*, 1901; C. C. Polhill, *Christmas in Ritual and Tradition*, 1925; D. B. Wyndham Lewis and G. C. Heseltine, *A Christmas Book*, 1928.

Christmas Island. 1. Is., never more than 12 m. long and 9 m. broad, in the E. part of the Indian Ocean, 190 m. S. of Java. Area 60 sq. m. It is a Brit. possession under the gov. of the Straits Settlements, and now part of the Federation of Malaya. It is the deposits of phosphate of lime, the result of the continuous action of the dung of sea-fowl on the chalk below, which give the is. its one commercial value. It is the top of a submerged mt., some 15,000 ft. high, of which 1200 ft. only rise above the surface of the sea. It was visited by Daupler in 1688 and was annexed in 1889. It was then uninhabited. Pop. about 1300, employees of the Phosphate Company. Most of the houses on the is. have electric light and running water. There are 11 m. of railway and 8 m. of road. A wireless station was installed in 1923. The is. was occupied by the Jap. during the Second World War. 2. Is. (with a 90-m. circuit) in Polynesia, Pacific Ocean, lies a little above the equator, S. of Honolulu. It is attached to the Gilbert and Ellice Is. colony, and lies in 1° 59' N. lat., and 157° 30' W. long., and about 160 m. E.S.E. of Fanning Is. Discovered by Cook in 1777, it was annexed by Great Britain in 1898 with a view to laying the Pacific cable, of which Fanning Is. is a station. Under a licence dated 1914 the Central Pacific Coco-nut Plantations Ltd. has the exclusive right to occupy the island for their own use for the planting of coco-nuts, the manuf. of copra, the export of coco-nut oil, pearl shell, and guano for eighty-seven years. Periodical visits are made by H.M. ships. Area 80,000 ac. (12,000 under coco-nuts). Pop. 50.

Christmas Rose, or *Helleborus niger*, also known as the **Black Hellebore**, is a species of Ranunculaceæ which is a native of Europe and flowers in the winter. The leaves are evergreen, the rhizome is black—hence the second popular name—and the flower has at first a white or reddish-tinged calyx, but this becomes green after fertilisation has taken place. Despite the fact that the plant is ranunculaceous, the flower really bears considerable resemblance to a single rose, for there are five petaloid sepals and the stamens are numerous. Formerly the hellebore was considered to be of medical value in cases of mental derangement, but it is little

used nowadays; it contains a property which renders it an acrid poison. See also HELLEBORR.

Christophe, Henri (1767-1820), Negro king of Haiti. Originally a slave of Grenada, he became a chief under Des-salines, emperor of Haiti. After the latter's murder he estab. himself as king of the N. Civil war followed, but he was declared king in 1812. His cruelty caused a revolt, and to escape imprisonment he shot himself. A bronze plaque on his tomb is inscribed 'Ci-git le Roi Henri Christophe, né le 6 Octobre, 1767, mort le 20 Octobre, 1820, dont la devise fut: Je renais de mes cendres.'

Christopher I., king of Denmark (1252-1259), succeeded his brother, Abel. He was obliged to make over the rich duchy of Schleswig to his nephew, Valdemar, thereby beginning the regrettable dissensions over the Crown lands. When C. imprisoned his primate, Jakob Erlandsen, like a common felon, because of his devotion to the pope and contempt for his own authority, he was excommunicated, but sudden death (probably by poison) put an abrupt end to the dispute.

Christopher II., king of Denmark (1319-1332), made repeated attempts to secure the duchy of S. Jutland (Schleswig), which had fallen to a minor, Valdemar V. But the latter's guardian expelled him finally. However, when C. secured the recognition of Valdemar as heir to the Dan. throne, he received the duchy, after promising that it should never be incorporated with Denmark. During his reign the royal prerogative was considerably curtailed, and the privileges of the aristocratic party strengthened. The virtual dissolution of the kingdom at his death into the Scanian prov., Schleswig, E. Denmark, and Jutland and Funen, clearly demonstrates the weakness of his rule.

Christopher III. (1418-48), king of Norway and Sweden, besides Denmark. C. owed his accession (1439) to the Rigs-raad, not to the people. In his reign the peasants were downtrodden, and in Jutland, after their rising of 1441, were reduced almost to the condition of serfdom.

Christopher (1515-68), Duke of Württemberg, son of Duke Ulrich I., who d. 1550 when C. succeeded him. He completed the work of his father by converting his subjects to the reformed Protestant faith and establishing the Lutheran Church. He introduced a system of church government, part of which still endures. He was a recognised protector of the Protestants throughout the religious wars of the period.

Christopher, St. (d. A.D. 250), patron of ferrymen, was a great preacher of Syria, who converted, it is said, 48,000 people to Christianity, before he himself was finally martyred, after excruciating torture, during the persecutions of A.D. 250. His world-wide renown is due to legend rather than to fact. The representation of him in art with the infant Christ upon his shoulder is founded on a beautiful story, of which the following is a bare epitome. A little child once asked C.,

who was of imposing stature, to carry him over a bridgeless stream. Staggering across, the bearer cried out against the strange heaviness of his load, but the boy replied: 'Marvel not, for with me hast thou borne the sins of the whole world.'

Christopoulos, Athanasios (1772-1847), Gk. poet, studied at Buda and Padua, and from 1811 assisted Prince Caradja, hospodar of Moldavia and Wallachia, in making a code of laws for his country. When Caradja fell he lived in retirement, and composed his lyrics and drinking songs which earned him a wide popularity. Besides translating Homer and Herodotus into modern Gk., he wrote *Politika Parallela*, on different forms of gov., a tragedy, and some philological works.

Christ's College, college of Cambridge Univ., England, founded in 1505 by Lady Margaret Beaufort, mother of Henry VII. On the site of C. C., previous to 1505, had stood 'God's House,' founded in 1439 (or 1436) by Wm. Byngham, rector of St. John Zachary in the city of London, under the supervision of Clare Hall. There is little record of the friends who helped Byngham, but it is said that one of them was John Brockley, master of the Drapers' Company in 1442. Henry VI. gave the new foundation his royal charter on April 16, 1448. It was only a small college or hall, and was intended for the training of schoolmasters and has been described as the first secondary training college in England. Byngham, who became the first proctor or master of God's House, d. in 1456. For some years after this time the revenues of God's House languished, and by the beginning of the sixteenth century it maintained only four scholars, besides the proctor. It was then revived as C. C. by Lady Margaret Beaufort, who declared herself to be heir to all King Henry's godly intentions, and her endowment provided for a much larger foundation—for the maintenance of a master, twelve fellows, and forty-seven scholars. In the letters patent of Henry VII., dated May 1, 1505, Henry is recognised as founder of this new but continuing college. Part of the building was refaced in the seventeenth century. The fellows' building in the second court was partially built by Inigo Jones, and is a fine example of Palladian style. The garden is especially beautiful, having suffered least of all the college gardens during rebuilding or enlarging. The rooms once occupied by the foundress have been preserved with very little alteration. John Milton was a scholar here, and a mulberry-tree said to have been planted by him still lives and bears fruit. Among C. C.'s famous alumni are Bishop Latimer, John Leland, the antiquary, and Charles Darwin. The college is closely connected by exhibitions with schools of N. England. In 1948 F. M. Smuts, the most distinguished living member of the college, was installed as chancellor.

Christ's Hospital (the Blue-coat School) was founded in 1553 by Edward VI. The original buildings were those of the monastery of the Grey Friars in Newgate

Street, London. King Edward VI. gave a grant of money, and various charitable persons assisted, and it became richly endowed. It was at first devoted to orphans, and in 1553 was providing home and education for 400 children. The mayor and citizens of London were nominated governors in its charter. Thomas Guy, the founder of Guy's Hospital, endowed the school with £400 a year. In 1677 'parish children and foundlings' were excluded, and only children of the freemen of the city were admitted. Sev. new regulations have been added from time to time, and children presented by governors are admitted to the foundation, also sons of naval officers. The dress of the boys has scarcely differed in style since 1553; they wear a long blue coat and knee-breeches with yellow stockings and white neckbands, the only difference being that the yellow petticoat and flat blue cap have been discarded, and no covering for the head is worn. From time to time alterations were made in the buildings; in 1692 Sir Christopher Wren built the S. front, which is now destroyed. In 1902, the school was removed to new buildings at Horsham in Sussex, which were designed by Sir Aston Webb; the building is on an entirely new plan for public schools, accommodating over 800 boarders (there are now no day scholars). The old buildings were destroyed, except a portion incorporated in the enlargement of St. Bartholomew's Hospital. The boys still retain the auct. name of Grecians and deputy Grecians for the two highest classes. The main school is divided into the Lat. school and the mathematical school, corresponding to the usual classical and modern sides. There are many univ. scholarships and exhibitions, and large sums are spent annually in apprenticeship for both boys and girls. Many distinguished men have been pupils at C. H.; among these were Camden, Stillingfleet, Charles Lamb, S. T. Coleridge, and Leigh Hunt. The girls' school, also originally in Newgate Street, was removed in 1798 to Hertford, and now takes 280 boarders (no day scholars). Lamb's essay on C. H. gives a picture of the school in its old days.

Christ's Thorn, or *Palurus aculeatus*, species of Rhamnaceæ which flourishes in S. Europe and in W. Asia. The shrub is common in Palestine, and is said to have provided the crown of Christ; the thorns are formed from the stipules. The name is applied for a similar reason to other plants, especially to *Zizyphus Spina-Christi*, another species of the same order with stipular thorns, related to plants which produce the fruit known as the jubebe.

Christy, Henry (1810-65). Eng. ethnologist, was a director of the London Joint-Stock Bank, but from 1851, when his interest in ethnological questions was stimulated at the Great Exhibition, he gave his whole life to travel and research. From 1853 till his death he explored the caves in the valley of the Vézère in S. France, trying to deduce from the flint

implements, etc., he found the antiquity of man in Europe. He pub. the results of his investigations, and at his death bequeathed to the nation his unique archaeological collection, made in Scandinavia, Denmark, Brit. Columbia, and Mexico, besides in France. The *Guide* to this collection was pub. in 1868.

Chromatic Scale, in music, a series of semitones written with sharps ascending and flats descending, not involving a change of key, and arranged with accidentals.

Chromatic Thermometer, apparatus for measuring temp. by observing the colour of the light radiated from a heated body. A heated body changes in colour from red to white as its temp. rises, and a comparison of the colour with a standard that gives an indication of the temp.

Chromatography, or Adsorption Analysis, method of analysing mixtures of chemical compounds by their differential adsorption on a solid adsorbing medium through which they are passed in solution. The process was originally invented by the Polish botanist Tswett in 1906, but it is only within the last few years that its possibilities have been realised. The solution to be analysed is allowed to seep down through the finely divided adsorbing solid, such as magnesia, alumina, gypsum, or calcium carbonate, contained in a vertical glass tube. The ingredients in the mixture are thus withdrawn from the solution, but at different levels, and if they are coloured a series of zones or bands is seen. The column with its absorbed coloured compounds is called a chromatogram. It is pushed out of the glass tube and cut up into its various coloured zones. The compound in each zone is then washed out with a suitable solvent, which is afterwards evaporated, so leaving the coloured compound itself. In this way, separation of the mixture into its ingredients is effected. Though originally applicable to the analysis of coloured substances only, the method has recently been extended by the use of ultra-violet light, in which many compounds colourless in ordinary light appear brightly coloured. C. is extremely useful in biochemistry, e.g. the study of vitamins and plant pigments, and also has industrial applications. See T. I. Williams, *An Introduction to Chromatography*, 1946.

Chromatophores, pigmented cells in the surface of plants and animals, whose function appears to be restricted to the production of colour for appearance' sake. They are developed out of young cells which may become *leucoplasts* or starch-formers, *chloroplasts*, or chlorophyll cells with nutritive functions, or may be specialised to the production of pigment only.

Chromatype, a photograph on paper sensitised by salts of chromium.

Chrome Yellow (Lead Chromate, $PbCrO_4$), colouring material used in dyeing and as a pigment. It is found as a mineral in Siberia, in the Urals, Brazil, and the Philippines, under the name of crocoisite. It may be prepared by precipitating a solution of a lead salt with

potassium dichromate. Different shades may be obtained by mixing with lead sulphate, which gives a lighter shade, or with C. red, which gives numerous shades of C. orange.

Chromic Acid (H_2CrO_4) is important because of its salts, the chromates. It is liberated on adding to a concentrated solution of potassium anhydrochromate a sufficient excess of sulphuric acid. The acid, when the solution is concentrated, loses water and deposits deep red crystals of C. anhydride or chromium trioxide. The excess of sulphuric acid and potassium sulphate is washed out with nitric acid, which is then driven off by gentle heat. C. A. has never been isolated in the pure state. With sulphuric acid, C. A. acts as a powerful oxidising agent, and as such is much used in organic chem., while in botany it is used for dissolving intercellular tissue. The acid is used for dyeing in red and brown colours. C. A., however, is not so important as the chromates. In their production the native chrome iron ore, $Fe(CrO_4)_2$, is used. This is heated in the powder form with lime and potassium carbonate in a reverberatory furnace, where oxidation takes place and potassium and calcium chromates are formed together with ferric oxide. This is treated with water, and the chromates are thus extracted. For the production of the bichromate of potash, or, more properly, potassium dichromate ($K_2Cr_2O_7$), which is used as a pigment, the solution of chromates is treated with sulphuric acid, and the potassium sulphate formed produces, by means of double decomposition, the potassium chromate and precipitates calcium sulphate. To convert the chromate into dichromate, a certain quantity of sulphuric acid is added to the solution. The bichromate forms large red prisms, and in solution gives a very poisonous acid solution.

Chromite, mineral which forms the chief source of chromium and its compounds. It consists of chromium, iron, and oxygen, $FeO Cr_2O_3$, and is known as chrome iron ore, chromic iron, and chrome iron stone. It forms octahedral crystals, but is usually found in granular masses; its hardness is 5½, sp. gr. 4.5, and it is black or dark-brown in colour. It is found in ultra-basic igneous rocks, and is mined in California, New Zealand, Turkey, the Urals, and in the Shetland Is.

Chromium (symbol Cr; atomic weight 52.01), hard steel-grey metal belonging to the same chemical group as molybdenum, tungsten, and uranium. It is not found free in nature, but in chrome iron ore ($Cr_2O_3 \cdot FeO$), crocoisite, and chrome ochre it is found very frequently. Many green stones, such as emerald and serpentine, owe their colour to its presence. The general methods of production are the reduction of the oxide by carbon in the electric furnace or its replacement by aluminium. Its chief industrial uses are in C. plating and in the addition of very small quantities to steel, which it renders hard and tenacious. The important salts are the chromates.

Chromosome, body—generally one of sev. similar bodies—formed from the chromatin network of a cell-nucleus during the process of normal cell-div. (karyokinesis or mitosis). The C. is supposed to be the carrier of hereditary factors. See CELL; GENETICS, HEREDITY.

Chromosphere, name given to the shell of luminous gas which surrounds the photosphere of the sun. When observed in its usual condition by the eye or the telescope, the sun is seen as a highly luminous disk with a sharp edge: this is called the photosphere. When, however, the eye cannot see the bright photosphere, as in an eclipse of the sun, its great luminosity does not mask the lesser luminosity of the C., which can then be clearly seen or photographed. The edge of the C. is, however, not regular, for there shoot out from it gigantic flame-like masses of luminous material called prominences, which testify to the greatly agitated state of the sun's surroundings. With only the telescope, eye, and camera not much more information can be gained with regard to this peculiar atmosphere, but from the kinetic theory of gases we might deduce that the great temp. of the sun would give the molecules of its gaseous constituents enormous velocities which would enable them to go a long way from the sun before they were brought back by the gravitational force. The most fruitful method of study, however, is by means of the spectroscope, which has been applied to the purpose very successfully by Lockyer, Hale, Deslandres, and others. By its means the C. was seen to be composed of many elements in the gaseous states, particularly hydrogen, helium, and calcium, a line spectrum being observed in place of the continuous spectrum of the sun. It has been possible to photograph any portion of the C. and the prominences issuing from it, and it has been found that the prominences are associated with the sun-spots, or faculae, which reach the edge of the sun's disk, so that they are often the accompaniment of violent eruptions in the interior portion of the sun.

Chronicle (Gk. *χρονος*, time) denotes a hist. in which facts are recorded according to the sequence of time. The oldest C. in Eng. literature is the A.-S. C., part of which is, in fact, 'the oldest historical prose in any Teutonic language.' The C. exists in seven different MSS., which are generally designated by the first seven letters of the alphabet. It is probable that the C. in part represents the work of King Alfred, and that much of it was written under his superintendence. The A or Parker MS. is the best authority for the earlier periods. The work of chronicling contemporary hist. was probably carried out by monks. Winchester, then the most important place in Wessex, being at first the centre from which the work was done. The events of Alfred's reign are written in a spirited style but the account of events towards the end of the tenth century, when the work of chronicling was moved to Canterbury, is meagre. The A MS. carries the hist. down to the year 1071. The B MS. is fragmentary

and a transcript of A. The C MS. was written in (or from) Abingdon, and extended to the Conquest, B extending only to 977, and differing very little from C. The E. or Laud MS. is of great interest. It was written probably in Peterborough and is full of patriotic spirit. It is the latest of all the versions, the last entries dating from 1154. In it is to be found the celebrated passage describing the sufferings of the country from the self-seeking, avaricious barons of Stephen's reign. For the most part the C. is bare and scrappy, the briefest notices being given of deaths, coronations, the founding of monasteries, and the like. There are, however, some passages, such as that relating to the tragic death of King Cynewulf in 755, which are written in a vivid, graphic style, and, occasionally, pieces of verse are inserted, of which the poem celebrating the battle of Brunanburh is pre-eminently the finest. The C. was printed as early as 1643, and has since been frequently reprinted and trans. The most important eds. are *Two of the Saxon Chronicles Parallel* (1865), ed., with an introduction, by Prof. Earle; re-ed., with appendices and glossary, by Charles Plummer (1892, 1899); *The Anglo-Saxon Chronicle*, ed. with a translation, by Benjamin Thorpe (2 vols.) (1861). (Consult *The Cambridge History of English Literature*, vol. i., 1907.) Other Cs. of interest to the student of Eng. literature may be briefly noticed. The *New Chronicles of England and France*, by Robert Fabyan (d. 1513), was pub. in 1516, and relates the hist. of England from the arrival of Brutus to the battle of Bosworth (1485). The standard ed. is that of Sir Henry Ellis (1811). Raphael Holinshed's *Chronicle*, pub. in two folio vols. in 1578, is of supreme importance from the fact that Shakespeare owed to it so much of his material for most of his historical plays, as well as for one or two others, such as *Cymbeline* and *King Lear*. John Stow (1525-1605) assisted in the continuation of Holinshed's C., and himself wrote a *Summary of English Chronicles* (1561). Sir Richard Baker's *Chronicle of the Kings of England* was written in Fleet Prison, and was pub. in 1643. Two books of the O.T. are called Cs., and are dealt with in the next article.

Chronicles, the First and Second Books of the. The Heb. name, *ḥayyamim*, signifies events of the days, whereas the Gk. of the Septuagint, *ἱστορίαι*, means things passed over. These two books of the O.T. form one book in the Heb. canon, and constitute a hist. of the Jewish people from the time of Adam up to the return from captivity. Some of the events recorded in the Second Book of Samuel and the Books of Kings are here repeated, and the narrative is continued in the books of Ezra and Nehemiah. Nothing is known of the authorship of C., except what can be deduced from internal evidence. It was written by someone who had Levitical leanings, and who apparently, from the language and syntax he used, lived about 330 B.C., or even later. It was therefore written at a time when prophecy had become extinct, and when

every Heb. was chiefly interested in Jerusalem, the hist. of the Temple, and all things that pertained to the theocracy of Zion. The early part of the hist. is contracted into the form of genealogies (1 Chron. i.-ix.). There are numerous omissions in the records of the reigns of David and Solomon (1 Chron. x.-2, Chron. ix.), only those things being mentioned which serve to prove God's goodness to those who obey the divine law. Accordingly, the sin of David, the revolt of Absalom, the idolatry of Solomon, etc., are omitted, as they do not serve the purpose of the author. Many details are given as to divine feasts, and offerings and services in the Temple, which are not mentioned elsewhere. The author refers sev. times to the 'Book of the Kings of Israel and Judah,' to a *midrash* or commentary of the Book of Kings, and to the words of the prophet Jehu, and the vision of Isaiah. Modern scholars do not regard very highly the historical value of C. The most useful commentaries are those by Bertheau and Benzinger. See S. R. Driver, *An Introduction to the Literature of the Old Testament*, 1891, and Dr. Curtis in the *International Critical Commentary*, 1910.

Chrono-chrome. One of the earliest systems of colour cinematography introduced by M. Gaumont in 1912. When first shown to the public at the Gaumont Theatre, Paris, the system was received with enthusiasm owing to the naturalness and delicacy of the colours obtained, but it did not develop commercially, and is now entirely superseded. C. was produced by taking three pictures simultaneously through red, green, and blue-violet screens, and then projecting the three pictures through similarly coloured screens. All shades of red, violet, and blue, and even a perfect white, were portrayed—colours which had proved almost impossible to reproduce hitherto. They were poetically described as 'pictures from the palette of the sun.'

Chronograms (from Gk. *χρόνος*, time, and *γράμμα*, a letter) were extravagant devices in fashion during the late Rom. Empire and afterwards in the Renaissance period, whereby the date was indicated by certain letters in the inscription, written large to stand out. The reader had to rearrange the outstanding letters so as to form the date. Thus ChristVs DVX; ergo triVMphVs was stamped on a coin struck by Gustavus Adolphus in 1632 MDCCVVVVII.).

Chronograph, instrument by which the length of a period of time is recorded. Strictly speaking, there should be a distinction between the meanings of the words chronoscope and C. The former should apply to instruments which allow the extent of passage of time to be seen by reference to a dial or other indicator, while a C. should possess an apparatus for making permanent records of certain desired periods. A stop-watch is therefore a chronoscope, and a watch or clock provided with a stylus capable of tracing lines proportionate in length to the corresponding periods of time would become a

C. Cs. are usually constructed to indicate very short periods with great accuracy, and for this purpose the ordinary clock mechanism is unsuitable, as any error within the period of its escapement can be introduced. Cs. of various forms are used for astronomical purposes, for estimating high velocities, for measuring certain physiological phenomena, and even for determining the finish of a horse-race. The essential parts of a C. are a pendulum or other mechanism for indicating solar time, a stylus or recorder which can be applied promptly at the beginning of the period and released at the end, and a moving surface on which the record is made. Instead of a pendulum or clock, actual time may be indicated by the vibration of a tuning-fork, to one of the prongs of which a light stylus is fixed. When the period of the tuning-fork's vibrations has been ascertained by comparison with mean solar time, it is possible to indicate small fractions of a second by the number of vibrations in a period. The moving surface is generally cylindrical in form, and smooth enough to offer little resistance to the stylus. The surface is graduated by lines at right angles to the direction of its motion, and it is obvious that the greater its velocity the more graduations will be covered in a given period and the more accurate it will be to ascertain small fractions. The stylus is in most cases applied and released by breaking or establishing an electrical circuit. In the Bashforth C. for determining the velocity of shot, there are two recorders: one is controlled by an electromagnet in circuit with a clock, the other forms a circuit with a series of screens placed at known distances apart. When the shot passes through a screen, it displaces a weight which breaks the circuit, which is then almost immediately automatically re-established through the second screen; it is again broken by the shot, again re-established, and so on to the end of the series. The length of a second as indicated by the one recorder is represented by 18 in. and the interruptions in the other record, therefore, lead to an accurate determination of the time spent by the shot in traversing the distances between the screens. Cs. are also used to indicate the period of transit of a star, to estimate the velocity of sound, and to measure accurately certain muscular movements, when the stylus may be moved by the muscle itself. For physiological uses of Cs. see E. H. Starling, *Principles of Human Physiology*, 1926.

Chronology (Gk. χρόνος and λόγος, discourse, account), science of computing and adjusting time, or periods of time, in order to ascertain the true historical sequence of past events and their exact dates. C. differs from hist. in that it recounts events purely with regard to their order in time and without taking into account their relation to each other. Time has from the beginning been measured astronomically, according to the revolutions of the sun and moon and to recurring celestial phenomena. The natural divs. of time are the day and

night, a larger div. being the lunar month. Barbaric races have generally reckoned their time by means of lunar months, without thought of dating events from a fixed epoch. The early civilised races, however, regulated their time from a fixed epoch, each choosing a great event in its national hist. from which to date all other events, both prior and subsequent to it. The epoch universally adopted in modern times is the birth of Christ, the years before it being marked B.C., and those after it A.D. (Anno Domini). This method of dating events was first practised by Dionysius Exiguus about A.D. 533. The first era made use of by the Gks. was that of the Olympiads. The Olympic Games were held every four years, so that an Olympiad was reckoned as a period of four years. The epoch from which the Gks. reckoned time was the victory of Coræbus in the first Olympic Games, held in Elis, and calculated to have taken place in the year 776 B.C. The Gk. historian Timæus, who lived in the reign of Ptolemæus Philadelphus (283-245 B.C.), was the first to reckon by means of Olympiads, and his method was followed by other Gk. historians. The Nabonassar era owes its name to the founder of the Babylonian kingdom, and is said to have been used from the time of its origin, Feb. 26, 747 B.C. This era was adopted by Hipparchus and Ptolemy, and was used by astronomers because its calculations were based on celestial phenomena. The Rom. era dated from the foundation of the city of Rome, which is generally accepted, from the computation of Terentius Varro, as 753 B.C. Verrius Flaccus, however, placed it a year later, whereas M. Porcius Cato gave it as 751 B.C., Polybius as 750 B.C., and Fabius Pictor as 747 B.C. The years were denoted by the letters A.U.C. *anno urbis conditæ*, 'in the year of the founding of the city.' Another common method of reckoning among Lat. historians was by the ann. consulships. Not infrequently both the year of the city and the names of the consuls are given. The dates according to various eras can easily be transferred to each other or to the Christian era by arithmetical calculation. For example, to change from the Rom. to the Christian era, if the date is before the birth of Christ the years of Rome should be subtracted from 754; if the date is after the birth of Christ, 754 should be subtracted from the years of Rome. Other eras of note are the era of Constantinople, dated from the supposed creation of the world, 5508 years and four months before the beginning of the Dionysian or Christian era; the era of Alexandria, placing the creation of man Aug. 29, 5502 B.C.; the era of Alexander, counted from the date of his death, Sept. 1, 323 B.C.; the era of the Seleucids, also known as that of the Macedonian era, beginning Sept. 1, 312 B.C., and commemorating the capture of Babylon by Seleucus Nicator; the Julian era, at the time of Cæsar's reformation of the calendar; and the era of Spain, dating from the conquest of Spain by the Romans, 38 B.C. The Gk. and Rom. methods of reckoning continued long after

the birth of Christ. From A.D. 312, however, the general mode of computation throughout the Rom. Empire was by a system known as Indictions, which were cycles or periods of fifteen years, beginning with the year 312. Indictions were of three kinds: The Indiction of Constantinople, beginning Sept. 1, A.D. 312; the Imperial Indiction, beginning Sept. 24, A.D. 312; and the Pontifical or Rom. Indiction, beginning Dec. 25, A.D. 312 or Jan. 1, A.D. 313. The method of reckoning from the birth of Christ was first invented, as has been mentioned above, about A.D. 533.

The Dionysian year began on March 25, from the Annunciation. If the date of man's creation on this earth could possibly have been estab., that would form the most convenient point from which to start the reckoning of time and to date the events of hist. The great objection to the use of the Dionysian or Christian era, is, of course, that it is divided into two parts, which necessarily involves a certain amount of confusion in reckoning. Furthermore, as the year immediately preceding the birth of Christ is called 1 B.C., and the year immediately following it A.D. 1, the birth itself has to be fixed at 0. Joseph Justus Scaliger tried to obviate these difficulties in 1582 by his invention of what is known as the Julian period. His period began 4713 B.C., so that the year 4714 of the Julian period corresponded to A.D. 1. He also estimated 7980 years in a Julian period. According to the Septuagint version of the Bible, the creation of the world took place 6000 years before the birth of Christ, and 2250 years before the flood. The Heb. version reckons 4000 years from the creation to the birth of Christ, and 1656 from the creation to the flood. The Samaritan version, however, allows for an interval of only 1307 years between the creation and the flood. According to the modern interpretation, by scientists and theologians alike, of the first few chapters of Genesis, the creation of the world cannot be fixed with any definiteness whatever, and must have taken place at a far earlier period than any suggested above. The chief eras that date after the birth of Christ are the Diocletian, or era of martyrs, A.D. 284 (still in use among the Copts and Abyssinians); the Mohammedan era, dating from the flight of the prophet from Mecca and Medina, July 16, A.D. 622, and the Persian or Gelat-ed-din era, dating from the accession of Yezdegird, A.D. 632. The chief eras may be tabulated thus:

	B.C.
Era of Constantinople	Sept. 1, 5508
Era of Alexandria	Aug. 29, 5502
Era of Antioch	Aug. 29, 5492
Julian period	Jan. 1, 4713
Jewish Mundane era	Oct. 1, 3761
Olympiads	July 1, 776
Era of Rome	April 24, 753
Era of Nabonassar	Feb. 26, 747
Era of Alexander	Sept. 1, 323
Era of the Seleucidæ	Sept. 1, 312
Julian year	Jan. 1, 45
Era of Spain	Jan. 1, 38

A.D.

Era of Diocletian	Sept. 1, 284
Era of Mohammed	July 16, 622
Era of Persia	June 16, 632

The year began on different days in different places. When Julius Cæsar reformed the calendar in 45 B.C., Jan. 1 was fixed on as the beginning of the year. This was used in England as the first day of the year from the time of the Conquest till 1155. After that date, March 25 was regarded as the beginning of a year in conformity with the continental custom. In 1582 Pope Gregory XIII. reformed the calendar, and introduced what is known as the New Style. During the sixteenth and early seventeenth centuries, the New Style, with Jan. 1 as New Year's Day, was adopted by most of the European powers, including Italy, France, Germany, Spain, and Portugal. England, with Russia and Sweden, adhered to the Old Style until 1751, when Lord Chesterfield took the matter up and tried to rouse interest by his contributions to the *World*. 'It was not,' he said, 'very honourable for England to remain in a gross and avowed error, especially in such company.' The Eng. calendar was, by comparison with the continental, eleven days out, and Chesterfield, in collaboration with Lord Macclesfield, the mathematician, and Bradley, the astronomer, drew up a scheme and passed the motion through the House at the time of the Pelham ministry. The year 1752 was to begin on Jan. 1 instead of March 25, and in order to rectify the error in the Old Style, the day following Sept. 2 was to be called Sept. 14. The reformation of the calendar met with much ignorant opposition on the part of the public. The scheme was regarded as a wicked concession to Rome, and the popular Opposition: election, cry was 'Give us back our eleven days.' Consult Scaliger, *De Emendatione Temporum*, 1582; Sir I. Newton, *Chronology Amended*, 1728; C. L. Ideler, *Lehrbuch*, 1831; Sir H. Nicolas, *Chronology of History*, 1833; Woodward and Cates, *Encyclopædia of Chronology*, 1872; J. C. Macdonald, *Chronologies and Calendars*, 1897, etc.

Chronometer, see HOROLOGY.

Chronometer, in music, see METRONOME.

Chronoscope, instrument which indicates the length of a short period of time. The term is applied to an apparatus for measuring the period of certain luminous phenomena of which the eye can be no accurate judge, on account of the persistence of a sensation in the retina. It consists of a rapidly moving mirror, which, owing to its motion along the circumference of a circle, reflects a flash as a luminous arc; the length of the arc thus indicates the duration of the flash. Sir Andrew Noble invented a C. which might more accurately be called a chronograph. A series of plugs is arranged so as to project inside the bore of a gun, each forming part of the primary circuit of an induction coil. The circuit is broken in each case by the passage of the shot, and the spark passing between the terminals of the secondary produces a spot on the

edge of a rapidly rotating disk which is coated with lamp-black. There is a disk to each plug, so that the positions of the spots enable the velocity of the shot to be ascertained. See CHRONOGRAPH.

Chrudim, tn. of Czechoslovakia, 62 m. S.E. of Prague, situated on the Chrudimka. It is noted for its horse markets, and has manufs. of cloth and sugar. Pop. 13,000.

Chrysalis, or **Chrysalid**, term applied to the pupa of an insect; but especially to that of a butterfly or moth. It is essentially the resting stage of the

STAGES IN THE LIFE OF THE BUTTERFLY
A egg (magnified); B, caterpillar; C, (chrysalis); D, butterfly

creature's life, when, the larva having stored up much food, the perfect insect is built up from the disintegrated tissues. The pupa may be exposed or within a cocoon.

Chrysanthemum (Gk. χρυσός, gold, ἄνθος, flower), genus of Compositae, contains about 150 species of varied and beautiful plants which are natives of all countries but Australia, and are generally hardy in Britain. The plants are either herbaceous or shrubby in habit, and the flower-heads consist exclusively of ligulate florets of almost every colour except blue. Pure white, bright yellow, deep and pale red, rich purple, and dark brown occur in different varieties, and contribute to the beauty for which the species are admired. The order is popularly known from its comprehending the species *C. sinense* and *C. indicum*, and natives of China and Japan, from which our autumn varieties are derived. In cultivation the different varieties require a good, rich, well-manured soil, and they should be carefully protected from frost. In Britain we have sev. common species. *C. segetum*, the corn marigold, is an annual with yellow flowers, and occurs as a weed in fields; *C. Leucanthemum*, the ox-eye or dog-daisy, is a well-known meadow plant with white ray florets and yellow disk-florets; *C. frutescens*, the Paris daisy or marguerite of France, is grown as a

garden plant and somewhat resembles *C. Leucanthemum*: *C. Parthenium*, the feverfew, has small flower-heads, and is used as a remedy for slight fevers; *C. carinatum*, the tricolor daisy, comes from Barbary, and is an annual cultivated in Britain, *C. arcticum* is a small species with pink and white florets. In this country hardy perennial Cs. include the hardy border as well as the early and late flowering Jap. (greenhouse) kinds, both single and double flowered in white, and practically every colour and shade excepting blue. They flower from Aug. to Christmas (indoors), from Aug. to mid Dec. (hardy border) outdoors. Hardy annual types (*C. carinatum*) or summer-flowering marguerite, will flower from seed sown in a very sheltered border, or in a cold frame the previous autumn, or in a greenhouse. They have both single and double (*C. coronarium*) flowers in many colours, and white. There is a growing tendency to sustain the stock of perennial Cs. from seeds sown in heat in February to flower the following autumn, so as to obviate the trouble of growing on from cuttings year by year in greenhouses.

Chrysanthemum, Order of the (Kikkwa Daijasho), was instituted in 1877 by the Emperor Musto Hiti of Japan, and is conferred on members of the royal house and on foreign princes. The badge is conventional in design, with a red sun in the centre, sending forth white and gold rays, separated into four groups by a yellow C. with green leaves, the whole hanging from a larger yellow C.

Chryseis, daughter of the Gk. priest, Chryses, Achilles, by his rape of C., had called down the wrath of Apollo, who sent a dreadful pestilence in token of his displeasure. When Calchas, the seer, revealed the cause of the god's anger, Achilles, on the demand of Agamemnon, the king, was obliged to restore C. to her father, but insisted on receiving Agamemnon's slave, Briseis, in compensation. Homer in his *Iliad* tells the disastrous sequel to the strife which thus arose between the two champions of the Gks.

Chryselephantine (Gk. χρυσός and ελεφανς, ivory), adjective used to describe the gold and ivory statues of the Gks., by far the most famous of which were the colossal Zeus at Olympia and Athena in the Parthenon of Pheidias. A development from wooden images where flesh was painted white and drapery gilded, these C. statues were built up on wooden or clay cores, by attaching thin plates of ivory (to represent flesh tints) and gold. The preciousness of the materials amply accounts for the non-survival of any illustration of this art.

Chrysididae, family of insects, in the series Hymenoptera Tubulifera, consists of near allies of the true wasp which are called popularly ruby-wasp or golden-tailed flies. They are brightly coloured creatures with wings moving so swiftly as to make them invisible, and in habit they are parasitic in the nests of bees and wasps. *Chrysis ignita* is a common Brit. species. The adult wasp lays her eggs

in the nest of other species, and the larva feeds upon the young insect which it has supplanted. The Chrysis is a brilliantly coloured and very active creature.

Chrysippus (c. 280–206 B.C.), Gk. philosopher, and one of the leaders of the Stoic school of philosophy, b. at Soli in Cilicia. He came to Athens and studied under Cleanthes. His skill in argument and his impartiality and reasonableness earned him the name of the Column of the Portico (Stoa). He saved the doctrines of the Stoics from extinction. He wrote 750 treatises, of which only fragments survive; some of them are preserved in the MSS. found at Herculaneum. See N. L. Davidson, *The Stoic Creed*, 1907; E. Bréhaut, *Chrysippe*, 1910.

Chrysobalanus, one of the sub-orders of the natural order Rosaceae, formerly considered to be a distinct natural order. Warming, however, has classed it as a sub-order of Rosaceae, a position it now usually holds. The sub-order contains the typical genera *Hirtella* and *Chrysobalanus*. The species are tropical trees and shrubs, often bearing the name of plum. *C. Icacó*, the coco plum, is a native of the W. Indies, where the fruit is considered to be a delicacy.

Chrysoberyl, crystallised mineral, generally of a green colour, translucent, and having a vitreous lustre and conchoidal fracture. Sp. gr., 3.8; hardness, 8.5. It consists of alumina, 77.0 per cent; glucina, 17.5 per cent; protoxide of iron, 5.0 per cent; other matters, 0.5 per cent. A few specimens are met with uncrystallised. It is found mostly in Ceylon and Brazil. When the green is very pale it is often called oriental chrysolite. It crystallises into six-sided crystals.

Chrysochloridae, family of insectivorous mammals containing a single genus with about half a dozen species known as Cape golden moles. The Chrysochlore has mole-like habits, and its eyes are covered with skin, but it has only four digits on its fore-paws, while the mole has five. It has no tail, and the ears lack pinnae. *C. capensis*, the Cape chrysochlore, has a velvety fur of metallic lustre, burrows underground, and feeds on worms and insects.

Chrysocolia, ore of copper, being the hydrated silicate of that metal. It is of a bluish colour, and found in large quantities in the Mississippi valley and in smaller quantities in Cornwall and Cumberland.

Chrysocoma, genus of composite plants, is indigenous to S. Africa. *C. lineoyris* is rarely found in limestone cliffs of Britain; it is fleshy with yellow flowers.

Chrysolite (golden stone), mineral of pale greenish colour, crystallising in rectangular prisms. It is a silicate of magnesia and protoxide of iron, the formula being $2(\text{MgFe})\text{O} \cdot \text{SiO}_2$. It is mostly used in jewellery, and is occasionally found in rounded masses, but usually as a constituent of basalt and lavas. The common form of the mineral is olivine, which is of an olive green or brownish colour. The crystals are positively doubly refractive.

Chrysoloras, Manuel, or Emmanuel (c. 1355–1415), one of the chief introducers of Gk. literature and learning to W. Europe, b. at Constantinople; he studied under the philosopher Gemistus, and was sent in 1383 by the Emperor Manuel Paleologus to Italy to beg for help against the Turks. On his return he was invited by Florence to reside in the city and teach Gk. Here he lived for three years, travelling much in Italy, his translation of Plato and Homer becoming famous. He went on an embassy to Germany in 1413 to fix on the place where the approaching general council of the Church was to meet, and he represented the Gk. Church in the train of John XXIII. at Constance, where he d. suddenly. His printed works are two only: *Erotemata*, a Gk. grammar, and *Epistola de comparatione veteris et novae Romae*.

Chrysomelidae, large family of coleopterous insects, consists of smallish and brilliantly coloured species. The fat little grubs and the perfect beetle are both vegetarian in diet, and many are destructive to crops. The well-known Colorado beetle (*q.v.*) is a species which feeds on potatoes.

Chrysophrys, genus of the Sparidae or sea breams, contains acanthopterygious fish which inhabit warm and tropical seas. *C. aurata*, the gilt-head, is an hermaphrodite species which has been found off our coast, but usually frequents the Mediterranean.

Chrysophyllum Cainito, or Star-apple, is a species of Sapotaceae which grows in the W. Indies and is valued on account of its edible fruit. The plant is a moderately sized spreading tree, and the fruit abounds in a sweet milky juice which flows copiously when it is beginning to mature. The flowers grow in small purplish bunches. When cut across the seeds present a stellate figure, whence the name.

Chrysosplenium, genus of Saxifragaceae, occurs in mild countries, its species being herbaceous plants with pale green flowers. *C. alternifolium* and *C. oppositifolium* are natives of Britain, and are called golden saxifrages.

Chrysoprase, mineral variety of chalcopyrite used as a precious stone, more particularly on the Continent. Its principal constituents are crystalline and amorphous silica which are combined to give differential effects; but the fine apple-green colour is given by the presence of nickel oxide.

Chrysops, genus of Tabanidae, contains sev. species of flies known by the name of cleg or gad-fly, and noted for their large and beautiful green-gold eyes. Three species occur in Britain, they are all bloodsuckers, and are very troublesome to cattle and horses in summer. The gad-fly (*Tabanus bovinus*) is nearly 1 in. long. See also CLEG; HORSE FLY. *C. excrucians* and *C. relidus* have an unenviable notoriety.

Chrysorrhoea, see JOANNES DAMASCENUS, ST.

Chrysostom (Gk. *Χρυσόστομος*, the golden-mouthed), St. John Chrysostom (c. 345–

407), one of the great fathers of the Christian Church, also known as John of Antioch, *b.* at Antioch. He attended the school of the sophist Libanius, and showed such remarkable powers of mind that he would have succeeded his teacher as the head of the school had not the influence of his mother and many Christian friends persuaded him to be baptised, about A.D. 370. For ten years he lived in the desert, studying theology, but his austerities led to a severe illness, and he returned to Antioch, where he was ordained. After another ten years' strenuous work in Antioch he was made archbishop of Constantinople, and became one of the most famous preachers of the age. His knowledge of human nature was keen and deep, and his eloquence made him as many enemies as adherents. His sermons in St. Sophia were directed not only against the Arians but even more against the licentiousness of the imperial court and the idleness and vice of the innumerable monks who thronged the city. The Arians at this time had no place of worship and met at night outside public buildings, where they sang hymns expounding their doctrines. To counteract their influence on the orthodox, C. arranged a system of nightly processional hymn singing, the first example of hymns combined with a service. Riots ensued and much bloodshed, the Empress Eudoxia's chief eunuch being slain. In order to condemn C., Theophilus, bishop of Alexandria, summoned a synod which met at Chalcedon through fear of the fury of the people of Constantinople, who were the ardent supporters of their archbishop. He refused to appear, was condemned on the charge of Origenism and contumacy, and was removed to Nicæa in Bithynia. The fury of the populace was so aroused that he was hastily brought back to Constantinople, but two months later he was once more exiled, this time to Cucusus in Cilicia. From here he wrote many of his greatest sermons and letters, and planned missions to the Persians and Goths. His vindictive enemies then secured his removal to the far desert of Pityus, and on his way there he d. Fresh riots broke out in Constantinople at the news of his death, and peace was not finally restored until his bones were brought back thirty years afterwards. His festival in the Gk. Church is on Nov. 13, in the Lat. Church Jan. 27. The prayer of St. C., that stands last but one at the end of matins, evensong, and the litany in the Eng. Book of Common Prayer, is taken from the liturgy of St. C. His works are voluminous, and nearly all have been preserved. See *Oxford Library of the Fathers*; and lives by W. R. W. Stephens, 1872; H. W. Bush, 1885; and A. Pouch, 1891. See also Palladius, *Dialogus de vita S. Chrysostomi* (ed. by P. R. Coleman-Norton), 1928; *Divine Liturgy* (trans. by E. E. Brightman), 1931.

Chrysostomus, see **DION CHRYSOSTOMUS**.
Chrysothrix, genus of squirrel monkeys, belongs to the family Cebidae (*q.v.*). It consists of four species, all of which are

arboreal, insectivorous, and gregarious; the long tail is non-prehensile and the face is small.

Chrzanow, tn., 25 m. W. by N. of Cracow, in Poland. Pop. (1939) 12,000.

Chu, a riv. some 570 m. in length, in the Kirghiz S.S.R. of Soviet Central Asia. Rising in the Tianshan Mts., in the W.S.W. of Lake Issyk Kul, it is first known as the Koshkar. Passing within 3 m. of Issyk Kul, it swerves into the gorge of Buam, and leaving Tokmak behind flows on towards Lake Saumulkul, disappearing in the desert 125 m. before reaching it. Its valley supports one-third of the total pop. of the republic, and its water has in recent years been used for irrigation works, bringing 200,000 ac. of formerly arid land under cultivation. The valley produces grain and cotton, and is noted for horse-breeding.

Chüanohow (Chinchew), anct. port and walled city in the prov. of Fukien, China. There being now a great sand-bar across the harbour mouth, C. has been outstripped in trade by the port Amoy. The most famous bridge in the whole of China connects C. with its suburb, Loyang. Marco Polo and other travellers mention C. as carrying on a large traffic with Europe in the Middle Ages.

Chub, name of sev. carp-like fishes, in the large family Cyprinidae, is applied in Britain to *Leuciscus cephalus*. In N. America, however, it is given to the near ally, *Leucosomus corporalis*, and to fishes of the genus *Ceraticthys*.

Chubb, Charles (d. 1845), locksmith, improved the detector lock, which his brother had originally patented in 1818. After managing a hardware business with 200 hands in Wolverhampton, he went to London, where he set up a factory for burglar- and fire-proof safes of his own patent in 1835.

Chubb, Thomas (1679-1746), Eng. deist, *b.* at E. Harnham, near Salisbury, the son of a maltster. Apprenticed to a tallow chandler, he educated himself on the death of his father in 1688, theology being his favourite subject. In 1715 he wrote *The Supremacy of the Father*, followed by sev. other theological works. C. is interesting as representing a popular form of deism, and as showing the hold that rationalism had taken on the popular mind. His works also include *The Supremacy of the Father asserted* (1715); *A Discourse concerning Reason* (1711); and *The True Gospel of Jesus Christ* (1739).

Chubut, ter. in S. Argentina, bounded on the N. by Rio Negro, on the E. by the Atlantic, on the S. by Santa Cruz, and on the W. by Chile. Connected by rail with Puerto Madryn on the Bahía Nueva. Rising in the Andes, the R. C. flows straight across to the Atlantic. The Senguerr discharges into Lake Colhuapi, other lakes of size being La Plata and Fontana in the Andean highlands, and Musters in the interior. Save for the fertile, forested valleys on the Andean border the whole country is an arid pebble-strewn waste, clothed with stunted vegetation. Nevertheless, there is a Welsh colony near the C. mouth, with Rawson as its cap. and

Madryn (44 m. distant) as its chief port. Total area, 93,427 sq. m. Pop. 28,000 (of whom 18,000 are at Rawson).

Chuching, or **Kiutzing**, well-fortified city, 78½ m. E.N.E. of Kunming, in the prov. of Yunnan, S. China.

Chudleigh, tn. in Devonshire, England, 8 m. S.W. of Exeter. In 1807 it was almost destroyed by fire, but was rebuilt. It is noted for cider. Pop. 2000.

Chudleigh, or **Chidley**, promontory on the N. coast at the entrance of Hudson Straits in Labrador, Canada.

Chudskoye, Lake, see **PEIPUS**.

Chufut-Kaleh, deserted tn. 2½ m. E. of Bakhiserai in the Crimea region of the R.S.F.S.R. Perched on precipitous and wellnigh inaccessible cliffs, 1835 ft. above sea level, it was in the fifteenth century the refuge of the Karaites Jews from the Crimea. Between C. and Bakhiserai is the Uspenskiy monastery, clinging like a limpet to the cliff face.

Chuguyev, tn. on the r. b. of the N. Donetz, 24½ m. E.S.E. of Kharkov, in the Ukraine S.S.R. Pop. 16,000.

Chuhsung, or **Tsuyung**, tn. 77 m. W. of Kunming, in Yunnan, China.

Chukchi, people dwelling in scattered groups along the Arctic shores between the Bering Straits and Kolyma R. in the Chukhot National region of the R.S.F.S.R. Nordenskiöld, who first studied this curious tribe during his expedition of 1878-79, came to the conclusion that their language resembled Koryak, not Eskimo, and sums up his discussion of their racial characteristics by saying that they bear 'an unmistakable stamp of the Mongols of Asia and the Eskimo and Indians of America.' The C., who are divided into the poor Fishing C., with fixed homes, and the comparatively well-to-do and nomadic Reindeer C., who breed great herds of reindeer and live on their milk and flesh, are tall and lean, with thick lips, coarse lank black hair, and puffy cheeks which often completely wrap in the nose.

Chukiang, see **CANTON RIVER**.

Chulmleigh, mkt. tn. 2 m. from Eggesford station and 14 m. S.E. of Barnstaple in Devonshire, England. Pop. 1143

Chumba, see **CHAMBA**.

Chumbi Valley, natural approach to Tibet from India, up which the Brit. expedition to Lhasa in 1904 advanced. Flanked by Bhutan and Sikkim, it lies on the S. slopes of the Himalayas at an elevation of 9500 ft.

Chumbul, or **Chambal**, unnavigable riv. (514 m. long) of central India, rising in Málwá, near Mau, and joining the Jumna, W. of Cawnpore.

Chunam, Indian name for quicklime, made from very pure limestone or from calcined shells. It is used as an ingredient for plaster, when it is well mixed into a paste, together with fine riv. sand and jaggery (coarse sugar).

Chunar, see **CHANAR**.

Chunchos, The savage people who dwell in communal houses and live by hunting in the forests E. of Cuzco, central Peru. They are an independent tribe of S. Amer. Indians, not unlike the Antis. But the

term C. has also been referred to one of the three aboriginal peoples of Peru.

Chunchuses, warlike tribe of marauders, dwelling in certain parts of Manchuria and Mongolia. In the Russo-Jap. war, the Jap. were suspected of bribing these freebooters to wreck the railroads. They disown the suzerainty of China.

Chungking, commercial cap. of the prov. of Szechwan and of the whole of W. China. As a result of the Jap. invasion of China during the Second World War C. became the Chinese cap. of Chiang Kai-shek's Gov. and the centre of Chinese resistance to both the Jap. invasion troops and the Chinese Communists. It occupies the end of a high rocky bluff at the junction of the R. Kiating with the Yangtze, and is surrounded by a stone wall in good repair. Before the war with Japan it had many fine shops and streets. Its pre-war exports were yellow silk, wax, hides, wool, hemp, feathers, etc., and Chinese medicines, but even before the Jap. invasion trade had been crippled by brigandage in the interior. In the Second World War (and even before) C. was repeatedly bombed by Jap. aeroplanes, but its natural defences and shelters guaranteed its immunity from destruction. In May 1943 five Jap. divs. pushed up the Yangtze valley with the object of forcing a passage through the mt. gorges which formed the gateway to the city, which was the centre and the symbol of resistance to Jap. aggression. The tide was turned largely by allied air power despite the smallness of the available forces. Heavy bombers struck at the Jap. base of Ichang, disrupting communications (May 29), and next day a Chinese counter-offensive was launched which threw the Jap. force back in disorder; and by June the threat to C. had been removed. With the walled city of Kiangpeiting now incorporated in C. and the large vils. near, C. is estimated to contain a pop. (1944) of about 880,000.

Chunian, tn. in the Lahore dist., W. Punjab, Pakistan, 45 m. S.S.W. of Lahore. Pop. 10,300.

Chupanga, or **Shupanga**, vil. of Portuguese E. Africa, on the r. b. of Lower Zambesi R. The scenery is beautiful, but the dist. malarial. The wife of Livingstone, the explorer and missionary, was buried here (1862).

Chupra, see **CHAPRA**.

Chuquicamata, tn. in the prov. of Antofagasta in the N. highlands of Chile. Since 1910 it has been an important mining and coal centre. There are especially rich copper mines. Pop. 15,000.

Chuquisaca, or **Chareao**, dept. in Bolivia lying between the Andes and the Paraguay R., forming the S.E. corner. The cap. tn. is Sucre. It covers an area of 26,400 sq. m. Pop. 370,000.

Chuquisaca, or **Sucre**, cap. of Bolivia, S. America. See **SUCRE**.

Chuquito, **Chucuito**, or **Chucuyito**, prov. of Peru, also cap. of this prov., 12 m. from Puno, on W. of Lake Titicaca. There are silver and gold mines, woollen manufs., dyeing of vicuña wool. Prehistoric remains have been found in the dist. Pop. 5000.

Chur, see COIRE.

Chura, feudatory state of Kathiawar, Gujarat, India; also cap. of same, 56 m. from Cambay. Pop. 5500.

Church, derived from the Gk. word *κυριακόν* (*δῶμα*), meaning the Lord's House, from *κύριος*, lord, or master. Other forms of the word are seen in the Swedish *kirka* the Ger. *Kirche*, the A.-S. *circe*, and the Scottish *kirk*. Its original meaning, therefore, was limited to the place of assembly and worship, but, like numberless other words of common usage, which have been adopted from a classical into modern European tongues, its sense has expanded with the development of new thoughts and customs. Thus C. may be applied also to a Christian sect, to the clergy, or to the whole community of Christian people, and it is interesting to notice the word *ecclesia* (from Gk. *ἐκκλησία*, assembly) has undergone an exactly contrary transformation, being now applied to the building rather than to the body of Christians (cf. Welsh *eglwys* and Fr. *église*). Inasmuch as the structure of the place of public worship or C. is indissolubly bound up with the development of ritual, dogma, and organization, it has been thought well to preface this article with a brief sketch of the hist. of C. architecture. It was in the fourth century that Christianity was officially adopted as the religion of the Rom. Empire, and it was natural that C. architects should seek inspiration from some existing architectural type. This they found in the basilica (*q.v.*), which must therefore be regarded as the basis of all C. architecture. The magistrates were accustomed to sit in the apse of the basilica, separated by the *cancelli* (the bar or lattice) from the litigants and common people, who stood facing them in a long atrium or open court at the W. In the embryo C. the officiating priests occupied the apse in the E., and sat with their backs to the wall in the presbytery, looking towards the congregation gathered in the court, now called the nave. The *cancelli* exercised an incalculable influence in completely cutting off the clergy from the laity and so augmenting the dignity of their sacerdotal functions. In the E. this lattice developed into a screen of sacred paintings which effectually hid from the laity the supreme act of the holy eucharist. The bema or choir, which was simply an enclosure between the presbytery and the nave, arose from the need of greater accommodation for clergy and singers, and later was further augmented where it was necessary to seat a large body of monks. The chancel—that is the choir and the sanctuary, which was the portion of the apse especially railed off for the priests—was divided from the nave by a structural arch, a screen, or steps, and sometimes by all three. The two pulpits or ambons on either side of the choir, from which the gospels and epistles were read to the assembled worshippers, may still be seen in the basilica C. of San Clemente in

Rome. There is some doubt as to the exact origin of the cruciform Cs., although the popular belief that they were always meant to be symbolical of the cross of crucifixion assuredly accounts for their speedy adoption in medieval Cs., for in the Middle Ages the love of symbolism amounted to a passion. In the E. the popularity of the dome led to the erection of Cs. in the shape of a Gk. cross with one central and four smaller domes

TYPICAL PLAN OF A CRUCIFORM CHURCH

A, apse; B, presbytery; C, choir; D, chancel; E, chancel arch; F, sacristy or vestry; G, north transept; H, south transept; J, the crossing; K, nave; L, north aisle; M, south aisle; N, tower; and O, porch.

over the arms of the cross. It is easy to see how desire to accentuate the cruciform figure and faith in the efficacy of the altar sacrifice together tended to the extension of the N. and S. arms, which grew into the transepts of the great Gothic cathedrals, for these side aisles offered a splendid opportunity for subsidiary chapels and altars where masses might be said. It early became the custom to build the chief of these chapels, that dedicated to the Blessed Virgin, and known as the Lady chapel, behind the high altar in the E., and the increased love of ritual and pageant induced architects to continue the nave and chancel aisles between the high altar and the Lady chapel, so as to form ambulatories—an arrangement which contributed much to the dignity and

picturesque scope of processions. Though the circular form was almost invariably confined to the apse in the chancel, the Knights Templars usually built their Cs. round, in imitation of that of the Holy Sepulchre in Jerusalem. But the Reformation and the later spread of nonconformity and puritanism altered C. architecture and decoration so as to suit the needs of what men now conceived to be the ideal form of service and worship. The medieval builders had made their cathedrals a magnificent embodiment of that somewhat materialised literal Christianity, the highest expression of which is found in Dante, and had therefore embellished the walls with great paintings representing scenes from the O.T. and N.T. and episodes in the lives of the saints, had set everywhere sculptural figures of the Virgin, the apostles, the saints, and Christ, and had freely depicted in pictures the terrors of hell and the majesty of heaven, whilst outside they delighted in carving hideous gargoyles to typify the expulsion of all demons from the house of God. Moreover, the wealthy religious houses had vied with one another in erecting spacious and splendid edifices to the greater glory of God, with small regard to the needs of the congregation or the neighbourhood of tns. But with the rise of Protestantism, a mighty iconoclastic wave swept over Europe, and cathedrals and Cs. were ruthlessly stripped of all their adornment save their stained glass. In truth the substitution of the Bible for the mass was almost the death-blow of C. architecture as a fine art. The Renaissance had already led to a disastrous imitation of anct. and especially of Gk. models, and now 'the new religion' was responsible for the growth of Cs. of the so-called conventicle type. In these the auditorium where the congregation sits is merely a great hall with a gallery running round three sides, whilst on a dais at the E. end is set the pulpit from which the minister addresses his people without being separated from them otherwise than by his platform. Cs. are designated metro-politan, cathedral, conventual, collegiate, and par., according to their status, size, and importance, but difference in name does not imply a difference in structure. In modern times Cs. are frequently built in imitation of Romanesque, and especially of Gothic models.

Church Discipline (*Disciplina ecclesiastica*) is the means by which the Christian C. deals with any of its officials and members, who, by serious immorality or other dishonour, have fallen completely away from the Christian standard of living and visibly and palpably stained the purity of a common spiritual life. In the days of the apostolic fathers the practice, which St. Paul had encouraged in his Cs., held good—that is, the local ecclesia were entirely responsible for the behaviour of its members. The accepted doctrine was that if any man will not listen to the C. when it expresses on any moral issue the teaching of Jesus Christ, he is *ipso facto* self-excommunicate,

having rejected the final and supreme court of appeal. When, however, Christianity was finally and openly adopted into the great Rom. Empire, the C. ceased to consist of separate and independent societies of 'saints,' and these latter were obliged to sacrifice their anct. prerogatives one by one, including discipline, and to pass gradually into a state of spiritual pupillage to that great unifying body whose highest representative the pope was soon to be. During the period of persecutions under Decius, the alarming increase of apostasy led to stringent rules for the restoration of the lapsed rules which were not superseded till the end of the fourth century.

Up to the seventh century the (to us) extraordinary custom of public penance was in force. The enrolment of sinners into the rank of penitents took place during Lent. Penitential canons regulated the time during which the sinner must remain in the sev. grades of weepers, hearers, prostraters, and standers, whilst their readmission within the pale of the C. usually occurred in Holy Week. As regards the treatment of the *lapsi*, various opinions obtained among the different sects. The Novatians believed that forgiveness of those who had fallen away from faith rested only with God, whilst the Montanists insisted that a sinner once under the ban of his C. must remain in *status penitentis* for the remainder of his life. The dreadful humiliation of public penance accounts for its disappearance by the eleventh century. Before that date it had become hopelessly abused. For letters of recommendation (*libelli pacis*) often secured the restoration of penitents, and the vicious system of commuting penance for taxes appeared as early as 550. The Celtic monks were responsible for the compilation of lengthy Penitentials.

But the most effectual of the weapons of the medieval C. were excommunication and the interdict. The greater excommunication deprives the individual of all civil and social intercourse besides all the ordinances of religion. Lesser excommunications do not involve exclusion from communion and fellowship other than religious. The interdict involved only the suspension of religious services in a church or dist., not exclusion from the Church. It was inflicted therefore on places instead of on persons. Calvin, who, unlike Zwingli, was opposed to the surrender of all eccles. power to the state, advocated the retention of the *discipline de l'excommunication*. It was because Geneva refused to sanction his proposals that Calvin was driven into banishment in 1538. Yet in 1541, on his return, Calvin triumphed, and henceforward a consistory or council of elders was estab. in every par. of the Reformed Church—a chief function being the exercise of disciplinary authority over the congregations. In the seventeenth century, notwithstanding that penance had been formally abolished, evildoers were wont to make satisfaction publicly

on the stool of repentance, and for grave transgressions against eccles. law it was the fashion in Ayrshire, as late as 1781, for the penitent to stand in a public part of the C., dressed in sackcloth, to signify his contrition. The kirk-sessions can still pronounce the lesser excommunication, by which the offender is banned from all sealing ordinances.

Church History may conveniently be divided into three epochs, anct., mediæval, and modern. (For the development in the *treatment of church hist.*, see CHURCH HISTORY.) The first period reaches from the death of Christ to A.D. 590 or perhaps, in the estimation of some, to the foundation of Charlemagne's empire (800), the reign of Constantine forming a dividing line; the second extends to the Reformation, being divided at the supremacy of the papacy under Innocent III.; and the last may be subdivided by the treaty of Westphalia, which closed the Thirty Years war. The Pentecostal assembly of the apostles (A.D. 33) may be regarded as the seed of the Catholic C. Here the disciples received the fullest conception of their mission as preachers of the Resurrection and the great Messianic gospel of their Master. During his missionary travels from A.D. 40 to 58 Paul began the huge task of evangelising the Gentiles, and he, more than any other, must be revered as the founder of Christian theology. As the Romans only appreciated a state religion, the humble and despised Christian sects of the metropolis and greater Italy were persecuted because they practised a *religio illicita* (an unlawful superstition). The outbreaks of persecution occurred principally under the Emperor Nero (64), Domitian (96) and Trajan, whose famous correspondence with Pliny is well known. It should here be noted that the fall of Jerusalem, about this time (70), must be held an inestimable boon to Christianity, in that it finally freed it from the oppressive fetters of Judaistic legalism. Up to the days of Decius persecution was purely spasmodic and ineffectual, whilst with Hadrian and Antonius Pius the Christians, who were regarded as a negligible factor, enjoyed considerable toleration and protection, being allowed to form themselves into funeral associations and poor men's guilds. But from 250, when the Catholic community, with its hierarchical constitution and systematised worship was held to be a serious menace to the whole military and religious policy of the empire, the emperors instituted universal massacres which continued till the abdication of Diocletian in 305. This last made desperate but futile efforts to exterminate the whole Christian society. At last, with the advent of Constantine in 313, came peace; for Constantine, who himself on his deathbed received the holy

baptism, extended to Christianity all the privileges and rights that hitherto paganism alone had enjoyed. But it was not until the accession of Theodosius the Great (379-95) that Christianity was finally adopted as the one and only religion of the state. Meanwhile, since the early years of the third century the conversion of the heathens in the E.—that is, in Arabia, Persia, and Armenia, and on the N. and W. confines of Rom. rule—had been making continual headway, so that before the great migrations of the fourth century the Goths and Teutonic invaders were already Christian.

In Persia and elsewhere political persecution and later the force of Islam wiped out all traces of Christian proselytes, but in the W. the effect of the barbaric invasions was to endure the Christian bishops with much of that social and moral power formerly wielded by the Rom. officials, so that the C. came naturally to be regarded as the heir to all the majesty and influence of anct. Rome. There emerge in the second century three officials connected with the Christian ecclesie, namely, the bishop, presbyter, and deacon, whose functions at first were patriarchal—that is, they administered charities and punished offenders against C. discipline. In earliest times there was one bishop attached to each C., but if he were away, it is easy to see how natural it was for his duties to devolve on the presbyters, sev. of whom were frequently appointed to each community. Ordinarily, however, the presbyters constituted the bishop's council, and the deacons his assistants merely. But as early as the third century diocesan began to supplant congregational bishops, or, in other words, the principle of centralisation was put into action whereby a number of Cs. were entrusted to the care of one bishop, usually a bishop in a large tn., who alone could ordain, and as whose representatives the presbyters only could conduct worship in the sev. Cs. The emergence of metropolitan bishops and finally of the papacy was a natural outcome of this process of centralisation. By the metropolitan system, the bishops of Ephesus, Carthage, and Arles, etc., exercised authority over many Cs. of neighbouring provs., whilst the bishops of Rome, Constantinople, Antioch, Alexandria, and Jerusalem exercised a still wider jurisdiction, and early became known as the patriarchs.

The mediæval doctrine that the C. was the ultimate authority on all questions, temporal as well as spiritual, received a mighty support from Augustine's *De Civitate Dei*, wherein the author maintained that the unified Christian C. was the kingdom of God, and accordingly was supreme over all nations here on earth. Upon this theory, too, was based the papacy—that is, the supreme authority of the bishop of Rome as Christ's vicar in this world. Christian doctrine, as embodied in the prayer books, took centuries to evolve, yet within a few years of Christ's death men's minds were agitated by questions of faith and belief, and bitter controversies rent asunder

the smallest Christian gatherings. The struggle with Gnosticism in the second century helped immeasurably towards the clearer definition of Christian theology. For an apostolic scriptural canon, our N.T. was drawn up, as also an apostolic rule of faith which forms the germ of the present Apostles' Creed. Above all, the doctrine of apostolic succession was promulgated—that is, that the bishops alone are qualified and inspired to interpret and expound the teaching of the Apostles, of which, indeed, they are the sole inheritors. Montanism (170) was essentially an outcry against the growing institutionalism of the C. It was in connection with this controversy that the first C. synods were held.

The first general or œcumenical council of the whole Christian community was held at Nicæa in 325, and from that time forward it became customary to call such a representative gathering whenever grave doctrinal difficulties arose. These synods and councils have a twofold importance: they were invaluable aids towards the principle of unification, and they laid the foundation stones of Christian orthodoxy. At the Nicæan Council the Godhead of Christ received official definition and official expression in the Nicæne Creed, whilst at the Council of Chalcedon (451) an attempt was made to find an answer to that long-debated problem, 'What is the relation between the divine and human nature of our Lord?' By the decisions of these two councils and that of Constantinople (680) the doctrine of the Trinity, held by both the W. and E. Cs., was explicitly formulated. The broad tendencies noteworthy in the mode of worship during this period are the elaboration of ceremonies and the rapid increase in their importance; the complete severance of the sacerdotal functions from those of the laity and the augmented dignity of the priests. While the E. C. was engaged in thrashing out the Christological and Trinitarian doctrines, the main controversy of a similar nature in the W. was that aroused by Pelagius, who came from Britain, on the nature of grace. A doctrine which was deemed a pillar of early Christian theology, was that the C. was the one ark of salvation, outside of which none could be saved. Thus to attain everlasting salvation a man must undergo baptism to release him from the devil and to generate in him a new spiritual nature, and, further, he must continually increase the divine life in him by feeding his soul on the body and blood of Christ in the holy communion. It is quite impossible within the limits of a short article to outline, even in the simplest form, the conclusions arrived at by the early theologians. The reader is therefore referred to the copious writings of the apostolic fathers, in whose works will be found an explanation of the countless schisms which oppressed the infant C., such, for instance, as the Origen controversy (394–438), the Apollinarian (362–81), and the Nestorian (428–44).

To take up the thread of the course of

the external hist. of the C. at the eighth century—there were at that time two great forces which seemed likely to swamp Christendom, namely, Mohammedanism and the idolatry of the Saxons and other barbaric hordes. But the Gallic conqueror, Charles the Hammer, by his victory at Tours in 732, effectually put a stop to the inroads of the Saracens in the W., whilst a stubborn warfare of thirty-two years (772–804) at last enabled Charles the Great to subjugate the Saxons, their conversion to Christianity being accomplished by the building of tns. and castles and the foundation of missions and monasteries. With the Christian religion once firmly estab., the medieval hist. of the Catholic C. resolves itself into an account of the rapid consolidation of the papal power and of its lengthy struggle with the Holy Rom. Empire, and, further, into an account of the movements of reform which arose in the C. itself, and also of those wider and more influential strivings after other forms of religion and worship which took firm root in the hearts of men throughout the Christian world.

From 730 eccles. lawyers spread the fable that Constantine had given the guardianship of the Catholic C. and State to the bishop of Rome, but an event which in actual fact contributed far more than this fable to the confirmation of the pope's authority was the final severance in 1054 of the W. from the E. C. The Monophysite (484–519) and other schisms had much to do with this rupture, but its real cause was the refusal of the bishops of Constantinople to submit in any way to the Rom. see. It was, of course, the great monastic orders, such as the Benedictines, Dominicans, and Franciscans, which, in particular, kept burning during the Middle Ages the flame of the lamp of anct. science and culture. From the fourth century onward, monasticism continually gained new ground: men of religious fibre gladly sought solitude or communion with kindred spirits, that in peace they might develop their higher life. The conventual life, indeed, was in part a revolt against contemporary society, with its wars and lusts and manifold corruptions, and it was ever a bulwark of the C. Thus from the monastery of Cluny, founded in 910, there passed out to the world what were known as the Cluniac reforms directed towards the reorganisation and cleansing of eccles. offices, and above all towards emancipation from state control. Yet, in spite of new orders, reformed clergy, and the work of such churchmen as Gerbert, Lanfranc, and Anselm, evils like the marriage of clergy, simony, and the selling of benefices continued. But for a time the papacy triumphed. From 1048 to 1266 Europe was divided by the famous struggle between pope and emperor. In 1073 Hildebrand, or Gregory VII. as he was then called, one of the noblest bishops Rome ever had, secured at Canossa the complete humiliation of Henry IV., but the vexed question of lay investiture, which also formed the substance of the

quarrel between Becket and Henry II., was not finally settled by compromise till 1122. It was probably during the reign of the youthful Pope Innocent III. (1198-1216) that the papal power attained the summit of its glory, but up to the death of Boniface VIII. (1303) its supremacy was almost unquestioned, for the four crusades (1095-1202) had greatly enhanced its reputation.

Nevertheless, in the light of modern hist., the struggle between pope and emperor was a fatal disaster, for the former, by stirring up the It. cities against the latter, postponed for centuries the consolidation of the Ger. states into a united kingdom. The practice of pious frauds, the growth of corruption, within the C., the so-called Babylonian captivity when the popes stayed in France (1305-1377), and above all the schism (1378-1409), during which there were rival popes at Rome and Avignon, disabused men's minds of that fine conception of a world C. and a world empire mutually indispensable and working in harmonious accord. Thinkers revolted against the conclusions of scholasticism, as also against the persecutions of the Waldenses and Albigenses (1207 and 1229), and later of the Hussites and Lollards. The lowered esteem of the schools of philosophy, the relaxed conditions of life among the clergy, the growth of national feeling combined with the changed attitude to the Papacy prepared the way for a new period. With the Renaissance came also the Reformation to open up a new era in C. hist. As the direct outcome of the preaching of the religious leaders Luther, Zwingli, Melancthon, and Calvin, Protestantism was estab. in opposition to the older Christian C., which still acknowledged the pope as its head, and which from this time forth became known as the Rom. Catholic C. It was left to the Protestant delegates to the Council of Trent (1545-63) definitely to set forth those new doctrines, such as the priesthood of all believers and the absolute authority of the Bible in matters of faith, which left no loophole by which the two could ever be reunited (*see also Church of England*). *See* C. Church of England.—In England Henry VIII. was recognised by Parliament as 'the only head in erthe of the Church of England.' The Eng. C. had been liberated from its subjection to Rome only to find itself under the heavy heel of a

temporal sovereign, whose will was law over all persons and 'in all causes ecclesiastical and civil within his dominions supreme.' The Reformation, in the sense of the setting forth of new formularies of faith, or of enforcing any change in the public worship or the ritual of the Eng. C., or, in fact, of breaking with the past in the matter of doctrine or ceremonies professed or observed in England up to the time of the great breach with Rome, can hardly be said to have begun when the reign of Henry VIII. came to an end. With the single exception of the Eng. litany, all public worship was celebrated in Lat., and though a copy of the Great Bible in Eng. was set up in the Cs., it remains still difficult to say when, by whom, and under what regulations the Eng. version so set up was publicly read. Great changes were to come, but they had to wait. During the reign of his son, Edward VI., the Common Prayer book was drawn up through the good offices of Crammer, Latimer, and Ridley—a compilation which, with its Thirty-nine Articles of faith, has ever since remained the criterion of Christian orthodoxy in the Eng. C. Lutheranism, which flourished in Scandinavia and Germany, was too conservative of monarchical principles and Rom. ceremonies to retain a lasting hold in other European countries. Here, and especially in S. Germany, Switzerland, Scotland, and the Netherlands, the Calvinistic or Reformed C. sprang up; for in these the congregations were organised on a thoroughly democratic footing—an arrangement which recommended itself to men of radical leanings, whereas the rigidity of its intellectual doctrine appealed to men of sterner mould and in general to the less passionate character of the colder N. In Germany it was only after the peace of Westphalia (1648) that Protestants other than Lutherans won freedom of worship. The reaction against Protestantism, or the Counter-Reformation as it is called, was led everywhere by the order of Jesuits.

Beginning in Bavaria (1563), it swept through S. Germany, and appeared in France during the sixteenth century, and did not finally lose its impetus till after 1650. From the Reformation onward the hist. of the Christian C. cannot be set forth in any connected narrative, for the simple reason that, whereas hitherto the Catholic C. with the pope at its head had been a great riv. with which all other streams of thought could be connected, the main channel is now divided into endless branches, no longer linked by an all-embracing central organisation, but having Christianity alone, and that in its broadest sense, as a common basis. The complete divergence of the Reformed Churches came through the growth of a new theory, which gave rise to the so-called Free Cs., but which had played no part whatever in the great Reformation. Dissidents from estab. religious communities, eager to find some logical apology for their dissent, promulgated the doctrine that the Catholic C. was no actual and material organisation, but

rather a spiritual association of all the faithful throughout the world. Moreover, according to this doctrine every man is justified in seceding from one sect or C. and in forming or joining another, there being no such thing as schism between Christian bodies. Hence arose that enormous multiplication of sects which is so striking in America and in other countries of comparatively recent origin. Some attempt will now be made to trace the development of a few of these. Puritanism in England dates from 1567, and may be described as an attempt to subvert the episcopal system and to remove those rituals and ceremonies which still savoured of the odious Papists. The formal confession of the Puritans, offshoots of whom were the Baptists and Friends, was drawn up by the Westminster Assembly in 1643-1649. Under Charles II. episcopacy replaced independency, and nonconformists were persecuted by a series of Acts, including the Act of Uniformity (1662). Latitudinarianism, which grew up within the Anglican C. in the seventeenth century, was an attempt to steer a middle course between the Churchmen and Puritans, whilst Deism was a futile attempt to reconcile Christianity with that philosophy and natural science which were then attracting so much serious attention.

Eng. Methodism was founded in 1739, after its leaders, Wesley and Whitefield, had been driven from the Anglican C. They developed no new doctrine, but aimed rather at a deeper realisation of the spiritual life, and were forced by the action of the C. to organise a new sect—a course certainly against their natural inclination. Methodism spread rapidly among the poorer classes, and twenty years after Wesley's death embraced 100,000 members. The Evangelical party whose stronghold was Cambridge, was the direct outcome of the reaction of Methodism on the Estab. C.; it numbered among its adherents some of the greatest churchmen of the day. About 1833 the Tractarian movement emanated from the High C. movement in Oxford: no doubt it was largely stimulated by the contemporary revival at Cambridge. This religious phase has been well described as an æsthetic development from the so-called Romantic movement in poetry and art. The chief doctrines to which attention was re-directed by the Tractarians were the divine authority of the C., baptismal regeneration, the real spiritual presence of our Lord in the holy communion and its sacrificial character, apostolic succession, and the divine origin and necessity of episcopacy. In the eyes of many the Tractarian movement seemed to have a Rome-ward tendency, and was therefore to be strongly opposed. The publication of Tract XC. by J. H. Newman, who argued that the Thirty-nine Articles condemned abuses of doctrine rather than the doctrines themselves, brought matters to a head. Bishops condemned the tract; Pusey, one of the leaders in the movement, was suspended by the univ. authorities. Meanwhile Newman had retired. Some of the younger followers of the Trac-

tarians had already drifted to Rome. In 1845 Newman seceded also, and was followed by many Anglicans of learning and ability. Pusey, Keble, and others, however, remained faithful to the C. and succeeded in establishing an Anglo-Catholic wing within the C. of England. The Anglo-Catholics adopted the ritual and doctrine of the Rom. C. but refused all allegiance to the pope. Finally there grew up the Broad C. party, who counted Kingsley, Dr. Arnold, and Dean Stanley among their chief lights. Though they were all loyal supporters of the Anglican body, these men urged a wider liberty in the subscription of creeds and in the interpretation of dogmas, and whilst minimising the importance of ceremonies and vestments and of the evangelical doctrine of sovereign grace, were insistently anxious to preserve the unity of their C. The above is the crudest outline of what followed the Reformation in England.

In Scotland national character and the personality of Knox gave the movement a different and peculiar development. The confession of faith sanctioned by the Scottish Parliament (1560) followed swiftly on the covenant signed by the Scottish nobility who were then known as the Lords of the Congregation. It was useless for Mary to try to restore Rom. Catholicism, or for James I. to attempt to foist Anglican dogmas on an unwilling people. The Presbyterian constitution was drawn up in 1592, and the Solemn League and Covenant of 1638 was an effectual remonstrance against the introduction of the liturgy. The Relief and Secession Cts. left the Estab. C. as a protest against the continuance of patronage and the *laissez-faire* attitude of the General Assembly. In 1843 the Non-Intrusionists—that is, those who held that no minister must be intruded on an unwilling congregation—separated to form the Free C. of Scotland, whilst four years later the Relief and Secession Cts. coalesced and adopted the name of the United Presbyterians. In Ireland an overwhelming majority has always been Catholic, the Protestants being chiefly confined to Ulster. The glaring injustice perpetrated by James I., who handed over the whole eccles. endowment of this country to Anglican clergy, was eventually remedied by the Irish Church Act of 1869, which arranged for the disestablishment of what is always known as the C. of England in Ireland. The assembling of the Pan-Anglican bishops for the first Lambeth Conference in 1867 manifested a wider vision of the mission of the Eng. C. The conference, which has no legislative authority, meets at intervals of ten years for the discussion of questions of outstanding importance to the work and witness of the C. in the light of the experience of the episcopate. It has been attended by increasing numbers of bishops, and their encyclical letters and the reports of the committees have had increasing weight among churchmen.

An Act of Parliament, disestablishing the C. in Wales, was delayed from becoming operative by the outbreak of the

First World War, but after final revision and amendment in 1919, came into operation in 1920. Between 1920-27 a proposed revision of the C. of England prayer book caused much debate, not only in that body but also among nonconformists. A Bill to authorise the use of a revised version was defeated in Parliament. (See under PRAYER. BOOK OF COMMON.) Other notable discussions of the time centred on the effects of modern scientific conclusions on religious belief, particularly in America, where anti-science groups adopted the title of Fundamentalists (*q.v.*).

The report of the archbishops' commission of theologians on Christian doctrine, pub. on Jan. 14, 1938, comprised the results of fifteen years of study by a commission appointed in 1922 by the archbishops of Canterbury and York. On the sources and authority of doctrine the report said that the authority of the Bible does not prejudice the conclusions of historical, critical, and scientific investigation in any field, not excluding that of the biblical documents themselves. The 'Church has always claimed that its doctrine is based on scripture, and therefore the commission places scripture first and the Church second. The authority of the Church's official formulations always rests, at least in part, on their acceptance by the whole body of the faithful, in view of its wide range and varied quality of spiritual experience, and of the witness borne alike in the practice of Christians generally, and in the doctrine of the theologians, to the truth of the gospel. The weight of this *consensus fidelium* rests principally on its continuance through the ages and the extent to which it is genuinely free.' On God and the world the report, by implication, denied the existence of any complete distinction between natural and revealed religion. A 'strict physical determinism' cannot be reconciled with Christianity. While 'many regard a miracle as a striking demonstration of the subordination of the natural order to spiritual ends, others regard it as less congruous with the wisdom and majesty of God than the observance of a strict physical uniformity.' Original sin was strongly affirmed in the report. The theological and religious values of the doctrines of the virgin birth and the resurrection are set out clearly in the report. It is, however, allowed that some members of the commission, while accepting the reality of the incarnation, regard the virgin birth as less consistent than a purely normal birth with the completeness of the incarnation. On sacraments, the report stated that the C. of England 'neither enjoins nor advises the regular and universal practice of auricular confession. Nevertheless the Church does not minimise the need of confession and absolution.' Confession to an authorised representative of the C. recognises the injury done to the whole body by sin, and also meets a deep-seated instinct of human nature. Finally, on the future life, the report stated that the predominant con-

temporary concern is with the personal destiny of individuals. In the N.T. this motive is secondary, and the chief concern is with the fulfilment of the purpose of God, to which the destiny of the individual is subordinate. That purpose is wrought out partly through hist., but for its complete working out it requires a new creation, not only of men, but of the earth and the heavens. Traditional orthodoxy has tended to take the scriptural imagery of the last things semiliterally, and to explain that the time of Christ's coming has been merely postponed. In a sense, however, the real heart of the eschatological message is to be found in the assertion of the immediate relation of human life here and now to eternity, judgment, and the triumph of God. It is therefore suggested that a truer perspective may be secured by taking the imagery in a symbolical sense, and affirming the continuous and permanent relation of the perpetually imminent eternal order to the process of events in time. In the last century of missionary and colonial expansion, there have grown up many overseas bishoprics. At the beginning of the last century there were but two colonial bishoprics, Nova Scotia and Calcutta. There are now over twenty-five dioceses in Canada alone, and some 124 colonial and missionary bishoprics. New Cts. have sprung up within the Anglican communion, but outside the boundaries of the Eng.-speaking race. The last quarter of a century or more has seen the organisation of the self-governing Cts. of Uganda, Japan (Nippon Sei Kokwai), China (Chung Hua Sheng Kung Hui), and India. Another notable step forward has been the increase of interdenominational co-operation, not only in such bodies as the student movement, but in the United Missionary Council, which has been able to bring before the gov. its views of the united missionary societies on various points of policy. These analogous signs of life are inevitably accompanied by an accentuation of different points of view within the C. of England, and by a sharper distinction between different schools of thought on matters of teaching and observance; but emphasis on the spiritual importance of the points in dispute has led also to an increased zeal for evangelisation of outsiders. See also ENGLAND, CHURCH OF, where will be found a bibliography.

Russia and the East.—The chief events of C. hist. after the First World War were those that took place in Russia. From the time when the Soviet Gov. disestablished the Russian C. in 1918, the experience of Christian believers, Orthodox, Catholic or Nonconformist, in that country were of the most distressing nature, as each succeeding year brought new persecutions and punishments for those who attended places of worship. In 1929 atheism was recognised by statute as the state attitude toward religion, and only those who showed themselves atheists were permitted the legal right to teach their beliefs. C. buildings were seized as the property of the State and provision

was made that any group of twenty citizens might lease a C. from the State. Religion was entirely banished from the teaching in schools, though teaching religion in private was still permitted. In spite of the severity of the new Acts the Cs. opened as usual and the services drew large attendances; a condition of things that led to such an outbreak of persecution as the rest of Europe has hardly known for centuries. This serious threat to religious liberty caused a number of earnest protests and entreaties to be sent to the Soviet Govs. in which Rom., Protestant, and Nonconformist Cs. of other countries united with the Gk. C. in their endeavour on behalf of their fellow Christians in Russia. Although freedom of religious worship was recognised later for all citizens of the Union, there is much anti-religious propaganda and the C. remains separated from the State: the parishioners give voluntary contributions for the support of the clergy. In 1943 Stalin agreed to the appointment of a patriarch and holy synod for the Orthodox C. in Russia.

The Church in Germany.—Pietism and Moravianism are two important issues for the orthodox Cs. of Germany. Spener and Francke, Pietist leaders, founded their *collegia pietatis* (1670) and *collegia philobiblica* respectively, and Halle soon became the heart of the new C., just as Geneva had been of Calvinism—a heart from which arteries carried the new religious ideals to many foreign countries. Moravianism, as it was preached by Zinzendorf, was merely a development from Pietism, both religions laying stress on the necessity of the closest fellowship between every member and Jesus Christ, and giving prominence to the doctrine of regeneration and sanctification rather than that of justification by faith.

The Church in France.—Deism, to which reference has already been made, blossomed anew in France. Here it found many adherents during the reign of Louis XIV., and was afterwards metamorphosed by the *encyclopédistes* into what was known as Atheism, and also into the religion of materialists. During the stormy years of the Great Revolution the most daring and unparalleled experiments were made in the field of religion as of politics, but these experiments, according to Hase, only served to prove beyond possibility of doubt not only the necessity of religion for a civilised people, but also the national indispensability of a C.

The broad tendency to be noted in the Rom. Catholic C. subsequent to the Reformation is towards Ultramontanism—that is, towards the recognition of the pope as the infallible head of the C., a doctrine which was proclaimed by the Vatican council in 1870. Thus, where any doctrine is in question or under dispute, the final and supreme decision as to whether that doctrine bears the true Catholic stamp, or, in the words of the famous canon, is 'quod semper, quod ubique, quod ab omnibus creditum est,' rests with the pope. This much controverted doctrine has often been confused with impeccability or personal inferrancy.

The Greek Church.—As regards the Gk. or Orthodox C., which grew out of the E. C., the reader is referred to the special article on that subject, but it cannot with propriety be completely neglected in this present abstract. Although the capture of Constantinople by the Turks (1453) doomed the Gk. C. as a political force, its spiritual ascendancy still remained paramount in spite of the fact that its four patriarchates were continually threatened with submersion by the inroads of the Moslems. Yet its activity was arrested when it fell under Turkish rule, and abroad it numbers few proselytes. The patriarchs of Constantinople, Antioch, Jerusalem, and Alexandria have equal authority, and decide all questions of doctrine and worship. In spite of the efforts of Melancthon, Crusius, and the renowned Lucaris—all apostles of reform—the Gk. C. remained almost indifferent to the gospel of Reformation. But, like the W. C., it has again and again suffered from a process of disintegration, the most important branches being the Ethiopian C. of Abyssinia, the Jacobites of Syria and N. Africa, the Armenians of European and Asiatic Turkey, the Maronites, and the Nestorians. The Orthodox Gks., before the Russian revolution, were numerically strongest in Russia, but are found in all the Balkan states, besides Turkey in Asia. Uniates are members of the Gk. C. who wish to heal the differences between the scattered and dismembered communities, and who therefore acknowledge the papal supremacy. The Cs. of Rumania and Yugoslavia style themselves autocephalous; those of Greece and Bulgaria are independent, the latter acknowledging the supremacy of an exarch.

The Church in the U.S.A.—The early hist. of the C. in the U.S.A. is bound up with the struggle between the Puritans, many, if not most, of whom were hostile to control from England, and the clergy sent out from the latter country. Prior to that period the Jesuits sent out missions to America, though the first missionaries in the New World were Franciscans and Dominicans. In the sixteenth century began the arrival of the new order of Jesuits. Taught by experience the Jesuits took care to concentrate their converts into settlements, these converts, so far as the U.S.A. are concerned, being Indians of the Sp. possessions of California. The more striking Jesuit successes, however, were won in Canada and in Paraguay. In Quebec the first Jesuits arrived in 1611, and began mission work among the Indians in 1615, continuing their labours until they were expelled in 1761, after having in the meanwhile endured almost incredible hardships from cold, squalor, and the indifference of their converts. The forests of N. America, in what was then New France and subsequently became Canada, were, indeed, the scene of the most heroic Jesuit missions in the whole hist. of the C., and names like that of Champlain, who made the first permanent settlement (1609), are famous in Canadian hist.

As has been often said, the greatest achievement of the Puritans was the

settlement of New England, where, in their new world 'they redressed the theological balance of the old.' Throughout these earlier years, following the pilgrimage of the *Mayflower*, there was a bitter conflict between the Separatists and those who still regarded the C. in England as their sole external authority in matters of religion. There were famous names among the non-Separatists, including men like John Harvard, the founder of Harvard College, but the majority of Puritans in America were Separatists, or men who wished on principle to separate not only from corruptions in the C., but from a C. which tolerated corruptions. Independent or Congregational principles prevailed among them, each congregation being an independent brotherhood bound together by a mutual covenant. The C. or congregation was accordingly the source of whatever external authority there was, and the community was organised on a theocratic basis. Discipline was rigorous, no distinction being made, for example, between sin and crime, and maypole revels and the celebration of Christmas Day were penal offences. Throughout the seventeenth century the Puritans were in the ascendancy, and they extended no kind of toleration towards those who disagreed with them, and were, moreover, jealous of their hard-won privileges. Early there were collisions with the Anabaptists, who, however, differed little from the Congregationalists except in the matter of infant baptism. The first Baptist C. in America was founded at Providence, by Roger Williams, an extreme Separatist, who, as an advocate of toleration, wrote a tract *The Bloody Tenent of Persecution*, which was answered by Prynne. In his enthusiasm for toleration Williams afterwards founded the colony of Rhode Is. in 1644 for the express purpose of furthering toleration. On at least two occasions Charles II. intervened in favour of toleration for Separatists in America, once on behalf of the Anabaptists and again in order to secure better treatment for the Quakers, who were accused of defying all civil authority. A royal letter of 1661 requesting that corporal punishment of Quakers should be discontinued gave the Quakers some relief, but in general their zeal was of so provocative a nature that the respite proved but temporary. Apart from the Jesuits, the Moravians were the only influential missionary agency prior to 1800, though the Society for the Propagation of the Gospel had over fifty missionaries distributed over New England, New York, New Jersey, Pennsylvania, Carolina, and Georgia, and their ministrations were given not only to the colonists, but also to the Negro pop. and to the Indians.

The most far-reaching event in the religious hist. of America in the eighteenth century was the movement called the Great Awakening which began in 1735 and lasted until 1760. It was a Pietistic movement which preceded the arrival of the Wesleys, and the chief figure in it was the famous preacher, Jonathan Edwards,

whose book, *Narrative of Surprising Conversions*, proved so great an influence over Wesley himself that he joined the Moravian brethren in their journey to Georgia in 1736. Methodism proper did not begin in America until thirty years later, the first Methodist bishop being Francis Asbury, whom Wesley sent out in 1771. The movement thereafter spread quickly, and Methodism is said to be to-day the most powerful religious body in the U.S.A. The most remarkable influence in the Great Awakening was the emotional preaching of George Whitefield, and it is frequently said that no one ever preached to such vast crowds or received such popular adulation as Whitefield did in America. On the other hand, Wesley's first visit, namely to Georgia in 1736-37, was a failure, a consequence of his insistence on baptism by immersion, his refusal of sponsors who were not communicants, his rejection of dissenters except on re-baptism, and the personal nature of his sermons, all of which considerations alienated the settlers and eventually brought him into conflict with the Moravian brethren themselves.

There was a reaction, however, during the war of Independence, when Rationalism spread from Europe to America. The remarkable influence of Tom Paine's *Age of Reason* in the U.S.A. was due partly to the fact that its *réchauffé* of Voltairian cynicism by way of expounding the common Deist objections to the Bible, were calculated to appeal to a more uneducated type of colonist grown discontented under the anarchy of *laissez-faire*, and the more prone to sympathise with Fr. opinions because their allies in Quebec were of that nationality; and furthermore, Paine himself was popular for having fought for the colonists in the war of Independence. The way, too, had been prepared to some extent by the Universalists, whose movement had begun a decade before, but was only reorganised on a definite basis for the first time some thirty years later, when the parent body was estab. in Massachusetts. The doctrine of Universalism as expounded by Hosea Ballou, an excommunicated Baptist, assumed the final salvation of all men and denied the Trinity.

There is no estab. C. in the U.S.A. The constitution of the U.S.A. expressly provides 'that Congress shall make no law respecting an establishment of religion or prohibiting the free exercise thereof.' But though there is no estab. C., there is a considerable following of the C. of England, which in America calls itself the Episcopal C. Anglicanism, however, had a hard struggle in the U.S.A., the colonists of New England, in the seventeenth century, being intolerant of it; and it was not until after the lapse of many years that the episcopal clergy from England obtained a permanent footing in the country. The C. was, however, early endowed in Virginia, and also in Maryland. Early in the eighteenth century the S.P.G. kept episcopacy alive in America through their missions to the Indians in New York, and for the better

part of the century supported over 300 ordained missionaries in the country, of whom, as we have seen above, Wesley was one. There was a set-back during the War of Independence, when episcopacy, which elsewhere than in Connecticut had close ties with England, was openly aspersed for that reason; and in the S. the existence of the C. practically ceased. The Amer. historian L. W. Bacon considers that the real revival of Anglicanism in America dates from the consecration of Bishops Griswold and Hobart in 1811. Among the chief representatives of Anglicanism in America at this time were John Henshaw, bishop of Rhode Is., who pub. *The Apostolic Ministry* on apostolical succession, and Richard Moore, bishop of Virginia. Some twenty years later a ritual movement began in America, and though it encountered, as in England, much hostile criticism for alleged superstitious practices, yet, generally speaking, the question of rites and ceremonies was settled far less acrimoniously in America than in England. In spite of occasional internal discords, the growth of the denomination in America continued to be rapid and enduring, and it is remarked by Bacon that 'no fact in the external history of the American Church at this period is more imposing than the growth of the Episcopal Church from nothing to a really commanding station.' See also CLERGY; CLERGY DISCIPLINE ACT. See J. Edwards, *Works*, 1806-11; A. Andrews, *The Ecclesiastical History of New Britain*, 1867; L. W. Bacon, *The History of American Christianity*, 1899; Platner and others, *The Religious History of New Britain*, 1917; H. K. Rowse, *A History of Religion in the United States*, 1924.

Church, States of the, or the Papal States (in It., *Stati Pontifici*, *Stati della Chiesa*, etc.), were those portions of Italy formerly under the dominion of the pope. The temporal rule of the papacy, which dated from the bestowal of the exarchate of Ravenna upon Pope Stephen II. by King Pépin, and reached its height under Innocent III (1198-1216), was finally suppressed in 1870. The total area of the states in 1859, the last year of their entirety, was 16,000 sq. m.; the pop. six years earlier being over 3,000,000. Legations were ruled by cardinals, delegations by prelates. With two small exceptions, the papal states may be said to have formed a compact prov. bounded on the N.E. by the Adriatic, on the S.E. by the kingdom of Naples, on the S.W. by the Mediterranean, on the W. by Tuscany and Modena, and on the N.W. by the Lombardo-Venetian kingdom. In 1930 a Concordat between the It. Gov. and the papacy granted the pope independence and the control of a small area known as the Vatican State. See G. Botero, *Discorso*, 1605; J. Guiraud, *L'état pontif.*, 1896; A. Eitel, *Kirchenstaat unter Clemens V.*, 1907; R. Mocalgne, *L'église mérovin-gienne et l'état pontif.*, 1929.

Church-ale, kind of ann. church festival in medieval England at which quantities of ale were drunk. (For the compound,

cf. *bridal, scot-ale*.) It was held in the churchyard or near the church, usually at Whitsuntide or Easter. The profits were often used for church funds or charitable purposes. Music, bull-baiting, dice, and dancing formed the amusements. The practice died out after the Reformation, and was always strongly denounced by the Puritans. The nearest modern equivalents are village fairs or wakes. See Philip Stubbs, *Anatomie of Abuses*, 1583.

Church Army, mission of the Church of England estab. in 1882 by the late Prebendary Wilson Carlile, C.I.L., D.D., as a working people's mission to working people. It has maintained this characteristic throughout many changes and developments. The evangelistic work includes a training college for evangelists and mission sisters, and for men and women representatives of various pars. during special Evangelistic Week-ends; parochial evangelists and mission sisters working as lay helpers of the clergy in various pars.; mission vans visiting remote country pars.; missions at the seaside, in prisons, public assistance institutions, and slums; and news teams in many dioceses. The social work includes lodging and residential hostels throughout London and the provs. for the reception of tramps and working men; lodging hostels, moral welfare work, homes, hostels, etc., for women, girls, and children. In various parts of the country there are also homes for elderly men and women. There are also youth centres and clubs. In addition to carrying on and developing most of its normal work the C. A., working on behalf of men and women on foreign military service, has provided rest and recreation centres, hostels, clubs, mobile canteens, libraries, etc. C. A. Housing Ltd. has built upwards of 1000 houses and flats which are let to poor, large families. 'Churchill' houses are being purchased and adapted to let at low rentals to elderly people who need security with independence. Everything is done under episcopal authority and in co-operation with the parochial clergy and responsible chaplains. The C. A. work is also carried on in many other parts of the world. Headquarters: 55 Bryanston Street, London, W.1.

Church Assembly, The, was set up in 1920 for the purpose of co-ordinating the work of the scattered units of the Church of England. It consists of three Houses, composed of bishops, clergy, and laity. The assembly is free to discuss any proposal concerning the Church of England, and to make provision in respect of such matters, but where this includes parli. sanction for any alteration contemplated, this authority is to be sought under the Church of England Assembly (Powers) Act, 1919, which is commonly known as the Enabling Act. Suggested alterations in doctrinal formulæ or in services or ceremonies or in the administration of the sacraments must be voted upon by each of the three Houses sitting separately, then by the Assembly, and finally by the House of Bishops. Parliament has the right of veto in the last instance in view

of the close association of Church and State. The Church of England Assembly (Powers) Act enabled the Church to become, for the first time, articulate as a body, and since it became operative many measures of reform have been passed, including the Clergy Pensions (Amendment) Measure, 1927; Representation of the Laity Measure, 1929; Ecclesiastical Dissolutions (Amendment) Measure, 1929; Clergy Pensions (Older Incumbents) Measure, 1930, and many others. None of the powers belonging to the convocations of Canterbury and York is to be diminished or derogated by the Assembly, which is also prohibited from exercising any power or performing any function distinctively belonging to the bishops by right of their episcopal office.

Church Association, founded 1865, with the object of 'maintaining the principles and doctrines established at the English Reformation and of preserving the purity of Protestant worship in the Church of England. . . . A strong Low Church body, it has formed a Protestant electoral association in many of the parls, bors, and divs. of England. Its organ is the *Church Intelligencer*. Address: 13-14 Buckingham Street, Strand, London, W.C.2. See *Official Year Book of the Church of England*.

Church Brief, see *BUTER*.

Church Congress, name of free gatherings of both ministers and laymen of the Church of England, annually convened for free discussion of great questions concerning Church and State. The first was held at Cambridge in 1861. The attendance is usually large, including bishops and lower dignitaries. Full reports of each session are pub. Since 1875 similar congresses have been held in the U.S.A., when the General Convention does not meet.

Church, Alfred John (1829-1912), Eng. classical scholar, educator, and author, master at the Merchant Taylors' School, 1857-70. With Brodrick he trans. Tacitus (3 vols., 1862-77). He is best known for his attempts to popularise the classics. His *Stories from Homer* and *Stories from Virgil* appeared in 1878. He also wrote *Stories from the Greek Tragedians* (1879); *Stories from Livy* (1882); and *Stories from Herodotus*. Other works are *Roman Life in the Days of Cicero* (1883); *Carthage* (1886); and *The Crusaders* (1903). C. ed. *Horæ Tennysonæ* (trans. into Lat. verse) (1868).

Church, Sir Arthur Herbert (1834-1915), Eng. chemist and scientific writer, prof. of chem. in the Agric. College of Cirencester, 1863; at Royal Academy of Arts, 1879-1911; lecturer at Cooper's Hill, 1888-1900. Among new minerals discovered by C. are churchite (called after him), and the animal pigment turacin. He was president of the Mineralogical Society, 1898-1901. He carried out researches in various branches of chem., and besides scientific memoirs his works include *Precious Stones* (1883); *English Earthenware* (1884); *English Porcelain* (1885); *Food Grains of India* (1886); *The Chemistry of Paint and Painting* (1890);

Josiah Wedgwood (1894); *The Conservation of Historic Buildings and Frescoes* (1907). He was made K.C.V.O. in 1900.

Church, Sir Richard (1784-1873), Brit. soldier, one of the liberators of Greece, son of a Quaker, b. at Cork. He accompanied the expedition to the Ionian Is. in 1809, raising two regiments of Gk. light infantry in 1809 and 1812. C. was Eng. representative with the Austrian troops at the time of Napoleon's fall (1813-14), and served King Ferdinand of Naples from 1817 to 1820. On the outbreak of the Gk. revolution and war of independence he became general of land forces there (1827), but an attempt to relieve the Acropolis failed, owing to lack of co-operation. He was more successful in W. Greece, forcing the garrisons of Missolonghi and Lepanto to surrender (1828), but resigned his command in 1829. He helped in the revolution of 1843, which overthrew King Otho and gave Greece a constitutional gov., becoming general of the Gks. again in 1854. *Consult* Correspondence and papers of Sir R. Church (29 vols. in Brit. Museum); E. M. Church, *Sir R. Church in Italy and Greece*, 1895.

Church, Richard William (1815-90), Eng. divine, nephew of Sir R. C. (d. 1873), became fellow of Oriel, 1838. C. was an intimate friend of Cardinal Newman at this time, and allied to the Tractarian party. In 1844, as junior proctor, he vetoed a proposal to censure *Tracts for the Times*, No. 90, publicly. He founded the *Guardian*, 1846, and contributed also to the *Saturday Review*. C. became rector of Whately, 1852, and was nominated by Gladstone to the deanery of St. Paul's, 1871. He declined promotion on Archbishop Tait's death. As an ardent high churchman he deprecated anti-ritualism, and urged toleration. Among his many works are *Civilisation and Religion* (1860); univ. sermons in *Human Life and its Conditions* (1876-78); a series of St. Paul's and Oxford sermons in *The Gifts of Civilisation* (1880); and *Sacred Poetry of Early Religious Discipline of the Christian Character* (1885); *Village Sermons preached at W'hadley* (1892-97). C. wrote *Spenser* (1879) and *Bacon* (1884), for the Eng. Men of Letters series, both admirable works. Other works are *The Beginning of the Middle Ages* (1877); *The Oxford Movement* (1891). C. ed. Hooker's *Ecclesiastical Polity*, I., 1868, and with Paget revised Keble's ed. of Hooker, 1888. See M. C. Church, *Life and Letters of Dean Church*, 1895; D. C. Lathbury, *Dean Church*, 1907.

Church Enabling Act, short title of an Act passed in 1919 setting up the Church Assembly (q.v.).

Church History, hist. of the Christian Church and religion, dealing not only with external matters such as its extension and its political and social relations, but also with its inner development in doctrine, ritual, and ceremonial. C. H. is divided into three main periods: *Ancient*, usually dated to the end of the pontificate of Gregory the Great (A.D. 590), but carried by some to Charlemagne's foundation of the new empire

(A.D. 800); *Medieval*, which closes with the Reformation; and *Modern*, from the Reformation to the present day. (A sketch of these three periods is given under CHURCH). Here we shall deal only with the development in the treatment of C. H. Our earliest documents consist of the books of the N.T., and various scraps of information contained in the letters and writings of the early fathers. In the second century, Hegesippus, a Jewish Christian, compiled some memoirs of the early days of the Church, but only a few fragments remain. Eusebius of Cæsarea, who wrote in the early part of the fourth century, is known as the father of the Church history. He gave an account of the Church of the first four centuries, and his work was continued in the next century by Socrates, Sozomen, and Theodoret. All these were produced in the E., whence no important Church historian but Nicophorus Callistus in the fourteenth century has arisen since. Rufinus trans. Eusebius's *History* into Lat., and fresh continuations were made by Theodorus Lector, Evagrius, Theophanes, etc. A trans. of the works of Socrates, Sozomen, and Theodoret was made by Cassiodorus in the sixth, and this compound work, known as the *Historia Ecclesiastica Tripartita*, formed the medieval text-book on the subject. Among other early names may be mentioned Sulpicius Severus, Jerome, Idatius, Prosper, Victor Tununensis, Isidore of Seville, Gregory of Tours, Bede, and Paulus the Deacon. In the later Middle Ages, the chief names are those of Haymo of Halberstadt, Anastasius, Ordericus Vitalis, and Otto of Freising. The greatest, however, is that of the Dominican, Antoninus of Florence (archbishop, 1446-59), whose work is often modern in its aspect. Since the Reformation there has been a steady stream of hist., at first largely polemical. The *Magdeburg Centuries* was a Lutheran attempt to show the primitive nature of Protestantism, and called forth the *Annales Ecclesiastici* of the Rom. Catholic Baronius, who was later followed by Alexander Natalis (Noël), Bossuet, Tillamont, etc. The scientific and critical era of Church hist. began with the Ger. Moshelm, who was followed by Schröckh, Semler, Planck, and a host of others. The names of Neander and Baur rank with that of Niedner, and mention must be made also of Hagenbach, Schaff, Ritschl, Möller, Mohler, Hefele, Pastor, Flche, and Martin. Harnack's *History of Dogma* also bears on the subject.

Churchite, see under CHURCH, SIR ARTHUR HERBERT.

Church Lads' Brigade, founded in 1891 by Col. W. M. Gee, and organised on the same lines as the Boys' Brigade. The C.L.B., however, is confined to members of the Church of England, and its purpose is to instil a regard for religion, health, and citizenship. The organisation is military in outline, and ann. camps are held each year. The movement has spread through the empire, and its enrolment is over 50,000 lads. It supplies

many missionaries to the Church, as well as church workers. The headquarters of the C.L.B. are at 58 Gloucester Place, London, W.1.

Church Missionary Society. This society was founded in April 1799 by a little band of about twenty-six men, among them being Wilberforce, Venn, Sharp, and Woodd. It resulted directly from the evangelical movement in the Church of England, but is now supported more widely by many schools of thought. Its original name, Society for Missions to Africa and the E., never came into practical use, and the full Church Missionary Society for Africa and the E., adopted in 1812, has come to be shortened to C.M.S. Missionary recruits were slow in offering themselves for service at first, and consequently many of the early missionaries were provided by Germany, among them Krapf, Pfander, and Rebmann; but the society has now and for many years past had on its roll over 1000 Brit. missionaries, and the present number is 1054, including 181 doctors and nurses. Associated with them in the work are 31,000 nationals of various countries, among them 216 clergy. The baptised Christian community connected with the society numbers over 1,000,000; and 516,380 students and pupils are being educated in its 6539 schools and colleges. The society's fields for foreign work are very extensive. Some of the earliest operations began in Sierra Leone, where the liberated slaves were settled; but the society is now at work not only in W. and E. Africa, but in Egypt, Palestine, Iran, India, and China, in all of which countries an indigenous Church has been estab. The C.M.S. has been instrumental in forming twenty-nine dioceses in various parts of these countries. The society's patron is always a member of the royal family; its vice-patron is the archbishop of Canterbury. Among the chief periodicals issued are the *C.M.S. Outlook* and the *Round World* (for children); the society also issues a number of books and other publications every year. Headquarters: 6 Salisbury Square, London, E.C.4.

Church of England, see CHURCH; ENGLAND, CHURCH OF.

Church Rates were formerly a tax levied in England and Ireland on all occupiers of land within the par. for the purpose of meeting the expenses incidental to the celebration of divine service and to the preservation and repair of the church fabric. The tax was assessed by the par. vestry. Property formed the basis for the amount which each tenant was required to pay. A dissenter might either be called on to appear in an eccles. court, or, if the sum were under £10, he might be ordered to pay by the local justices of the peace. Since the Compulsory Church Rates Abolition Act of 1868, maintenance of the churches has depended entirely on voluntary contributions, so that the rates are now only laid on actual members and supporters of the church.

Church Stretton, mkt. tn. and health resort of Shropshire, England, 13 m. from

Shrewsbury and 162 m. from London. It is picturesquely situated on the slopes of Longmynd, at an altitude of 700 ft. pop. 1800.

Church Union (English), formed in 1859 as a consequence of the Protestant riots at St. George's-in-the-East, its purpose being to maintain unimpaired the doctrine and discipline of the Church of England against Erastianism, Rationalism, and Puritanism, and, further, to repel any attempts to seize the church endowments for secular purposes and resist all attacks on the Church's marriage laws. The organ of the C. U. is the *Church Observer*. Its offices are at Lord Halifax House, 6 Hyde Park Gate, London, S.W.7.

Churchill, John, see MARLBOROUGH, DUKE OF.

Churchill, Charles (1731-64), satirical poet, was the son of the rector of Rainham, Essex. His marriage at the age of seventeen prevented his going to a univ., but he was prepared for the Church, and took orders in 1753. He became curate to his father when he was ordained priest in 1756, and when his father died, two years later, he succeeded him as curate and lecturer at St. John's, Westminster. The Church, however, was not his vocation, and in 1763 he resigned his offices, probably under compulsion, for his disorderly conduct made it impossible to allow him to continue in them. Somewhat earlier he had looked to literature to supplement his meagre stipend, and in 1761 he pub. at his own expense, having failed to obtain a fair price for it from the booksellers, his theatrical satire, *The Rosciad*. This was at once successful, not only owing to its undoubted merits, but also owing to its numerous personalities. This was followed by other works, the best known of which is *The Apology*, all of which are distinguished by their robust satire and the vigorous versification. C. now became acquainted with Wilkes, and he wrote many papers for the *North Briton*. When Wilkes was arrested, after the issue of the notorious 'No. 45,' C. only escaped by his friend's ready wit. As a reply to Hogarth's caricature of Wilkes, he wrote the stinging *Epistle to Hogarth*; and when Martin forced a duel on Wilkes, he lampooned the aggressor in *The Duellist*. In Oct. 1764 he went to Boulogne to meet Wilkes, but was there taken ill and d. in his thirty-fourth year. The best accounts of C. are by John Forster (*Historical and Biographical Essays*, 1858) and J. L. Hannay (prefixed to the Aldine ed. of the poet's work, 1866).

Churchill, Randolph Henry Spencer, more commonly known as Lord Randolph Churchill (1849-95), was the third son of the seventh duke of Marlborough. Educated at Eton and Oxford, where he showed great intellectual powers. He was also passionately devoted to exercise, and was very fond of hunting. He left the univ. in 1870, and devoted the next four years of his life to Blenheim. In April 1874 he married the daughter of Leonard Jerome of New York, and in the same year he was returned for Wood-

stock as the Tory member. During the early years of his parl. life he took no very great interest in parl. matters, although on at least two occasions his speeches attracted great attention in the House. During this period, however, he estab. his ideas concerning the gov. of Ireland, since he spent much of his time there, his father being the lord-lieutenant. In 1878 he attacked bitterly what he described as the 'old gang' of the party, and put himself up practically as the champion of orthodox Toryism. He, however, supported generally the policy of the Conservative Gov. The crushing blow which the Tories received at the general election of 1880, however, led to the formation of the Fourth party. This party, founded and led by Lord Randolph, had for its object the vindication of Conservative principles and the harassing of the 'old gang,' especially Sir Stafford Northcote. By this time C.'s speeches throughout the country had obtained for himself prominence as a politician and leadership in his own party. He began to advocate openly his principles of Tory democracy, which seem to have been based upon the theory, 'trust the people,' and which were to win for the Tories the suffrages of the masses. In 1885 he attempted to defeat Bright at Birmingham, and was ultimately returned as Conservative member for S. Paddington. In Salisbury's first administration he was secretary of state for India. After the defeat of the Home Rule Bill and the disintegration of the Liberal party, he became chancellor of the Exchequer and leader of the House of Commons. His resignation in six months was due to his inability as chancellor to acquiesce in the vote for supplies for the army and navy, and he probably thought that the mere threat of resignation would bring the gov. to their knees. He was mistaken; his resignation was accepted, and the ministry continued and flourished. After this period, he played no very active part in politics. In 1892 he was re-elected for Parliament, but during the session of 1894 he showed signs of mental and physical breakdown. His son, Winston C. (q.v.), wrote his life, 1905.

Churchill, Winston (1871-1947), Amer. author, b. at St. Louis, Missouri, U.S.A. Nov. 16. He graduated from the U.S. Naval Academy in 1894, but did not pursue a naval career, turning instead to editing the *Army and Navy Journal* and the writing of novels dealing with Amer. hist. and politics, in which he was very successful. He was a member of the New Hampshire State Legislature from 1903 to 1905. He formed an association called the Lincoln Republican Club to reform local politics, but the club was dissolved after C. had vainly sought to become governor. As he and the well-known Eng. statesman had the same name, were of about the same age, and both had written books, many people often confused them. Apropos of this, the Englishman once wrote an amusing and charming letter to his Amer. namesake. The Amer. novelist's best-known books are *The Celebrity* (1893); *Richard Carvel*

(1899); *The Crisis* (1901); *The Crossing* (1904); *Coniston* (1906); *A Modern Chronicle* (a study of the conflicts between ideals and realities) (1910); *The Inside of the Cup* (1913); *A Far Country* (on corrupt local politics) (1915); and *The Duelling Place of Light* (1917). Of these the second, third, and fifth, at least, became famous both in America and in Britain. After 1917 he went into retirement amid the New England mts., and only wrote one more book, *The Uncharted Way* (1941).

Churchill, Winston Leonard Spencer (b. 1874), Brit. statesman, soldier, and historian, eldest son of Lord Randolph C. (q.v.). He was educated at Harrow and Sandhurst, and entered the army in 1895. During the Sp.-Amer. war he served with the Sp. forces in Cuba. Between this date and the ending of the S. African war in 1902 he saw much active service: fighting in India, Egypt, and finally S. Africa. During the latter war he acted as the war correspondent of the *Morning Post*. On Nov. 15, 1900, he was taken prisoner by the Boers, but within a month succeeded in making his escape. In 1899 he contested Oldham in the Conservative interest. He won it the following year, at the khaki election, and he held it for nearly six years. When Chamberlain's Tariff Reform was launched in 1903, C. was one of the active opponents of any change in the fiscal system. At the election of 1906 he won N.W. Manchester in the Liberal interest. He had in the meantime been appointed under-secretary of state for the colonies in the Campbell-Bannerman administration, and proved one of the bitterest of opponents to the Conservative party. In 1908 he became president of the Board of Trade. He was, however, defeated at the by-election necessitated by his appointment. He soon obtained another seat at Dundee. He was peculiarly obnoxious to the militant suffragettes, who made him suffer much in all his election campaigns. In 1910 C. was appointed home secretary. It was during his tenure of this office that C. incurred a measure of quite unmerited ridicule at the hands of the opposition press for apparently superintending the 'operations' in Sidney Street, Whitechapel, when some Brit. infantrymen were detailed to fire on a house in which some foreign anarchists had taken refuge and which they were prepared to hold *a outrance*. He held this office for nearly two years, and was then appointed first lord of the admiralty. In his pre-war work in that office he conferred frequently with Lord Fisher, then in retirement. The fleet's excellent state of preparedness on the outbreak of the First World War was due largely to C. The naval brigade that C. procured and personally directed at Antwerp delayed the fall of that city. On the recall of Lord Fisher to duty in Oct., he and C. projected a diversion in the E. The Dardanelles scheme was the outcome—disapproved by Fisher. On Mr. Balfour taking the Admiralty, May 1916, C. became chancellor of the duchy; but, not being included in the War

Cabinet, he resigned in Nov., and spent the early part of 1916 as lieutenant-colonel commanding the 6th Royal Scots Fusiliers in Belgium. Wrote an 'appreciation' of the battle of Jutland for the neutral press. Later, he sought solace in painting and, as 'Charles Morin,' sold his pictures. In July 1917 he succeeded Dr. Addison as minister of munitions, at which office he accelerated the supply in larger quantities of the requisite shells and other munitions for the final allied advance of 1918. In this work, however, his policy

Elliot & Fry

WINSTON CHURCHILL

of increasing the munition workers' wages by 12½ per cent was freely criticised as materially contributing to the cost of the war; but the vital need of the moment was to secure the necessary output, a need which probably could have been met in no other way. His greatest triumph in this office was the organisation of tank construction on a large scale, and it is worthy of remark that C. was in a measure the originator of the tank. At the Armistice he became secretary for war and for air, and in that capacity he lent troops and other aid to the White or anti-Bolshevik armies in Russia. Here he has incurred much criticism, but apart from the sinister influence of the Bolshevik regime in these earlier years, which would have justified strong measures at the outset, it is to be borne in mind that the anti-Bolsheviks were allies of the Entente before the close of hostilities in the First World War. The defeat, however, of Adm. Kolchak prevented the

junction of his forces with those of Gen. Rawlinson, with the result that the only course was for the latter to evacuate the Brit. troops already stationed at Archangel and Murmansk. With the defeat of Gen. Denikin in the S., C.'s plans were frustrated and the last chance of restoring the old regime in Russia had gone. During his tenure of office as war secretary, C. rendered valuable and expert service in reorganising the regular army and in reconstituting the territorial forces as a second-line army available, with due constitutional safeguards, for foreign service. He was secretary for the colonies from early in 1921 until the Coalition fell in Oct. 1922, and again there fell to him tasks of great urgency by way of aftermath of the First World War. In Ireland he pursued a vigorous policy during the Sinn Féin outrages of those years and advocated reprisals. Subsequently, however, the Cabinet, largely at the instance of Amer. opinion, reversed its policy and made terms with Ireland, C. taking a prominent part in the generous settlement made with the newly created Irish Free State. At the Colonial Office, too, C. had much to do with the setting up of the mandatory rule of the Brit. Gov. in Iraq—a name substituted by C. himself for Mesopotamia as more in consonance with hist. and present boundaries—and in Palestine. In the general election of Nov. he lost his seat at Dundee to the Labour party, whom he had antagonised by a circular on military action in case of a general strike, which was characterised by his Socialist opponents as a strike-breaking device.

When Baldwin went to the country in Nov. 1924 C. stood for W. Leicester, and was again defeated by Labour. He dissented from the Liberal-Labour agreement to throw out the Baldwin Gov., and stood as an Independent candidate in a by-election in the Abbey div. of Westminster, but was defeated by the local Conservative. Back again at the parting of the ways, he stood as a Conservative in the general election of Oct. 1924, and was elected for Epping. Mr. Baldwin made him chancellor of the Exchequer, and he so remained while Baldwin's ministry lasted. During the general strike of May 1926, C. rode the whirlwind in the Ruritanian way described by H. G. Wells in *Meanwhile*. His budgets showed a gentle drift away from Free Trade, proerring and extending 'safeguards': his last, 1928, was coupled with derating (q.v.). Out of office once again, he was the chief critic of the National Gov.'s policy on the question of Indian autonomy; but in these ensuing years his most valuable work lay in his vigilant watch on the rate of Ger. rearmament, to which he never ceased to direct the attention of the gov. He was out of office from 1929 until the outbreak of the Second World War in 1939, when Mr. Neville Chamberlain, bowing to popular demand, appointed him first lord of the Admiralty. In this office his influence was immediately felt in the steps taken to combat the submarine and mine menace

—a task he had shouldered in the previous war under equally difficult circumstances. This was his old place in the Imperial War Cabinet during the First World War, but in the Second World War he became also head of a committee composed of the heads of the fighting services. The plight of Norway in 1940 was the acid test of the allied position. On April 11 C., repeating Chamberlain's pledge, said: 'We shall aid them to the best of our ability. We shall make peace only when their rights and freedom are restored' (April 11, 1940). But the collapse of the Norwegian campaign early in May brought about the fall of Chamberlain after a dramatic debate (May 8), in which C. chivalrously supported his chief; but, while the gov. was nominally sustained by a majority of eighty-one, it was obvious that when only 252 of 365 Conservatives in the House voted for the gov. the vote was in effect a heavy moral defeat for Mr. Chamberlain (q.v.). Yet C. himself did not escape criticism—on the ground of lack of boldness in the Norwegian campaign, criticism which was voiced by Adm. Keyes (q.v.), who resented the rejection of his offer to lead an attack on Trondheim. But C., even assuming that he had shown optimism in promising that the allied armies would 'cleanse the soil of the Vikings from the filthy pollution of Nazi tyranny,' had no real share in the responsibility for the major deficiencies which had wrecked that campaign. Moreover, it was common knowledge throughout Britain that ever since Hitler had been rearming C. had been hammering at the gov. of the day in an effort to persuade them of the dire need to arm against the struggle which he believed to be inevitable. Mr. Chamberlain now tried to restore the gov.'s position by broadening the basis of his ministry, but Labour refused his offers. When he resigned on May 10 C., who in his career had held every great office of state, at length achieved that of Prime Minister.

In effect the people of Britain chose him for their leader and never was popular trust more justifiably reposed in a national leader; for C., then in his sixty-sixth year, was setting out on a brilliant tenure of five years during which his incomparable gifts as a statesman and strategist were seldom at fault, and when the greater the disasters which befell the allied arms the more surely did he rise to every occasion—always the buoyant spirit inspiring a whole people with his own resolution and unswerving confidence in the ultimate issue. It was a tenure which, beginning in the bitter prospect of 'blood, toil, tears, and sweat,' ended in the blaze of victory, only to be followed by the defeat of the gov. a few weeks later by the resumption of party strife and the defeat of the Conservative followers of C.—a reversal of fortune which was in no way a reflection on C.'s leadership, but the normal reaction consequent on the break-up of a coalition, the dominant party of which had been the Conservatives. Disasters soon came after C.'s assumption of office, for the country was almost entirely unprepared for a

major war; but, in the midst of disaster, came the epic of the Dunkirk evacuation when C., tempering triumph with realism, warned the nation that 'victories were not won by evacuations.' In his new Cabinet of five (himself, Halifax, and Chamberlain representing the Conservative majority, with Attlee and Greenwood as representatives of Labour) C. continued to act as co-ordinator of the service depts. in the capacity of minister of defence. More than the change in personnel, however, was the change in spirit, the new spirit which C. himself infused into the gov. and the nation. 'Victory at all costs; victory in spite of all terrors; victory, however long and hard the road may be, for without victory there is no survival.' With the approach of the Fr. collapse C. was quite prepared, if necessary, for the nation to fight on alone. On June 12 the destiny of France came to a head when Weygand told the Fr. Cabinet that the war was lost. But though the Fr. Gov. decided that Britain must be asked to release France from her engagement of March 28 (to make no separate peace) C., with Lord Halifax and Lord Beaverbrook, flew to Tours on June 13 to resist this move. On June 16, after a further desperate appeal by Reynaud (Fr. Premier), C. made a dramatic proposal for the merging of the Brit. and Fr. Empires under a common citizenship in order to continue the war under a single War Cabinet, the two Parliaments to be formally associated—but the peace group in France showed no enthusiasm for a proposal which they said involved the loss of Fr. independence (which had now in fact virtually disappeared) and subjection to England. Soon afterwards Reynaud resigned and C. perforce gave up the idea of a further meeting with him.

The realism and effectiveness of C.'s policy in times of deepest stress and anxiety manifested itself in the face of the treacherous armistice concluded by Pétain (q.v.), which C. heard of with emotions of 'grief and amazement,' the 'terms of which might well strike a fatal blow at France's former ally.' For the Brit. Gov.'s acquiescence, albeit reluctant, in France's negotiation of a separate peace had been accompanied by one vital condition—that the Fr. fleet should be sent to Brit. ports and remain there during the negotiations; but in the result the Fr. fleet was preparing to go over to the Gers. and to resist Brit. action to turn it from that course. At the battle of Oran, C.'s Gov., having formally severed relations with the Pétain Gov., succeeded in thwarting Ger. hopes of acquiring this fresh accession of naval power (see further under NAVAL OPERATIONS IN THE SECOND WORLD WAR). Britain now had to fight on alone as 'the sole champions now in arms to defend the world cause. . . . We shall do our best to be worthy of that high honour' (C. on June 17). And always, throughout the darkening hours, C. would make some characteristic utterance which will survive in the language—as, for example, in the Battle of Britain (q.v.), 'Never in the

field of human conflict was so much owed by so many to so few,' in reference to the bravery of the Brit. pilots. C.'s most striking contribution, strategically, to the victory of the Allies probably lies in his Mediterranean strategy. He appreciated that the line through the Middle E. (q.v.) was the vital artery of the Brit. Empire; whence his anxiety to render harmless the Fr. fleet at Alexandria; whence, too, the 100 per cent reinforcements which the Brit. Mediterranean fleet received at the beginning of Sept. 1940 and his bold decision to send to the Middle E. Britain's one armoured div. Some broadcasts he uttered were highly effective, for example, that to the It. people (Dec. 23, 1940) in which he accused Mussolini of the sole responsibility for all Italy's woes and promised still greater calamities if he were allowed to continue his ruinous course. Thus for the first time a Brit. leader appealed to the spirit of revolution in an enemy nation and it may well be that his prophetic vision foresaw the 'jackal' Mussolini's doom. The loss of Cyrenaica early in 1941 was a sore disappointment to C., the Brit. generals on the spot having underestimated the weight of the coming Axis blow, and when ultimately Rommel (q.v.) reached Egypt, C. acted with dramatic firmness (see *infra*). Always bold, he decided that Crete should be defended, it being his belief, erroneous as it transpired, that 'we had a good chance of winning the battle.' Later, however, the scantiness of the available anti-aircraft artillery was adduced by him as the reason why more airfields had not been constructed in the Is.; but in fact this did not explain the early fall of those that were in existence, and doubtless Ger. initiative and imagination had caught the Brit. by surprise.

Then C., faced with the seriousness of Britain's situation owing to the decline of shipping through heavy losses in the so-called battle of the Atlantic, called, in June 1941, on America for 'a gigantic building programme as the only true remedy,' and he did not appeal in vain; for, as C. had always said, 'if America would give them the tools, they would do the job.' C.'s relations with President Roosevelt were those of perfect mutual understanding and confidence. Towards the period when Ger. relations with America were growing more difficult owing to Roosevelt's policy of resistance far beyond America's territorial waters, he and C. met on a warship in the Atlantic when, as the result of the famous if somewhat impracticable Atlantic Charter (q.v.), Amer. policy took a vital step forward. If the principles of the charter hardly came up to allied hopes, which indeed in the circumstances looked for a programme of immediate action, the charter's long-range policy of appealing to the conquered nations with the presentation of a programme to which they could rally as active allies of the democracies was well conceived. And at least C. could announce that President Roosevelt had made it the joint purpose of America by decisive military victory

to prevent another war, and that together they had 'jointly pledged their countries to the final destruction of Nazi tyranny,' a statement which was borne out by the President's subsequent course in speech and action. In a memorable invocation to the conquered after the Atlantic conference, C. said: 'Keep your soul clean from all contact with the Nazis. Make them feel, even in the hour of brutish triumph, that they are the moral outcasts of mankind. Help is coming. Mighty forces are arming in your behalf. Have faith. Have hope. Deliverance is sure.' Memorable will always be C.'s prompt pledge of all aid to Russia made immediately on receiving intelligence that the Wehrmacht had invaded Russia, an offer more striking in view of C.'s unchanged views concerning Communism.

Again, when there were indications in Oct. 1941 that Japan was making preparations for further expansion in China, and before America had issued orders to withdraw the few Amer. marines then still in China, C. had promised immediate support if the U.S.A. should become involved in war with Japan. A month later C., accompanied by a staff of military and technical advisers, had arrived in Washington to confer with Roosevelt on their common defence so as to secure unified direction in the different theatres of operations and co-ordination between the various sectors of the far-flung battle fronts. Matters went badly from the start in the war with Japan; for the gov. had sent out the battleships *Prince of Wales* and *Republic* with a view to building up allied naval strength in the Pacific; but the loss of these ships led to a somewhat critical debate in the Commons which opened (Jan. 27, 1942) on a motion of confidence in the names of C., Attlee, Sir Archibald Sinclair and Ernest Brown. In this three-day debate C. in his inimitable way pointed out to his critics many fundamental strategic truths and in the resulting div. there were 363 votes for C.'s Gov. and one (Mr. Maxton's) against. On June 18, 1942, C., with the Brit. chief of the general staff and other military authorities, made his second visit to America, for the express purpose of discussing the strategic situation with Roosevelt direct. Under C.'s lead the Brit. aerial effort against Germany was now growing apace, as was shown, for example, on the night of May 30, 1942, when over 1100 planes were concentrated in a mass attack on Cologne. This was followed by great daylight sweeps which further demonstrated the growing power of the R.A.F., a development which lent force to C.'s grim forecast that 'as the year advances Ger. cities, harbours, and centres of war production will be subjected to an ordeal the like of which has never been experienced by any country in continuity, severity, or magnitude.'

Difficult as was the path of the gov. in these fateful early years of the war it is possible to see the beginnings of the turn of the tide in C.'s decision to appoint Gen. Alexander as supreme commander

in the Middle E. and Gen. Montgomery as commander of the Eighth Army (q.v.). C. expressing himself as satisfied 'that this combination is a team well adapted to our needs and the finest at our disposal at the present time.' He had taken advantage of his visit to Moscow to investigate the situation in the Middle E. At the conference in Moscow, held early in Aug., C. with Roosevelt and Stalin, together with various military leaders, had a four-day discussion on strategic plans. C.'s changes in the Middle E. commands were soon followed by the remarkable Brit. victory at El Alamein (Oct. 23-Nov. 4), truly, with the concurrent battle of Stalingrad, the turning point of the war. The battle of Stalingrad was, however, not yet over and, moreover, the Gers. were concentrating with increasing intensity on submarine warfare. C. was well justified in his timely warning (Nov. 29, 1942): 'I know of nothing that has happened yet which justifies the hope that the war will not be long or that bitter and bloody years do not lie ahead'; but C. would have been the last to deny that the conditions of victory, notably in the progressive increase in the war potential of the United Nations partly effected through his own remarkable exertions, were becoming clearer and appearing steadily more attainable. In the matter of the 'second front,' it had been agreed between Britain and America to postpone an attack on Europe and to undertake an expedition to N. Africa, but it was left to C. to explain this delay to Stalin and to gain his acquiescence. One reason for the postponement was no doubt the increasing success of the Ger. submarine campaign. But, as C., in his report on the Casablanca Conference (Jan. 1943), had said, 'our duty to aid to the utmost in our power the magnificent, tremendous effort of Russia and to try to draw the enemy and the enemy air force from the Russian front was accepted as the first of our objectives once the problems of the U-boat war had been met in such a way as to enable us to act aggressively'—an assurance that was the key to all the plans and efforts of the Allies in the months that followed Casablanca.

C. fully supported the strategic task of night bombing imposed on the R.A.F., a policy that was certainly justified by its results. 'It was our settled policy,' said C. in his speech to the Amer. Congress (May 19, 1943), 'to make it impossible for Germany to carry on any form of war industry on a large or concentrated scale, either in Germany, in Italy, or in the enemy-occupied countries,' and in that speech he had hinted that the advocates of victory through air power might be given their chance to prove their case. While at Washington, C. took the opportunity of reassuring the U.S.A. that Britain's interests in the struggle with Japan were at least equal to those of the U.S.A. and that the Brit. would wage war side by side with the Amers. in accordance with the best strategic employment of their forces—a full answer

to those Amer. critics who, from ulterior motives, were casting ill-founded doubts on Britain's readiness to aid America against Japan once Hitler had been beaten. C.'s strategic gifts were once again evident in the conduct of the campaign in Italy in 1943, though there were not lacking critics who thought that valuable time had been lost between the fall of Mussolini and the delivery of the major assault on the mainland of Italy, a charge which C. vigorously refuted by the valid defence that the 'condition and the preparation of the landing craft were the sole and decisive limiting factors.' It is true that in the interval between July 25 and Sept 8 the Gers. had made ample preparations to meet invasion, preparations which some think could have been thwarted or checked by airborne invasion, commando attacks, or other prompt action in adequate measure if not on any full scale. But these criticisms might well seem to involve confusion between political issues and strategic or logistic considerations; for the gravamen of the charge was that the armistice with Italy had been unduly delayed and the allied air attacks in Italy suspended in the expectation that Marshal Badoglio would initiate negotiations for peace. C.'s retort was 'The truth is that the armistice was delayed to fit in with the attack and not that the attack was delayed to fit in with the armistice.' Time alone and the disclosure of the essential documents can determine these controversial questions, though the fact remains that by strenuous efforts the date of the invasion, originally planned for Sept. 15, was advanced by a full week, and even though the Allies may not have pressed their advantage to the maximum limits, their gains were immediate and substantial (see further under ITALIAN FRONT, SECOND WORLD WAR CAMPAIGNS IV). What is important to recognise is that C. never regarded the N. African operation and its sequel in Italy as a substitute for a direct attack across the Channel upon the Gers. in France or the Low Countries, but only as an essential preliminary to the main attack on Germany and her ring of subjugated and satellite states. With C. and his advisers the second front existed and was a main preoccupation already with the enemy, and 'on the day,' he said, 'when we and our American allies judge to be the right time this front also will be thrown open and thrown into play, and a mass invasion of the Continent from the west and south will begin'—a promise which was fulfilled in ample measure on D day in June the following year. Speaking at Harvard (Sept. 6, 1943), C. enlarged on the steady advance in the fundamental unity of the Allies for war purposes, and even boldly challenged the ant. Amer. tradition of isolation, advocating an even closer unity for the future—a unity which he himself had advanced to some extent by leasing naval and air bases in Brit. overseas terr. in exchange for fifty Amer. destroyers (Sept. 1940). Of all the conferences

between C. and Roosevelt the Quebec Conference (which began on Aug. 11, 1943) was the most comprehensive; for then fundamental agreement on immediate ends was arrived at, including action in China, though once again as at Casablanca no Russian representative was present, the main cause of Stalin's impatience with his allies being the continued absence of a second front in W. Europe.

In the flying bomb period, in 1944, C. scorned the idea that Parliament should transfer its location to some safer city and called upon all who had duties in London to remain at their posts; and in view of the brilliant work of defence in overcoming this terror he was justified in his attitude. The internecine strife in Greece in 1944, coming on top of the political incidents in Italy of 1943, engendered in some political circles in Britain an idea that as victory was approaching C.'s policy was inclining to the support of effete regimes in Europe as against the popular forces which had emerged; nor could it be denied that the Brit. Gov. had manifested much greater sympathy with the exiled Gk. dictatorship in Cairo than with the popular resistance movement fighting in the Gk. mountainous regions; but the main preoccupation of C.'s Gov. was to maintain order in Greece and safeguard the distribution of food supplies. But fighting still continued in Athens, and to restore confidence in the gov. C., with Eden, foreign minister, flew on Christmas Eve to Athens. The results of his visit, however, were less spectacular than the visit itself, though C.'s presence there restored the confidence of the Gk. people in Britain's good intentions. In this year (1944) C. also visited the battle front in France, and indeed it was a feature of his premiership that he was so often overseas, whether at vital conferences or in theatres of war. In the Commons (Aug. 2) he disclosed for the first time some of the background of the campaign in France in the matter of planning and preparation and emphasised that they had had neither the experience nor the tackle to execute so vast an enterprise any earlier than they actually did. No impartial person could deny that C. had given a convincing answer to those ideological opponents who had demanded the opening of a second front without knowing what that great operation involved. On Sept. 10 C. went once again to Quebec to confer with Roosevelt, and there he and the President reached decisions on all points respecting the completion of the war in Europe and the destruction of Jap. power in the Pacific. Less than three weeks after his return from Quebec C. left England again for Moscow, accompanied by Eden and members of the general staff. This conference (Oct.) was the sequel to Quebec, the discussions concerning, chiefly, their common problems in E. Europe. In Feb. 1945 C. went to the important conference at Yalta, in the Crimea, where, with Roosevelt and Stalin, the Allies drew up a plan for the final

defeat of Germany, and the occupation and control of that country after her unconditional surrender. The conference also reaffirmed the Allies' common determination to maintain in the peace the unity of purpose and action which had made victory certain; but in the sequel at Paris in 1946, many months after C. had resigned, it soon became evident that the policies of the W. democracies and Russia were entirely divergent. The ultimate delimitation of Germany's boundaries was considered by a three-power conference at Potsdam on July 16, 1945, between C., President Truman, and Stalin, but certain changes had then already taken place and in the Commons in Aug. 1945, after the change of gov., C., in the debate on the King's Speech, said, as to the results of that conference, that it would be impossible to conceal the divergence of view which existed about the state of affairs in E. and Middle Europe. Early in April (1945), as victory was approaching, the exchange of reaffirmations between Conservative and Labour ministers heralded the break-up of the Coalition.

The end of war with Germany brought C. face to face with the question whether the time had come for a dissolution of Parliament or a general election. The Conservative Party managers pressed him to hold an election in July as most favourable to Conservative prospects. C., however, sounded the Labour leaders on the possibility of continuing the Coalition Gov. until the end of the war with Japan, but their response was unfavourable, though they were willing to remain in the Gov. until the end of the session in Oct. On May 18 C. suggested to the Labour and Liberal leaders that they should remain till Japan was defeated and that then they should discuss means for taking the nation's opinion, e.g. by referendum, on the issue whether in such conditions the life of Parliament (which already had long exceeded its term) should be further prolonged; but in the result he committed himself to dissolving Parliament at the earliest possible moment, and on May 25 he formed a new gov. (the 'Caretaker Gov.') almost exclusively of Conservatives. Parliament was prorogued on June 15 and immediately afterwards formally dissolved. In the ensuing election campaign C. toured the provs. and was everywhere greeted with unbounded enthusiasm; but his audiences in many cases made it evident that they intended to draw a sharp line between his personality and the policies advocated by his party. In London he toured certain critical constituencies, but while his reception was again most enthusiastic, the dissent from his political views was even more marked. It cannot be said that in this campaign C. really rose above the partisan, his broadcast address on June 30, on the relations between the Labour party executive and Labour ministers, and in particular on the influence of the Labour 'caucus,' being all too reminiscent of the 'Zinoviev Letter' tactics of 1924. The

results of the election disclosed a great victory for Labour. C. was of course elected (for Woodford) by a large majority; but he at once bowed to the verdict of the nation and on July 26 resigned. In the debate on the Address from the Throne (Aug. 1945) the new Prime Minister (Mr. Attlee) paid a warm tribute to C. for his services as a war leader. 'His had been,' said Mr. Attlee, 'a true leadership which meant the expression by one man of the soul of the nation and its translation of the common will into action. In undying phrases he had crystallised the unspoken feeling of all. He had radiated a stream of energy throughout the machinery of government. Indeed throughout the life of the nation. While many others had shared in the work of organising and inspiring the nation in its great effort, he had set the pace, and he had known how to bring into co-operation men of very different political views and to win from them loyal service. His place in history was secure, and though he was no longer at the head of affairs when final victory came, this really was the outcome of plans made long before under his leadership.' Churchill River, rises in Lake La Loche (or Methy), Canada, between Rs. Athabasca and Saskatchewan, flowing through various lakes into Hudson Bay, near Fort Churchill in Keewatin. It forms the only harbour on the W. of Hudson Bay for large vessels at all states of the tide (6-8 fathoms deep), but has rapids only navigable by canoes, 5 m. from the month.

Lake Reindeer or Caribou connects it with Wollaston or Great Hatchet Lake and Mackenzie R.; La Loche portage with the Athabasca's trib., Clearwater. Known as C. R. as early as 1688 (probably after Lord Churchill—Marlborough). It is also called Mississippi, English, or Beaver R. It is about 900 m. long.

Churching of Women, public thanksgiving in church by mothers for their motherhood and recovery from the perils of childbirth. This religious usage (probably borrowed from the Jewish law, Lev. xii, 6) has prevailed in the Christian Church from early times. In former days the practice was usual, but among Protestants it is falling into disuse, though still obligatory in the Gk. and Rom. Catholic Churches. Presbyterian and Independent Churches of Britain and America reject the service. The Gk. rite also celebrates the presentation of the infant in the Church, the Lat. is exclusively a blessing on the woman (whose child is born in wedlock). The first definite mention is in the pseudo-Nicene Arabic canons. The formularies now used date only from medieval times.

Churchwardens are lay eccles. officers, who represent the body of the par., and are, as their name implies, guardians of the church. In all new pars., according to the Church Building and New Parishes Acts of 1818-84, they are appointed one by the minister and the other by the parishioners, and this custom prevails in England, but where a different practice has been time-hallowed no alteration need be made. Thus in some old London pars. the parishioners choose both wardens; in others they are appointed by the select vestry, the lord of the manor, or even the outgoing officers. They are elected annually, for the most part during Easter week, being required to make a declaration before the ordinary—usually the bishop of the diocese—to the effect that they will perform their duties in good faith. In early times the *Seniores ecclesiastici* merely had charge of the fabric and furniture of the church. To-day the wardens have to collect the offertories, provide the necessities for divine service, protect and repair the building with its goods and fixtures, and also the churchyard enclosure, and assign seats to the parishioners. As the office of churchwarden is single, either officer holding an undivided moiety, the vicar's warden and the par. warden cannot legally act without mutual support. Those primarily eligible are resident householders, but habitual occupiers, who happen to be non-resident householders, may also be appointed. Certain classes, such as peers, justices, clergymen, etc., are exempt, whilst others, as, for example, aliens and felons, are ineligible. In the Rom. Catholic Church lay officials like the three *marguilliers* in pars. of France offer the nearest analogy to the Eng. C.

Churchyard, name of a piece of consecrated ground attached to a parochial church (thus differing from a cemetery), used as a burial-place. Cs. are often of earlier date than the church itself, since

Rom. law protected any area containing monuments of the dead with the utmost reverence. Burial in Cs. in England is ascribed to Cuthbert, archbishop of Canterbury (741-58). All Christian services may now be used at C. burials (Vict. 43, 44, chap. 41). The C. is the freehold of the parson. It may never be used for secular purposes, and misbehaviour of any kind within its precincts can be severely punished by law. See also under BURIAL ACTS.

Churl, see CEORL.

Churn, vessel or utensil for the purpose of making butter, by shaking the cream and so separating the serous from the fatty parts. The form of C. which for long held its position was an upright wooden vessel, shaped like a travelling metal milk can, in which the cream was worked by a wooden plunger by hand. To this succeeded a wooden box, in which moved a splasher, or dasher, a small wooden wheel, like a water wheel, turned by a crank by hand. Large Cs. are now turned by machinery, and revert in a way to the primitive form by being revolved or swinging on themselves by mechanical means. Good Cs. should be of seasoned oak-wood, and so constructed with removable splashers or dashers that they can be easily and thoroughly cleansed after use. In modern large Cs. glass lights are fitted through which the butter can be watched as it begins to form, and the exact moment for withdrawing the buttermilk be ascertained. See BUTTER and DAIRY.

Churu, tn. of the native state of Rajputana, India, 100 m. from Bikaner. Pop. 14,000.

Churubusco, vil. situated on the Rio de C., 6 m. S. of Mexico City. Before the Sp. conquest there was a large Aztec city on the same site, called Huitzilpochtli, of which the name C. is a corruption. C. contains a stone convent which in later days was the stronghold of the Mexican defence against the Amer. troops under Gen. Scott at the important battle of C. on Aug. 18, 1847, during the Mexican war. The Mexicans under Santa Anna were eventually defeated, losing about 7000 men, the Amer. losses being only 1000.

Chusan Islands form an archipelago off the E. coast of China. The largest, C., is 20 m. long and from 6 to 12 m. wide; it is regarded as the key to China. There are sev. tns., of which the cap. is Tingha. Pop. 250,000.

Chusite, variety of olivine, which is itself a variety of chrysolite, from which Dana considers it to be derived.

Chust (uz, salt), tn. of the Uzbek Republic, Russian Central Asia, on Syr Darya, 32 m. from Namangan, 80 m. from Margelan, at the foot of the Chotkal Mts. Manufs. knives. Pop. about 15,000.

Chu Teh (b. 1886), Chinese soldier, b. at Hung, Szechuan. A descendant of the mandarin class, he was trained at the Yunnan military academy and was given a commission in the army of Tai Ao, governor of Yunnan. He saw service in the 1911 revolution and at thirty was a brigadier general. But in 1916 he

exchanged a military for a political career. Tsai Ao appointing him successively Director of the Bureau of Public Safety and Prov. Commissioner of Finance. In these offices he seems to have found the opportunity to acquire considerable wealth; but, like Tolstoy, his birth did not preclude much sympathy with the serf class and he abjured his easy life, joined the Kuomintang and then travelled to Europe to study sociology and the writings of Marx, Lenin, and Bukharin and also took a course of instruction in Moscow (1926). When Chiang Kai-shek broke with the Communists, C. T. had to flee and thus ended his membership of the Kuomintang. With some hundreds of followers he waged guerrilla warfare on the frontiers of Kiang-si and Hunan, revealing considerable military talents. In May 1928 he joined forces with Mao Tse-tung (see CHINA, *History*) who was subsequently the supreme director of the Chinese Communists—and a Chinese Soviet state was proclaimed by them in the mts. of the Fukien Kiang-si border, with Mao Tse-tung as political organiser and C. T. as commander-in-chief. He was the outstanding military genius of the Chinese Communist army as was shown by his conduct of its retreat to Yen-an, the Communists' N.W. cap., after five years of campaigning against the enormous armies of Chiang Kai-shek. The successes of the Communist armies against the Nationalists were mainly due to the principles he inculcated in his followers though he did not lead the Communists in their conquest of N. China and their subsequent advance S.

Chutney, **Chutnee**, or **Chutny** (Hindu *chāṭni*), E. Indian condiment made of mangoes, chillies, or capsicum, and lime-juice, with other native fruits, such as tamarinds or ginger-root. The flavour is often heightened by garlic. It is now manufactured for sale in the W., like pickles. Home-made Cs. are often made with various fruits, acids, and spices, tomato flavouring being very common. The chief ingredients generally used are chillies, green ginger, crushed tamarinds, apples, sultana raisins, distilled vinegar, shallots, cayenne pepper, fine salt, garlic, and cucumber. See J. Forbes, *Oriental Memoirs*, II., 1813; and for detailed recipes any modern cookery book.

Chuvashes, or **Tchuvashes**, people of E. Russia, near R. Volga, W. of Kazan, probably of mixed Finnish and Tatar origin, now generally considered of Turkish stock, numbering between 500,000 and 600,000. They are nominally Christians. Their country is an autonomous republic of the R.S.F.S.R., with an area of 18,413 sq. km., and a pop. of nearly 900,000.

Chuyungkuan, customs station in the Nankow Pass, 30 m. N. of Peking, China. It possesses a polyglot inscription.

Chyle, milky-looking fluid passing through the lacteals, which are the vessels which absorb fat from food passing from the smaller intestine. The liquid, which consists of a mixture of these fat globules with the natural juice, passes from the

lacteals into the thoracic duct. **Chyluria** is the passage of C. with the urine. It is commonly caused by the presence of the parasitic *Filaria sanguinis-hominis* in the blood and lymph channels. Where filaria are not present the condition is probably due to a disordered state of the lacteals, the capillary vessels of the small intestine that normally take up the C. Chyme is the pulpy mass into which food is converted in the stomach prior to its separation in the small intestines of the C.

Cialdini, **Enrico** (1811–92), It. general and politician, who in 1860 won the battle of Castelfidardo. In 1861 he forced Gaeta and Messina to yield, for which services he was created duke of Gaeta.

Ciamiciari, **Giacomo Luigi** (1857–1922), It. chemist, b. at Trieste, educated at univ. of Vienna. Assistant at Chemical Institute of Rome, 1880; prof. of general chem., Padua, 1887. From 1889 ordinary prof. of general chem. at Bologna. Senator, 1910. Works include *Organico e fisiologico chimica* (1908); *Fotochimica nell'avenire* (1912).

Clampoli, **Domenico** (1855–1929), It. writer, b. at Aversa, in the Abruzzi. He was a prof. of literature at Ancona, and has written some stirring novels which represent the life of the natives in the Abruzzi, such as *Conti Abruzzesi* (1880); *Treccie Nere* (1882); *Cicula* (1884). Other novels are *L'ignoto* (1883) and *Roccamorina* (1890), besides various works on Slav literature, as the *Melodie Russe* (1881) and *Littérature Slave* (1889–90).

Cianciana, tn. in the prov. of Girgenti, Sicily, which possesses extensive sulphur mines. Pop. 8000.

Ciano, **Galeazzo**, Count (1904–44), It. Fascist leader, son of a naval officer and ex-president of the Chamber of Deputies. Was in the diplomatic service in S. America and China. Supported the Fascist movement from the beginning; married Edda, daughter of Mussolini, through whom he acquired much of his influence. Under-secretary of state for propaganda, 1934. In the Italo-Ethiopian war he served as an air pilot, commanding a squadron. Foreign minister, 1936. In 1937 he signed the Anti-Comintern Pact (q.v.) on behalf of Italy and also, in 1939, the Italo-Ger. military alliance. He left the Foreign Office in 1943 to become ambas. to the Vatican. In 1944, together with others, he was brought to trial at Verona. Mussolini, though by that time devoid of any real power, wanted to avenge himself on the men who, he supposed, had brought about his downfall, and on Jan. 11, 1944, C. was shot. See M. Muggeridge (ed.), *The Ciano Diaries* (1939–43), 1947, and *Ciano's Diplomatic Papers* (1936–42), 1948 (a record of every phase of the Nazi-Soviet friendship as well as of contemporary It. foreign policy).

Cibber, **Gabriel** (1630–1700), Dan. sculptor, who came to England and worked at Chatsworth for the fourth earl of Devonshire, under whom he fought for William of Orange, who made him royal carver. His son, Colley C. (q.v.), was the well-known actor and dramatist. His

most famous works are the statues of 'Melancholy' and 'Raving Madness,' and the bas-reliefs on the Monument. The Dan. church in Stepney (demolished in 1860), where he was buried, is supposed to have been built by him.

Cibber, Colley (1671-1757), poet laureate, dramatist, and actor, came to London in 1687, and on hearing of the landing of William of Orange, offered himself as a volunteer to Wm. Cavendish, earl of Devonshire. Soon after the revolution, C., being disappointed in his hopes of obtaining a commission in the army, joined the united companies at the Theatre Royal, where he made his first appearance in 1691, and in the following year his first success, in the part of the Chaplain in *The Orphan*, by Otway. In Jan. 1695 his first play, *Love's Last Shift*, or *the Fool in Fashion*, was produced, and it was so successful that Vanbrugh wrote a sequel to it, called *The Relapse*, in which C. scored his first big hit as an actor. He wrote a great number of plays, many of which found appreciative audiences, and played many parts, in pieces by both himself and others. *The Careless Husband* (1704) was, in the opinion of Horace Walpole and others, C.'s best play. C. initiated the reaction from Restoration drama by introducing a moral tone into his comedies; but his heart was with the actors, not with the tragedy and comedy of the outside world, which they might be expected to portray. He was at his best in eccentric comedy, his voice being too thin for any declamatory roles. In 1709 he became a joint proprietor of Drury Lane, and he was the first manager to run a theatre on strictly business lines. After the death of Laurence Eusden in 1730 he was appointed poet laureate, less, as he himself admitted freely, for his literary merits than for his political activities on behalf of the Whigs and in active opposition to the Jacobites. In 1740 he pub. *An Apology for the Life of Mr. Colley Cibber, Comedian*. This work, in the absence of any biography, is the prin. authority for his life. See F. D. Senlor, *The Life and Times of Colley Cibber*, 1928.

Cibber, Susannah Maria (1714-66), wife of Theophilus C., actor, and sister of Dr. Arne, the composer. She started as a singer, and was the original Galatea in Handel's *Acis and Galatea*. Afterwards she became famous as a tragic actress, and played with David Garrick at Drury Lane.

Cicada, genus of hemipterous insects of the sub-order Homoptera; the species usually inhabits tropical countries, America being especially favoured by its presence. These insects vary in size from one to seven inches across, and are remarkable for their longevity and for their song. The male utters a curious sound, by some thought agreeable and by others intensely unpleasant, by means of a peculiar apparatus on the abdominal and metathoracic segments; it was heard by Darwin when he was on the *Beagle* a quarter of a mile from shore, and inspired the saying of the GK. poet Xenarchus: 'Happy the cicadas' lives, for they have

voiceless wives.' *C. tibicen*, the dog-day harvest-fly, is a black and green species which infests N. America in summer, and utters a shrill cry in the noontide hours; *C. septendecim*, the periodical C., is noted as the longest-lived insect, for the perfect creature requires thirteen to seventeen years for its development. The eggs are placed in the slits of twigs by the ovipositor of the female, and the larvæ are always subterranean. They are said to damage roots, and are in process of extinction.

Cicadella, group of hemipterous, homopterous insects, synonymous with the *Cicada ranatra* of Linnaeus. The species are usually small, and leap by means of their hind legs.

Cicatrization, process of healing over of an ulcer or broken surface in the skin or the mucous membrane, in which process the original surface is replaced by a material of a fibrous texture and resisting in nature. This effectually shelters the portion of flesh which was exposed, but contains no glands or blood vessels which were present in the original tissue.

Ciccio, l'Abate, see SOLIMECA, FRANCESCO.

Cicendia, genus of plants in the order Gentianaceæ, containing a single species, *C. pusilla*, which grows wild in S. Europe and the Channel Is. *C. fliformis*, the gentianella, a yellow-flowered plant found in damp sandy places of England and Ireland, is now generally referred to the allied genus *Microcala*.

Cicer, genus of leguminous plants, allied to the vetch. The best-known species is *C. arvense*, popularly called the gram or chick-pea (q.v.).

Cicero, Marcus Tullius (106-43 B.C.), Rom. orator and politician; b. at Arpinum, the son of a Rom. knight whose lineage is not known. He spent the greater part of his early life between his native tn. and Rome. As his health prevented him from taking an active part in boyish pursuits he devoted the greater part of

his time to literature. He studied poetry under Archias, was much under the influence of Phædrus the Epicurean, and he studied dialectic under Diodotus the Stoic. Later he went to Rhodes, where he studied rhetoric and law. His literary attempts at this time consisted principally of trans. from the older Grk. writers, some of which have come down to us. He also did his period of military service in accordance with the practice of Rome, and at the age of seventeen saw service during the Social war, in which for some time he served under Sulla, for whom and whose cause he had considerable sympathy. At the age of twenty-five he began his life as an orator. His first speeches are not masterpieces of rhetoric, but he showed no little ability, and one at least of his speeches was recognised as being of considerable merit. For two years C. travelled in the E., still continuing his studies, especially of philosophy and rhetoric, but his travels were made necessary not by his desire to study but by his health. During this period he himself owns that his rhetoric was very much improved, and he returned to Rome at the end of two years with a great many of his previous faults rectified. On his return he married a certain Terentia, a woman who seems to have been noted chiefly for her bad temper, and he became actively engaged in the political life of Rome. He was quaestor in 75, and five years later he prosecuted Gaius Verres. C. in this prosecution was simply following the example of all who desired to get on in the state; he is chiefly noted for his defences, but on this occasion, following the usual Rom. practice, he attacked a noted offender. In 66 he was praetor. Two years earlier saw the beginning of his famous letters. These letters give us an extraordinary insight into the hist. and the manners of the time. C. was not yet certain, however, of political support, especially of the senatorial party, and for some time he thought seriously of throwing in his lot with the democratic party, but finally the senatorial party decided to support him, and he remained true to their cause for the rest of his life. In 63 he was consul. He was not, however, well supported by the nobility, who always remembered that he was not the descendant of one of the noble families. His year of office was crowded with events, his chief speeches being those made against Publius Rullus and Catiline. The case of Rabirius Postumus found him deserted by the senatorial party, and since he had rejected the overtures made by Caesar, he was forced into exile. He went into exile in 58, and returned in the following year, but his property had been destroyed by Clodius. He was enthusiastically received, but no return was made to him for his losses. While the breach between Caesar and Pompey was increasing he began to attack Caesar, but he was forced to withdraw these attacks. He accepted financial aid from Caesar, and after this did not actively oppose his actions, but during the period when it became obvious that Caesar and Pompey

must quarrel he devoted himself to literature. In 55 appeared *De Oratore*, in 54 *De Republica*, and *De Legibus* probably in 52. In the latter year he defended Annus Milo, who was charged with the murder of Clodius, and in the same year he was sent to govern the prov. of Cilicia. He put down sev. risings in that prov. and did his best to alleviate the distress which existed there. In 50 he returned to Rome, but did not enter the city. He found that war was inevitable, and threw

CICERO

A bust in the Capitoline Museum, Rome

in his lot with Pompey, taking, however, no very active part in the war, and finally returning to Rome in 47, on the invitation of Caesar. During the dictatorship of Caesar he refrained from politics, again devoting himself to literature. At this time also he suffered much from domestic troubles; he divorced his wife, Terentia, and married his ward, whom also he shortly afterwards divorced; his greatest trouble, however, was the death of his daughter, Tullia. For some time after Caesar's murder he took no active part in politics, but was gradually drawn into them afterwards. He became the acknowledged leader of the republican party, and relied for safety on the influence which he felt he had over Octavian. In 43, however, he was amongst the proscribed, and on Dec. 7 of that year he was slain. His head was exposed at Rome, and there Fulvia, the wife of Antony and widow of Clodius, thrust a hairpin through his tongue. His chief works, some of which have been lost, are *De Oratore*, *De Republica*, *Brutus*, *Orator*, *Partitiones Orationum*, *Paradoxa*, *Academica*, *De Finibus*, *Tusculanae Disputationes*, *Laus Colonis*, *De Natura Deorum*, *De Divinatione*, *De Fato*, *De Senectute*, *De Amicitia*, *De Officiis*. Among his most notable speeches were the Verrine orations, the defence of Cluentius, the fourteen orations against Mark Antony (the *Philippics*) and the defence of Milo. His political works

include fifty-six speeches all professing to have been delivered in the forum or the curia, though some of them, as, for example, that for Milo and the greater number of the *Philippics*, were written for publication but not actually delivered. C.'s letters, addressed to his brother Quintus, give a day-to-day account of his life and are valuable not only for their historical information but also for the light they throw on the character of C. himself and of his leading contemporaries. Complete works: C. F. W. Muller, G. Friedrich, A. S. Wessenberg, R. Klotz, *Scripta quæ manserunt omnia*, 1869-96. Trans.: J. S. Watson, *Oratory and Orators*, 1891; J. Marthia, *Brutus* (Fr.), 1923; C. D. Yonge, *Academica; De Finibus; Tusculanae Disputationes*, 1865, and *On the Nature of Gods; Divination; Fate; the Republic; the Laws; and Standing for Consulship*, 1871; J. S. Reid, *De Finibus*, 1883; W. Melmoth, *On Old Age and Friendship*, 1773; Sir R. Allison, *On Old Age* (verse), 1916; C. R. Edmonds, *Three Books of Offices*, 1856; G. B. Gardner, *Offices*, 1899; Everyman's Library, *Offices, Essays on Friendship and Old Age, and Select Letters*, 1909; E. S. Schuchburgh, *Letters*, 1899-1900; R. Y. Tyrrell and L. C. Purser, *Letters of Cicero*, 1904-18; W. C. Williams, *Letters to his Friends*, 1927. See also Plutarch's *Lives*; Cardinal Newman, *Historical Sketches* (vol. 1.), 1872-73; A. Trollope, *The Life of Cicero*, 1880; J. L. Strachan-Davidson, *Cicero and the Fall of the Republic*, 1894; W. Warde Fowler, *Social Life at Rome in the Age of Cicero*, 1908; F. R. Cowell, *Cicero and the Roman Republic*, 1918.

Cicero, Marcus Tullius (b. 65 B.C.), only son of Marcus Tullius C., the great orator, and his wife Terentia. In 44 B.C. he joined the republican party and served as military tribune under Brutus in Macedonia; and after the battle of Philippi, 42 B.C., he fled to Sicily, where he joined Sextus Pompeius, but on the conclusion of peace between the latter and the triumvirs in 39 B.C. he returned to Rome. Octavian received him as his colleague in his consulship of 30 B.C.

Cicero, Quintus Tullius (c. 102-43 B.C.), younger brother of Marcus Tullius C. He was ædile in 67, prætor in 62, and for three years governor in Asia, where his profligate habits gained him an evil character. He distinguished himself as one of Cæsar's officers in Gaul. In the civil war between Pompey and Cæsar he joined the former, but later deserted him and reinstated himself with Cæsar. He was eventually put to death.

Cicerone, guide, especially for galleries of art or museums or other places of historical interest. The term was first applied in Italy to antiquarians and men of learning, and is supposed to be derived from Cicero as typical of such.

Cicester, see CIRENCESTER.

Cicindelids, family of coleopterous insects in the section Adephaga, consists of active, voracious, and terrestrial species commonly known as tiger-beetles. Their colouring is generally rich and metallic, and the insects are to be found on sandy

plains or heaths, sometimes on the seashore or the shore of rivers.

Cicisbeo, It. word applied to a gallant who waits upon a married woman. Among the higher ranks of It. society it was formerly the fashion for a C. to be in daily attendance upon the married lady of his choice, who could never be seen in public with her husband. The word is synonymous with *cavaliere servente* and *patito*. It originally meant a knot of ribbons, hanging on to the hilt of a sword or to the handle of a fan.

Cicuta, genus of umbelliferous plants, contains about half a dozen species growing in the N. hemisphere. The best known of these is the water-hemlock or cowbane (*C. virosa*), found occasionally by the sides of ditches and ponds of Britain.

Cid, The, historical and legendary hero of Spain. The legends which have accumulated round his name for a time gave rise to the theory that he was a purely mythical character, but it has since been proved that he existed, although his deeds, great as they were, are not actually identical with those with which he is credited. New research, much of it into Moorish sources, often lend surprising confirmation to the historical accuracy of the *Poema del Mio Cid*. Thus, a recently discovered passage by Ben Aliath not merely confirms the C.'s victory at Cuarte, in Valencia, but describes in detail the strategy ascribed to him in the poem. He was b. during the fourth decade of the eleventh century, of a noble Castilian family. He reached manhood just at the time when Ferdinand died and left his dominions divided amongst his five children. He became a prominent supporter of Sancho of Castile; Spain at this time was equally divided amongst the Moors and the Spaniards. The Moors also, freed from allegiance to the caliphate, were divided up into small and independent states, continually quarrelling amongst themselves as well as with the Spaniards. The Spaniards, moreover, were not in a very united state. The C. plunged into the wars of the period; he won the title of Campador by his valour in fighting against Navarre, and he supported Sancho of Castile against his brother Alfonso. Whilst journeying to Seville to collect tribute from one of the subject Moorish rulers, he took part in the fight against the king of Granada, whose forces he was responsible for routing. Returning to Burgos, he found himself the victim of a plot and was forced into exile (c. 1075). After this date the C. became the captain of a free company. He sold his services, now fighting for the Moors, now for the Christians. His valour as a warrior and his capability as a general cannot be doubted, but although he made many attempts to reconcile Alfonso of Castile, his career at this time must be regarded in the light of a mercenary and not a national patriot. He led a successful expedition against Valencia, and for some time ruled over Valencia and Muroia. The Almoravides, whom he had defeated on more than one

occasion, at length rose once more against him, and although he was not personally defeated, his army and chief lieutenant were. In 1099, worn out with war and grief, he died. The city of Valencia held out for yet another three years, and at the end of that time his body was taken to Burgos and there buried. He has been regarded always as the national hero, and within a century of his death legend after legend had sprung up concerning him. Over 200 ballads still exist which have him for their hero, and which ascribe to him all sorts of wonderful and heroic adventures. The poem *El Cid* itself is but a fragment of some nearly 4000 lines. But these lines all form part of a great rugged epic in which the national hero of a national Spain struggles against the Moors. He combines in his person the highest conception of valour and courtesy. He was indeed the greatest of all guerrilla warriors and generals, and perhaps this is the best reason why he should for all time be held up by the Spaniards as the national hero.

There is a translation of the *Cid* by J. Ormsby. See also Cornille's *Le Cid*, based on a drama by the Sp. poet Guilhem de Castro, and Southey's *Chronicles of the Cid*, 1808; H. Butler Clark's *The Cid Campeador*, 1877, and B. Menéndez Pidal, *La España del Cid*, 1948.

Cider, alcoholic beverage made from the juice of apples. The proportion of alcohol depends on the properties of the fruit employed, the method by which fermentation is carried out, and any subsequent treatment, such as blending with other alcoholic liquors. In England and America C. contains from 2 to 8 per cent of alcohol, but in certain continental Cs. the proportion may be 10 per cent, or even more. C. containing a large proportion of sugar and comparatively little alcohol is known as sweet C., and the term rough is applied to those Cs. containing little sugar and an appreciable amount of bitter extractives and acetic acid. The chief C. dists. of England are the cos. of Hereford, Devon, Somerset, Worcester, Gloucester, and, to a less extent, Kent and Norfolk, with a C. orchard acreage of (1947) 58,000; in Ireland C. is made in cos. Louth, Cork, Waterford, and Tipperary; large quantities are also produced in the U.S.A. and in the N. dists. of France and Germany. The premier C. apple is Kingston Black; others are Yarlington Mill, Foxwhelp, Cap of Liberty, Cheathoy, Bloody Butcher, and Slack-ma-Grille. The apples used are grown and picked for that purpose, and are usually varieties unsuitable for eating on account of the presence of bitter substances which effectually neutralise the taste of the considerable quantity of sugar. The apples are then crushed in a mill, and the juice is drained from the pulp or pomace. The juice is then placed in casks with large vents and allowed to ferment, a temp. of 55-80° F. being deemed suitable. The casks should be full, in order to give an opportunity of removing the excess yeast as it rises, as this is said to prevent the formation of

acetic acid, which would give too astringent a flavour. The period of fermentation is usually a week to ten days, after which the C. is siphoned into casks; these are stored in a cool place and the C. is re-racked in a few months. The good qualities of C. depend on preventing acetification and producing a moderate amount of alcohol. It should be mellow and pleasantly alcoholic, though in some dists. a certain amount of roughness or astringency is preferred. Its appearance is improved by the use of a fixing to clear the liquid, and alcohol may be added to increase its strength. C. is produced to the extent of many millions of gallons annually in the United Kingdom; it has long been the favourite beverage of the inhab. of fruit-growing dists., and has acquired a reputation as a specific for gout. C. research is carried out at Long Ashton National Fruit and C. Institute. Of recent years in England sev. manufacturers have bottled various forms of apple juice of a tectotal nature under brand names derived from *cider*; these are extremely palatable, and often so closely resemble sweet C. that only an expert could detect the difference.

Ciechanow, tn. in the dist. of Plock, Poland, 55 m. N.W. of Warsaw. Pop. (1939) 12,000.

Ciego de Avila, tn. in the prov. of Camagney, Cuba, with sugar factories. Pop. 16,400.

Cielo Dalcamo, or Ciuillo d'Alcarno, It. poet, b. at Alcarno near Palermo, who lived at the end of the twelfth and beginning of the thirteenth century, and was one of the first to write poetry in It. Of his works only one poem remains, pub. in 1661. This is a spirited dialogue between lover and lady and was translated by Rossetti in *Dante and his Circle*. See Alessandro d'Anccona's works on It. literature, and Gardner's *Italian Literature* in Beun's sixpenny series.

Cléneaga, or San Juan, tn. in Magdalena, Colombia, near the C. Grande, or lagoon of Santa Marta, from where it is distant 22 m. Pop. 45,400.

Cienfuegos, tn. in Cuba, 42 m. N.E. of Trinidad. It is situated on a fine, sheltered harbour, and is an important seaport of Cuba. It has an active trade in sugar. Pop. 91,800.

Cieszyn, see TESCHEN.

Ciezo, tn. in Spain in the prov. of Murcia. It lies in the Segura valley, with mts. on the N., and a fertile plain on the S., which produces grain, wine, olives, and fruit. Pop. 16,000.

Cigala, Lanfranco (c. 1218-78), It. poet, b. at Genoa. His poems are concerned principally with political subjects, such as Louis IX. and his crusade. His love poems deal with two Provençal ladies, Adalais de Vidalhana and Salvaja. Thirty only of the poems have been preserved, and these have never been critically ed. In 1241 he was sent by his fellow countrymen to obtain a treaty of peace from Count Raymond Berenguer V. of Provence. Upon his return to his native tn. he was appointed judge, 1243, and in 1278 he was made consul. He is

supposed to have been murdered near Monaco the same year.

Cigar, roll of tobacco leaf for smoking purposes. The prototype of the C. was one of the earliest known forms of smoking, and its use was widespread among the natives of the Americas at the time of Columbus's voyages. The C. was adopted by the Sp. and Portuguese sailors, but although Eng. and other mariners were occasionally seen with crude rolls of tobacco leaf this method of smoking was, to all intents and purposes, confined in the W. world to the

These machines are composed of a bunch-making unit and a wrapping unit, and are manned by two operators. To make a C. the filler, which is the inside or the core of the C., is rolled in a leaf known as the binder or bunch wrapper, and has to be made to the shape, size, and weight of the particular C. Finally this is covered with an outer leaf called the wrapper. The wrapper is the most expensive leaf used in C. manuf., and has to be sound and of good texture and colour. The binder need not have these qualities, and inferior grades and colours can be used, but it is

Imperial Tobacco Co.

CIGARETTE-MAKING MACHINE

Iberian peninsula for almost three centuries, probably owing to the almost universal acceptance of the pipe. The C. was brought to England as a result of the Peninsular war, and in spite of much criticism, gradually ousted the snuff habit which was fashionable at that time. By 1840 the production of Cs. in England was increasing rapidly. Leaf for the Brit. C. industry is obtained from the U.S.A. (particularly Wisconsin, Connecticut, and Pennsylvania), Brazil, Cuba, W. Canada, Jamaica, Brit. N. Borneo, Dominican Republic (San Domingo), and the Dutch F. Indies.

Cs. are produced by three methods: (a) Entirely handmade, which requires the greatest skill and is the most expensive; (b) the mould principle, where the bunches are shaped either by hand or machine, and pressed in wooden moulds, after which the outer wrapper is put on by hand; (c) entirely machine-made.

preferable for it to be sound and of good size. Both wrapper and binder must have good steady burning qualities. For filler the small and broken leaves can be used. The shape, size, and colour of Cs. are indicated on the outside of the C. box. There are many shapes and sizes, and there is no hard and fast rule governing the choice of name to describe them, although certain names have become accepted by common usage. For instance Corona indicates a straight-shaped C. with a rounded top approximately 5½ in. long, while a torpedo shape (i.e. a pointed C. drawn in at both ends) might be called Imperiale or Elegante. Panatella denotes a thin straight C. 5 in. to 6 in. long—the imported varieties being pointed while the Brit. product is usually open at both ends. Cheroots vary considerably in size, but are usually straight or very slightly tapered with both ends left open.

The colours or shades of Cs. are denoted

by the following markings: *Claro, light; Colorado claro, medium light; Colorado, medium; Colorado maduro, medium dark; Maduro, dark.*

Cigarette (dimin. of the word *cigar*), small roll of fine-cut tobacco, usually wrapped in thin paper. Cs. were popularised in England by soldiers returning from the Crimean war, and the first Eng. factory was set up at Walworth in 1856. C. smoking has increased steadily, particularly since the First World War, and now provides considerable revenue through heavy tobacco import duties. The most popular Cs. in Great Britain are made from flue-cured Virginia type tobacco. This tobacco originated in the U.S.A., which still produces the finest types, and remains the main source of supply. In recent years Virginia type tobacco has been produced successfully in empire countries, notably Canada, Rhodesia, and India. Turkish Cs. are also manufactured in Great Britain, but their highly distinctive flavour is not generally popular in this country. The term Turkish is loosely applied to cover all oriental tobacco, i.e. tobaccos grown in the Near E., including Turkey, Greece, Cyprus, Syria, and the Balkans. Amers. prefer blended Cs., which are often sweetened with glycerine. Customs regulations in Great Britain forbid the treatment of Cs. in this way. Contrary to widespread belief, saltpetre is never used during manuf. Considerable quantities of Cs. are exported from Great Britain. Cs. were originally made by hand, but hand-making is gradually dying out, having been superseded by modern high-speed machinery. There are two methods of hand-making—rolling by hand and push work, in which the tobacco is filled into a ready-made paper tube. Modern C.-making machines, having been fed with cut tobacco, bobbins containing up to 3 m. of C. paper, printing ink, and paste, can produce perfect Cs. at the rate of 1000 per min. The cut tobacco is fed into a narrow trough housing the C. paper, which runs in an endless stream from the bobbin. A printing device, incorporated in the machine, has meanwhile printed the makers' name and brand name, at C.-length intervals, on the paper. One edge having been gummed, the paper is curled round the tobacco and sealed to form one long C., which is cut into lengths by a rotating knife. Machines are also used for packing cartons and boxes, and electrical devices eject any packet containing an incorrect number of Cs. Many novelty types of C. have been produced—scented Cs., self-lighting Cs., and Cs. in coloured papers—but none have attained popularity.

Cigliano, tn. in prov. of Novara, Piedmont, Italy, 32 m. S.W. of Novara. Pop. 6000.

Cignani, Carlo (1628-1719), It. painter, b. at Bologna; a pupil of Battista Carlo and Francesco Albani, he derived his inspiration from Correggio. His best known work is the 'Assumption of the Virgin,' at Forlì. Others are 'Entry of Paul III. into Bologna'; 'Francis I.

touching for King's Evil'; 'Power of Love,' painted on the wall of the palace at Parma; and 'Adam and Eve,' at The Hague.

Cignaroli, Giovanni Bettino (1706-70), It. painter, who in 1769 became director of the academy at Verona. He belonged to the late Venetian school.

Cigoli, Lodovico Cardì da (1559-1613), It. painter, architect, and poet, b. at Cigoli, in Tuscany. He was a pupil of Alessandro Allori and Santi di Tito, but he followed the great Florentine painters and especially Correggio, being known as the Florentine Correggio. His 'Ecce Homo,' which gained a prize against Passignani and Caravaggio, was taken to France by Napoleon, but restored to Florence in 1815. His paintings include 'St. Peter healing the Lame Man,' in St. Peter's at Rome; 'Conversion of St. Paul,' in the church of San Paolo fuori le Mura; 'Story of Psyche,' in fresco at the Villa Borghese; and a 'Martyrdom of Stephen.'

Cilia are minute, fine-hair-like protoplasmic processes attached to one or both ends or the sides of some bacilli, by means of which they propel themselves. Bacilli possessing them are termed motile. Cells with C. attached also line some parts of many-celled animals.

Ciliata, div. of the Protozoa, composed of the infusorians which have a mouth and anus, move and feed by means of cilia, and usually possess undulating membranes near the mouth, membranelles and cirri. The body is nearly always surrounded by a thin layer of cuticle, contains many nuclei and sev. contractile vacuoles. Reproduction is generally by means of div.

Cilicia, dist. of Asia Minor, along the S. coast between Syria and Pamphylia, which before the First World War, was included in the Turkish vilayet of Adana. In ant. geography it included the valley of Adana and Tarsus, bounded by the Mediterranean on the S., Mt. Taurus on the N., and Amanus on the E. It was part of the Persian Empire until Alexander's conquest, 331 B.C. At his death it fell to Ptolemaic rule and later to the Seleucids. The inhab. of the mountainous dists. became famous pirates. In 64 B.C. it was subdued by Pompey and made Rom. ter. It formed part of the Ottoman Empire in 1515. In 1833 it was ruled from Cairo, but was evacuated by Mehmet in 1840, and given back to the Turks. It is now included in the vilayet of Adana (Seyhan) in Turkish Asia Minor. Only ruins remain of its two great tns., Tarsus and Soli, once centres of Gk. civilisation. C. was occupied by Gen. Allenby's troops in the First World War soon after the armistice of Oct. 31, 1918, was signed with the Turkish commander-in-chief, the object of the occupation being the protection of the Bagdad railway (q.v.). By the treaty of Sèvres (q.v.) part of C. was granted to France, but in 1921, after serious conflict with the Nationalist forces, France abandoned all claim to the dist. The products of the dist. include corn, wool, and sesame.

Cilician Gates (Ghulek Boghaz), narrow

pass over the Taurus range in Asia Minor. The great highway led from the W., on a long rough descent from the central plateau, to the valley of Adana and Tarsus. At the gates themselves the width of the road is 25 ft.

Cilli Celje, tn. in Yugoslavia, lies picturesquely on the l. b. of the Sann, having remains of anct. walls and towers. It was besieged by the Turks in 1492. Pop. 8000.

Cima, Giovanni Battista, called Cima da Conegliano (c. 1460-1518), It. painter. His work resembles that of Giovanni Bellini, of whom he is believed to have been a pupil, and consists of landscapes, altar-pieces, scenes with architectural backgrounds, and a few classical pictures. In various churches at Venice are to be found his 'Saint John the Baptist'; 'Saint James and Saint Nicholas'; and 'Saint Thomas touching the Wounds of Christ.' Other of his works are at Milan, Munich, and Dresden. In the Louvre is his 'Virgin and the Child Jesus,' and in the National Gallery, London, are some panels.

Cimabue, Giovanni (1240-c. 1302), It. painter, b. in Florence, the family name being Gualtieri. Tradition credits him with being the greatest artist of his time, but much of the work attributed to him is not authenticated. His influence on the art of the period resulted from his attempt to get away from the severity of the earlier It. painters and to introduce a softer yet more virile style, which later developed in his pupil Giotto, whom he is supposed to have found as a child drawing on a slate with a piece of coal, and brought to Florence to teach. His most famous painting is a 'Madonna and Child with Angels,' which forms the altar-piece of the chapel of the Rucellai in Santa Maria Novella, Florence, but, according to some, this work has been proved to be by Duccio. Other Madonnas are to be found in the Academy of Arts at Florence and at the Louvre. He is also credited with some frescoes in the church of San Francesco, Pisa; his most famous work is a mosaic in the cathedral at Pisa, 'Christ in Glory between the Virgin and John the Evangelist.' He is buried in the cathedral at Florence. See T. Cole and W. J. Stillman, *Old Italian Masters*, 1892; Julia Cartwright (Mrs. Ady), *Painters of Florence*, 1901.

Cimarosa, Domenico (1749-1801), It. musical composer, b. at Aversa, Naples. His first comic opera, *Le Stravaganze del Conte*, composed when he was twenty-three, was a great success. His opera bouffe, *Il Matrimonio segreto* (Vienna, 1792), is sometimes still performed. His serious opera, *Gli Orazi*, ed. i *Curiosi*, like much of his light-hearted comedy, is in a style which has earned him the sobriquet of 'the Italian Mozart.'

Cimbex, genus of hymenopterous insects in the sawfly family, Tenthredinidae. The species are often larger than bees, although most of the other members of the family are small and inconspicuous. The larvae are often very destructive to vegetable life, e.g. *C. americana*, which is known to destroy large elm-trees.

Cimbri, or Kimbri, anct. people whose original home and location have been a matter of much dispute, but they are now generally believed to have belonged to the Teutonic race. Pliny writes of the peninsula of Jutland as the Cimbric Chersonese; Pomponius Mela that the C. and Teutones lived on the Sinus Codanus, i.e. the S.W. corner of the Baltic. In Ptolemy's map Jutland is also marked as the Cimbric Chersonese. They may probably be traced to the prov. of Aalborg in Jutland, which was earlier known as Himmerland, a name which may be connected with C. Former authorities who believed they were Celts pointed to Cymry, the Welsh. The C. were certainly the first Teutonic people the Romans encountered; at the end of the second century B.C. they invaded Gaul, Illyria, and Italy, driven, as it was believed, from their home by inundations of the sea. They wandered about the Danube for some time, fighting with the various Celtic tribes settled there. In 113 B.C. they first appear in Rom. hist., when the consul Cn. Papirius Carbo was defeated by them at Noreia (Carinthia). They demanded land, which was refused. They then moved W., and in 109 B.C. defeated the consul M. Junius Silanus in the S. of Gaul. In 105, led by their king Bolorix, they annihilated the Rom. army under Cn. Mallius Maximus and Cæpio at Arausio (Orange). Turning off towards Spain, they were driven back, and in 103 overran Gaul as far as the Seine, where the resistance of the Belgæ forced them S. once more. They were now reinforced by the Teutones, and moved S. with the intention of invading Italy and conquering Rome. They divided their forces; the Teutones to take the W., the C. the E. passage of the Alps. At Aquæ Sextilæ (Aix), 18 m. N. of Marseilles, Caius Marius, the Rom. consul, inflicted a total and crushing defeat on the Teutones, 102 B.C. The C. had passed the Alps to the E., and had forced the other Rom. army under Lutatius Catulus beyond the Adige and the Po. Marius followed up his victory over the Teutones by a still more crushing blow upon the C. on the Raudine plain, near Vercellæ, annihilating their forces and slaying their king Bolorix. By these two victories Marius saved Rome from a disaster probably as great as that inflicted on her by the Gauls at the Allia in 390 B.C.

Cimicidæ, small family of hemipterous insects, in the section Heteroptera, is represented in most lands where civilisation is predominant. The insects are parasitic on various vertebrates, such as men and birds, but are in turn preyed on by larger insects. The chief genus is *Cimex*, which contains few species, and none with which mankind would not gladly dispense. *Cimex lectularius* is the bed-bug. See BUG.

Cimicifuga, genus of ranunculaceous plants, consists of perennial herbs with divided leaves and racemes of whitish flowers; the roots act as drastic purgatives, and are poisonous.

Cimiez (anct. Civitas Cemenellensis), residential quarter 2½ m. from Nice, S.

France, with many fine hotels and villas. A favourite resort of Queen Victoria.

Ciminna, tn. in Sicily, 20 m. S.E. of Palermo. Pop. 6500.

Cimmerii, name of an anct. people of the far W. of Europe, first mentioned by Homer, and living on the banks of a stream in darkness and mist (*Odyssey*, xi. 14). They are talked of by Herodotus in his account of Scythia, who says they were the early inhab. of S. Russia, compelled by the Scyths to flee into Asia Minor, where they dwelt for about a century. About 650 B.C. they invaded Lydia, destroyed Sardis and Magnesia, and between 605 and 556 B.C. were entirely defeated by Alyattes, king of Lydia. They have been identified with the Cimbr of Jutland, but only on account of similarity in name.

Cimolite, variety of clay (hydrous aluminium silicate), which is used as fuller's earth, that is, to absorb grease and oil from cloth. See also under FULLER'S EARTH.

Cimon (c. 507-449 B.C.), celebrated Athenian general, was the son of the great Miltiades and Hegesipyle. He distinguished himself by his valour in the Persian wars, and was, with Aristides, put in command of the Gk. fleet sent to Asia against the Persians. He was later in sole command of the Gk. naval forces, and conquered the Isle of Scyros in 470 B.C. He achieved a dual triumph in 466, defeating the Persian fleet off the R. Eurymedon in Pamphylia, and later in the same day winning a battle on the land. He was for some time one of the most prominent members of the aristocratic party in Athens; in pursuance of his policy of friendliness to Sparta, he led an Athenian force to aid them when the helots revolted in 462 B.C. The Spartans, however, dismissed with scorn his proffered aid, and the Athenians in anger ostracised him in the following year on a pretext of corruption. He was recalled in 457 (or 451), and he defeated the Persians off the coast of Cyprus; the victory was due to him, but he d. before the engagement.

Cinchona, genus of Rubiaceæ, consists of about forty species which are indigenous to the E. slopes of the Andes, but are also cultivated in Java, S. India, and the E. Indies. The trees belonging to this genus vary very much in size, have evergreen leaves, and flowers in panicles, white or pink in colour. The useful part of these trees is their bark, from which quinine is manufactured, this medicine first being used by the countess of Clinchon, wife of the ruler of Peru, to cure a fever, about the year 1638. After this it was taken to various places in Europe by the Jesuits, and obtained the name of Jesuits' bark. The work of obtaining the bark of these trees is carried on by Indians, who have to make their way through thick forests to the trees. The latter are detached from any vegetation growing round the stem, and after having been felled as near the root as possible, have their bark cut off from both the main stem and the branches. It is then dried and packed, the thinner bark of the

branches curling up to form quills. This method, however, was seen to be very expensive, and was leading to the extermination of the trees. Accordingly, plantations were tried in other parts, especially Algeria, Java, the Himalayas, and Ceylon. Cinchonidine, cinchonine, and other alkaloids are obtained from the bark in addition to quinine.

Cinchona Bark Alkaloids. The term alkaloid (i.e. like an alkali) is applied to certain basic substances derived from plants and chemically related to pyridine, quinone, etc. They are generally of considerable physiological potency and many are valuable drugs. Sev. distinct members of the group have been obtained from C. B., the most important being quinine, $C_{20}H_{21}O_4N$, and cinchonine, $C_{21}H_{23}ON$, together with quinidine, an isomeride (see ISOMERISM) of quinine, and cinchonidine, an isomeride of cinchonine. Quinine, which is a specific for malaria and an excellent febrifuge, is a white crystalline solid melting at $177^{\circ} C$. It readily forms salts, e.g. quinine sulphate, and these salts are usually preferred in medicine to the alkaloid itself. Ammoniated tincture of quinine is a solution of quinine sulphate in a mixture of water and alcohol to which a little ammonia has been added. Cinchonine is very similar in constitution to quinine, but a solution of its sulphate does not show the characteristic fluorescence of quinine sulphate solutions. The structure of the C. B. A. has been solved only recently, and so far it has not been possible to make them synthetically. Similar compounds, however, such as mepacrin (Ger. Atebrin) have been artificially prepared in the laboratory.

Cinchonine ($C_{21}H_{23}ON$), alkaloid prepared from cinchona, the bark of certain trees grown in S. America and the E. and W. Indies. Cinchona contains five alkaloids, quinine, quinidine, C, cinchonidine, and conquinamine, of which C. and cinchonidine are isomeric. C. is similar to quinine in its effect upon the malaria parasite, but is not so active. It also has a tendency to produce convulsive movements in certain patients, which renders it advisable that quinine preparations should be free from C. C. is a colourless crystalline body, insoluble in water. The sulphate is dissolved with difficulty in pure water, but is soluble in acidulated water.

Cinchovatine, or **Arisine** ($C_{23}H_{25}O_4N$), crystalline alkaloid obtained from the *Cinchona ovata*. It occurs with the alkaloid cusconine in *Cusco Cinchona* bark. The crystals are white and prismatic.

Cincinnati, second largest city of Ohio, U.S.A., situated on the N. bank of the Ohio R., 270 m. to the S.E. of Chicago. Five bridges and sev. ferries are the means of communication with Covington and Newport on the opposite side of the riv.; there are lines of steamers from Pittsburg and New Orleans. The land near the riv. is low-lying and level; this portion of the city is occupied by the commercial buildings. The residential part is on the

bluffs which are situated around the valley. There are a number of fine buildings, of which perhaps the best is the Rom. Catholic cathedral of St. Peter's, which contains the 'St. Peter Delivered' by Murillo. Among other noteworthy examples of architectural art are the U.S. gov. buildings, Masonic Temple, Chaubert of Commerce, Odd-fellows' Hall, Mechanics' Institution, the opera house, the city hall, co. court-house, the United Bank building, and the forty-storey skyscraper in Fountain Square. The educational institutions of the city include the univ. of C., a Jewish, a Wesleyan, and two Jesuit colleges, the Mechanics' Institution of Ohio, a theological seminary, two medical colleges, and an art school. Its cultural institutions also include the Conservatory of Music, the Museum of Art, and the Academy of Art. Recreation is well provided for by ninety-five parks, of which the finest are Eden Park, situated to the E. of the city, and Burnet-Woods Park. There is a zoological garden. The municipal library contains 700,000 vols. C. is a commercial centre of the first rank, and its manufs. are varied and important. Among them may be mentioned the manuf. of machine tools, paper, paints, wholesale meat packing, vehicle bodies and parts, men's clothing, petroleum refining, soap, steel works, rolling mill products, and a large printing and publishing industry. It is the centre of the Amer. radio industry. It has air-lines to Chicago, Detroit, etc. Eighteen railway lines meet here. It is the terminus of the great Mississippi steamers. Harriet Beecher Stowe lived here from 1832 to 1850, and many fugitive slaves were aided in C. homes in their flight to liberty. C. was founded in 1788 by a trader chasing Indian horse-stealers down the R. Ohio. He bought 10,000 ac. of land at a dollar an acre. Fifty years later refugees from Prussia discovered that grapes grew abundantly in its vicinity, and it became a chief wine-producing centre, and then for a time Porkopolis, because of its huge pig industry. Since 1924 it has been governed by a city manager with a council of nine elected by proportional representation. It is the only city in the world which, out of its own resources, built a railway system, the C. Southern, which for many years has been leased by the municipality to one of the big trunk lines. The pop. was, in 1940, 453,000, of whom nearly one-half are said to have been of Ger. descent.

Cincinnatus, Lucius Quinticius, one of the earliest and most typical of the Rom. heroes, was b. about 519 B.C. The legend runs that in 485 B.C., when the Rom. army had been cut off by the Aequians, he was called from his plough to become dictator. He overcame the enemy, and after serving the republic, returned to his farm. He was again made dictator in 439 B.C., this time in order to avert, if possible, civil war in Rome. Rivalry was high between the patricians and the plebeians; C. checked the disorder, and caused Spurius Maelius, who was sus-

pected of conspiring to become king, to be executed.

Cincius, Lucius Alimentus, Rom. historian who flourished in the third century B.C. Very little is known of his life beyond the fact that he took part in the second Punic war, and was taken prisoner by Hannibal, who treated him with courtesy. He wrote works dealing with Hannibal and with Gorgias of Leontium, of which only fragments remain.

Cinder-bed, name of a stratum of the Middle Purbeck series of the Jurassic system, so called by the quarrymen of the dist., and composed chiefly of the aggregated shells of an oyster.

Cineas, Thessalian, chief adviser and minister of Pyrrhus, king of Epirus. He studied oratory in Athens, and was known as the ablest and most eloquent man of his time. In 280 B.C., after the defeat of the Romans at Heraclea, he was sent on a mission of peace to Rome. The terms were rejected through the agency of Appius Claudius Cæcus, the censor, but on being sent again in two years' time, with easier terms, induced the senate to accept his proposals of peace.

Cinematograph, apparatus for projecting on to a screen in rapid succession a series of images or pictures representing successive stages of appearances involving motion, thus producing the effect of a continuously moving picture which accurately re-creates the normal movement of the people or objects photographed. The principle of moving pictures was first introduced as a toy, consisting of a number of pictures representing successive stages of some simple movement bound together in book form, the pages of which were released quickly by the thumb. In 1833 the zoetrope, or 'wheel of life,' was introduced. This was a hollow cylinder in the sides of which were vertical slots at regular intervals. It revolved on a vertical axis, and the pictures, on strips, were arranged round the inside, and viewed through the slots as the cylinder revolved, and they appeared to come to life. Machines basically similar which have contributed to the evolution of the present-day film camera and projector were the kinesiograph, nutograph, autoscope, biograph, and bioscope, all of which produced what were variously called 'living,' 'moving,' and 'animated' pictures. The mechanical operation is to project, highly enlarged, a single picture on to a screen for a small fraction of a second which is instantly followed by a similarly short interval of blackness, and then the next picture, and so on, at great speed. As each picture persists on the retina for an appreciable time after it has been withdrawn, it follows that if the intervals are brief enough, they become imperceptible, and the spectator receives an impression of continuous movement. Silent films used to be photographed and projected at the rate of sixteen frames a second. The modern talking or sound film is photographed and projected at the increased speed of

twenty-four frames a second. This results in 90 ft. of film being projected a minute. In 1877 E. Maybridge obtained a rapid succession of photographic pictures by means of a row of cameras with shutters electrically controlled so as to admit of the snapshotting of the successive movements of a horse. In 1890 E. G. Marey used a celluloid film to take successive photographs, and in the same year Edison contrived a machine to

onespool through a gate behind the lens and on to a second spool. At a speed invisible to the eye a revolving shutter blacks out the image which passes through the lens on to the film, thus dividing the successive images into frames. When the complete roll of negative has been exposed, it is unloaded in a dark room and dispatched to a laboratory to be automatically developed. A positive print is then made. Such first prints from negatives

BOTH SIDES OF THE CAMERA

Director, behind whom are grouped his technical assistants, leans forward to direct two actors in the film *The Loves of Joanna Godden*.

reproduce the appearance of the movements depicted by such photographs. In London in 1896 a film of the Derby was shown at the Alhambra by means of an Animatograph invented some years earlier by Friese Green and Robert Paul.

C. negative film consists of sensitised gelatin mounted on a strip of celluloid about one inch wide. It is usually obtained in rolls of 1000 ft. for use in cameras employed in studios, and in rolls of 200 ft. for use in portable cameras used on locations unrelated to studios. Studio cameras are electrically driven, whilst portable cameras are usually driven by clockwork or by electric batteries. All modern cameras, however, irrespective of size or type, are geared to run film at the aforementioned rate of twenty-four pictures per second. The film is driven from

are termed 'rushes,' and are viewed by the producer as soon as possible to check results. Professional productions are made on standard size film, which is 35 mm., whilst educational and amateur films are made on sub-standard size film—16 mm. and 9.5 mm.—and are non-inflammable. Standard size films are highly inflammable, and so the projection box in a cinema is fireproof, fitted with two exits, and iron shutters to cover the apertures in the wall through which the film is projected on to the screen. Until the thirties films were silent, their action and stories being explained by captions, and the cinema programme being accompanied by an orchestra. With the birth of the talking film, both the technique of production and the character of the cinema programme were revolutionised,

for each film supplies its own dialogue or music (or both), thus making orchestral accompaniment unnecessary. Many experiments were carried out before perfect synchronisation between the pictures and their corresponding sounds or dialogue was achieved. Ultimately consistent perfection was obtained by driving the camera taking the pictures, and the instrument recording the sounds and dialogue occurring in those pictures, *from the same source of electric power*, so that the speed of both would be identical and constant. Just as the picture camera is loaded with film which photographs people and scenes, so the recording instrument can be likened to a second camera through which film passes at the same speed, photographing all the sounds and spoken words uttered by the people in a scene. The film in this case is called recording stock and is developed and printed in just the same way as is the negative exposed in the picture camera. The recording camera is connected to a microphone through which all sounds pass, and they create sound waves which are photographed, resulting in a sound track. At the commencement of each scene clapper boards are placed in front of the picture camera bearing the scene number. The clappers are swung together, making a sharp report which is recorded through the microphone on to the sound track, where it registers as a jagged peak. The action of the clappers coming together is simultaneously photographed by the picture camera, and consequently when the positive print of the clappers meeting is placed against the jagged peak in the sound track created by the clapper report, picture and sound will synchronise. Throughout the editing stage the picture film and the corresponding sound track remain entirely separate, and remain so until editing is completed, otherwise pictorial and sound adjustments could not be made. When an entire film has been finished, consisting of hundreds of separate strips of film, each presenting a different scene or a different angle of the same scene, and the corresponding sound track, then the original negative, up till now untouched (for only the positive print is edited), is cut to match the finally edited film, and only when negative cutting has been completed is a combined print made, when, for the first time, the sound track and the picture are printed on the same film. It is in this form that the film is projected in the cinema.

The production of a feature film is carried out by a team of highly skilled technicians, grouped into different departments, and co-ordinated by the director, who is responsible for the results. The chief technicians are the lighting cameraman, the recorder, the art director, and the editor, each aided by technical assistants. In control of a studio which may be making three, four, or more films simultaneously, each with its own director, is the producer, who is finally responsible to the company for all productions. Whereas each film is being made by a

director, all the directors are responsible to the producer. A feature film may take from two to six months to complete. The star system has been more highly developed in America than elsewhere, with the result that American film stars are literally world famous, and vast numbers of cinema-goers go to see their favourite stars irrespective of the subject-matter of the films in which they appear.

Films may be broadly divided into two main categories—features and shorts, most of the former being fictional and most of the latter being factual, covering documentary production and newsreels. The majority of cinema programmes in America and Britain consist of two feature films divided by a newsreel and perhaps a short travel or interest film. This is known as the double-feature programme. Some years ago, however, only one feature was shown, supported by a wide assortment of short films. It is thought that the single-feature programme will be reverted to in the future owing to the shortage of dollars. Should this occur short films will reappear in the cinema from which they have been almost absent owing to lack of programme space because of the above-mentioned double-feature programme. There are two main channels through which films are exhibited: *the theatrical* or ordinary cinema exhibition for providing entertainment and the *non-theatrical*, which covers the distribution and exhibition of films of an informative and instructional character to audiences unrelated to cinemas, as in clubs, institutes, factories, colleges. Non-theatrical shows are given on sub-standard size film, 16 mm. The non-theatrical film show developed enormously during the Second World War in all countries, and the governments of the belligerent nations organised regular propaganda film shows to keep their respective populations informed on all vital matters. In Britain documentary film producers were employed by the government to make great numbers of such films which circulated in many parts of the world. British documentalists excel in the production of such short films, and the non-theatrical system of distribution has given them the opportunity denied them by the double-feature cinema programme of obtaining large audiences. Since 1945, non-theatrical showings have continued, and plans are laid for such films to play a permanent part in the government's informational services. By this means special films are made for farmers, scientists, doctors, and students training for most professions and trades. Similarly the 16-mm. film is being employed increasingly for educational purposes in schools, and this visual method of teaching will, in due course, supersede many existing methods, for film is without equal for demonstrating and explaining processes, and bringing distant parts of the world to the classroom. The British Film Institute serves as a link between the commercial film industry and the educational or non-theatrical film world, and records the

hist. of the industry, and possesses a library of all films which are important enough to preserve for future reference.

From being regarded as a mere toy, and an interesting novelty, film has grown into perhaps the greatest influence in our midst to-day, not only as the most popular form of entertainment for millions, but as a medium without equal for widening the experience of people of all types and nationalities. Whilst the technical side of film-making has made rapid progress, subject-matter of many films remains unworthy of all the technical skill devoted to their production. A great many film stories are adapted from novels and plays, not necessarily because they lend themselves to presentation on the screen, but because their titles or the names of their authors are famous. Thus film depends largely upon other media for its material. When it presents material especially created for it, it will rank as an independent medium of expression, side by side with the legitimate stage, and the novel. The unique ability of film to present all parts of the actual world on the screen to serve as backgrounds for its dramas and comedies will eventually be taken full advantage of, thus enabling film to present material fundamentally different to that which is presented by stage and book.

Development of the Film and Film Acting.—Actuality films and topical events, filmed often from studio reconstructions, were the mainstay of the C. for public exhibition in its early days. Pioneer work in this direction is associated with the names of Leon Gaumont, Charles Pathé, and Georges Méliès in France, Edison, Edwin Porter, and Carl Laemmle in the U.S.A., and in Great Britain Cecil Hepworth, J. Williamson, R. W. Paul, and Bennett Stanford, who made films of the S. African war. Louis and Auguste Lumière, inventors of the first projection machine (1895), made films from scenes from home life, and in these members of their own families took part. Professional actors and actresses of the stage at first looked askance at the new medium. Dramas soon found a place on the screen; an early example was *The Life of Charles Peace*, made by the Sheffield Photo Company in 1905. Historical dramas came into fashion. *Quo Vadis?* (1913), an It. film, was a spectacular achievement which influenced the development of the feature film in America. Great stage celebrities began to make their appearance on the screen, Mlle Réjane in a film version of *Madame Sans-têche* (1911) and Sarah Bernhardt in *Queen Elizabeth* (1912), a film which the Amor. promoter Adolphe Zukor imported into America, and which helped to establish the feature film there. The film 'vamp' was created at this time by Madeleine Roch of the Comédie Française in *Femme Fatale* (1912).

In the U.S.A. the 'star' system came into being as a result of the struggle for the control of the C. industry between a number of independent producers and a combined trust which was attempting to

secure a monopoly of production and distribution. The independents, one of the chief among them being Carl Laemmle, sought to gain publicity by using the names and personalities of their actors and actresses. Thus Florence Lawrence became one of the first of the 'stars.' Until launched by Laemmle, she had been known only anonymously as the 'Biograph girl' when working for the Biograph studio within the Trust. Similarly, 'little Mary' who had been discovered by D. W. Griffith in 1909 in *The Viola Maker of Cremona*, subsequently became famous as Mary Pickford. George Anderson, King Baggott, John Bunny, Marguerite Snow were other actors who achieved early stardom at the hands of the independents. George Anderson in particular, known as 'Broncho Bill,' W. S. Hart, and Tom Mix, who had been a cowboy in Oklahoma before taking to films, became world famous for their cowboy films which thereafter were an outstanding characteristic of Amer. films.

It was in comedy that the film before the First World War had its most promising developments. France led the way, with the trick comedies of Méliès, and then with the comedians Dranem and Prince, the latter in the successful *Rigadin the Clown* Series. A better-known figure was Max Linder who began a tradition of screen comedy in which Charlie Chaplin also made his name. Chaplin's first film, *Kid's Auto-Races*, was made for Keystone in 1913. He owed a good deal to the example of Mack Sennett, the hero of the celebrated Keystone comedies, as did other Keystone artists, Mabel Normand, 'Fatty' Arbuckle, Mack Swain, as well as later comedians such as Buster Keaton, Harold Lloyd, and W. C. Fields. It was while working for Keystone that Chaplin developed the character of the little man with the moustache and the baggy trousers who became world famous.

The pre-eminent figure in the development of the film during the First World War was David Wark Griffith. He was one of the first directors to make films of more than one reel. His first film to become known internationally was *The Birth of a Nation* (1915), followed by *Intolerance* (1916). The photographic quality and the masterly production, exemplified by the handling of great crowds, and the introduction of the close-up to give emphasis to incidents and facial expressions, the development of the flash-back and the fade-out, all mark the work of Griffith as amongst the greatest in the annals of film production. With him were associated a number of celebrated players. Mary Pickford has already been mentioned. Others are Dorothy and Lillian Gish, Henry Walthall, and Douglas Fairbanks, who later developed his clever brand of debonaire, dare-devil adventure. Lillian Gish and Mae Marsh were the stars of *Intolerance*, a masterpiece which was to influence the work of the great Russian director, Eisenstein. During the early years of the First World War the serial film enjoyed popularity both in Europe and America, notably *The Exploits of*

Elaine with Pearl White. The film, particularly in America, soon became more sophisticated. The winning innocence of Mary Pickford's characters gave way to the screen 'vamp,' personified in 1915 by the Amer. actress, Theda Bara. Heroines became complex emotional personages, and were portrayed by a succession of popular actresses, Norma Talmadge, Pauline Frederick, Alla Nazimova, and Greta Garbo in Amer. films, Pola Negri in Ger. (later also in Amer.), and Raquel Meller in Fr. Greta Garbo, who was to become renowned for her portrayal of great heroines of hist. and fiction: Queen Christina, Anna Karenina, and Canille, first appeared at the age of seventeen in the Swedish film *The Story of Gosta Berling* (1923), directed by Mauritz Stiller, who later brought her to Hollywood. The major films of this period were based on 'sex appeal,' a phrase coined at the time and credited to the Amer. director, Cecil DeMille. DeMille had won international fame in 1915 with his film *The Cheat*, with Fanny Ward and the Jap. actor Sessue Hayakawa. Gloria Swanson and Thomas Meighan also appeared in films made by him, notably *Male and Female*, based on Sir James Barrie's *The Admirable Crichton*. DeMille's high society films had a strong effect on manners, morals, and on dress. His heroines became leaders of fashion, and from that time costume designers for the C. have had to exercise the greatest care not only towards the creation of new fashions but to ensure that their designs are not outmoded by the time the film reaches the public. Less of a popular success than DeMille but perhaps more powerful as an influence on the film was the Austrian actor Erich von Stroheim, who directed and acted in a number of realistic films made by him in the U.S.A., notably *Blind Husbands* (1919) and *Greed* (1923) with Gibson Gowland and Zasu Pitts.

The Amer. film industry was at this time enjoying great prosperity. Hollywood attracted many outstanding directors, actors, and actresses from Europe. Among them, besides Greta Garbo and Pola Negri, were Emil Jannings, Lars Hanson, and Conrad Veidt, who had made his name in the famous Ger. expressionist film *The Cabinet of Dr. Caligari*, directed by Robert Wiene in 1919 on the subject of insanity. Stardom in the U.S.A. was at its height. To the names already mentioned may be added those of Richard Barthelmess, John Gilbert, Richard Dix, John Barrymore, Constance Talmadge, and Adolphe Menjou. Menjou had been a success with Edna Purviance in *A Woman of Paris* (1923), a film directed by Chaplin but in which he himself only made a brief appearance. Edna Purviance also appeared with Chaplin in *Shoulder Arms* (1918), and *The Kid* (1920). Rudolph Valentino became the idol of the 'fans' in *The Four Horsemen of the Apocalypse* (1921), and *Monsieur Beaucaire* (1924), the latter made by Sydney Olcott, a celebrated director who rivalled Griffith. Olcott was responsible for the

spectacular *Ben Hur* in 1909. A film of the same title in 1928 became perhaps the most popular achievement of the silent film after the First World War. It made Ramon Novarro a star, the equal of Valentino. Another eminent recruit to Hollywood from Europe was Ernst Lubitsch, who made his name in Germany in 1920 with the production of *Madame Du Barry*, entitled *Passion* in the U.S.A., and starring Pola Negri. His Amer. films begin with Mary Pickford in *Rosita* (1923), Pola Negri in *Forbidden Paradise* (1924), Emil Jannings in *The Patriot* (1926), and continue well into the talkie era with the musical play *Monte Carlo* (1930), with Jeanette MacDonald. Later films of his include *Bluebeard's Eighth Wife* (1938), with Gary Cooper and Claudette Colbert and *Ninotchka* (1939), with Greta Garbo.

Outside the U.S.A. film production in the twenties was being developed, particularly in Germany, on ambitious, decorative, and highly dramatic lines, exemplified by *Siegfried* made by Fritz Lang in 1923. Russia was employing film for propaganda purposes—to tell to her millions the story of the revolution. The early Russian silent films, *The Battleship Potemkin*, made by S. M. Eisenstein in 1925, and *The End of St. Petersburg*, made in 1927 by V. I. Pudovkin, were unsurpassed, and made the fullest use of film to create powerful drama by the use of impressive camera angles, and by skilful editing. In 1928 appeared the great Fr. production, *La Passion de Jeanne d'Arc*, regarded as one of the finest of the early historic films, and in the same year the genius of René Clair was revealed in the whimsical comedy, *The Italian Strain Hat*. Excellent pioneer work in the documentary field had been done by the Amer. producer and explorer, Robert Flaherty, who took the camera to the Eskimos for *Nanook of the North* (1922), and to the S. Sea Islanders for *Moana* (1926). He later himself contributed to the Brit. documentary movement with *Men of Aran* (1934). Meanwhile, under Grierson's leadership, a number of Brit. directors as well as the Fr. director, Alberto Cavalcanti, were producing notable work with the G.P.O. Film Unit and other organisations which provided opportunities for documentary. In this connection mention must be made of the series of Brit. 'shorts' which achieved world-wide popularity in silent form and which were continued successfully as sound films—namely *The Secrets of Nature* series made by Bruce Woolfe, Percy Smith, Mary Field and others, and the *Cinemazine* edited by Andrew Buchanan.

To return to the feature film, the story and the style of acting underwent considerable change in the years immediately preceding the talkies. This was mainly through the influence of the Russian directors, Eisenstein, Pudovkin, and Dovzhenko. More attention was paid to character and to a more natural style of acting. This was made possible by the introduction of the panchromatic film

in 1925, which needed less light and less distortion of natural tone values. The development of silent film technique was, however, halted by the coming of the talkies in 1927. The first feature film with synchronised sound including speech, song, and music, was *The Jazz Singer*, produced by Warner Brothers with Al Jolson on Oct. 6, 1927. From that time talkies became the rage. The reputations of many actors and actresses made in silent films were lost, others were consolidated. Acting became more natural. The conventions of the silent film disappeared. A director who came to the fore with the use of sound was King Vidor whose film *Hallelujah* (1928) was distinguished by an all-negro cast. New names appeared among movie stars, among them Marlene Dietrich who appeared with Emil Jannings in *The Blue Angel* (1930), a film made in Germany by Von Sternberg. Others made their name in the gangster films which were popular in the early thirties—Edward G. Robinson in *Little Caesar* (1930), James Cagney in *The Public Enemy* (1931), and George Raft and Paul Muni in *Scarface* (1932)—in comedy the Marx Brothers (Groucho, Harpo, and Chico), Laurel and Hardy, and W. C. Fields. The period pieces such as *The Belle of the Nineties* (1931) provided an attractive setting for Mae West. Among other films of the thirties *Little Women* is remembered for the acting of Katherine Hepburn. *Hell's Angels* for that of Jean Harlow, *The Thin Man* with Wm. Powell and Myrna Loy, *Gone with the Wind* with Clark Gable, Leslie Howard, and Vivien Leigh. The early gangster films had idealised the gangster. Their anti-social attitude was killed in such later films as *Crime Does Not Pay* and *The Petrified Forest* with Leslie Howard and Bette Davis. The feature film tended to become more serious and to present social problems in a fearless and provocative manner.

The advances which the Amor. producers had made during the First World War both in production and in securing world markets, enabled them to keep the lead in volume and technical quality in the years that followed. The Brit. film industry had great difficulties in re-establishing itself. In the early twenties under thirty Brit. feature films were made annually, but by 1934 the number had risen to nearly 200. This was largely due to the Cinematograph Films Act, 1927, known as the First Quota Act, which obliged exhibitors to show a minimum proportion of Brit. films as against foreign. In 1929 came the first Brit. sound film. This was *Blackmail* made by Alfred Hitchcock, who in this and his later thrillers—notably *The Lady Vanishes* with Margaret Lockwood, *Michael Redgrave*, and Paul Lukas—estab. a reputation for his imaginative use of the medium. Anthony Asquith who made *Tell England* (1931) with Carl Harbord and Fay Compton, and Walter Forde who made *Rome Express* (1932) with Esther Ralston, Conrad Veidt, and Gordon Harker, were among other directors who

estab. the Brit. film during the successful decade before the Second World War. Alexander Korda's *The Private Life of Henry VIII* (1933), with Charles Laughton and Robert Donat, was the first of many successful period films, including Paul Czinner's *Catherine the Great* (1934), with Elizabeth Bergner, Victor Saville's *The Iron Duke* (1935), with George Arliss and Gladys Cooper, and *Victoria the Great* (1937), made by Herbert Wilcox with Anna Neagle and Anton Walbrook.

Nearly every country has embarked on film production with great success, but linguistic barriers prevent many worthwhile films from circulating in countries other than that of their origin. Russian production, controlled by the State, has continued to make excellent progress, whilst Fr. films have won a special place by reason of their naturalness, charm, and originality. Mention should be made of René Clair whose genius as a director puts him alongside Chaplin, Eisenstein, and Pabst. His *Sous les Toits de Paris* appeared in 1930, and was followed by *A Nous la Liberté*, *Le Million*, and others. It. films have since the Second World War shown a marked resurgence, and the work of the director, Roberto Rossellini, who made *Open City* (1946) and other films became known internationally. Ger. production suffered a setback during the Nazi regime, but there are signs that it will re-discover its original artistic approach to film-making. In both quantity and technical excellence, however, the U.S.A. continues to hold the field, despite the increasing quality of the output of other nations, in particular Britain. Brit. producers and directors who contributed to the improvement in production during and since the Second World War are, to mention only a few, Anthony Asquith (*The Way to the Stars*), Michael Powell (*The Life and Death of Colonel Blimp*, *A Matter of Life and Death*, and in particular *The Edge of the World*), Carol Reed (*The Stars Look Down*), Sir Laurence Olivier (*Henry V.*), one of the few Brit. technical films), Harry Watt (*The Overlanders*, made in Australia), Michael Balcon (*San Demetrio, London*), Sydney Box (*The Seventh Veil*), Gabriel Pascal (*Major Barbara*, *Casar and Cleopatra*), Noel Coward and David Lean (*This Happy Breed*, *In Which We Serve*, and particularly *Brief Encounter*).

Many actors and actresses of the Brit. theatre have become stars of the screen, notably, besides those already mentioned, Vivien Leigh, Sir Ralph Richardson, Ann Todd, Flora Robson, David Niven, Celia Johnson, Bernard Miles, Rex Harrison, and Eric Portman. James Mason and Stewart Granger are Brit. stars who have headed the list for popularity. Perhaps the greatest individual success in film-making after Charles Chaplin (q.v.), is Walt Disney, whose feature-length cartoon films, beginning with *Snow White and the Seven Dwarfs* in 1938, and followed by *Pinochio*, *Bambi*, and others, pointed the way to a form of film-making which, with skilful use of colour, with perfect synchronised sounds and music, exert

a universal appeal. A survey of films, however brief, would not be complete without mention of the opportunity for music given by the introduction of sound. Scores for films were contributed by such celebrated composers as Vaughan Williams, Arnold Bax, Benjamin Britten, Wm. Walton, Arthur Bliss, while others such as Richard Addinsell, Wm. Alwyn, and Clifton Parker became known chiefly for their work for films. Among film music directors mention must be made of Bretton Byrd, who was associated with the outstanding Brit. comedy films of the thirties with Will Hay, Jack

the cine-film astronomers have known for many years that large masses of incandescent matter are shot out of the sun and can be seen as solar prominences at the time of a total eclipse. Again, the technique of photographing a phenomenon at spaced-out intervals and projecting the film at the usual speed has been applied by the chemist and the metallurgist to the study of the growth of crystals. Hundreds of motions in industry and in the laboratory have been studied with the same technique as that used in the slow-motion films of athletes and race-horses. The value of such

Henry V. (Sir Laurence Olivier) with the French royal family.

Hulbert, and Cicely Courtneidge, also John Hollingsworth, Charles Williams, and in particular Muir Mathieson, who has appeared in films with the London Symphony Orchestra.

Films as an Aid to Scientific Research. The cine-camera is of great use in research work. It can act as a time-expander recording with an 'unblinking eye' intimate details of a process which lasts for a thousandth of a second or even less, and it can spread out its record to show for minutes or hours events that lasted only a few seconds. Conversely, it can be used equally well as a time compressor when pictures taken once every hour can be projected as a continuous film compressing the events of days into a few minutes. The cine-camera can—as in X-ray cinematography—do the same kind of things for the otherwise invisible, giving us, for example, a motion record of events within the animal body which cannot be seen in any other way. Through

films lies in the exactness with which it is possible to take measurements of events too fast to see with the human eye.

In 1946, the estimated amount of money invested in the Amer. motion picture industry was \$2,600,000,000, of which \$127,750,000 were invested in studios. In the same year there were 21,519 cinemas in the U.S.A., 15,425 in U.S.S.R., 5000 in Great Britain, 4579 in S. America, 4422 in France, 3500 in Spain, 2351 in Sweden, 1100 in Belgium. In Czechoslovakia there are 1600, though not all are in operation since the Second World War. Similarly of Germany's 5500 cinemas, many are not in operation since the war, nor, whilst the country is divided into zones, is it possible to assess the number open to the public, although it is known that about 800 were operating in the Brit. zone in 1946. Denmark has 430 cinemas, Holland 379, Switzerland 371, Poland 336, and Hungary 300. See also CHRONO-CHROME;

TECHNICOLOR. See J. R. Cameron, *Motion Pictures with Sound*, 1929; R. Arnheim, *Film*, 1933; R. Spottiswoode, *A Grammar of Film*, 1935; P. Rotha, *Documentary Film*, 1936; A. Buchanan, *Film Making from Script to Screen*, 1937; M. Hardeche and R. Brasillach, *Histoire du Cinéma*, 1935 (Eng. trans. 1938); L. Jacobs, *The Rise of the American Film*, New York, 1939; F. Cinerary Urns, hand-made vessels of clay, glass, or sculptured marble, in which the ashes of those who had been cremated were preserved. They are relics of the Stone and Bronze ages of N. Europe, while others of a widely different type are found in Rom. tombs. The urn proper used for containing the ashes is a large flower-pot-shaped vessel, and decorated only on the top; but other urns used were the food-vessel variety, rather broad in shape, and standing low, the drinking-cup variety, tall and slim, with beautiful decorative designs covering the whole surface, and a vessel shaped like a cone, decorated, and having two or three perforations through the periphery, and known as incense cups. These latter were probably used to contain the fire with which the funeral pyre was lighted.

Cingoli, tn. in the prov. of Macerata, Italy, occupying the site of the auct. Cingulum. Pop. 3000.

Cinisi, tn. in Sicily, 15 m. N.W. of Palermo. Pop. 8800.

Cinna, Gaius Helyius, Lat. poet, who was tribune in 44 B.C. His chief work is a poem called *Smyrna*, of which only fragments have survived; it was, according to Plutarch, of an obscure nature, and had taken the poet eight years to write. He was attending the funeral of Caesar, with whom he had been friendly, when the populace mistook him for Lucius Cornelius C., the praetor, and lynched him. Shakespeare has included the incident in his *Julius Caesar*.

Cinna, Lucius Cornelius (d. 84 B.C.), Rom. statesman, was leader of the popular party at Rome. He was elected consul in 87 B.C.; Sulla only permitted this on condition that C. pledged himself not to tamper with the constitution of the state. C., when elected, promptly broke his pledge and impeached Sulla. The other consul, Octavius, drove him out of the city; C., however, enlisted the aid of Marius and his army, and returned to capture Rome. Every one who was unfortunate enough to have incurred their enmity was put to death, and the loss of life through these massacres was very great. In 86 C. was consul with Marius, and held office in the two following years, after Marius's death. When, however, he ordered his soldiers to march into Greece to oppose the returning Sulla, they revolted and murdered him.

Cinnabar, prin. ore of mercury, is the

sulphide HgS. It crystallises in small rhombohedral crystals with an adamantine lustre. The usual method of obtaining mercury from the ore is by roasting the ore when the sulphur is oxidised off into sulphur dioxide, and the mercury distils off and is condensed in a series of flues or chambers. It is found in Almaden in Spain, California, the Bavarian Palatinate, and Idria in Calabria.

Cinnamic Acid ($C_6H_5 \cdot CH \cdot COOH$), or **Phenylacrylic Acid**, a constituent of storax (*Styrax officinalis*), from which it may be extracted by warming the resin with caustic soda. C. A. is a crystalline solid melting at 133° C.

Cinnamomum, important genus of Lauraceae, confined to the E. Indies. There are over one hundred species, many of which yield either cinnamon or cassia, two aromatic barks. *C. zeylanicum* produces the finest cinnamon, and is cultivated in Ceylon; *C. Cassia* produces cassia, and is often used to adulterate cinnamon; *C. Camphora* is the plant from which camphor is distilled. See separate articles for various products.

CINNAMON

Cinnamon, bark of certain small trees belonging to the genus *Cinnamomum* (q.v.). The bark is taken off, and when dry curls up. It is the oil of C. which produces its flavour, and this is prepared from pieces of bark which are first soaked in sea water and then distilled. The oil itself is of a yellowish-brown colour. C. is useful both as a medicine and as a flavouring in cooking. Cassia, which is produced from another variety of the genus, is sometimes used instead of C., but is much coarser.

Cinnamon Stone, variety of garnet so called on account of its resembling cinnamon in its yellowish-brown colour. It is found in Scotland, Ireland, Ceylon, and the U.S.A., sometimes occurring in shapeless masses and sometimes in the form of crystals. The variety found in Ceylon is used in jewellery work.

Cinnoroth, Sea of, see under **GALLIE**.
Cino da Pistoia (c. 1268-1337), It. poet and lawyer. He wrote a commentary on the first nine books of Justinian's *Code*.

and this was much read, and after 1483 was many times reprinted. He was a friend of Dante, who addressed two sonnets and a letter to him. He was possessed of much genuine merit and passion, which stand forth in many of his poems, though at times he is obscure in expression.

Cinquecento, It. word, meaning literally 500, but used as a contraction for 1500. It is used to describe the new style in all depts. of culture which began to flourish in Italy about the year 1500. The whole civilised world was in reality about to revert to the anct. style of art; everywhere about this period men were seeing the decadence of the Gothic. In France, in Germany, and in England the change was not definitely to come about till later, and when it did come was to be preceded by a period of transition. Thus the new movement was characterised by a revival of classical taste and design in all the arts; C. may thus, when used as an adjective, be said to correspond to the Fr. style *Renaissance* or style *François premier*, and to the Eng. Elizabethan. The change in It. methods commenced in the fifteenth century; Ghiberti and Donatello were the pioneers in sculpture, Alberti and Brunelleschi in architecture. By the end of the century the standard of Brunelleschi, in particular, had been recognised throughout the country. The best examples of C. work in architecture are St. Peter's and the Vatican, in Italy; the Louvre, etc., in Paris; and St. Paul's Cathedral, in London. Among the famous cinquecentists may be mentioned Michelangelo and Benvenuto Cellini, in sculpture; Titian, Leonardo da Vinci, Bramante, and Correggio, in painting; and Berni, Ariosto, and Tasso, in literature.

Cinquefoil, in architecture an ornament consisting of five lobes meeting in points, called cusps, and tangent to the inner side of a larger arc. Arches may be formed with a C.

Cinque Ports, five (*cinque*) large ports on the S.E. coast of England, which once had special privileges and duties. The original five ports were Dover, Sandwich, Hastings, Romney, and Hythe; later the anct. tns. of Winchelsea and Rye and other places were added. Their origin dates back for a long time, possibly to the Rom. times; they were of considerable importance in the A.-S. period, and in a charter of the reign of Edward I. a reference occurs to a previous charter given by Edward the Confessor. After the Norman Conquest William I. made this line of coast into an entirely separate ter. under the jurisdiction of a warden, corresponding to the count of the Saxon Shore (*comes littoris Saxonici*). This official had his residence in Dover Castle, and exercised civil, military, and naval authority, combining the functions of sheriff, *custos rotulorum*, lord-lieutenant, and admiral. The chief duty of the C. P. in early times was to furnish shipping for the state. In the reign of Edward I. they were bound to provide not fewer than fifty-seven ships for a period of fifteen days without recompense, but in return

for this they had many privileges, such as exemption from taxes, the power to make their own by-laws, etc. The C. P. played an important part in the hist. of the thirteenth and fourteenth centuries. Until 1688 one or two of the members for each of the ports were nominated by the lord warden, but after that year they were elected. The Bills of 1832 and 1835 reduced the members for the C. P. from sixteen to three, and since then they have been merged with the co. The Municipal Reform Act has broken up the anct. organisation, and though the anct. courts of Shepway, Brotherhood, and Guestling still meet sometimes, it is as a matter of form. The civil jurisdiction of the lord warden has been abolished, but he still exercises maritime jurisdiction, presides at the court of Shepway (held in the aisle of St. James's Church, Dover), and appoints justices of the peace within the jurisdiction of the ports; he has an official residence at Walmer, and is entitled to £3000 a year for his office. See A. E. Bradley, *England's Outpost: the Country of the Kentish Cinque Ports*, 1921.

Cinthio, name assumed by Giovanni Battista Giraldo (*q.v.*).

Cintra, tns. Portugal, in the prov. of Estremadura, 16 m. N.W. of Lisbon. Owing to its picturesque situation, sheltered by hills, and its agreeably mild climate, it is a favourite resort for the wealthy Lisbon residents. There is an anct. royal palace, partly of Christian and partly of Moorish architecture. C. is noted for the convention which took place in 1808. Pop. 8000.

Cione, Andrea di, see ORCAGNA.

Cionus, genus of Curculionidæ, or weevils, contains sev. Brit. species. These are small beetles, living both in their larval and imaginal states upon plants.

Ciotat, La, seaport of France, in the dept. of Bouches-du-Rhône. It is situated on the Mediterranean coast, 20 m. S.E. of Marseilles, and has a fine harbour. There is a good coasting trade and a noted coral fishery; ship-building is carried on. Pop. 13,400.

Cipher, see under CRYPTOGRAPHY.

Cipolin, crystalline rock, usually containing mica. It is a granular limestone which, through metamorphism, has become a white marble with green veins, the latter being caused by the presence of bands of finely divided mica.

Cipriani, Giovanni Battista, or Giambattista (1727-85), Florentine artist who studied at Rome and, later, settled in London. His graceful drawings soon won popularity. His pictures are not of so high a quality as his designs, which were engraved by Bartolozzi. Designed the diploma of the Royal Academy and many of the exterior and interior decorations of Somerset House.

Circæa, genus of Onagraceæ occurring in cold climates. There are two species in Britain, one of which, *C. lutetiana*, the enchanter's nightshade, grows in damp and shady places.

Circars, The Northern, anct. Indian ter. on the E. coast of India, stretching along

the shores of the bay of Bengal. The dists. now corresponding to them are Ganjam, Vizagapatam, Godavari, and Kristna. They became the possessions of the E. India Company.

Circassia, name of a region in the Caucasus, lying in the basin of the Kuban, a portion of the Upper Terok, and S. of the Caucasus on the Black Sea from Anapa to Gagry. Formerly it was a part of the Russian prov. of Kuban, but is now shared between the Krasnodar Ter. of the R.S.F.S.R. and sev. small Caucasian republics. The Russian name for the Circassians is Cherkesses, the Ossetian name Kazaks; the Circassians call themselves Adygheb. When C. was surrendered to Russia by Turkey in 1829, the people refused to submit, and it was not till 1859 that they were finally conquered. After the conquest large numbers emigrated to Turkey, principally in Bulgaria and Thessaly. Most of the common people belong to the Christian religion, though the higher classes on the whole are Muslims. The number of the Circassians dwindled during the nineteenth century, as although they numbered 500,000 in 1850, they were not more than 100,000 at the end of the century. Circassian women are noted for their beauty, and in past times, were often captured by slave-traders. See E. Chantre, *Anthropological Researches in the Caucasus*, 1855-57; and D. Totaeff, *The Soviet Caucasus*, 1942.

Circe, daughter of Perse and Helios and sister of Aetes. She lived on the is. of Aëa, and when Odysseus's followers were cast on this is. she gave them her magic cup to drink from and they were turned to swine. She was unable, however, to bewitch Odysseus, as Hermes had provided him with a herb which enabled him to drink without being transformed. He also compelled C. to re-transform his followers, and spent a year on the is. of Aëa with her.

Circinus, the Compasses, a S. constellation noticed by Lacaille, who placed it below the Centaurus and not far from the S. pole. It contains a white star of 3.4 magnitude, with a brick-red attendant.

Circle, figure enclosed by a curved line called the circumference which is at all points the same distance from a fixed point called the centre. A C. is, therefore, strictly speaking, the space included by the circumference. The distance from centre to circumference is called the radius, and a straight line drawn through the centre and terminated in both directions by the circumference is called a diameter, which is therefore twice the radius in length. A part of the circumference is called an arc, and the straight line joining the ends of an arc is called a chord. The figure enclosed by an arc and its chord is a segment, and that enclosed by two radii and the arc intercepted by them is a sector. An ant. problem is the determination of the ratio of the length of the circumference of a C. to its diameter. This ratio is the same for all Cs., and is an incommensurable quantity, i.e. it cannot be stated exactly in figures. It is repre-

sented by the Gk. letter π , and its value may be approximately rendered by the following quantities: $\sqrt{10}$, $\frac{22}{7}$, $\frac{355}{113}$, 3.1416, 3.1415926535. In the same C., or in equal Cs., equal angles are subtended by equal arcs and by equal chords, therefore divs. of the circumference is a convenient method of measuring angles. The angle at the centre subtended by one quarter of the circumference is a right angle; this is divisible into 90 degrees, each degree into 60 minutes, and each minute into 60 seconds. In the circular measure of angles as employed in trigonometry, the unit is that angle subtended by a part of the circumference equal in length to a radius. The unit is called a radian, and it follows that there are two π radians in four right angles. The properties of the C. are discussed in Euclid's *Geometry*, book III.

Circle, Magic, piece of ground chosen in some dark and lonely place, used by sorcerers and magicians as a place of refuge against evil spirits. The whole area of ground varied, sometimes being 9 ft. square, and on this area were marked out two concentric circles. Within the smaller sat the wizard, for it was a common belief that it was only by remaining on this particular piece of ground that he could prevent the evil spirits, with whom he was dealing, from carrying him away with them.

Circle of Curvature, circle having the same curvature as that at a given point on a given curve. The C. of C. varies for different points on the curve.

Circle of Diffusion, in photography, the degree to which a geometrical point of light is diffused in the image projected by a lens. The maximum permissible diameter of the disk is $\frac{1}{10}$ in., but this is much too large for critical definition, and especially when the image is to be subsequently enlarged.

Circle, Quadrature of the, see QUADRATURE.

Circles of Stones, standing stones formed in circles. They are unhewn and set up at intervals round a circular space, generally on level ground, though they are occasionally found on the slightly sloping side of a hill. They cover a space of ground varying from 20 to more than 100 ft. in diameter, and the number of stones forming the circle also varies. It is impossible to ascertain exactly what the original number may have been, as most stone circles now existing are in a state of dilapidation, sometimes being mere boulders rolled together, or else long stones, wedged upright by smaller ones inserted round their bases, in a hole in the subsoil specially prepared to receive them. These stone circles are often, but wrongly, called Druidical circles in Great Britain, and are known as cromlechs in France. One of the greatest and most interesting stone circles is Stonehenge, a circular group of gigantic stones standing on Salisbury Plain, situated amidst an extensive group of prehistoric barrows of the Bronze Age. Another large circle of unpolished stones is at Avebury (q.v.), Wiltshire. The largest of the Scottish stone

circles is that of Stennis in Orkney, 4 in. from Stromness. Near this particular circle stood the perforated stone through the opening of which it was customary in the eighteenth century for young men and women of the dist. to plight their troth by joining hands, the promise thus made being regarded with superstitious reverence. There is a fine group of standing stones at Callernish (q.r.), Lewis. Scotland contains many other varieties of stone circles, and excavations have disclosed burials of the Bronze Age, chiefly after cremation. In many parts of Europe are found circles of small boulder stones, indicating that the space thus enclosed has been reserved for burial

barons of the exchequer partly for judicial, but principally for financial purposes. The great function of these old itinerant justices was that they linked up the local with the central administration. In 1173 the country was divided into six C. for exchequer purposes. The judicial functions were further developed by commissions of justices to try criminals presented by the hundred and the shire. Edward I. replaced the irregular C. of the itinerants by regular C. of the judges of assize; the country being divided into four C. in 1293, with two judges to each div. The present assizes may be said to date from the close of the thirteenth century, when the judges

RESTORATION OF STONE CIRCLES, AVEBURY

deposits in prehistoric times. Few stone circles are met with in France, and very little is as yet known of the contents of those found. The most important is at Carnac, Brittany. S. of the Baltic, circles of standing stones are rarely met with. See also AVEBURY; CROMLECH; DOLMEN; MENHIR; STONEHENGE. See Sir H. James, *Plans and Photographs of Stonehenge*, 1867; Ferguson, *Rude Stone Monuments*, 1872; Anderson, *Scotland in Pagan Times*, 1886; and Sir N. Lockyer, *Stonehenge and other British Stone Monuments Astronomically Considered*, 1906.

Circleville, tn. in Ohio, U.S.A., in co. Pickaway, was laid out within a prehistoric circular embankment of which no trace now remains, there is an ann. pumpkin show and vegetables are canned. Pop. 7500.

Circuit, Electric, see ELECTRIC CIRCUIT.

Circuits, periodical progresses of the judges of the king's bench div. of the high court of justice through the sev. co. of England and Wales, for the purpose of administering justice in civil and criminal matters. The circuit system dates almost from the reign of Henry I., who organised C. of the judges of the *curia regis* and

of assize were empowered to act under commissions of *nisi prius* (q.r.), oyer and terminer (q.r.), and jail delivery. The regulation of the present C. was originally provided for by the Judicature Act, 1875, but this is now replaced by the Supreme Court of Judicature (Consolidation) Act, 1925. At the present day the C. comprise eight divs.: the S.E., Midland, N., N.E., Oxford, W., N. Wales and Chester, and S. Wales. The winter assizes commence about the middle of Jan.; the summer, the middle of May; and the autumn, the middle of Oct. No civil (*nisi prius*) business is taken at the autumn assizes except in Bristol, Devon, Glamorgan, Lanarkshire, and Suffolk. There are additional assizes in May for Lancashire and Yorkshire. In the U.S.A., there are nine federal circuit courts of appeal, each circuit having appellate jurisdiction over sev. federal dist. courts. The President appoints the judges to these circuit courts, but judges of the dist. courts are eligible to sit. These courts have appellate jurisdiction over most of the issues cognisable by the dist. courts, though some issues go direct to the supreme court. See also ASSIZE.

Circular Measure, in geometry, a method of measuring angles. The angle between two straight intersecting lines, AX and AY, is expressed as the ratio of the length of the circular arc XY to the length of the radius AY of the circle; in general, $\text{angle} = \frac{\text{length of arc}}{\text{radius}}$. This expression is independent of the length of the given radius, since, for a given angle, the length of the arc is proportional to the radius.

The unit of C. M. is the *radian*, the angle subtended at the centre of the circle by an arc of length equal to the radius. Since the length of the circumference of a circle = 2π radius, the number of radians in a full circle is 2π , i.e. approximately 6.284. In order to convert the measure of an angle from degrees to radians, multiply by $\frac{2\pi}{360}$ or divide by 57.296.

Circular Note, see CREDIT, LETTER OF. **Circular Numbers**, those which form the last digit of any power to which they are raised. Thus every power of five ends in five.

Circulating Decimals, see DECIMAL FRACTIONS.

Circulating Library, see LIBRARIES.

Circulation, see MONEY.

Circulation of the Blood. Harvey in 1628 was the first to demonstrate that the blood circulates. The ancients had conceived that the arteries held air, and it was generally held prior to Harvey that the blood was pumped from the heart to the veins, and that the blood moved in a to-and-fro movement. He, however, showed that the veins have valves which prevent the blood flowing back, and at the same time he proved that the arteries contained blood, not air. The circulating system consists of arteries, veins, capillaries, and the heart. The arteries are tubes, with stout elastic walls well provided with muscular tissue. They branch in their course, becoming thinner-walled and smaller as they subdivide, and finally they pass into the capillaries, which are very minute and walled only with a single layer of cells. These capillaries run through the tissues and unite to form small veins, and these in their turn are

gathered together to form the large veins. As has been pointed out, these veins often possess valves which prevent a reflux of blood into the arteries. The heart (*q.v.*) is a four-chambered muscular bag, which by its alternate contraction and dilation acts as the pump which maintains the circulation through the body. These four chambers are divided into pairs, the right and left ventricles, and the right and left auricles. The auricles are in communication with the ventricles, but the right chambers of the heart are only connected to the left in the indirect manner shown in the description of the circulation. The vessels which lead from the ventricles are respectively termed the pulmonary artery on the right and the aorta on the left. There are valves between the auricles and the ventricles, that on the right side consisting of three flaps and being termed bicuspid or tricuspid, that on the left being termed mitral and consisting only of two flaps. In order that the blood may circulate through the body it has to describe two circles. It has to pass through the body generally in a large circle, and this is called the systemic circulation, while it further has to pass through the lungs, forming the pulmonary

DIAGRAM OF THE CIRCULATION OF THE BLOOD

circulation. In the diagram the black portions will represent the flow of de-oxygenated blood, and the white portions show the flow of oxygenated blood. The two auricles of the heart contract and drive the blood into the still expanded ventricles. Thereupon the auricles relax and the ventricles contract, driving the blood through the aorta and the pulmonary arteries. This alternate contracting and expanding will evidently cause a continual flow of blood in a series of spurts (the pulse beats). The blood driven into the pulmonary artery passes

through it into its two branches, one branch passing through each lung. Here the blood is oxygenated and purified, since it is passed through smaller and smaller branches, ultimately directed into the pulmonary capillaries covering the air cells of the lungs. Here the carbon dioxide is given up and oxygen taken. These capillaries then reunite into four pulmonary veins which carry the blood to the left auricle. Oxygenated as it now is, it is in a similar manner passed again into the left ventricle, and from thence into the aorta, which carries it in a great curve down alongside the vertebral column. Branches are given off from this for the head, the neck, and the arms at the curve, while on its downward course it throws branches to the thorax, abdomen, and legs. From the various branches of the aorta the blood passes into the capillaries, and is again gathered up into the veins after it has parted with its oxygen to the tissues and gathered up the carbon dioxide gas which represents the waste. These veins unite into two large trunks, the superior and inferior vena cavae. The superior vena cava receives the blood from the head, neck, and arms, while the inferior vena cava receives the blood from the rest of the body. Through these the blood is poured back again into the right auricle, whence it repeats the above process, being reoxygenated each time on circulating through the pulmonary system before it begins its course through the general system. The blood of the abdominal viscera, however, takes a different course. It comes from the aorta, but from the capillaries of the stomach, intestines, and spleen, it is gathered into the portal vein. From here it passes into the liver, where again it is distributed into capillaries. At the same time blood travels direct from the aorta to the liver by means of the hepatic artery. It is through the portal vein that many of the products of digestion are carried to the liver, mingling with the blood from the hepatic artery, and the capillaries reuniting to form small veins; these again join together to form the hepatic vein, which carries the blood back into the inferior vena cava. This course taken by the blood from the abdominal viscera, through the liver to the hepatic vein, involving a passage through the two sets of capillaries, is often referred to as the portal circulation (see LYMPH). The heart itself receives its supply of blood from what are termed coronary arteries which spring from the root of the aorta. This blood, after passing through the heart capillaries, is passed directly into the right auricle. The disease angina pectoris is caused by a partial blocking of these coronary arteries.

Comparative.—It is not until we come to the higher worms that we arrive at anything approaching a vascular system, the various types giving rise to manifold stages until the highest stage for them is reached in the possession of a dorsal heart. In crustaceans, arteries are fairly well developed through which the blood is driven from this dorsal heart. The

venous system is lacunar, the venous blood passing along body cavity spaces to the gills and thence back to the heart. In insects the vascular system is not very distinctly developed. In molluscs the arterial system is fairly well developed. Passing to the vertebrates, the heart is a ventral and not a dorsal vessel. The typical fish circulation involves the fact that the heart always contains deoxygenated blood, which is taken by the afferent branchials to the gills, where it absorbs oxygen. The dorsal aorta, formed from efferent branchials which drain the gills, carries the blood to the body; thus showing the great difference between them and the higher vertebrates, in whom the dorsal aorta arises from the heart. Moreover in fish the blood travels along a single circuit, in contrast to the double circulation of higher vertebrates. In amphibians the heart has developed into a three-chambered organ. They have a right and left auricle and one ventricle; the ventricle drives the blood to the head, body, and lungs, while the right auricle takes deoxygenated blood from the body, and the left oxygenated blood from the lungs or gills. In all these stages oxygenated and deoxygenated blood is more or less mixed, and it is only in birds and mammals that there is a complete separation of the two sides of the heart, resulting in the separation of the arterial and venous systems, so that they can only communicate through capillaries. In birds the aorta goes to the right, while in mammals it goes to the left, but except for the fact that their hearts are different in structure, and for the above fact, the circulatory systems are similar in birds and mammals. In this matter the metamorphosis of the frog affords a striking example of the evolution of the circulatory system from the fish-like arrangement of the tadpole to the circulation of the adult frog as described above. See W. Harvey, *De Motu Cordis et Sanguinis*, 1628 (Eng. trans., *The Motion of the Heart and Blood*, in Everyman's Library); C. Singer, *The Discovery of the Circulation of the Blood*, 1922, and *Short History of Biology*, 1931.

Circumcision (Lat. cutting round), cutting off of the foreskin (prepuce), is a rite of ant. origin and widespread use. It was practised among the early Egyptians, as is proved by extant monuments; and it is a primitive Arab custom. It was practised by the Aztecs, and at the present time by all Muslims, the Kafirs, the Australian aborigines, the Papuans, and the Jews. The last-named people regard it, as they have always done, as a custom of great religious importance; and one of the earliest controversies of the Christian Church was on the subject of its retention. The reason for the rite is not known, but it originated probably either as a sacrifice or as a distinctive tribal mark, like tattooing. C. is also practised on purely medical grounds in cases where the foreskin cannot be drawn back to allow cleansing of the underlying parts, or when the opening of the prepuce is so small as

to obstruct the flow of urine. It is a trivial operation in infancy.

Circumcision, Feast of, religious festival observed both by the Rom. Catholic and Anglican Churches, celebrating the C. of Christ. It is commemorated on New Year's Day, Jan. 1.

Circumference (Lat. *circum*, round, and *ferre*, to carry), or periphery, is the name given to the curved line which encloses a plane geometrical figure, such as a circle, an ellipse, etc. The length of the C. varies according to the nature of the curve, and there are different formulæ to ascertain it. The C. of a circle, for example, is $2\pi r$ (r , radius; π , 3.1416).

Circumferentor, name of a mathematical instrument used chiefly in connection with the surveying of mines, etc. It consists of a compass, with diametrical sights, the dial of which is divided into degrees. This is attached to a stand, and can be adjusted so that the angle which the line of sight makes with the magnetic N. can be observed on the dial.

Circumlocution Office, name applied, in satire, by Charles Dickens in *Little Dorrit* (1885), to gov. offices on account of their interminable delays—duties being so divided that the simplest process had to pass through a whole body of officials. Some of the more ludicrous of these circumlocutions are recorded in Baron Stockmar's *Memoirs*, 1888.

Circumnavigation means literally sailing around, but is usually applied to voyages round the world. Among famous circumnavigators may be mentioned Francis Drake (q.v.). Bougainville, one of the first Frenchmen to sail round the world (1766); and Capt. Cook (1776–1779).

Circumpolar Stars, see under STARS.

Circumstantial Evidence, see under EVIDENCE.

Circumvallation. In fortification, an entrenchment or chain of defensive works, erected by a besieging army, but facing outwards towards the country, so as to guard against attempts at relief by a field army, is called a line of C. The field-works are sometimes connected by a parapet or a rampart.

Circus (Lat. *circus*; Gk. κίρκος or κίρκος, a circle or ring), was anciently a space, circular, oval, or sometimes oblong in shape, which was intended for the performance of races and athletic contests. The Rom. C. was in the form of an ellipse cut in half at its vertical axis, whilst along the transverse axis the fence (*spina*) ran, which separated the starting course from the return course. The seats rose in tiers parallel to the sides of the course, and in a crescent round one end; there were no seats at the other end, which was the front of the building, and the main entrance, but the *carceres*, or stalls, for the horses and chariots were here. The seats were made of stone in the lower tiers, and in the others of wood. The lower seats were reserved for members of the upper classes, whilst there were a few *cubicula*, or state boxes, for the giver of the C. and his friends. The C. was the only public spectacle at Rome in which

the sexes sat together. The *spina* was decorated with carving and statues, besides seven figures of dolphins and seven oblong objects, of which one was removed after every lap, as a race consisted of seven rounds of the course. Colours were used to distinguish the various chariots and their drivers. At first only red (*russula*) and white (*albata*) were used, but later green (*prasina*) and blue (*veneta*) were introduced. Domitian introduced purple and gold (*purpureus et auratus pannus*), but afterwards their use was discontinued. Chariots with two horses (*bigæ*) or four (*quadrigæ*) were generally used, though sometimes there were three (*trigæ*) or even more than four horses. The drivers (*aurigæ*) were members of the slave class; the best horses came from Sicily, Spain, and Cappadocia. The chief C. at Rome was the C. Maximus, built in 329 a.c., though races had previously been run on the site. The C. Flaminius, built in 221 a.c., the C. Caligula, afterwards known as the C. Neronis, and the C. built about A.D. 311 by Maxentius, were the remaining Cs. of Rome. Of these only the last-named has been preserved. The modern C., which dates from the eighteenth century, has not much in common with the anc. It is often nomadic in character, and the performances are given in a tent, with a central arena. The *pièce de résistance* of the modern C. has been a display of equestrian skill. Jumping through hoops, riding two horses at the same time, and such exhibitions, varied by the witticisms of the traditional clown, formed almost the sole attractions for a long time. Philip Astley popularised the C. in London at the end of the eighteenth century, followed by the noted horseman Andrew Ducrow, Batty, Hengler, and Sanger. P. T. Barnum revolutionised the C. with his 'biggest show on earth,' in which he gave displays necessitating the use of intricate machinery and large companies. His chief successor was the late Bertram Mills. At the London Hippodrome, which was built as a C., menagerie, and variety theatre, various animals have appeared on the stage, and many realistic representations of natural scenes have been given. At the Paris Hippodrome, which resembles a Rom. C. in having a central stage, chariot races were run after the Rom. fashion at the end of the nineteenth century for prizes offered by the management. The modern C. is almost entirely a display of trained animals varied by acrobatic feats, but conditions are very different from what they were in the nineteenth century. The greatest advance is in the cessation of cruelty towards animals, especially since cruelty teaches the animal nothing and makes it unreliable. First the animals are taught not to fear man, and then they learn simple tricks by repetition, usually followed by reward. While amusing themselves in the training den the animals are watched, and an animal's natural aptitude for any particular type of trick is soon discovered. In a modern C.

not only horses and dogs but every kind of animal will perform—lions, tigers, seals, elephants, and monkeys. Transporting animals from their native country to captivity is an organised trade, but some animals, especially monkeys, have difficulty in becoming acclimatised. They travel backwards and forwards on tramp steamers until they become used to change. In America, where the distances that the C. has to travel are great, the animals travel by rail in vans, but in England the C. travels along the roads at night, drawn by steam power; on the Continent Cs. are usually stationary.

The greatest modern development of the travelling C. has taken place in the U.S.A., where it has proved vastly profitable on account of the extent of the country and the considerable number of large fairs, which furnish the audiences. The start in this direction was made by the famous showman P. T. Barnum and by 'Buffalo Bill' Cody, who had a Wild W. show rather than a C. strictly speaking. Adam Forepaugh and the Sells brothers were the next to come, followed finally by the Ringling brothers, who eventually absorbed practically all their biggest rivals. Under the Ringling regime the C. is no longer a more or less Bohemian affair, but a vast business organisation with its advance agents to procure sites for the vill. of tents, properly to advertise in all the countryside, and make provision for the large amount of food for the army of employees and fodder for the hundreds of horses and for the immense travelling menagerie. The Ringlings have their own trains and make journeys of from 150 to 400 m. overnight by rail from tn. to tn. See P. T. Barnum, *Autobiography*, 1854 (enlarged in 1888); M. R. Werner, P. T. Barnum, 1923; R. Gómez de la Cerna, *El Circo* (Valencia), 1924; J. Lloyd, *My Circus Life*, 1925; M. W. Disher, *Clovens and Pantomimes*, 1925; Lady E. Smith, *British Circus Life*, 1948.

Cirencester, or **Cicaster**, parl. bor. in Gloucestershire, England, situated on the R. Churn, and connected with the Thames and Severn Canal. It is 16 m. S.E. of Gloucester, and 14 S.E. of Cheltenham. Agriculture is the chief industry, and the manufs. are unimportant. The Royal Agric. College is here. Carpets and carriers' knives are made. It has a fine live-stock market. C. was founded by the early Britons, and became a Rom. station under the name of *Corinium*. Various Rom. remains have been discovered. Pop. 10,600.

Cire Perdue, name given to an old method of producing bronze statues. The molten bronze was poured into a model made in wax which had been cased over, and as the bronze melted the wax it assumed the shape of the model.

Cirie, It. tn. in Piedmont, which lies about 12 m. from Turin. Pop. 8000.

Ciro, It. tn. in the prov. of Catanzaro. It lies N.W. of Cotrone and near the Ionian Sea. Pop. about 8500.

Cirpan, or **Tehirpan**, th. of E. Rumelia,

Bulgaria, 30 m. E.N.E. of Plovdiv (Philippopolis). Pop. 11,000.

Cirque, or **Corrie**, crater-like basin, semicircular in shape, occurring at the head of a valley or in the side of a mt. They are caused in hillsides by a permeable soil overlaying a hard rock, and by the water dissolving this permeable soil and causing a collapse of the ground, leaving the formation above referred to. In glacial regions Cs. are said to be due to the wearing away of the land by the action of the ice.

Cirrhosis, disease of some of the internal organs of the body, such as liver, lungs, and kidneys. It is due to continual inflammation, and consists in the hardening and shrinkage of the parts, making them horny. See under **LIVER**.

Cirripedia (Lat. *cirrus*, curl, pes, foot), order of Crustaceans which includes the barnacles and acorn-shells (g.r.). All the species are marine, and live in either a parasitic or a sessile state. Nearly all the species are hermaphrodite, but in some genera dwarf male forms known as *complemental males* are also to be found.

Cirrus, see **CLOUD**.
Cirrus, botanical term applied to a tendril formed from the apex of a leaf, and the corresponding adjective is *cirrose*.

Cirta, formerly the cap. of Numidia. It is now called Constantine, having been restored by the Emperor Constantine the Great.

Cisalpine Republic (Lat. *cis*, on this side, meaning on this side of the Alps, and originally so used by the Romans.), was formed in 1797 by the joining of the Cispadane and Transpadane republics formed the year before by Bonaparte. The whole republic consisted of Mantua, Brescia, Lombardy, Cremona, Verona, Rovigo, Modena, Massa, Carrara, Romano, Ferrara, and Bologna. The headquarters of the gov. was Milan, and its army consisted of Fr. soldiers. It was eventually known as the It. republic, and a little later Napoleon received the title of king of Italy.

Cisneros, **Francois Ximenes de** (1436-1517), see **XIMENES** (OR **JIMENES**) **DE CISNEROS**, **FRANCISCO**.

Cissampelos, genus of Menispermaceae. *C. Pareira*, the pareira-brava, is a native of sev. W. Indian Is., and of Brazil. The root is employed in Europe as a tonic diuretic, and the juice of the fresh plant in its native country is said to be an efficacious application to the bites of serpents.

Cissbury, large prehistoric earthwork with a number of deep, circular pits, in Sussex, England, 2 m. N. of Worthing. It contained flint instruments of the Stone Age. Rom. antiquities have also been found. Near by is Chantebury Ring (g.r.).

Cissoid (Gk. *κισσός*, ivy), cuspidal curve invented by Diocles, the mathematician of Alexandria. He came across it in his investigation of the problems of the trisection of a plane angle and the finding of two mean proportionals between two straight lines. One method

of describing the curve is as follows: In a circle draw any diameter. Then erect two perpendiculars on this diameter at equal distances from the centre and on the same side of the diameter. Let one of these cut the circumference in a point C, and let A be the extremity of the diameter on the same side of the centre. Join CA and let it cut the other (produced) perpendicular in P, then the locus of P is the C. curve. The tangent to the circle at the other end of the diameter is the asymptote to the curve which consists of two similar portions on either side of the diameter with a cusp at A.

Cistaceæ, order of dicotyledonous plants, contains trees, shrubs, and herbs bearing beautiful flowers. There is considerable diversity among the various species.

Cistellidæ, family of coleopterous insects nearly related to the Tenebrionidæ, differs from it chiefly in that the species have the claws of the tarsi comb-like. Little is known about these beetles.

Cistercians, name given to the members of a monastic order, which was founded by Robert of Champagne, a Benedictine abbot. After many attempts he estab. with twenty companions, in the forest of Cîteaux (Cistercium), near Dijon, a monastery for the purpose of carrying out the strictest observances of the rule of St. Benedict. After a time the order was blessed with the pope's favour and confirmation, and the Institutum Monachorum Cisterciensium was drawn up, declaring the new foundation to be the home of the only true Benedictinism. The order was, however, in a very languishing condition when the famous St. Bernard joined it in 1113; two years later he became the first abbot of Clairvaux, which was henceforward the centre of the movement. The C. were known in France about this time as Bernardines. Their influence spread rapidly during the twelfth century; before the end of that period they possessed 800 abbeys, and by the middle of the thirteenth century they had about 2000. Their first Eng. estab. was Waverley Abbey (1128), near Farnham in Surrey. When the monasteries were suppressed by Henry VIII., the order had seventy-five abbeys and twenty-six nunneries in England, and eleven abbeys and seven nunneries in Scotland. Of the Eng. abbeys may be mentioned Woburn, Tintern, and Kirkstall; of the Scottish, Melrose, Dundrennan, New, and Deer. The last remnants of the order were suppressed at the end of the eighteenth century but the order was revived by the Trappists in the nineteenth century. At Mt. St. Bernard, near Coalville, Leicestershire, there is a 'mitred' abbey built by Pugin the elder. The most noteworthy Fr. abbey, besides Clairvaux, was Pontigny, which had 700 benefices in its gift. The C. owed their downfall to their increased worldly prosperity; they could not serve God and Mammon, and consequently as their riches grew, their austerity of life dwindled, and many of the more earnest members left them and founded new orders, such

as the Feuillants and the Trappists. They were principally interested in agriculture and Gothic architecture. Their dress was a white robe with a black scapulary. See also TRAPPISTS.

See MAURIQUEZ, *Annales Cistercienses* (4 vols.), 1642; Cardinal J. H. Newman, *The Cistercian Saints of England*, 1844-1845; H. Collins, *Spirit and Mission of the Cistercian Order*, 1866; F. A. Gasquet, *English Monastic Life*, 1904; D. Knowles, *The Monastic Orders in England*, 1940, and *The Religious Orders in England*, 1948.

Cistern, see under WATER.

Cisternino, lt. tn. in the prov. of Bari. Pop. 3000.

Cists (Gk. *κίστη*, Lat. *cista*, a box or chest) belong to the early ages of man, and were enclosures formed of stones, the latter being placed on end and another slab of stone being used as a cover. These C. were found in barrows or mounds of earth which were placed on the spots where burials had taken place, and one barrow sometimes contained more than one cist. A cist was also a small receptacle carried at the Gk. mysteries.

Cistus, or **Rock-rose**, genus of Cistaceæ, contains sev. very beautiful plants bearing large red or white flowers. The species are indigenous to the Mediterranean, but are cultivated in Britain as ornamental shrubs.

Citadel, strong fortress situated in or near a city, to keep the inhab. of the city in due order and submission, and also to form a rallying-point and last place of defence when the tn. is attacked. Famous Cs. of the past include the Acropolis of Athens and the Rom. Capitol.

Citation, process in the commencement of a suit by which the parties are commanded to appear before the consistorial courts (see under ECCLESIASTICAL COURTS). In the old prerogative courts it was called a decree. In a wider sense C. denotes the act of summoning a person to appear before any judge. C. was formerly the method of commencing all probate proceedings requiring the aid of the court, whether arising out of common form business or otherwise; its object was to compel a representation to be taken by those who were primarily entitled to it, or to provide a substitute for a voluntary renunciation on their part. The word C. is also used to denote the citing of reports and authorities in a court of law to establish any proposition submitted to the court.

Cîteaux, Fr. hamlet in Côte-d'Or. N.E. of Beaune. The remains of its abbey still exist, and the Cistercian order of monks was founded here in 1098.

Cithæron (Gk. *Κιθαίων*), range of mts. in Attica, separating Megaris and Boeotia. Its highest point is Mt. Elatia.

Citharinus, fresh-water fish of tropical Africa. *C. Geoffroyi*, the moon-fish of the Nile, is a well-known species about 3 ft. in length.

Citium, anc. name of Larnaca (q.v.).

Citæen, see CRY.

Citral, aldehydic terpene occurring in lemon and lemon-grass oils, and in other

essential oils. Chemical formula $C_6H_8O_7$, boiling-point $228-29^\circ$. On heating with potassium bisulphate it forms cymene. It can be obtained from geraniol, the corresponding alcohol, by mild oxidation.

Citric Acid ($C_6H_8O_7$), constituent of the juices of many fruits. It occurs in large quantities in lemons, in smaller quantities in unripe gooseberries, raspberries, etc. It is usually prepared from lemon juice, which is boiled and then treated with calcium carbonate. The resulting calcium citrate is decomposed with dilute sulphuric acid, and the C. A. filtered off, after which the filtrate is evaporated to crystallisation. C. A. is a crystalline solid melting at 100° C., soluble in water and alcohol. It has the property of preventing the precipitation of certain metallic hydroxides from solutions of their salts, and is used for this purpose in calico-printing.

Citrine, Walter McLennan, first Baron Citrine (b. 1887), Brit. trade union leader, b. in Liverpool. Joined the trade union movement in the Merseyside. In 1914 he was appointed dist. secretary of the Electrical Trades Union; in 1917 he became president of the Federated Engineering and Shipbuilding Trades, Merseyside; and, in 1925, general secretary of the Trades Union Congress. Visited Finland during the Russian invasion of 1940, and also the W. Indies shortly after the Trinidad riots and disturbances in Jamaica. Has written on trade unions, Labour policy, and the Soviet. Chairman of a committee to study the question of regional boards for production, which pub. its report in May 1942. Took a leading part in the struggle to secure the repeal of the Trades Dispute Act of 1927. Chairman of Brit. Electricity Authority, 1947.

Citrine, yellow pellucid variety of quartz resembling topaz in colour. This yellow strain is caused by the presence of iron oxide. Also called Sp. topaz.

Citron, or *Citrus medica*, Asiatic species of Rutaceae cultivated on account of its acid fruit. It is closely allied to the lemon, which it greatly resembles, but it is larger and has a thicker and fragrant rind which is used in the preparation of perfumes and confectionery.

Citronella, name of a fragrant ethereal oil obtained from the grass *Andropogon Nardus*, which is cultivated in Ceylon and grows wild in Africa, Australia, and tropical Asia.

Citronwood, name applied to sev. kinds of wood used in furniture-making, is most properly applied to that of *Thuja orientalis*, a coniferous tree often spoken of as the arbor vitae of China.

Citrulline, recently discovered amino acid, first isolated from the water-melon (*Citrullus vulgaris*). It may also be isolated from the products of the tryptic digestion of caseinogen. C. is closely connected with the bodily mechanism concerned with urea excretion.

Citrus, genus of about thirty aromatic evergreen shrubs and trees. *C. Aurantium* is the sweet orange, *C. decumana* the shaddock, *C. Limonium* the lemon, *C. medica* the citron, while the lime, sweet

lime, bergamot and Seville oranges are well-known varieties of *C. Limonium* and *C. Aurantium*.

Cittadella, tn. situated in the N. of Italy on the Brentella, and in the prov. of Padua. A medieval tn. surrounded by superb walls. Pop. 12,500.

Città della Pieve, tn. of Italy, situated in the prov. of Umbria. Perugia was born here. The tn. sustained some damage from shelling and from Ger. mines in the Second World War. The most important church, Santa Maria della Mercede, was unharmed; the oratory of San Francesco was badly hit in its non-monumental parts, but was otherwise spared. The roof of the cathedral was damaged and the campanile thrown down. Pop. 9,100.

Città di Castello, It. tn. in the prov. of Umbria, central Italy. It is situated on the Tiber, N.W. of Perugia, and possesses an old cathedral and sev. palaces, as well as some beautiful old pictures. In the Second World War the Gers. mined the Porta Santa Maria, a fifteenth-century structure, but otherwise damage to the tn. was slight. Pop. 32,000.

Cittanova, tn. in the prov. of Reggio di Calabria, Italy, near the tn. of Palmi and 31 m. N.E. of Reggio. It was built from the ruins of the former Casalnuovo, which was destroyed by an earthquake in 1783, and it took its present name in 1852. Produces olive oil. Pop. 15,000. Also the name of a vil. 4 m. from Modena, N. Italy, which represents the former Città Geminiana, a city founded in the eighth century by the exiles of the anct. Rom. colony of *Mutina* (Modena) which had been devastated by the Lombard invasion but restored in the ninth century.

Cittanova, or **Cittanova D'Istria** is the name of a small port at the mouth of the Quieto R., forming the S. tip of the boundary of the Free Ter. of Trieste. Pop. 3,000.

Città Sant' Angelo, It. tn. in the prov. of Teramo, situated N.E. of Penne and near the Adriatic Sea. Pop. about 3,000.

Città Vecchia, see under MALTA.

Cithern, **Cithara**, or **Cithern** (Lat. *cithara*, Gk. *κύθα*), old instrument which resembles a guitar. It was strung with wire, and each pair of its four pairs of strings were tuned in unison. It was generally played with a plectrum.

City (through Fr. *cidé*, from Lat. *civitas*), bor. or tn. incorporate, which is or has been an episcopal see. There are so many exceptions, however, to this definition, that the term is often used indiscriminately of any large industrial centre. The

CITHERN

Roms. used the word *civitas* to denote the whole state or body politic, *urbs* and *municipium* being applied to tns. This meaning of the word has been totally lost in modern times, but the large Cs. of the United Kingdom and the U.S.A. do somewhat resemble the Cs. of ant. Greece in their local self-government. The Gk. *polis* represented a collection of families, gathered together within a certain space, who administered their own foreign and domestic affairs, and had their own religion. These Cs. were only bound by affection to the *μητρόπολις* (mother city), of which they were, in a sense, colonies. The indeterminate use of the word C. probably began at a very early date. Du Cange in his glossary of medieval Lat. words defines the word *civitas* as *urbs episcopalis*, and says that tns. were called *oppidu* or *castra*. The modern definition, given above, is derived from his glossary, yet there were exceptions to this rule at an early period. For example, Dorchester and Sherborne were once episcopal sees, but have never been called Cs., not even now that they have corporations. In the Domesday Book Gloucester and Leicester are called both *civitas* and *burgum*. The word is now used chiefly as an honorary title, as it is thought to confer more dignity than the word *town*. In 1889 Birmingham, though not an episcopal see, was raised to the rank of a C. on account of its industrial importance; since that time the title has been conferred on many other tns. incorporate in the United Kingdom, and it is the common ambition of growing tns. to be so called.

In the U.S.A. a C. may be defined as an incorporated municipality, governed like an Eng. bor. by a mayor, aldermen, and common council. For all practical purposes the term is synonymous with municipal corporation. Cs. existed in Virginia from the commencement of Amer. hist., though it is not clear that these Cs. were chartered, or that the title they assumed was anything more than vainglory. In certain cases, where the pop. has grown very considerably and the tn. has spread into numerous suburbs, the term C. is applied to the space within the original boundaries, as, for example, the Cité of Paris. Thus, curiously enough, London, which is called the largest C. in the world, has within it two Cs., the C. of London and the C. of Westminster. A citizen, as defined by Aristotle (*Politics*, III. 1.), is one who has the right to take part in the legislative proceedings of the state to which he belongs. He is a subject with particular privileges. In ant. Rome there were two kinds of *cives*. The majority had certain private rights of citizenship, such as the right of intermarriage (*jus connubii*) and right of trade intercourse (*jus commercii*) with the allies or friends of Rome. A few, however, had special privileges, of voting in the tribe, and were eligible for the higher offices of state. The rights of citizenship were generally acquired by birth, but both parents had to be Rom. citizens. At a later period, it merely denoted free birth as opposed to those who were born slaves.

The word *citoyen* was particularly popular during the Fr. Revolution, as it was felt to express all that *liberté, égalité, et fraternité* comprised. It was used as the common title of address, irrespective of the person's position. The term, however, fell into disuse when the gov. came into the hands of Napoleon. In Great Britain it has never been used to any great extent, and its meaning is indefinite.

'City of Benares,' Brit. liner which sailed from Liverpool for Canada, Sept. 13, 1940, with a party of ninety children being evacuated from air-raided England, together with ten adult escorts and a crew and other passengers numbering 306. Four days later she was torpedoed by a Ger. U-boat at night in mid Atlantic, 600 m. from land, and sunk. Nearly all the children were below, and many were asleep. Rescue efforts were defeated by tempestuous weather and heavy seas, many boats being swamped. There survived of the children aboard, who had sailed under an official scheme of evacuation, only seven, and of their escorts four. The fourth officer and thirty-two lascars were also saved, but the remainder, including the captain, perished. See Elspeth Huxley, *Atlantic Ordeal*, 1941.

City of London School, founded by John Carpenter, clerk of the city, in 1442. It was estab. and erected under the authority of an Act of Parliament in 1834 on the site formerly occupied by Honey Lane Market, Cheapside. In 1883 it was removed to its present site on the Victoria Embankment. It is endowed with an ann. sum derived from certain estates left by the founder for educational purposes, and is under the government of the corporation of London.

City of Refuge. These cities were six in number (Num. xxxv.), three to the E. and three to the W. of Jordan, and were set apart to protect people who had committed murder unintentionally.

Ciudad Bolívar, tn. of Venezuela and cap. of the state of Bolívar. It stands on the r. b. of the Orinoco and is the principal port of its basin. Steamers run to Trinidad and along the Venezuelan coast, and in the rainy season far up the riv. It was founded in 1764 as Angostura (the Narrows), but renamed C. B. in 1849. It suffered severely in the war of independence when for a time it was Bolívar's headquarters. It is the seat of a bishop. It exports hides, rubber, coffee, cocoa, tobacco, and cattle. The trade is mostly in Ger. hands. The mean temp. is 83°, but the climate is healthy. Pop. 25,000.

Ciudad de las Casas, see SAN CRISTOBAL. Ciudad Juárez, tn. of Chihuahua state, Mexico, on the border between that country and the state of New Mexico, U.S.A. It was formerly known as El Paso del Norte and it is connected by bridge with the Texan tn. of El Paso (q.v.). Pop. 55,000.

Ciudad Porfirio Díaz, tn. in the prov. of Coahuila, Mexico. It is situated on the Rio Grande and on the Mexican International Railway. It was originally known as Piedras Negras. Pop. about 5000.

Ciudad Real (Royal City), cap. of the prov. of the same name, and an episcopal see, is situated 61 m. S. of Toledo and 105 m. S. of Madrid, between the Rr. Guadiana and Jabalon. There are the remains of the tn. walls, with a fine gateway, a beautiful Gothic church, and a hospital. Manufs. of woollen and linen goods are carried on. Pop. 23,600; prov. 557,900.

Ciudad Rodrigo, fort. tn., Spain, in the prov. of Salamanca. In 1706 it was taken by the Eng., and again in 1812 by Wellington, who was created duke of C. R. There are manufs. of leather and soap. Pop. 10,000.

Ciudad Trujillo, until 1936 Santo Domingo, cap. of the Dominican Republic, situated on the S.W. coast of the is. of Haiti. It is the oldest European tn. of the Americas, having been founded by the brother of Christopher Columbus in 1496. It has a harbour and is chiefly engaged in the export of sugar. Pop. 139,000.

Ciullo d'Alcamo, see CIELLO DALCAMO.
Civet, or **Viverra**, old-world genus of cat-like carnivores, typical of the family Viverridae. The genus contains the largest species in its family, and, like most of its allies, has a scent gland near the sexual organs from which the perfume C. is obtained. The animals are long and thin of body, and have long heads and short ears; the legs are short, the feet are small and hairy. In habit the Cs. are terrestrial, and they feed chiefly on birds and reptiles. The penetrating odour of the C. makes it of value as a perfume, and the animals are often kept in captivity in order that it may readily be extracted from them. *V. civetta*, the only African species, yields the best-known C. perfume of commerce; *V. zibetha* is the widely distributed Indian C.

Civetone, ketone present in natural civet (*q.v.*), obtained from the civet cat and used in perfumery. It is an unsaturated ketone, melting at 31°, and having the formula $C_{15}H_{22}O$. Civetol is the corresponding secondary alcohol.

Civiale del Friuli, It. tn. in the prov. of Udine, about 9 m. from the city of Udine. The tn. is noteworthy for its fifteenth-century bridge over the Natisone and for the anct. baptistry of its cathedral. The chief manufs. are linen and cotton goods. Pop. about 4600.

Civil Air Guard, organisation estab. in Great Britain in 1938 to give training in aviation to civilians of both sexes whose services might be required in times of emergency. It operated through light aeroplane clubs, and comprised a gliding section.

Civil Aviation, see AVIATION, CIVIL; AIR MAIL, ETC.

Civil Defence, see AIR-RAID PRECAUTIONS.

Civil Engineering, see CIVIL ENGINEERS, INSTITUTE OF, and under ENGINEERING.

Civil Engineers, American Society of, association of professional engineers of all branches, founded in 1852, for the advancement of engineering and architectural knowledge and practice. It holds an ann. convention in the summer,

at which there are technical discussions on the various papers submitted by its special committees and at which excursions to places of professional interest are arranged. Among the more important questions considered in recent years by the society have been the preservation and utilisation of Niagara Falls, the regulation of the flow of the Great Lakes, the engineering aspects of civil aerial transport, and the engineering features of the national cap. It now comprises about fifty local sections and nearly a hundred affiliated student chapters in colleges throughout the U.S.A.,

Civil Engineers, Institution of, granted a charter in 1828, in which civil engineering is described as the art of directing the great sources of power in nature for the use and convenience of man as the means of production and traffic in states, both for external and internal trade, as applied (1) in the construction of roads, bridges, aqueducts, canals, riv. navigation, and docks for internal intercourse and exchange; (2) in the construction of ports, harbours, moles, breakwaters, and lighthouses; (3) in the art of navigation by artificial power for the purpose of commerce; (4) in the construction and adaptation of machinery; and (5) in the drainage of cities and tns.

Civil Estimates, expenditure of the various depts. of state, excluding that of the three fighting services. The C. E. are pub. annually as a White Paper. They are divided into nine classes: central gov. and finance; foreign and imperial; home dept.; law and justice; education and broadcasting; health, labour, and insurance; trade and industry; common services; war pensions; miscellaneous. Between 1933 and 1938 C. E. grew steadily each year from £409,000,000 to £521,000,000. In 1945 it had risen to £1,211,190,938, of which £574,740,058 was attributable to the ordinary services and £636,450,880 to special war services. The total (including revenue depts.) for 1947-48 was £1,970,897,042, a decrease of £423,868,402 on the total for 1946-47 (including the supplementary estimates).

Civilisation, see under ANTHROPOLOGY.

Civil Law. This is generally understood to mean the municipal law of the Rom. Empire, as comprised in Justinian's Institutes, Digest or Pandects, Codes, *Novellæ* (supplementary to the Institutes), containing new constitutions by himself and some of his successors. These form the *corpus juris civilis*. As applied to modern systems, C. L. means the municipal law of those countries that have founded their system upon the Rom. law. Scots law is founded upon the C. L., as is the Code Napoléon. The N. states of the U.S.A. administer a system founded on common law, whereas in Louisiana a C. L. system is in vogue. Many of the principles of the canon law as administered by the eccles. courts (*q.v.*) are borrowed from the Rom. law. The common law (*q.v.*) of England is generally assumed to be indigenous, but the Eng. law merchant which is now incorporated in the common law owes much of its uniformity to ana-

logies drawn by such judges as Lord Mansfield from, among other sources, the Rom. Pandects.

Civil List. In former times the whole expenses of the gov., except that of the army, navy, and military depts. in general, were paid from the possessions of the Crown. In the reign of William III. the Commons separated the regular and domestic expenses of the king from the public expenditure, and took control of the latter. From 1697 until the reign of George II. the C. L. was fixed at £700,000, in the reign of George II. at £830,000, and at £800,000 in the time of George III.; these amounts were often supplemented by additional grants. All salaries were taken out of the C. L. at the time of William IV.'s accession, and the amount was fixed at £510,000. On the accession of Queen Victoria, the amount was £385,000, to be devoted solely to the support of the household of Her Majesty and the maintenance of the dignity of the Crown. The C. L. for the present reign is £410,000 per annum, from which is to be deducted, pending the birth of a duke of Cornwall, the balance of the Duchy of Cornwall revenues after payment of certain annuities to the Princess Elizabeth, etc.

Civil Research Committee, see ECONOMIC ADVISORY C. M. C.

Civil Service. All officers of the Crown who are engaged in the administration of the civil affairs of the state belong to the C. S.; the military, naval, and air services are included. Employment exchange clerks, school inspectors, postmen and telephone girls, research scientists in gov. laboratories, these and many more are civil servants. The service is divided into various depts., the total number of which is large (350,000 in 1939, 700,000 in 1944); some of the most important (in alphabetical order) are Admiralty, Ministry of Agriculture and Fisheries, Air Ministry, Assistance Board, Ministry of Civil Aviation, Colonial Office, Board of Customs and Excise, Dominions Office, Ministry for Economic Affairs, Ministry of Education, Ministry of Food, Foreign Office, Ministry of Fuel and Power, Ministry of Health, Home Office, Board of Inland Revenue, Ministry of Labour and National Service, Ministry of National Insurance, Ministry of Pensions, Post Office, Scottish Office, Stationery Office, Ministry of Supply and Aircraft Production, Ministry of Town and Country Planning, Board of Trade, Ministry of Transport, Treasury, War Office, Ministry of Works. The Cabinet has the ultimate control of these depts. in so far as any control is exercised over them; but of course that control is more evident in the case of what may be termed policy depts. than in those which in effect run themselves. The minister has the task of explaining to Parliament what his dept. is doing if Parliament asks questions about it; he is not allowed to blame the staff if matters go wrong; the responsibility for the doings of his dept. is his and he must shoulder it. Hence the civil servants must serve the minister loyally and carry out his decisions, and

the decisions of senior officers acting on behalf of the minister. In this latter connection it is a moot point how far senior officers have any actual share in shaping gov. policy; but it seems clear that their experience of every aspect of any given question must at the least be of the greatest value to a minister and especially to a new minister. When, after a general election, a new party comes into power in Parliament, and new ministers take office, the C. S. may find itself carrying out measures antithetical to those it has carried out in the recent past. But this is all in line with the traditions of the service and in accord with parl. democracy. But of course, in many aspects the work which falls to the civil servant does not change with a change of gov. Large parts of the administration of the country, particularly the routine work which is done by many in the C. S., are concerned with matters which obviously can only be done in one way, or on which Parliament has no strong views one way or the other, matters which do not arouse any political controversy.

In former times appointments to the C. S. in Great Britain were in the gift of the executive gov., and were obtained by influence. No qualifying examination was held, unless there were more nominations than there were posts vacant. When an appointment was made it was, as a rule, permanent. This system led, as may be imagined, to extraordinary inefficiency and favouritism; but it was not until 1870 that the system of open competition was introduced. Most of the posts in the service are now filled in this manner; but following both world wars arrangements relating to certain examinations were adjusted to the fact that the younger men had been required or would be required to undergo a period of military training at an age when they would normally be serving their apprenticeship as civil servants.

There are four main classes of the C. S., employed in nearly every dept.—administrative, executive, clerical, and the class of clerical assistants, typists, and shorthand typists. Then there are minor general classes; but equally important are the more specialised classes—scientists, lawyers, doctors, engineers, architects, actuaries, etc.; and a vast number of classes confined to one particular dept., e.g. the Tax Inspectorate working under the Board of Inland Revenue, the regional and local staff of the Ministry of Labour and National Service, including employment exchange managers, etc., the telephonists and telegraphists of the Post Office, and many others.

The *Administrative* class is a small one—before the Second World War its total size was approximately 1500; but in future it will probably be much larger by reason of the multiplicity of new depts. It is responsible for advising ministers on policy—that is, on problems which arise in deciding the general lines on which the country ought to be governed; on new proposals which ought to be put before

Parliament; and on how best to effectuate Parliament's wishes. It is responsible also for dealing with the difficulties which arise in carrying out existing policy; for forecasting the probable effects of new Acts and regulations; and for organising and directing the work of depts. It has, in addition, to assist ministers in their parl. duties—e.g. by preparing 'briefs' for speeches and answers to parl. questions and to letters from M.P.s, etc. White Papers, i.e. papers embodying policy, are drafted by senior civil servants. Most members of the administrative class are employed at headquarters offices, where policy is usually formulated, but in some depts., either as part of their training or because the exigencies of the service demand it, they may spend part of their career in regional or local offices. The junior grade of the administrative class is called assistant principal, and in normal times most entrants come to it at the age of twenty-two or twenty-three, after having taken a univ. degree, though there are also opportunities of promotion to it from other grades within the C. S. The examination is divided into two sections: the first, which is compulsory for all candidates, comprises essay, Eng., everyday science, auxiliary language, and viva voce. In the second section there is a comprehensive list of subjects from which the candidate elects up to a potential total of 1000 marks. It is a training grade, and its members spend most of their time in drafting letters, writing minutes, summarising information, and suggesting action on particular problems. After a few years they may serve as private secretaries to ministers or to senior civil servants. The next grade is principal, and at this level decisions on less important questions of administrative policy are taken. Next there is the grade of assistant secretary, usually in charge of a div. of the office; and higher still there are under-secretaries and the permanent heads and deputy heads of depts., who are concerned in major questions of policy. Normally an entrant to the administrative class may expect to rise in due course to the grade of assistant secretary; some, of course, will rise to the very top. Successful candidates at the administrative examination are normally appointed to salary scales as follows: men, £275 + £25-£325 + £30-£625; women, £275 + £25-£510. The highest salary (up to 1946) payable to permanent secretaries of the major ministries was £3000 per annum, with the exception of the permanent secretary of the Treasury, a post which also carries the title Head of the Civil Service and a salary of £3500 (now £3750) per annum. The *Executive class*, which stands next in importance to the administrative, carries out the higher work of supply and account depts. and specialised branches of the service. The examination for entry into the lowest grade of this class is based on a syllabus equal to the standard at the end of a secondary school course and candidates must be over

nineteen. Executive staffs in the services (Admiralty, War Office, and Air Ministry) depts. differ in that women are, ordinarily, ineligible, that service abroad is probable, and that the full London scale of salary is paid wherever the officer is employed, while prov. executives receive 5 per cent less. The audit staff is concerned with the issue of money from the Exchequer and the auditing of accounts of other depts., and assistant auditors are required to undergo a course of accountancy in their own time, but at gov. expense, before advancement. The examining staff, Estate Duty Office, is responsible for assessing and collecting estate and other death duties, and candidates require a knowledge of legal principles. Assistant examiners are required to obtain a univ. degree in law or to be called to the Bar before promotion. The actuarial staff comprises those who carry out actuarial work in connection with unemployment and health insurance and contributory pension schemes, old age pensions, friendly society valuations, and the like. A training in actuarial science is necessary and candidates for promotion are required to pass the examination of the Faculty of Actuaries. The scales of pay in the executive class are, for men, £100 + £10-£130 + £15-£400 a year; for women, £100 + £10-£300 a year. Above the basic grade the executive hierarchy consists of higher executives, senior executives, and in a number of depts. posts generally termed super-executive posts. The executive class numbered about 18,500 before Second World War and is expected to be larger in the future.

The *Clerical class* is the largest of the main classes of the service; before the war it numbered about 77,000. Its members undertake ordinary clerical work, the preparation of accounts and statistics, the management of official records, etc., and a good deal of interviewing when members of the public call. The clerical class is organised differently in different depts., but in the majority of depts. the junior grade (which is entered from school between the ages of sixteen and seventeen, or by promotion from lower grades) is known as clerical officer. The next as higher clerical officer, and the senior grades as staff officer and senior staff officer. In some cases higher clerical officers, staff officers, and senior staff officers are occupied in supervising junior clerical staff; they are the co-ordinators who see that the routine work of the service is completely done. The normal career for an entrant to this class goes up to higher clerical officer, though for the best there are fair chances of rising to at least staff officer; and there are opportunities of promotion to the executive class. The scales of pay for the general clerical class are men, £85 (at entry); £105 (at age eighteen) + £15-£120 + £10-£130 + £15-£160 + £12-£196 + £18-£214 + £12-£350, with an efficiency barrier at £250; women, £85 (at entry); £105 (at age eighteen) + £15-£120 + £10-£130 + £15-£160 + £5-£170 + £7 10s.-£185 + £10-£280, with an efficiency barrier at £195.

Clerical Assistant, Typist, Shorthand-Typist.—This class is now confined to women recruited between the ages of sixteen and seventeen (for clerical assistants) or sixteen and twenty (for shorthand-typists and typists); before 1939 men were sometimes appointed to routine clerical posts (generally known as S class clerks). Clerical assistants do the simple clerical duties, such as copying, keeping card indexes, preparing simple accounts. Typists have opportunities of promotion to shorthand-typist, and all these grades have opportunities of promotion to the clerical officer grade, normally within the first ten years of their service. The scales of pay are 28s. at 16; 31s. 6d. at 17; 35s. at 18; 38s. 6d. at 19; £2 2s. at 20; thence by 3s. to 57s.; thence by 2s. 6d. to 72s.—efficiency barrier at 57s.

Every new entrant to the estab. C.S. has to serve a period of probation, one year or two years according to grade, with extension in certain cases. Until this period of probation has been satisfactorily completed, the new entrant is not finally appointed to the C. S., and any one who during probation shows himself or herself to be really unsuited for C. S. work will be dismissed. Temporary staff are usually appointed for a period of trial in the first place, and may be dismissed at any time; the period of notice to be given is prescribed when they are appointed.

Pay.—The rates of payment mentioned above are those which were in use during 1914 plus a bonus governed by a sliding scale, which is regulated by the standard cost of living. In 1920 this was assumed to be 130 per cent (at one time the figure reached 176 per cent) higher than in 1914. Additions and deductions made subsequently affected one twenty-sixth part of the bonus for every 5 per cent of rise or fall in the basic rate. A sliding scale arrangement, under which the cost of living bonus was increased or diminished as the index figure of price levels rose or fell, was agreed upon by the National Whitley Council. This arrangement endured until the advent of the Labour Gov. in 1929. During the earlier part of the period 1929–31 reductions which would have been justified by the terms of the cost of living agreement were not, or were only partially, applied. Towards the end of this period the financial stringency which supervened led the gov. to impose the cuts and by March 1931 the service was being paid on the figure appropriate under the agreement—namely 55. About the same time the report of the royal commission on the C. S. was pub. This dealt, *inter alia*, with the bonus problem, and recommended consolidation on terms. In 1932 the bonus was stabilised, by agreement, at 50 until April 1934, when the gov. proposed to apply consolidation of bonus with salary. Bonus so stabilised continued to apply until 1st July 1934, as from which date consolidation was applied, or, in other words, the gov. decided at consolidate bonus with basic pay in order to bring the bonus system to an

end. The bonus rate diminished as the salary became higher until in the case of persons in receipt of £2000 a year it ceased to operate. In the Second World War after some time a bonus was allowed to some classes and later extended to all civil servants but with a ceiling of £2000, as before. Since Feb. 1944 the C. S. war bonus, in operation since Feb. 1940, is included with salary for purposes of calculating pensions. No bonus was added, during the Second World War, to C. S. salaries above £1500. The gov. therefore decided in 1945, in view of the 'additions which had been made to the emoluments of many of the higher salaried personnel in employments comparable with the civil service,' to increase the salary of heads of depts. from £3000 (the 1920 maximum) to £3500; and also to increase the salaries of deputy secretaries of major depts. from £2200 to £2500. Increases were also made to the salaries of under-secretaries and assistant secretaries. The salary structure of the administrative class under this reorganisation is as follows: head of major dept., £3500; deputy head, £2500; under-secretary, £2000; assistant secretary, £1200–£1700 (scale); principal, £800–£1100; assistant principal, £275–£625. The last three scales are subject to the addition of war bonus (at present £60 per annum, payable on all C. S. salaries up to £1500).

There has never been any clearly defined method of recruitment to many of the technical and professional posts, but some years ago the gov. appointed a committee (known as the Carpenter Committee) with the view of reaching more uniformity in the scales of pay and general conditions of staffs doing work of equal quality and requiring the same types of qualifications in the different depts. The recommendations of this committee produced a scheme which is used in some depts. This scheme covers civil servants employed in scientific research and development and chemical establs., the basic rates of pay being: prin. scientific or technical officer and prin. chemist, £850 + £30 = £1050 (women, £700 + £30 = £880); senior scientific or technical officer and senior chemist, £680 + £25 = £800 (women, £580 + £25 = £680); scientific officer, £400 rising to £580, with an efficiency bar, and then up to £680 (women, £350 to £464 and then to £580); junior scientific officer, technical officer, and chemist, commencing salary £275, rising (subject to efficiency bar at £455) to £680 (with lower rates for women); and ancillary staff, comprising assistants I., II., and III., with initial salaries of £400, £315, and £130 respectively. The qualifications required for appointment to the basic grades of these two classes are (a) junior scientific officer, technical officer, and chemist—an honours degree or its equivalent; (b) assistant III.—Inter. B.Sc. or its equivalent. Another general class in the professional and technical area is that of architectural and civil engineering assistants who are employed in the Admiralty, Air Ministry, Ministry of

Transport, Ministry of Works, Post Office, Ministry of Education, and Board of Control. The scales of pay for these staffs are: architectural and civil engineering assistant, Grade III., £210, rising to £320; Grade II., £320, rising to £420; and Grade I., £450, rising to £550.

The general administration of the C. S. is under a special dept. of the Treasury, which, however, usually acts with the dept. affected. The superannuation allowances of the C. S. bear a relation to the number of years of service. Service may conclude at any time through ill health, or voluntarily at sixty and compulsorily at sixty-five. In 1929 a royal commission was appointed to deal with new problems that had arisen in connection with the different rates of pay and superannuation allowances between men and women and also between recognised employees and those who, though temporary workers, continued in the service till compulsorily retired at sixty-five. In the case of many receiving about £3 5s., who received no pension but a small gratuity, it was felt there was much hardship. The Sex Disqualification Act of 1919, which placed women on an equality with men in many privileges and liabilities, contained a special clause under which the position of women in the C. S. was still left somewhat indefinite; but in 1921 a resolution was accepted by the gov. which placed women on equal terms with men.

C. S. remuneration, which, in the light of a gov. decision of 1934, must 'reflect the long-term trend of wage movements outside,' is not on the excessive side. The most senior civil servant, the permanent secretary of the treasury, receives £3500 per annum (since raised under Cmd. 6680) for 'undertaking responsibilities which, in the commercial world, would attract a salary four- or fivefold this amount, and indeed there are many cases at almost every range in the civil service who have been offered and in many cases have accepted posts outside with salaries which, compared with what they were paid in the service, are almost magnificent' (W. J. Brown, M.P.).

Regulation of Civil Service Conditions.—Most branches of the C. S. have their own associations, which in many cases are recognised when questions of difficulty and dispute arise. The Industrial Courts Act of 1919 estab. a court to deal with claims affecting emoluments, hours of work, and leave, but these matters are here treated on broad issues and are not for hearing specific cases. There are associations and unions constituted to accommodate every civil servant from the highest administrative official to the member of the most subordinate grade. Many of these organisations, such as the C. S. Clerical Association and the Union of Post Office Workers, have huge memberships extending to six figures, with branches all over the kingdom, and with full-time union officials to administer the organisation's affairs. There are many other smaller organisations, some of which are also administered by persons not actually

in the C. S., while others of the smaller type are under the direction of serving civil servants who devote their spare time to this work. It is with such unions of this sort as have been officially recognised by the gov. that negotiations take place to settle the conditions of employment of particular classes of civil servants. There are many subjects, however, in which almost all civil servants have a common interest, e.g. the arrangements about superannuation and sick leave and the mode of handling serious disciplinary cases. It is to deal with general questions of this sort that Whitley Councils have been instituted in the C. S. The main body of this kind is in the National Whitley Council. This body consists of an official and a staff side. The official side contains a number of the highest officials in the C. S. who speak in the name of the gov., whilst the staff side consists of nominees of the more important C. S. trade unions or associations. The agreements reached with the National Whitley Council are binding on the administration and the staffs of all depts. In addition there is in almost every dept. a departmental Whitley Council with its official and staff side; these departmental Whitley Councils cannot legislate on matters affecting the C. S. as a whole as can the National Whitley Council, but they are competent to deal with questions affecting the staffs of the particular dept. concerned. Finally, there is an independent court of appeal to which disputes about pay, hours, and certain other conditions can be referred. This is the Civil Service Arbitration Tribunal, which consists of an independent chairman nominated by the minister of labour and two other persons. Individual persons cannot take their disputes to this tribunal, which is available to Whitley Councils and recognised staff organisations.

Quality and Traditions of the British Civil Service.—The quality and traditions of the Brit. C. S. are high and have made a marked contribution to the national life. Yet the service is almost entirely the product of last century, having grown and developed at a great rate. The general constitution of the service and the method of recruitment 'have been well designed to attract men of the right type for the duties which they have to perform,' though it is not a career which appeals very strongly to an ambitious man. The estab. Brit. civil servant enjoys a measure of security which excites at times the envy and indeed criticism of the employee in the commercial world; but in consideration of this security of tenure most responsible civil servants show the qualities of loyalty and discretion in a high degree and it has been caustically said that 'incompetent ministers sometimes remain in office longer than they deserve through the protective loyalty of their permanent officials' (C. K. Allen). Again, an obvious characteristic of the Brit. civil servant is his incorruptibility, a reputation he enjoys not only in his own country but also abroad. But if the Brit. civil servant has

these merits, there are, *per contra*, defects which in the public mind have earned him the invidious label of bureaucrat. The Committee on the Training of Civil Servants in 1944 summed up the popular criticism in these words: 'While the defects commonly attributed to it are not the monopoly of the civil service, it may be that the conditions of the public service tend to foster particular weaknesses and to throw the limelight of publicity upon them to a greater degree than elsewhere. The faults most commonly enumerated are over-devotion to precedent; remoteness from the rest of the community; inaccessibility; and faulty handling of the general public; lack of initiative and imagination; ineffective organisation and misuse of man power; procrastination and unwillingness to take responsibility or to give decisions. We recognise that these defects exist in some measure—though not so generally or in such degree as is often alleged—and whether they derive from the individual or the system, post-entry training must be directed to eliminating them' (Cmd. 6525). Two years previously to the issue of this report the Select Committee on National Expenditure considered the organisation and control of the C. S. In a report p.b. in Nov. 1942 that committee recommended periodical overhauls of the machinery of government, and the estab. of a C. S. staff college to provide theoretical and practical training and refresher courses for picked civil servants after a few years' service. 'The evils of bureaucracy, and, in particular, its tendency to arbitrariness,' says Dr. Allen, 'do not spring from the sinister designs or the perverted views of individuals. They spring from the inherent and insidious characteristics of the system. And for the system it is not the civil servant, and it is not even Parliament, who is responsible. It is the nation. Let it, by all means, be properly informed of what is happening; but, so informed, it cannot escape its responsibility.'

Civil War (1642-49), see under **ENGLISH HISTORY**.

Civil War, American, see **UNITED STATES, History**.

Civita (from Lat. *civitas*), It. word

meaning city. It is the same as the Sp. *ciudad*, and forms part of sev. names of places in Italy, such as *Civitavecchia*, etc.

Civita Castellana, tn. of Italy in the prov. of Rome, 19 m. S.E. of Viterbo. It is a most picturesque tn., situated high on a rock, with an old citadel (1500) and a thirteenth-century cathedral. Near by are the famous Etruscan ruins of the anct. city of Falerii, which comprise a theatre, gateways, and towers, and some excellent specimens of anct. military architecture. Pop. 3200.

Civitanova, com. of Italy, prov. Macerata, pop. 7000. Its port called Porto di C. on the Adriatic is now an independent com., pop. 8000.

Civitas Cemeneliensis, see **CIMIZ**.

Civitavecchia, fortified seaport of Italy, situated on the Mediterranean, 50 m. N.W. of Rome by rail. The port, which is one of the best in the country, was built by Trajan. The city is on the site of Centum Cellæ, and has been besieged, destroyed, and taken sev. times. It is the tenth among It. ports. There is an important arsenal. Michelangelo's Fort was badly damaged in the fighting of 1944. The museum, too, was badly hit, but the most valuable of the contents had been removed to safety before the fighting began; and the public library and contents were severely damaged. The tn. fell to the allied Fifth Army on June 8, 1944. Pop. 32,000.

Civitella del Tronto, tn. of Italy in Abruzzi e Molise in the prov. of and 10 m. from the tn. of Teramo. It is situated on a high rock, which is capped by a castle. Pop. (com.) 9300.

Civitella di Romagna, mrkt. tn. of Italy in Emilia, in the prov. of Forlì. Pop. 7500.

Civray, tn., Vienne, France, on R. Charente, 30 m. S. of Poitiers. The anct. Severiacum. Pop. 2200.

Clackmannan, cap. of the co. of that name, situated on the Devon, 2 m. from Alloa. There is an anct. market cross, and in the near vicinity is a ruined tower of the Bruces. Pop. 1500.

Clackmannanshire, smallest co. in Scotland; bordered on the S.W. by the Forth, it lies between Perth, Fife, and Stirling. It is 10 m. long and 4 m. wide, with an area of 34,927 ac. The surface is varied. To the N. are the Ochil Hills, and the remainder of the country is somewhat level and extremely fertile. The Black Devon and Devon are the prin. streams, the latter being noted for its beautiful scenery. The soil is well cultivated; oats, wheat, and beans are the chief crops. Cattle and sheep are reared in great numbers. Much coal and iron abound, and small quantities of copper, lead, and silver are found. Coal has been worked for nearly two centuries, and there are large iron works, breweries, and distilleries. The chief tns. are Alloa, Clackmannan, Tillmoutry, and Alva. Woollen goods are manufactured at Tillmoutry, and in other parts glass-blowing, tanning, and shipbuilding are carried on. Pop. 33,000.

Clacton-on-Sea, seaside tn. in Essex with a beach sev. miles long, and a pier 1150 ft. in length at which steamers call daily during the summer. There is a promenade nearly 1½ m. in length and a marine parade along the cliffs, an ann. regatta and wild-fowl shooting in the marshes, a recreation ground with a Jap. rock garden, a hospital and six convalescent homes, an orphanage, and a holiday home for blind and crippled girls. Pop. 16,000.

Cladium, genus of Cyperaceæ, consists of tropical and temperate plants which are extremely common in Australia. *C. Mariscus*, prickly twig-rush, which derives its name from the almost prickly margins of the leaves, these latter being themselves rough, is found in various parts of England, besides being abundant in parts of Scotland.

Cladocera, or **Water-fleas**, form a sub-order of branchiopod crustaceans characterised by having not more than six pairs of trunk-legs.

Cladonia, genus of fruticose lichens, has sev. Brit. species. The shape of its branches gives it the appearance of a bundle of small worms or of vernucelli. *C. rangiferina*, the reindeer moss, occurs frequently on moors, heaths, and mts. In Lapland it is the most abundant of all plants, and is found chiefly in pine forests, covering the soil for miles together; it forms the prin. support of the reindeer.

Claim of Right, The: 1. Act passed by the Scottish Estates in April 1689, stating the offences for which James VII. had forfeited the crown, and the terms on which it was accordingly offered to William of Orange. It enacted that in future no papist should rule over Scotland, and declared the necessity of frequent parliaments. 2. Petition made by a majority of the Scottish General Assembly in 1842 against patronage and sent to the Parliament of Westminster. It stated their feelings with regard to the relation of the State to the Church. The terms of the petition were not granted by the gov., and, accordingly, in the following year, 400 ministers seceded and formed the Free Church of Scotland.

Clairac, tn., France, in the dept. Lot-et-Garonne, situated on the r. b. of the R. Lot, 18 m. N.W. of Agen. It was the first tn. in S. France to declare in favour of the Reformation through the example of the abbot of the Benedictine Abbey, who turned to Protestantism in 1527. There is white wine production. Pop. 2300.

Clairaut, Alexis Claude (1713-65), Fr. mathematician. He produced at the early age of twelve a treatise on four curves of the second order; this, together with his *Recherches sur les courbes à double courbure* (1731), caused him to be elected a member of the academy when nineteen. His *Théorie de la lune*, which gained the prize at St. Petersburg Academy, explains the lunar apogee, which had been omitted by Newton. His *Théorie de la figure de la terre* (1743) expounds the theorem that the variation of gravity on the surface of the earth, regarded as an elliptic spheroid, is altogether independent of the law of

density. He also calculated the perihelion of Halley's comet.

Clairon (**Claire Joséphe Loris**) (1725-1803), celebrated Fr. actress, was b. near Condé in Hainaut. After playing in prov. tns. and foreign countries, she made her debut at the Comédie Française in the part of Phædra. The time of her fame was 1743-66; she played many roles and excelled in Voltaire's tragedies. C. wrote her own memoirs (1798). There is also a life by Edmund de Goncourt, 1900.

Clairvaux, hamlet in the com. of Villers-la-Ferte, Aube, Franco, about 30 m. S.E. of Troyes. It is noted for its abbey, founded in 1111 by St. Bernard, after whose death it was improved and enlarged. It was suppressed at the revolution, and the building is now used as a prison. Pop. 700.

Clairvoyance, alleged faculty of being able to see objects not ordinarily visible to human eyes, and from those objects to describe events that are taking place at a distance. Such a faculty is said to be due to hypnotic power. See PSYCHICAL RESEARCH.

GIANT CLAM

Clam, term applied to many Eulamelli-branchiate molluscs varying in importance in different countries. In Scotland the scallops (*Pecten*) receive this name; they are edible creatures which swim by flapping the valves of their shells. In England the very various genera *Macoma* and *Mya* are known as Cs., *Mya truncata* being the soft C. The term largely applied in the U.S.A. to sev. species of bivalve molluscs of somewhat the same order as the Scotch scallops and the Eng. cockle. The name originates from the firm manner in which the creature closes its shell when alarmed. Two kinds are eaten in the U.S.A., the soft shell C. and the hard shell. The latter is sent in great quantities to the markets. It is eaten both raw and in a soup called C. chowder

The species are *Venus mercenaria* or hard C., and *Mya arenaria* or soft C. C.-shell is the Eng. name of the bivalve shells belonging to the molluscous genus *Tridacna*, and specially of *T. gigas*, which sometimes measures 2 ft. across. A pair of valves weighing upwards of 500 lb. were used as a receptacle for holy water in the church of St. Snipice, Paris.

Clamart, com. of France in the Seine dept., 5 m. S.W. of Paris. The chief industries are linen manuf. and stone quarrying. Pop. 33,800.

Clamecy, tn. of the dept. of Nièvre, France, at confluence of the Yonne and Beuvron, 38 m. N.E. of Nevers. Has a considerable trade in firewood. Pop. 5400; arron., 41,000.

Clan (Gaelic *clann*, meaning children), early form of organisation, of which the Highland C. of Scotland was the most highly developed of recent times. The Scottish C. was confined to the Highland regions, and was composed of the common descendants of the same progenitor. The chief, who was usually one of the oldest members, represented this common ancestor, and exercised patriarchal control over the clansmen. The name of the C. was frequently composed of that of the founder, with the addition of Mac (meaning 'son of'); thus we have the C. MacDonald, the C. MacPherson, and similar names. Theoretically speaking, every Scotsman named MacDonald was a descendant of the original Donald, and brother to every other MacDonald. The chief of a C. thus ruled by the right of primogeniture, and was revered and obeyed by his clansmen. Each C. in Scotland occupied a separate portion of ter., and not infrequently bitter rivalry existed between the neighbouring Cs. The near relations of the chief were generally in the position of sub-chiefs, and exercised some authority, this was not very well defined, and any disputes which arose in consequence were referred to a council of the C. In the later years of the Cs. the Scottish Gov. made it a rule that every C. should supply at court a representative of rank to give security for their good behaviour. Should a C. refuse to do so, they were termed a 'broken C.', and were proscribed and in a state of outlawry. The MacGregor C. was a notable example of such, holding their lands for long by the *coir* or glaive, or right of sword. The members of this C. who wished to earn their living in the lowlands were obliged to alter their name, which accounts for the variations found, such as Gregor, Gregory, and Grierson. The old Scots Acts always speak of the Cs. in terms of opprobrium. The rebellions of 1715 and 1745 were the means of inducing the Brit. Gov. to break up the Cs. Hereditary jurisdiction was accordingly abolished, the people were disarmed and forced to cease wearing their national costume, and at the present time few traces of the C. remain save in the persons of chiefs officially recognised as such by the inheritance of ancestral arms, and in the C. associations founded on sentiment.

Clan Line, Eng. steamship line. It started business in 1878, when steamers sailed fortnightly from Glasgow and Liverpool to Bombay and Karachi. Since then the company has extended its calling stations to all parts of the world. The company owns fifty steamships totalling over 200,000 gross tons. The C. L. controls the Brit. and S. Amer. Steam Navigation Co., and the Scottish Shire Line.

Clan-na-Gael, name of a secret society formed by Irish Fenians in the U.S.A. about 1833. Its object was to force the Brit. Gov. into giving Ireland home rule. The members of this society believed that the only way in which they could achieve their end was to terrorise the Parliament, as well as the public. The headquarters of the society was Chicago, but it had agents in England and Ireland, who were responsible for the assassinations and the dynamite outrages of 1883.

Clanvowe, Sir Thomas (fl. 1400), was a friend of Prince Hal. Prof. Skeat has attributed to him the authorship of *The Cuckoo and the Nightingale* (written about 1400-10), a poem which had long been thought to be by Chaucer. Wordsworth made a modernised version of it 'from Chaucer' in sixty-eight stanzas (1801).

Clanwilliam, tn. 135 m. N.E. of Cape Town in a fertile dist. producing corn and oranges. The gov. cedar forests are near. White pop. 350.

Clapham, two wards (N. and S.) in the metropolitan bor. of Wandsworth (q.v.), London. The station styled C. Junction does not serve C. at all, being wholly within the parl. div. of Battersea. C. Common, a public recreation ground of 200 ac., contains three large ponds.

Clapham Sect. The name hist. has given to the little coterie of intimate political friends, all humanitarians and all Evangelicals, most of whom lived in the then vil. of C. and whose dominant figure was Wm. Wilberforce. Next to Wilberforce, the most prominent member of this brotherhood of Christian politicians was Henry Thornton (1760-1815), like Wilberforce an independent-minded Tory, son of a successful banker who was a devoted disciple of the divine John Newton, co-author of the *Olney Hymns*. The large lofty oval-shaped library, designed by the architect Chatham, in Thornton's house was the usual meeting-place and club-room of the sect. Wilberforce lived in the house between 1792 and 1797 and for the ensuing ten years in a house called 'Broomfield', the garden of which bordered on Thornton's house. Most of the fraternity were rich, living in large roomy houses, but they were all generous givers to the poor. The patriarch of the community was Granville Sharp (1735-1813), a much older man than most of the others and, relatively, too poor for a parl. career. He seems to have been the confidant and counsellor of the group. Next in seniority and also somewhat apart from the rest, was Charles Grant (1764-1823), a servant of the E. India Company and later chairman of the company's court of

directors and M.P. for Inverness-shire. He was father of Lord Glenelg, whose notorious colonial policy owed both its strength and weakness to its inspiration in C. ethics. The rest of the group were Zachary Macaulay (1768-1838), father of T. B. Macaulay and a well-known philanthropist, who played a leading part in founding the Brit. colony of Sierra Leone for liberated African slaves; James Stephen (1758-1832), a barrister of St. Kitts, who was early a coadjutor with Wilberforce in his abolitionist crusade and an M.P. between 1808 and 1815; Wm. Smith (1756-1832), Whig M.P. for Sudbury, Camelford, and Norwich, also an enthusiast for the abolition of the slave trade; the Hon. Edward James Elliot (1759-97), member for Liskeard; John Venn (1759-1813), the preacher and vicar of C. at whose par. church, as the tablet there shows, the brethren of the sect congregated for Sunday worship; and John Shore (1751-1834), and Lord Teignmouth (q.v.), a great friend of Warren Hastings and later governor-general of India. Among other intimates, who did not live at C. but were constant guests of those who did, were the Rev. Isaac Milner, dean of Carlisle (1751-1820) (q.v.); the Rev. Thomas Gisborne, vicar of Yoxall and a lifelong intimate friend of Wilberforce; Thomas Babington, a zealous abolitionist and collaborator with Wilberforce; and Thomas (Clarkson) (q.v.) the anti-slavery agitator, whose share in the abolition of the slave trade and of slavery was hardly less than that of Wilberforce himself. The fraternity was remarkable for its affinity. It not only lived for the most part in one vil.; it had one character, one mind, and one way of life. They were all what Wilberforce meant by 'true Christians.' And as if to make them still more like a single family, many were related by marriage. Thus, Thornton's mother was an aunt of Wilberforce. Stephen married Wilberforce's sister, Gisborne Babington's, Babington Macaulay's. 'It was doubtless this homogeneity that gave the group its power in public life. They might differ on party issues; but on any question of religion or philanthropy, above all on the tremendous issue of the abolition of the slave trade, the voice of the 'Saints' in Parliament or in the press was as the voice of one man.' See R. and S. Wilberforce, *Life of Wilberforce*, second ed., 1930; Sir J. Stephen, 'The Clapham Sect' in *Studies in Ecclesiastical Biography*, 1849; J. S. Harford, *Recollections of Wilberforce*, 1865; J. C. Colquhoun, *William Wilberforce, his Friends and his Times*, 1866; and Sir R. Coupland, *Wilberforce*, 1945.

Clapiers, Luc de, see VAUVENARGUES, MARQUIS DE.

Clapperton, Hugh (1788-1827), Scottish explorer, b. in Dumfriesshire, and running away from home at the age of thirteen, went to sea. He accompanied Dr. Oudney and Denham on their exploring expedition by way of Tripoli and Murzuk to Kuka, on Lake Chad, which was reached in 1822, and thence to Sokoto, returning to England in 1825. The

results of this expedition had been more of an anthropological than a geographical nature, so in Aug. 1825 a second expedition set out from the bight of Benin to determine the course of the Niger. All the members of this expedition perished save Richard Lander, C. being the last to die, at Changary, near Sokoto.

Clapton, residential dist. of N.E. London, England, in the bor. of Hackney. John Howard, the philanthropist was b. here.

Claque (Fr. *claque*, to clap), body of men hired to applaud in theatres, and thus ensure the success of a play. According to Suetonius, the Emperor Nero had 5000 paid applauders who attended the performances of his plays. From the Rom. origin of the custom, the *claqueurs* are sometimes called *romains*. The C. became an openly organised institution in Paris towards the end of the eighteenth century. The leader, upon whom the responsibility rests, is called *entrepreneur de succès dramatique*, and under him are *pleureurs* (weepers), *bisseurs* (who cry his, or encore), and *richeurs* (laughers), etc. The Théâtre Français and the Grand Opéra, with a few of the leading Parisian theatres, have with more or less success abolished the C. from their houses.

Clare, maritime co., Eire, in the prov. of Munster, situated between Galway Bay on the N. and the Shannon estuary on the S. C. is the seventh of the Irish cos.; its length is 67 m. and the greatest breadth 43 m., the average breadth being 21 m. The surface is very irregular; there are mts. in the E., W., and N.W., whilst the centre is occupied by an undulating plain which runs from N. to S. The chief ranges of mts. are the Slieve Boughda Mts., which lie partly in Galway, and the Slieve Bernagh Mts.; the chief rivs. are the Shannon and the Fergus. Oats, potatoes, wheat, and barley are grown, slate and black marble are worked and the rearing of sheep and cattle is largely carried on. Limestone, lead, and slate are found, and beds of carboniferous limestone. There are as many as a hundred small lakes, and many chalybeate springs; the salmon fisheries are of importance, and in the N. are extensive oyster beds. The chief tns. of the co. are Ennis, the cap., Kilrush, Ennistimon, and Killaloe. Until the time of Elizabeth, C. was called Thomond; it derived its present name from Thomas de Clare, to whom was given all the land in the dist. that he was able to conquer. Area, 768,265 ac.; pop. 95,000.

Clare: 1. Tn. of England in Suffolk, on the R. Stour, 12 m. from Bury St. Edmunds, on the E. Region of Brit. Railways. It has an old castle, formerly the seat of the earls of C., and an Augustinian priory of the thirteenth century. Pop. 1400. 2. Tn. of S. Australia in Stanley co., chiefly noted for its vineyards and orchards. Pop. 1600.

Clare, John (1793-1864), Eng. poet, the son of a poor labourer. He was b. at Helpstone, near Peterborough, and has often been called the 'Northamptonshire peasant poet.' At the age of seven he was employed on a farm, and later received a

post as under-gardener, but in 1812 he ran away and joined the militia. For a time he lived with gipsies, then worked as a burner on a lime-kiln, but, being dismissed, was obliged to seek for par. relief. C. was fond of learning old songs, and when very young scribbled verses of his own. His inspiration came from Thomson's *Seasons*, and all his poems deal with out-of-door life and farm scenes. *Poems Descriptive of Rural Life and Scenery* (1820) was well received, and was followed in 1821 by *The Village Minstrel*. C. was helped by men of influence and rank, by whom he was received as a friend, but to the end of his life was poor. The *Shepherd's Calendar* (1827), and the *Rural Muse* (1835), were not so successful, though the latter brought him £40 and was praised by Christopher North. He d. in the co. asylum, Northamptonshire, where he composed his last poem, *I am: yet what I am who cares or knows?* See biographies by F. Martin, 1865, and J. W. and A. Tibble, 1932, and especially *Sketches in the Life of John Clare*, written by himself and ed. by Edmund Blunden (1930). The fullest and best collection of C.'s poems is by J. W. Tibble, 1935.

Clare, John Fitzgibbon, first Earl of (1749-1802), lord chancellor of Ireland. He was an antagonist of Grattan, strongly opposed Rom. Catholicism, and promoted the Union. He was raised to the peerage in 1795.

Clare, St. (1191-1253), founder of the order of Poor Clares. She came of a noble family of Assisi; but, through the influence of St. Francis, she gave up her wealth and her social life. At his advice, she founded her order, the Franciscan order for women, in 1212. St. C. was canonised two years after death by Pope Alexander IV. See P. Robinson (ed. and trans.), *The Life of St. Clare* (ascribed to Thomas of Celano), 1910.

Clare Hall, one of the colleges of the Cambridge Univ. It was first founded in 1326 as 'Univ. Hall,' but the building was destroyed by fire in 1342. It was rebuilt by Elizabeth de Burgh, countess of Clare, who in 1347 founded the new college, which was called C. H., for the purpose of educating clergy to take the place of those who had died during the plague. The present building dates from 1638, and the new chapel was consecrated in 1769. Cudworth was master of C. and among its noted fellows have been Bishop Latimer and Archbishop Tillotson.

Clare Island, is. off Mayo, W. coast of Ireland, at the mouth of Clew Bay. Length, about 4½ m.; area, 3946 ac. The vil. of Westport stands on its W. coast, and a lighthouse on the N.W. Pop. 500.

Clarendon: 1. Municipality of Cape Province, 6½ m. from Cape Town. The National Botanical Gardens of S. Africa in surroundings unsurpassed for grandeur are approached from here. The municipal gardens contain a famous collection of trees. Sir John Herschel's observatory formerly stood here. Pop. (white) 6000. 2. Tn. in Sullivan co.,

New Hampshire, U.S.A., on the Sugar R. and on the Boston and Maine railroad. It manufs. machinery, cotton, and woollen goods, paper, shoes, etc. Pop. 12,100.

Claremont Park, royal seat in Surrey, belonging to the Epsom div., 5 m. S.W. of Kingston. It was originally built by Sir John Vanbrugh in the eighteenth century, and has since been the residence of Lord (live, Louis Philippe of France (d. 1850), Princess Charlotte of Wales (d. 1817), and in 1882 it became the property of Queen Victoria.

Clarence, Eng. ducal title, sometimes conferred on a younger member of the royal family. It was first held by Lionel (1338-68), the third son of Edward III., in 1362, on the occasion of his marriage with Elizabeth de Burgh. Other notable dukes of C. are Thomas (1389-1421), second son of Henry IV., who d. at the battle of Beaugé; George (1449-78), brother of Edward IV., who d. in the Tower; William IV. (1765-1837), previous to his accession; and Albert Victor Christian Edward (1864-92), the eldest son of King Edward VII.

Clarenceux, or **Clarenceux**, Eng. heraldic officer, being the first of the two prov. kings-of-arms. His jurisdiction lies over England S. of the Trent, and it is his function to inspect the arms of all those who live within his prov. He may also grant arms with the sanction of the earl marshal.

LORD CLARENDON

Clarendon, Edward Hyde, first Earl of (1609-74), statesman and historian, was a prominent figure in the reigns of the two Charleses. In the Long Parliament he gave valuable support to the cause of the king. He assisted in the impeachment of Strafford, and vigorously opposed measures designed to limit the monarch's authority. With Falkland and Colepeper he formed what was for all practical

purposes the king's advisory council, but Charles I., determined to go his own way, and knowing the triumvirate would not approve, did not inform it of his intention to arrest the five members. After the death of Charles I. C. became one of the prin. advisers of Charles II., and went with him into exile. At the Restoration he was created Baron Hyde, and in the following year earl of C. He was appointed lord chancellor in 1658, and the appointment was confirmed when the king came into his own. His importance was enhanced by the marriage of his daughter Anne to the duke of York, heir-presumptive to the throne. As a minister he was unpopular, and in 1667 he fell from his high estate, the victim of a court cabal. In the same year he was impeached, but though the Lords did not convict him, he went abroad, where he remained during the rest of his life. There he finished his *History of the Rebellion*, which was pub. posthumously (1702-4). There are biographies by Thomas Lister, 1837-38; Sir C. H. Firth, 1909; and Sir H. Craik, 1911.

Clarendon, George William Frederick Villiers, fourth Earl of (1800-70), Eng. statesman and diplomatist. Ambass. to Madrid in 1833, but returned to England on the death of his uncle (1838), when he succeeded to the title. In 1840 he was made lord privy seal in Melbourne's ministry, and became chancellor of the duchy of Lancaster. In 1847 he was lord-lieutenant of Ireland, and displayed rare tact in quieting the Smith O'Brien agitators. Consult his life in P. M. Thornton's *Foreign Secretaries of the Nineteenth Century*, vol. iii., 1881-82; and Sir H. Maxwell, *The Life and Letters of the Fourth Earl of Clarendon*, 1913.

Clarendon, Constitutions of, were laws, passed in 1164 by a council of bishops and barons, at the hunting-lodge of C., near Salisbury, by means of which Henry II. was enabled to check the power of the pope in England. The constitutions were sixteen in number, the chief enactments being that titles to eccles. estates and the election of church dignitaries lay within the prov. of the Crown; that no beneficed clergyman might leave the country without the king's consent; and that no appeal to Rome could be presented without the consent of the *curia regis*. Pope Alexander III. refused to ratify the constitutions, and the quarrel which resulted between Henry and Becket led to the murder of the latter.

Clarendon Park, formerly a royal forest of England, in Wiltshire, 2½ m. from Salisbury. The remains of the royal hunting seat, where Henry II.'s council enacted the constitutions of Clarendon (1164), may still be seen.

Clarendon Press, former name of the press of the univ. of Oxford. It has been known since 1830 as the Oxford Univ. Press, and is now largely a commercial firm, in which the delegates of the univ. have a considerable influence. It was founded in 1672, and had its first home in the upper part of the Sheldonian theatre at Oxford. In 1711-13 a new printing

house was erected for it by Sir John Vanbrugh a little to the N. of the theatre and flanking Broad Street. The name came from the funds being provided by Lord Clarendon's *History of the Rebellion*, the perpetual copyright of which was given to Oxford Univ. by his son. This building was appropriated for use as a museum and lecture rooms, and the present Oxford premises of the press in Walton Street were erected by Blore and Robertson in 1825-30. All the subsidiary processes of book production, including type-founding and stereotyping, are done by the firm on its own premises, while paper is supplied by the univ. mills at Wolvercote. The C. P. carries out within its own walls the whole process of the production of Bibles, of which it has the right by royal patent. Together with the Cambridge Univ. Press, it purchased the entire copyright of the R. V. (1881-1885), and the Oxford Press alone sold over a million copies of the N.T. on the day of publication. By an Act of Parliament (15 George III., chapter lili.), the press has the perpetual copyright of all works belonging to it, and later given or bequeathed to it, provided such are printed on the univ. presses. This was confirmed by the Copyright Act (5 and 6 Victoria, chapter xlv).

Clarens, vil. of Switzerland in the canton of Vaud, on lake of Geneva, 3½ m. from Vevey. It has a mild, pleasant climate in winter, and is therefore much frequented by persons suffering from tubercular troubles. Altitude 1245 ft. With other vils. it forms the dist. of Montreux, which has a pop. of about 15,000.

Claret, name used in England to denote in general the red wines of Bordeaux. Bordeaux wines are produced in the prov. of Gironde, one of the best known coming from Médoc. Other celebrated clarets come from the vineyards of Châteaux Lafite, Château Margaux, and Haut-Brion. In France the word *clairnet* was applied to light-coloured red and yellow wines to distinguish them from *vins rouges* and *vins blancs*. The word C. is not known in that country. See WINE.

Claretie, Jules (properly Arsène Arnaud) (1840-1913), Fr. novelist, playwright, and journalist, b. at Limoges, Haute Vienne. He acted as war correspondent during the Franco-Prussian war; dramatic critic to *L'Opinion Nationale*, 1867; and had great influence as a political writer. His plays of the revolution—*Les Muscadins* (1874); *Le Régiment de Champagne* (1877); *Les Mirabeau* (1879)—were extremely popular. His novels include *L'Assassin* (1866); *Madeleine Bertin* (1868); *Le Train 17* (1877); *Monsieur le Ministre* (1882); *Le Prince Zilah* (1884); and *L'Accusateur*. He also wrote extensively on historical subjects: *Cinq ans après* (1877); *Les Prussiens chez eux* (1872); *La Vie à Paris* (1886). A complete ed. of his works was pub. 1897-1904.

Clarges, Sir Thomas (d. 1695), was a politician. He was first in the service of Richard Cromwell, and then became a supporter of Monk in his plans for the restoration of Charles II.

Claribel, pseudonym of Mrs. Charlotte Arlington Barnard (1830-69), ballad-writer. She was b. in London, and became a pupil of Madame Parepa and Signor Mario. She wrote many songs and ballads that were very popular, such as *Come back to Erin*. These were pub. in vol. form as *Fireside Thoughts, Ballads, etc.* (1865), and *Thoughts, Verses, and Songs* (1877).

Clarification, process of refining a liquid by separating or removing the substances which make it turbid. This can be done by straining through a sieve; by using a centrifugal or circular vessel, with a small outlet in the centre, which, when revolved at a high speed, will clear the liquid by lifting the particles of foreign matter to the surface; and by adding to the liquid gelatine, white of eggs, bullocks' blood, etc.

Clarichord, see CLAVICHORD.

Clarimontium, see also CLERMONT-FERRAND.

Clarinet (It. *clarinetto*, from Lat. *clarus*, clear), musical instrument akin to the

clarion (q.v.). It is supposed to have been first made after 1690 by Johann Christopher Denner of Nuremberg, who probably developed it out of the chalumeau or shawm, a wind instrument of the oboe type but of a primitive kind—the word chalumeau is still used to define the lowest part of the compass of the C. The C. consists essentially of a mouthpiece furnished with a single beating reed—i.e. a reed which vibrates against an air-slot in the mouthpiece—a cylindrical tube ending in a bell, and provided with eighteen openings in the side, half of which are closed by the fingers and half by the keys. The reed is made from a thin slip of a Sp. reed (*Arundo sativa*) and is kept in place on a flattened table by means of a liga-

CLARINET

ture. Since the reed at one end of the tube serves to close it at that end, the pipe acts as a 'stopped' one, sounding an octave lower than an open one, which explains why the pitch of the C. differs from that of the flute. In orchestral music two instruments are employed, namely A pitch and B \flat —the C pitch instrument, to be observed in the scores of 'classical' composers, is now obsolete. In military bands, the Cs. used are B \flat and E \flat . The C. was a common instrument in the church orchestras of this country in the late eighteenth and early

nineteenth centuries. Some notable orchestras evidently did not use Cs. until towards the close of the eighteenth century, e.g. the Viennese court orchestra, and it is to Mozart's fondness for the instrument that is owed the earliest notably artistic treatment of it. His symphony in E \flat major exemplifies his love of the instrument. Weber also showed great fondness for the C. and after that time two Cs. of the normal size became a *sine qua non* of every orchestra. Other great exponents of the C. are Brahms, Beethoven, Mendelssohn, Spohr, and Schubert. There are various other instruments of the C. family: high E \flat , which is pitched a perfect fourth above the B \flat instrument; the alto C. in E \flat and F, a military band instrument now superseded by the saxophone; and the basset horn. This latter, which in appearance is like the bass C., is in fact a tenor instrument, its pitch being an octave lower than that of the obsolete C. of C pitch.

Clarion: 1. A shrill-sounding trumpet, not now in use, formerly employed as a signal to arms. 2. An organ stop, having pipes with reeds, which give a piercing sound like that of a C. 3. A bearing much in use in early Eng. heraldry.

Clark, Charles Heber, see ADELER, MAX.
Clark, Edwin Charles (1835-1917), Eng. barrister, was b. near Shrewsbury, and graduated at Trinity College, Cambridge, of which he became fellow. Subsequently he was appointed regius prof. of civil law at Cambridge. Author of *Early Roman Law: Regal Period* (1872); *An Analysis of Criminal Liability* (1880); *Practical Jurisprudence* (1883); *Cambridge Legal Studies* (1888); *History of Roman Private Law*, vol. 1. (1906).

Clark, Francis Edward (1851-1927), Amer. clergyman (originally surnamed Symmes), b. at Aylmer in Quebec, Canada. He became pastor of a Congregational church at Portland, Maine, in 1876, where he founded (1881) the Young People's Society of Christian Endeavour. He was editor (later honorary editor) of the *Christian Endeavour World* from 1886 until his death, and president of the United Society (1887-1909). He travelled round the world five times, and wrote many books, including *Our Journey around the World* (1901) and *World-wide Christian Endeavour* (1906). See also CHRISTIAN ENDEAVOUR.

Clark, George Rogers (1752-1818), Amer. frontier general, b. in Albemarle co., Virginia; educated at a common school. Explored the region W. of the Alleghanies in 1772; practised as a surveyor; engaged in many encounters with the Indians on the Ohio R. in 'Dunmore's war.' Removed to Kentucky (then a mere dist.) in 1776 and became one of its delegates to the Virginia legislature. In the war of Independence he defeated Lt.-Governor Henry Hamilton, 1779, at Fort Sackville; for this and similar services C. received a grant of land from the U.S. Gov. He took part in the Fr. operations against Spain in the Mississippi valley. He d. in poverty near Louisville, Kentucky.

Clark, John Bates (1847-1938), Amer. economist, b. at Providence, Rhode Is. He studied at the univs. of Heidelberg and Zürich, and was appointed prof. of political economy and hist. at Columbia Univ. in 1895. Works: *The Philosophy of Wealth* (1885); *Capital and its Earnings* (1888); *Wages* (1889); *The Control of Trusts* (1901); *The Distribution of Wealth* (1901); *The Problem of Monopoly* (1904); *Essentials of Economic Theory* (1907); *The Modern Distributive Process*, with F. H. Giddings, 1909; *Control of Trusts*, enlarged ed., with J. M. Clark (1912).

Clark, Josiah Latimer (1822-98), Eng. electrician and engineer, b. at Great Marlow, Buckinghamshire. He took a junior position on the construction of the Britannia tubular bridge, after which he became assistant engineer to the Electric Telegraph Company, with whom he remained till 1870. He worked out the system of enclosing underground wires by means of gutta-percha coating, of sending messages by the pneumatic tube, and invented the double-cable invert insulator and the C. cell. He also made investigations with regard to submarine cables and invented C.'s compound, a mixture of asphalt, hemp, and silica, with which such cables are now covered. The practice now in use of stamping telegrams and of registering abbreviations for cablegrams originated from a suggestion by C. He pub. sev. works, including *Electrical Tables and Formulæ* (1871), and a *Dictionary of Metric and Other Useful Measures* (1891).

Clark, William Tierney (1783-1852), Eng. civil engineer, b. in Bristol. He became chief engineer to the W. Middlesex Waterworks, and constructed the Thames and Medway Canal, the Hammersmith suspension bridge (1824-27), and the suspension bridge over the Danube at Budapest (1839-49).

Clarke, Adam (1762-1832), Wesleyan Methodist preacher, b. co. Londonderry. He brought out a *Bibliographical Dictionary* (1802-6) in eight vols., but his chief work was a *Commentary on the Bible* (8 vols.) (1810-26). He also wrote *Memoirs of the Wesley Family* (1823). His biography, entitled *Account of the Infancy, Religious and Literary Life of Adam Clarke* (1833), is in 3 vols., the first being autobiographical (religious life) and the other two by his daughter. Consult also the life written by Etheridge, 1858.

Clarke, Charles Cowden (1787-1877), Eng. author, and an intimate friend of the Shelley group. His lectures on Shakespeare, delivered in London during the years 1834-54, made him famous. His wife Mary, daughter of V. Novello, musician, compiled a complete *Concordance to Shakespeare* (1844-45). Joint productions of the husband and wife included an annotated ed. of Shakespeare (1869); *The Shakespeare Key, unlocking the Treasures of his Style* (1879); and *Recollections of Writers* (1873). Charles Cowden C. also pub. *Tales from Chaucer in Prose* (1833); and *Shakespeare Characters, chiefly those Subordinate* (1863). See M. V. C.

Clarke, Centennial Biographic Sketch of Charles Cowden Clarke, 1887; and R. D. Attkin, *The Cowden Clarks*, 1949.

Clarke, Edward Daniel (1769-1822), Eng. traveller and mineralogist, b. at Willington, Sussex. After having graduated at Cambridge (1790), he accompanied Cripps on a tour through Europe, Egypt, and Asia Minor (1799-1802), from which he brought back the colossal statue of the Eleusian Ceres, now in the Fitzwilliam Museum. He was appointed prof. of mineralogy at Cambridge in 1808. He pub. his *Travels in Various Countries of Europe, Asia, Africa* (1810-23); *Greek Marbles brought from the Shores of the Euxine Archipelago and Mediterranean* (1809). See W. Otter, *Edward Daniel Clarke: Life and Remains*, 1825.

Clarke, Sir Edward George (1811-1931), Eng. barrister, eldest son of J. G. C., a London Jeweller. Educated at College House, Edmonton; City Commercial School; City of London College; King's College evening classes. He was a writer in the India Office, 1859-60, and Tancred law student, 1861, and was called to the Bar three years later. He sat in Parliament, representing Southwark (1880), Plymouth (1880-1900), and City of London (Jan.-June 1906). In 1886, during Lord Salisbury's ministry, was appointed solicitor-general and knighted. The chief cases that he was connected with in his legal career were the Pengo case (1877), the Bartlett case (1886), the Baccarat case (1891), and the Jameson case (1896). He disagreed with his party over S. Africa in 1899, and over Tariff Reform in 1903. He was made a Privy Councillor in 1908, and retired from the Bar, 1914. D. suddenly April 26, 1931. His pub. include a *Treatise on the Law of Extradition* (1866) (4th ed. 1903); *Public Speeches* (1888-90 and 1890-1900); *Selected Speeches* (1908); *Easy Shorthand* (1907); *The Story of my Life* (1918); *Benjamin Disraeli, the Romance of a Great Career* (1926).

Clarke, Sir George Sydenham, see SYDENHAM OF COMBE, LORD.

Clarke, James Freeman (1810-88), Amer. Unitarian minister, b. in Hanover, New Hampshire, U.S.A. He graduated at Harvard, 1829, and at the Cambridge Divinity School, 1833. He took part in the founding of the Unitarian Church of Disciples in Boston (1841), to which he acted as pastor (1841-50 and 1853-88). He was appointed prof. of natural religion and Christian doctrine (1867-71) and lecturer on ethnic religions (1867-77) in Harvard Univ. C. was a keen advocate of the anti-slavery cause, and a voluminous writer. His works include *Campaign of 1812* (1848); *Eleven Weeks in Europe* (1852); *The Christian Doctrine of Forgiveness of Sin* (1852); *Orthodoxy* (1866); *Steps of Belief* (1870); *Ten Great Religions* (1871-83); *Self-Culture* (1882); *The Ideas of the Apostle Paul translated into their Modern Equivalents* (1884); *Manual of Unitarian Belief* (1884); *Anti-Slavery Days* (1884); and *Vexed Questions* (1886). See his *Autobiography, Diary, and Correspondence*, ed. by E. E. Hale, 1891.

Clarke, Marcus Andrew Hislop (1846-1881), Australian writer, b. at Kensington, London. He emigrated to Victoria at the age of eighteen, and entered upon a journalistic career, writing under the pseudonym *Peripatetic Philosopher*. His best work is a novel on the cruelties of the life in a prison settlement, *For the Term of his Natural Life*, pub. in 1874. Among his other works are *Long Odds* (1869); *Holiday Peak* (1873); and *History of the Continent of Australia, 1787-1870* (1877).

Clarke, Mary Victoria Cowden (1809-98), wife of Charles Cowden C., was a pupil and a friend of Mary Lamb. In addition to the works written with her husband, she pub. *The Complete Concordance to Shakespeare* (1844-45); *The Girlhood of Shakespeare's Heroines* (1850); *The Iron Cousin* (1854); *World-noted Women* (1858); a biography of her husband (1887); and *My Long Life* (1896).

Clarke, Samuel (1675-1729), Eng. divine and philosopher, b. in Norwich. He could not agree with the theories of Descartes in vogue at the time, and accordingly became a follower of his friend Newton. In 1706 Queen Anne chose him as her chaplain, and in 1709 appointed him to the rectory of St. James, Westminster. His treatise *The Scripture Doctrine of the Trinity* (1712) in which he stated that the doctrine of the Trinity was not held by the early Church, was considered semi-Arian, and C. was brought before Convocation. His famous discussion with Leibnitz as to the relation of time and space to God was undertaken by request of the Princess of Wales, and the papers were pub. in 1717. C. delivered the Boyle lectures in 1704-5, choosing for his subject *The Being and Attributes of God*. C. won a very high reputation as a philosopher and in the sphere of metaphysics was regarded as second only to Locke. Other essays of his to be noted are *A Discourse concerning the Unalterable Obligations of Natural Religion* (1708); and *A Philosophical Inquiry concerning Human Liberty* (1715). Consult his life by B. Hoadly, prefixed to the collected ed. of his works, 1738-42; and the *Historical Memoirs* by W. Whiston, 1730; also Sir Leslie Stephen, *History of English Thought in the Eighteenth Century*, 1876.

Clarke, William Branwhite (1798-1878), Eng. geologist, b. at E. Bergholt, Suffolk. In 1840 he went out to Australia and became vicar of a church in Willoughby, New S. Wales, 1847-70. C. had previously made many geological investigations of the Continent of Europe. He discovered gold in Australia in 1841, tin in 1849, and diamonds in 1859. He carried on valuable investigations, and obtained the Murchison medal from the Royal Geographical Society in 1877. He wrote *Remarks on the Sedimentary Formations of New South Wales* (1878), and many other scientific papers.

Clarksburg, city in W. Virginia, heart of bituminous coal region, natural gas, factory for making toy marbles, glass factories. Pop. 30,500.

Clarkson, Thomas (1760-1846), Eng.

anti-slavery agitator, b. in Wisbech, Cambridgeshire. In 1785 he won a prize for his Lat. essay, *Anne liceat invitato in servitute dare?* of which his Eng. trans. (1786) had a very large sale. From this time he worked with ceaseless energy to bring about the abolition of African slavery by speaking in the chief towns of England and in Paris, and by issuing numerous pamphlets on the subject. In 1807 the Bill for the abolition of the slave trade became law, on which occasion Wordsworth wrote his sonnet, *Clarkson, it was an obstinate hill to climb*, and in 1808 C. himself pub. *The History of the Rise, Progress, and Accomplishment of the Abolition of the African Slave Trade*. He was active in founding an Anti-Slavery Society (1823), the object of which—to suppress slavery in the W. Indies—was accomplished by the passing of the Emancipation Bill in 1833. In his latter years he founded institutions for sailors at seaports, and did much philanthropical work. His essays include *On the Slavery and Commerce of the Human Species* (his trans. of the Lat. essay mentioned above, 1785) and *The Cries of Africa to the Inhabitants of Europe* (1822). He also wrote *Memoirs of the Private and Public Life of William Penn* (1813). See T. Taylor, *Biographical Sketch of Thomas Clarkson*, 1839; T. Elmes, *Life of Thomas Clarkson*, 1876; and E. L. Griggs, *Thomas Clarkson, the Friend of Slaves*, 1936. See also CLAPHAM SECT.

Clarksville, city in Tennessee, U.S.A., cap. of Montgomery co., 10 m. N.W. of Nashville, is a railway centre and has an important trade in tobacco and a snuff factory. Pop. 11,800, of whom 41 per cent are negroes.

Clarus Mons, see under CLERMONT-FERRAND.

Classical Association, The, founded in London, Dec. 1903, partly an outcome of the numerous controversies over classical education and in particular over compulsory Gk. at the univs., which started as early as 1867 in *Essays on a Liberal Education*. The association aims at promoting the development and well-being of classical studies by every possible means, including free discussion of methods and friendly intercourse between all interested in the subject. It took up the reformed Lat. pronunciation (first proposed 1871) in 1904-5. The headquarters of the association are at Westfield College, Univ. of London, N.W.3. The chief publications are *Proceedings of the Classical Association*, and *The Year's Work in Classical Studies*.

Classicus, The (through Fr. *classique* from Lat. *classicus*). The word *classic* was first used in its present sense by Gellius, who contrasts a *classicus scriptor* with one who is *proletarius*. The Rom. people were divided by Servius Tullius into five classes, the lowest class being called *proletarius*. The adjective *classicus*, from *classis*, literally belonging to a class, by transference meant belonging to the first or highest class. A *classic* writer is, therefore, one who belongs to the first class. A book is also called a *classic* if it

is of such a standard that it may be placed among the highest class of books. It is thus defined by Lowell, in *Among my Books*: 'A classic is properly a book which maintains itself by virtue of that happy coalescence of matter and style.' This every country is said to have a classical period in its literature—that is, a particularly fertile period when there is a great output of books in which imagination, thought, and style are perfectly blended. The so-called classical period of Eng. literature, however, is not her most flourishing period, but the period of Dryden and Pope, when it was the fashion of the day to adhere strictly to the rules and models laid down by the writers of anct. Greece and Rome. For, as Gk. and Rom. literature had long been regarded as affording perfect examples in every form of writing, the word classic was applied in particular to works of Gk. and Rom. authors. The term the C. is, therefore, applied to Gk. and Rom. literature, and is often applied to the languages themselves. Thus, the phrase 'the study of the classics' does not merely mean the study of anct. classical literature, but includes the study of the grammar and construction of the Gk. and Lat. languages. Modern classical scholarship begins with the Renaissance, although much work on Gk. literature had already been done by the scholars of Alexandria, who in the third century A.C. classified the texts that were then extant. After the Renaissance scholarship was naturally intent on going over the newly discovered treasures of classical literature. The printing of the C. in Italy in the sixteenth century—which was an event in itself—made classical study an integral part of the humanistic education, advocated by such a man as Erasmus. The founder of historical criticism was the younger Scalliger (1540–1609), who was also an adept at textual emendation, and his methods were inherited by the two great Eng. scholars of the eighteenth century, Bentley and Porson. In the nineteenth century scholarship in the hands of the Ger. scholars was mostly devoted to the editing and collating of the classical texts, while in England the Porsonian tradition passed from Cambridge to Oxford in the person of Elmsley (1773–1825). In Victorian England scholarship was marked by Jebb's ed. of Sophocles and Munro's ed. of Lucrētius, Jowett's translation of Plato, Thirlwall's and Grote's History and Liddell and Scott's Lexicon. In the U.S.A. during the nineteenth century classical studies became of increasing importance, represented at Harvard by the Lat. scholar Lane, and at Yale by the Gk. scholar Seymour. An Amer. school was founded at Athens in 1881 and a Brit. school two years later. Since then archaeology has been a stimulus to modern scholarship, which in recent years has been actively fostered by societies both in England and America, and this in spite of the fact that the value of a classical education has been called in question. The most monumental work of any single Amer. scholar

is the *Lexicon Plautinum*, recently completed by G. Lodge. The Loeb Library of classical authors, text and trans. was initiated in the U.S.A., and additions are made to it each year. The twentieth century saw the beginning of the popularisation of the C. in cheap eds., of which Everyman's Library (q.v.) is the most comprehensive.

Classification (Lat. *classis*, a class), name given to the process whereby a number of objects which are alike in one or more respects are collected under a common name. Systematic C. is essential to any science; artificial C. is the name given to a collection of facts for some special purpose, such as statistics of various kinds. Each science has its own system of C., but the problem which has engaged the minds of scientists and philosophers from very early times is that of the relation of sciences to each other—that is, the C. of sciences as a whole. Of the many attempts made in this direction, those of Bacon, Comte, and Spencer may be briefly outlined as being representative of various views. Bacon's C. was based on a subjective criterion of the various faculties which are concerned in the study of different sciences. Hist. is, according to this theory, the science of memory, philosophy that of reason, etc. Comte's C. was based on an objective criterion; all sciences pass through three stages, according to him—theological, metaphysical, and positive. Of the positive sciences mathematics is the lowest, sociology the highest. Spencer classified sciences under three heads, as abstract, such as logic, etc.; abstract concrete, such as physics, mechanics, etc.; and as concrete, such as astronomy, sociology, etc. It is obvious that no system of C. can be regarded as perfect, as a preconceived theory inspired them. For different systems of C. see, in addition to the writers named above, Aristotle, Plato, Hobbes, Bentham, Wundt, etc.

Classification, Library, see CATALOGUES AND CATALOGUING.

Clathropteris, genus of fossil ferns, founded by Brongniart. The typical specimen, *C. meniscoides*, occurs in the mesozoic sandstone of Hor in Scandinavia.

Claude, Jean (1619–87), Fr. Protestant preacher and controversialist, was pastor at Charenton (1666–85), but, on the revocation of the Edict of Nantes by Louis XIV., was obliged to seek refuge in Holland. His works include *Défense de la réformation* (4 vols.) (1671); *Réponse à la conférence de Bossuet* (1681).

Claude de Lorraine (1600–82), properly called **Claude Gellée**, Fr. landscape painter, b. at Chamaigne, in Lorraine. Being left an orphan at the age of twelve, he went to live with an elder brother, a wood-carver at Freiburg, and when still a boy travelled in Italy. At Rome he received employment in artists' studios, and was fortunate in coming under the notice of Agostino Tassi, the landscape painter, who gave him lessons. He may also have studied under Godfrey Waals at Naples, and finally settled in Rome in 1627. Not long after he attracted the attention

of Cardinal Bentivoglio, who procured him an introduction to Pope Urban VIII., and a commission for two paintings: 'La Fête Villageoise,' and 'Un Port de mer au soleil couchant,' now in the Louvre. C.'s pictures commanded high prices even during his lifetime (Clement IX. offered for 'Villa Madama' as many pieces of gold as could cover the canvas), and he was troubled with many forgers. Accordingly, he kept sketches of his pictures in paper books, which he called his *Libri di Verità*. Those were afterwards engraved by Karlom; the originals belong to the duke of Devonshire. C. excelled as a landscape painter. His colouring is

CLAUDE OF LORRAINE

Engraving after a painting in the Musée Royale, Paris.

very delicate and harmonious, and perhaps no other painter has had a more perfect knowledge of the lights and shades of the sky, changing continually from dawn till night. He was not successful in figure-drawing, in which he sometimes received help from fellow artists, and is supposed to have once said that he sold the landscape and gave away the figures free. His landscapes number about 400, and are to be found in all the chief galleries of Europe. Consult Ruskin, *Modern Painters*, 1843-60; Mrs. Mark Pattison, *Claude Lorrain, sa vie et ses œuvres*, 1884; A. M. Hind, *The Drawings of Claude Lorrain*, 1925; and P. Courthion, *Claude Gellée, dit le Lorrain*, 1932.

Claudel, Paul Louis Charles, b. at Villeneuve-sur-Fère, France, Aug. 6, 1868. is at once a distinguished diplomat and one of the best-known poets of his country. Has filled many consular posts, and has been Fr. ambas. to Japan, to the U.S.A. (1927-33), and to Belgium (1933-35). But he is chiefly known to fame as one of the greatest Catholic writers of France. His literary ancestors, so to speak, are the

Bible, Shakespeare, Æschylus, and Rimbaud. His dramas take place in time rather than in space. There is always a religious basis, the drama being one of the salvation or destruction of the soul. His prin. dramas are *Tête d'or* (1889); *L'Annonce faite à Marie*, originally written as *La Jeune Fille Violaine* (1910); *L'Otage* (1918); *Le Soulier de satin* (1929). His prin. poetic works are *Cinq Grandes Odes* (1911); *Corona benignitatis anni Dei* (1915); *Poèmes de guerre* (1922). Other pubs.: *Feuilles de saints* (1925); *Les Euménides d'Eschylus* (1920); *Conservation dans le Loir-et-Cher* (1937). A synthetic and obscure writer, who has adopted a form of verse recalling that of the Psalms and sometimes that of Walt Whitman, C.'s place in the literary firmament is both eminent and questioned. Some derive a novel æsthetic and spiritual experience from his drama and, to a less degree, from his verse, while others are unmoved by the shrill clarion call of his poetry. Those who, like M. Denis Saurat, deem C. inflated and meretricious, are perhaps justified in distinguishing between the sincerity of the work which is the outcome of his experience and the hollow rhetoric of the work which is merely founded on his opinions. Yet no other modern verse is at once so cosmic and yet personal, for it is the fruit of C.'s preoccupation with his own spiritual salvation, written without much regard for the contemporary world. His metrical ingenuity is marked and, like T. S. Eliot, he is skilful in the use of long unrhymed periods. C.'s plays are by no means easily adaptable to ordinary stage requirements and might seem rather to envisage a stage which exists only in the fancy. Thus *Le Soulier de satin*, divided into 'four days,' might well take as long to perform, but like Mr. Shaw's *Back to Methuselah*, it is none the less fine drama. An acting early version of this play was made by C. and performed with great success at the Comédie Française in 1944. More recently C. rewrote parts of *L'Annonce faite à Marie* for production in Paris. A less known play is *Partage de Midi*, written in the Far E. in 1906, only a few copies being printed. Yet it is regarded by the critics as one of his greatest works and, being an early work, throws light on the spiritual conflict out of which evolved the massive serenity of his matured religious commentaries.

Claudianus, Claudius (Claudian) (b. A.D. 365). Lat. poet, b. at Alexandria in Egypt. His native tongue was Gk., but he acquired a perfect command over Lat. In 395 he gained the favour of Stilicho, whom he eulogised in his *De Laudibus Stilichonis* (three books). His other writings are *Raptus Proserpine*, an epic poem; *Gigantomachia*, a fragment; *De Bello Gildonico*, and sev. occasional poems and panegyrics. After the war with Gildo, he was honoured by the Senate with a bronze statue in the forum of Trajan. His poems are vivid and written in a somewhat ornamental style. The best eds. are those of T. Birt (1892), J. Koch (1896), and M. Platnauer (with trans.

1922). See T. Hodgkin, *Claudian: the Last of the Roman Poets*, 1875; and J. W. Mackail, *Latin Literature*, 1895.

Claudius I. (10 B.C.–A.D. 54), Rom. emperor, whose full name was **Tiberius Claudius Drusus Nero Germanicus**. He was the son of Drusus Nero, brother of the Emperor Tiberius and Antonia, and was *b.* at Lugdunum (Lyons) in 10 B.C. He was sickly and neglected as a child, and did not come into prominence until in 41, after the assassination of Caligula, he was proclaimed emperor by the troops. C. embellished Rome by building an aqueduct and a harbour. In 43 he occupied Britain, to which he had previously sent two of his generals, **Plautius** and **Vespasianus**. In later life C. was ruled by his profligate wife, **Messalina**, who was executed for treason in 48. Two years later he married his niece, **Agrippina**, who prevailed on C. to adopt her son, **Domitius**, who assumed his stepfather's name of **Nero**. It is generally supposed that C.'s death by poisoning was at her instigation. (Tacitus, *Annals*, xi. and xii.)

Claudius II. (Marcus Aurelius Claudius), surnamed **Gothicus** (A.D. 268–70), Rom. emperor. He was *b.* in Illyricum of a family of no note, but distinguished himself in military service and was made governor of his native prov. under **Valerian**. On the death of **Gallienus**, the army proclaimed C. emperor. He defeated the **Alemanni** in the N. of Italy (268); and won a great victory over the **Goths** near **Naissus**, in **Dardania**, on which occasion he received his surname **Gothicus**. He *d.* at **Sirmium** in **Pannonia**.

Claudius Albinus, see **CLODIUS**.

Claudius, Appius Claudius Cæcus (fl. 320 B.C.), Rom. censor. He was elected to the censorship in 312, without having previously held the position of consul, and retained it for four years, though according to Rom. law no man might be censor for longer than eighteen months. He became blind, hence his name **Cæcus**. He built the **Applan aqueduct**, which brought water to Rome from **Tusculum**, and began the construction of the **Via Appia**. In the war with **Pyrrhus**, the terms of peace, drawn up by **Cineas**, were rejected by the Senate largely because of Appius's spirited opposition to them.

Claudius, Appius Claudius Sabinus Regillensis (fl. 500 B.C.), Sabine of the tn. of **Regillum**, where he was known as **Attus Claudius**. In the war between the **Roms** and **Sabines** in 504 B.C. he advocated peace. He settled in Rome, where he was adopted into the patrician rank. He became consul in 495, and the enmity he displayed towards the plebeians led to their secession to the **Mons Sacer** in the following year. The **Sabines** who accompanied him to Rome were given lands by the **Anio**, and were known as the tribe of **Claudians**.

Claudius, Publius Claudius Pulcher, generally known as **Clodius** (d. 52 B.C.), was descended from an illustrious family, and was notorious for his licentiousness. In 62 he entered the house of **Julius Cæsar** and profaned the mysteries of the **Bona Dea**, which were being celebrated

by **Pompèia**, **Cæsar's** wife, and other Rom. matrons. **Clodius** was brought to trial in the following year, but by corrupting the judges he obtained an acquittal. **Cicero** had given evidence at the trial, for which **Clodius** never forgave him. He descended from patrician rank, and was adopted into a plebeian family that he might become a tribune of the plebs. He was chosen tribune in 58, and used his influence to banish **Cicero** from Rome on the grounds that the latter had unlawfully punished the adherents of **Catiline** with death. In spite of **Clodius**, however, **Cicero** was recalled in the following year. In 56 **Clodius** became *ædile*, three years stood as a candidate for the pretorship, and was murdered in Jan. 52, on the **Applan road**, by the supporters of his enemy **Milo**.

Claus, Emile (1849–1924), Flemish painter, popular for his studies of children. Examples of his works are in the galleries of many of the chief tns. of Europe.

Claus, Santa, see **CHRISTMAS**.

Claudel, or Clauzel, Bertrand Count (1772–1842), Fr. soldier and marshal of France. He distinguished himself with the army in **Naples**, **Dalmatia**, and **Portugal**. In 1813 he was almost daily engaged with the Eng. during the retreat of the Fr. before **Wellington**, into France. He was exiled in 1815, after he had opposed the troops of the duchess of **Angoulême** during the **Hundred Days**, but returned in 1820. He was made a marshal by **Louis Philippe** and governor of **Algeria**. He was commander-in-chief of the African army until the check sustained before **Constantine** caused his recall in 1836.

Clausen, Sir George (1852–1944), Eng. painter, son of a decorative artist of Dan. extraction, was *b.* in London. Went to the National Art School (now Royal College of Art). Studied under **Bouguereau** and **Robert Fleury**, with whom, however, his work has nothing in common. He was, however, permanently influenced by **Millet**, **Corot**, and **Manet**, as was evident in the paintings which he exhibited at **Burlington House** in the seventies, pictures of country life and landscape full of life and movement. His best paintings were always the fruit of a deep study of country life—of landscape in sun and shade, of flowers, of work on the farm. His picture 'The Girl at the Gate' was bought by the trustees of the **Chantrey Bequest** for the nation and may be seen in the **Tate Gallery**. Nobody excelled him in the power of suggesting bulk and solidity in conditions when the actual features of the landscape were almost obliterated, and his pictures also render excellently the appearance of things in brilliant sunshine or under shelter. Of his landscapes in this kind 'The Gleaners Returning' in the **Academy** of 1908 was also bought by the **Chantrey Bequest**. **Barn Interiors**, paintings of the nude, and still-life compositions were other characteristic subjects. His portraits include that of himself at the **Fitzwilliam Museum**, **Cambridge**, in water colours. **A.R.A.**, in 1895; **R.A.** in 1908; knighted in 1927.

Clausewitz, Karl von (1780-1831), celebrated Prussian general and writer on theory and tactics of warfare at Burg. He served with Prussia from 1792—being engaged in the campaigns of the Rhine, 1793-94, and attending the Berlin school for young officers 1801-3, where he won the favour of Scharnhorst. In the campaign of 1806 he attended Prince Augustus as adjutant, was taken prisoner with him at the capitulation of Prenzlau. After his exchange, he was major on the general staff till 1812. In that year he entered the Russian service, in which he remained till 1814, having been Russian staff officer with Blücher's campaign of 1813. He returned into Prussian service. In all his campaigns he distinguished himself by his intelligence and resource. He was made chief of a Prussian army corps in 1815, and in 1818 was made major-general and a director of army schools and an inspector of artillery. It is, however, from his writings on the theory of warfare that he is most famous. His best-known work, his great book on war in three vols., entitled *Vom Kriege* (1832), was an epoch-making work in regard to the subjects of which it treats. He also wrote *Der Feldzug von 1796 in Italien*; *Der Feldzug von 1813 (1813)*; and *Über das Leben und den Charakter von Scharnhorst* (1832). Much capital was made out of his military theories during the First World War by the Allies' propagandists. He d. at Breslau of cholera.

Clausius, Rudolf Julius Emmanuel (1822-88), Ger. physicist, of Köslin, Pomerania. He taught for twelve years at the Federal Polytechnikum at Zurich. Thermodynamics was the science to which he gave special study and, in a lesser degree, optics and electricity. He earned the credit of being the founder of thermodynamics as a science; and, by his restatement of Carnot's principle (see THERMODYNAMICS) he put the theory of heat on a sounder basis. He was the developer of the kinetic theory of gases (1857), on which aspect of the theory of gases Joule (q.v.) and THERMODYNAMICS had six years before advanced the same hypothesis, based on his own studies in the mechanical equivalent of heat. C. calculated the average velocities of the molecules and the average distance through which they move in a straight line between collisions. He was awarded the Copley medal of the Royal Society in 1879. Among his numerous works may be mentioned *On the Nature of Heat, compared to Light and Sound* (1857); *Mechanical Theory of Heat* (1864-67).

Claustal-Zellerfeld, tn. of Hanover, Germany, among the Harz Mts., 25 m. N.E. of Göttingen. The centre of an important mining dist. for silver, lead, and other metals. Pop. 11,300.

Clavagella, or Club-shell, lamellibranch typical of the family Clavagellidae, to which belongs also the well-known mollusc *Aspergillum*. They usually live in corals and rocks.

Claverhouse, see DUNDEE, VISCOUNT.
Clavichord or Clavichord musical

instrument which preceded the pianoforte. The strings were struck by brass tangents projecting from the ends of the keys, instead of by hammers. It is of the same type as the harpsichord and spinet, but these are plucked to set the strings in vibration.

CLAVICHORD

Above is the typical clavichord; and below, a theoretical diagram of the action on a larger scale.

Clavicle (from Lat. *clavis*, key), bone commonly known as the collar-bone. It is connected at its inner end with the sternum or breastbone, and at its outer or scapular end with the shoulder-blade, together with which it forms the arm-socket. In animals it is shorter than in man, where it is a long bone shaped like an S and lying nearly horizontal. The bone is easily fractured or dislocated, but can be fairly easily returned to its place and pieced together when the arm is supported. The merry-thought of a fowl is composed of the two Cs.

Clavicornes (Lat. *clava*, club, *cornu*, horn), name given by Latreille to those coleopterous insects in the section Pentameria which have their antennae thickened at the apex and thus resemble a club in shape. Burying-beetles and bacon-beetles belong to the group.

Clavie, Burning the. This is an ant. Scottish custom, which was once more widely distributed, but is now only kept up at Burghhead, a small fishing vil. on the Moray Firth. The custom takes its name from the Lat. word *clavis*, a nail, as a bonfire is first made of split casks, one of which is then joined together again by large nails. The cask is then filled with tar, ignited, and carried round the vil. up to a headland where there are the remains of a Rom. altar; the assembled people scramble to get a piece of the C. with which to light their New Year's fire, and the charcoal of the C. is put up the chimneys, as it is supposed to prevent witches and evil spirits from descending. The date of this old custom is Jan. 12, the old New Year's Day.

Clavijero, Francisco Xavier (c. 1720-1787), Sp.-Mexican historian, b. at Vera Cruz, Mexico. Pub. in It. *Storia Antica del Messico* (Cesena, 4 vols., 1780-81). It was trans. into Eng. by Cullen in 1787. C. also wrote *Storia della California* (Venice, 1789).

Clavijo y Fajardo, Don José (1730-1806), Sp. publicist and naturalist, b. in the Canaries. He was challenged to a duel by Beaumarchais, whose sister he had jilted. He trans. Buffon's *Histoire Naturelle* in 1785-90, for which he was rewarded by being appointed director of the Natural Hist. Museum in Madrid. Goethe drew largely on C.'s story for his *Clavijo*, 1774.

Clavius, Christopher (1537-1612), Ger. Jesuit priest and mathematician, who was employed by Pope Gregory XIII. to superintend the reformation of the calendar. He had a very high reputation as a mathematical writer, and has even been called 'the Euclid of the sixteenth century,' but he had little original genius, and in consequence his works are not now held in such high esteem as formerly.

Claws, term applied in zoology to various sharp appendages on the limbs of different animals, and frequently they are not homologous. The sharp nails of a vertebrate, the chelipeds of a lobster, and the chelicere of a scorpion are all termed C. In vertebrates they are formed of hardened and thickened epidermal tissue, and in the cat they are retractile, i.e. they can be drawn in and thrust out at will.

Clay, name applied indefinitely to the finer waste matter arising from the decomposition of rocks. C. is distinguished by its ductility and tenacity, and consists mainly of alumina and silica with a small quantity of water. It is rarely found in a pure state except where rocks containing felspar have decomposed, and is used chiefly in the manuf. of bricks.

Clay, Alfred Borron (1831-68), Eng. painter. Received tuition in art from his father. He was articled to a solicitor, but gave up the law to study art. He attended the Royal Academy School. Among his works may be mentioned 'The Return to Whitehall, May 29, 1660' (1867), now at Liverpool; 'Imprisonment of Mary Queen of Scots at Lochleven Castle' (1861).

Clay, Cassius Marcellus (1810-1903), Amer. politician, b. in Madison co. in Kentucky, and educated at Central College, Danville, and at Yale Univ. He was passionately opposed to slavery, and spent much of his energies opposing it; as a result of his sympathies he was forced to fight many duels and made many enemies. He was U.S. minister to Russia 1861-69. In 1872 he was one of the organisers of the Liberal Republican revolt, and took a prominent part in politics until he retired.

Clay, Frederic (1838-89), Eng. musical composer, was the son of James C., the famous authority on whist. He studied music at Paris under W. B. Molique, and under Hauptmann at Leipzig. His works include a number of light operas, but he is best known by his songs, *I'll sing thee songs of Araby* (from a cantata setting of Moore's *Lalla Rookh*), *She wandered down the mountain side*, and *The Sands of Dee*.

Clay, Henry (1777-1852), Amer. statesman and lawyer, b. in Virginia. Called to

the Bar at an early age, after an indifferent education, he quickly distinguished himself as an advocate. In 1803 he, to fill unexpired term, was elected member of the Kentucky legislature, in 1806 and 1810, of the state Senate, and in 1811 of Congress, becoming speaker of that body. His fiery speeches did much to bring about the war of 1812, and in 1814 he represented the U.S.A. at Ghent in the peace negotiations with Great Britain. He thrice unsuccessfully contested the presidency: first in 1824, when he stood against Adams, and again in 1832 against President Jackson, and 1844 against Polk. In 1825 Adams made him foreign secretary. After a period of retirement from politics he again entered the Senate (1831), and till his death retained all his old influence either there or as an adviser of the Whigs. In his foreign policy he warmly espoused the cause of the S. Amer. republics in their struggle for independence. His objective was that the U.S.A. should recognise the republics as such, and accordingly, after the rising in Spain in 1820, he moved in Congress an appropriation for sending ministers to these republics. His resolution was defeated, but he followed it up by another in 1821, expressing the sympathy of the people of the U.S.A. with the struggle of the republics to throw off the Sp. yoke. This was passed, but not until after the Sp. treaty of 1819 respecting the boundaries of the Floridas and Texas and other, had been ratified by Spain, when the resolution could hardly prejudice Amer. interests. His name will ever be stamped on Amer. economic hist. by reason of his part in the development of the Amer. system of protection to manufactured goods by tariffs, and the fostering of internal improvements by state grants or loans. C. came out as a protectionist during the nullification campaign of 1832-33 (see NULLIFICATION), when he astounded his followers by introducing a new Tariff Bill in which he proposed to reduce all existing duties to an *ad valorem* basis of 20 per cent, such duties as exceeded that rate to be gradually diminished over a period of ten years, when the rate should become uniform. The Bill, which was a mere compromise, was passed mainly to appease S. Carolina; but in his subsequent speeches it is clear C. was for a protectionist policy on general grounds of political expediency, viz. that the European nations had adopted the system, that it was necessary to create a home market for agriculture so as to keep pace with the rapid increase in Amer. power of production; and that a compact system of home manufs. made for union among the states. He advocated a convertible paper currency, demanded state assistance in the development of rail and water communications, and effected a compromise between the slave states and the Abolitionists (see on this COMPROMISE MEASURES, OF 1850). See C. Colton (ed.), *Works of Henry Clay*, 1863.

Clay Cross, urb. dist. of Derbyshire, England. The centre of a coal and iron

dist. of some magnitude, it is situated 5½ m. S.E. of Chesterfield. Pop. 9000.

Clay Ironstone, name given to the ore from which iron is smelted, in particular the carbonate (siderite) which occurs mixed with clay. In common with blackband ironstone, the ore is found chiefly in beds composed of small balls or nodules, and fossils are frequently met with embedded in the plastic substance. Before smelting, C. I. is usually subjected to roasting for a period of a month or so—the ore being broken up for this purpose—and during this time it loses from one-quarter to one-third of its weight. The method of smelting adopted is, in most cases, that of the blast furnace. Analysis has demonstrated that C. I. contains a large number of impurities, but the two chief constituents are ferrous oxide (about 40 per cent) and carbonic acid (about 25 per cent). The total metallic iron present averages 30 per cent. The condition in which this is present (ferric or ferrous) depends on the extent to which the processes of oxidation and hydration have been carried by the atmosphere. Ironstone in some form or other is found in practically all the coalfields of Great Britain, generally in convenient proximity to the limestone, which then forms its fuel. The earthy nature of the ore renders the addition of calcareous fuel necessary before it can be properly smelted, and the convenient distribution of ironstone and limestone referred to has formed a big factor in the industrial development of Great Britain.

Claymore (Gaelic *claidheamh mor*, great sword), two-edged broadsword of the auct. Scottish highlanders, celebrated in many a song and ballad. It is also the name inexactly given to the basket-hilted broadsword introduced in the sixteenth century, which was frequently single-edged. It was not usual for the C. to be wielded with both hands. Cs. are still carried by the officers of Scottish regiments in the Brit. Army.

Clay Soils derive their specific character from the hydrated silicate of alumina ($Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$) which is found in them, both in a state of mixture and in chemical combination. China C. or kaolin is a very pure form of this silicate. Although some soils are found to contain upwards of 30 per cent of this alumina, and hardly any soil is quite free from it, the amount rarely exceeds 2 per cent. When farmers speak of a clay soil, they mean an intractable earth, which, when dry, becomes baked as hard as a brick, and which in its wet state is so sticky as to resist all efforts to work it with ordinary agric. implements. A pure clay soil would be quite infertile, but its felspars are almost always composed partly of lime, potash, and soda, which render the soil amenable to cultivation. As they hold water, are cold, and fairly impervious to air, C. S. are unsuitable for building purposes.

Clays, **Paul Jean** (1819-1900), Belgian painter of the school of Willems and Lays. Among his best-known pictures are 'Calm in Zealand,' 'The Open North Sea,' 'A

Squall on the Scheldt,' and 'Dutch Boats in the Flushing Roads.'

Clayton urb. dist. in the W. Riding of Yorkshire, England, situated 3½ m. to the W. of Bradford. Pop. 5000.

Clayton, John Middleton (1796-1856), Amer. politician, was b. at Dagsborough, in Sussex co., Delaware. He was engaged in politics from a comparatively early age, and sat in U.S. Senate 1829-37, 1845-49, and again from 1851 till his death. His is chiefly known by his negotiation of the C.-Bulwer Treaty, when he was secretary of state in 1850. He d. at Dover in Delaware.

Clayton, Robert (1695-1758), Irish bishop, whose motion in 1756 in the Irish House of Lords, for the expunging of the Athanasian and Nicene Creeds from the liturgy, gave great offence, and the feeling against him was increased by his pub. of *A Vindication of the Old and New Testament* in 1757. C. was threatened with a legal prosecution, but d. before the proceedings opened.

Clayton-Bulwer Treaty, between Great Britain and the U.S.A., was so called from the names of the statesmen representing the respective countries. The U.S.A. were represented by J. M. Clayton, Great Britain by Sir Henry Bulwer. By the terms of the treaty both parties pledged themselves to respect the neutrality of the proposed ship canal across Central America. Between 1880 and 1884 the Gov. of the U.S.A. put forward sev. reasons why it might, when it thought fit, withdraw from its contract. These reasons, it may be stated, could not be reconciled with any system of law, national or international. The C.-B. T., which was concluded at Washington on April 19, and ratified on July 4, 1850, was abrogated in 1902 by the Hay-Pauncefote Treaty, which embraced the neutrality rule for the Panama Canal.

Clayton-le-Moors, par. and tn. of Lancashire, England, in the div. of Accrington, from which it is distant 1½ m. It is situated on the Leeds and Liverpool Canal, and coal-mining is carried on. Pop. 7300.

Clazomenæ (the modern *Kelesman*), auct. tn. of Ionia, and a member of the Ionian Confederation of Twelve Cities, or Dodecapolis. The inhab., alarmed by the Persian invasions, removed to one of the small is. of the bay from an isthmus which connected the mainland to a peninsula. Alexander the Great built a pier to the mainland, and the remains are still visible. It was the bp. of Anaxagoras, and is famous for the terra-cotta sarcophagi found there.

Cleanthes (c. 300-c. 220 B.C.), Stoic philosopher, the successor of Zeno of Citium, was b. at Assos, in the Troad. He attended the lectures of Zeno for nineteen years, and, in order to obtain money to pay his class fee, he used to draw water for the gardens about Athens and to grind corn in the night. On the death of his teacher, C. became the recognised head of the Stoic school, and was himself succeeded by his pupil, Chrysippus. He wrote many treatises, but the only work

of his that is extant is a beautiful *Hymn to Zeus*, written in Gk. hexameters. He d. of voluntary starvation.

Clearances, The, dispossession of the crofters of the Scottish highlands, dating from 1750, by landowners who introduced sheep-rearing. This led to a considerable emigration to N. America.

Clear, Cape, most southerly point of Ireland. It is the name given to the south-westerly extremity of Clear Is.; there is a lighthouse and telegraph station on the cape.

Clear Island, small is. in the co. of Cork, Eire, about 4 m. from the mainland, with an area of only 1504 ac. and a pop. of 565. The chief occupation of the inhab. is fishing.

Clearachus, Spartan general of the fifth century B.C. After commanding a portion of the fleet in the battle of Cyzicus, he was sent as harmost to Byzantium, but so infuriated the people by his despotism that the inhab. opened the gates to Alcibiades. He assisted the young Prince Cyrus against Artaxerxes. He received the command-in-chief of the Gks. after the battle of Cunaxa, and directed the retreat of the Ten Thousand, until he was led into an ambush by Tissaphernes, and delivered to Artaxerxes, who put him to death in 401 B.C. See also TEN THOUSAND, EXPEDITION OF THE.

Clearfield, co. seat of C. co., Pennsylvania, U.S.A. It is situated on the W. branch of the Susquehanna R., at a distance of 92 m. to the E.N.E. of Pittsburgh. Has foundries, and tanning, tile, and drain-pipe works. Pop. 9000.

Clearing-houses, institutions estab. by bankers for the adjustment of their mutual claims for cheques and bills, by exchanging them and settling the balances. The London bankers' C. was estab. by the prin. bankers in London in the year 1770. There are two clearings, the balance being struck only at the afternoon clearing. Clerks representing the different banks first go to the C. for the purpose of getting 'in' clearings entered (i.e. drafts against their banks); they then return to their offices so that the 'out-books' there may be cast and sent down to the C. to be checked against the 'in-books' of other banks. The London bankers' C. enables the claims of the member banks to be set off against each other, only the balance of account (e.g. cheques) being met by a transfer of funds at the bank of England. See also BANKS and BANKING.

Clearing Nut, seed of a tree (*Strychnos peltatum*) of the order Coganaceæ. The fruit is a single seed enveloped in pulp. The people of India use it for scouring the inside of their pots before filling them with water from rivs. or ponds, the impurities in the water sinking to the bottom as a result of the albumen and casein in the seed.

Clear-story, see CLERESTORY.

Clearwater, city on the W. coast of Florida, U.S.A. 30 m. W. of Tampa, a winter resort with orchards and market gardens and fisheries. Pop. 10,100.

Clear, nautical term for a double hook used for making ropes fast without tying

them by a knot. They are of different shapes, and are placed in various parts of a boat. A thumb C. is a small piece of wood affixed to a spar so that a rope can be bent around it. A comb C. resembles a small double-arched bridge.

Cleator Moor, urb. dist. and tn. situated on the It. Eden, 4½ m. S.E. of Whitehaven. There are extensive coal mines and furnaces for the manuf. of hæmatite iron, also engineering works and brass foundries. From the moor itself large quantities of very good iron ore are obtained. Pop. 8000.

Cleavage, property possessed by rocks and crystals by which the forces of cohesion submit to a wedging strain more readily in some directions than in others. A homogeneous mass is broken into irregular fragments, but crystals, the molecules of which have been deposited with a certain orderly arrangement, tend to split into smooth-faced fragments. The direction in which the splitting occurs is always parallel to a possible face of the crystal, and is called a C. plane. The property is independent of hardness, as the hardest of crystals, diamond, is easily cleavable, while minerals of intermediate hardness are sometimes cleavable with difficulty, e.g. quartz and garnet; again, gypsum, a soft mineral, has a good C. The most perfect of all Cs. is possessed by mica, which can be divided and subdivided into laminae apparently without limit. In estimating the hardness of a mineral, the direction of C. should be taken into account, as a crystal shows less resistance to abrasion in a direction parallel to the C. The C. of non-crystalline rocks is often due to quite different causes. Rocks composed of coarse particles are either not cleavable or cleave in a direction parallel to the bedding planes. Fine-grained rocks, on the other hand, often exhibit a phenomenon known as slaty C. This occurs in a direction usually at a high angle to the bedding plane, and at right angles to some folding stress which the rock has at some time sustained. The cause is somewhat obscure, but there would naturally be a tendency for the particles to flatten themselves in a direction at right angles to the greatest stress. Again, slate contains plates or crystals of mica; these developed while the rock was in a plastic state and would tend to grow at the edges where the pressure was less intense, thus forming laminae whose direction would be parallel to the line of C. The property of C. in slate is of economic importance, as through it the rock may be readily split into plates suitable for roofing, etc.

Cleavers, or Goose-grass, *Galium Aparine*, ann. wayside weed of the order Rubiaceæ. Has small white flowers and bristly purple fruits which cling to wool or fur.

Cleburne, city of Texas state in the U.S.A., the cap. of Johnson co., situated 55 m. S.W. of Dallas. Pop. 10,500.

Cleckheaton, par. and tn. of the W. Riding of Yorkshire, England, 5½ m. S.E. of Bradford. The tn. has a very fine tn. hall, and industries of textile fabric

manuf. and machine-making; there are collieries in the dist. The par. has an area of 1750 ac. Pop. 13,000.

Clee Hills, range of hills situated in S. Shropshire, which rise here and there into fairly high peaks, of which the chief are Brown Clee Hill (1792 ft.) and Titterstone Clee Hill (1750 ft.). There is some coal in the dist., and a noted hard rock called Dhu stone is quarried in large quantities.

Cleethorpes, watering-place of Lincolnshire, England, situated 2½ m. S. of Great Grimsby, on a flat, sandy beach at the mouth of the Humber, here over 7 m. wide. There is a sea wall of nearly a mile in length, and C. is connected with Grimsby by train. The tn. is noted for its oysters. Pop. 27,100.

Clef, in music, a character placed at the beginning of the staff to determine the pitch and name of the notes. There are three Cs.: the G, or treble C., placed on the second line; the C clef, placed on the fourth line; and the F, or bass C., placed on the fourth line. The C clef is now only used for tenor and alto staves, though formerly it was of four kinds. As the alto staff it may also be placed on the third line.

Cleft Palate, congenital failure of development in the roof of the mouth, resulting in a fissure which may extend along the middle line of the hard palate and soft palate as far as the uvula. The reason for such lack of development is not known; it is often hereditary and frequently associated with hare-lip, where the upper lip is divided on one side, or on both sides, of the middle line. The condition, whether of C. P., or hare-lip, or both combined, is one dangerous to the welfare of the child, as swallowing is rendered difficult and sucking is rendered impossible, or results in the return of the milk through the nasal passages. In later years an additional disability is sustained through the impossibility of rendering some of the elements of speech, and the senses of taste, smell, and hearing may be considerably impaired. These considerations make an early operation advisable, and if the child is able to undergo a surgical operation, the matter should be attended to when it is a few weeks old. The plan adopted is to bring the edges of the soft palate together and to thrust forward strips of the mucous membrane and fibrous tissue covering the hard palate to meet at the middle line, where they are sewn up. If hare-lip exists, the gap should be closed by surgical operation as soon as possible. Where there is no C. P., the operation may be undertaken a week after birth, but is necessarily postponed for some months after the palate has to be operated on. Formerly artificial palates were used to cover the fissure, but with modern surgical methods this is rendered unnecessary.

Cleg, **Horse-fly**, **Breeze-fly**, **Forest-fly**, and **Gadfly** are various names given to members of the family of dipterous insects, Tabanidae. They are large, stout flies, with a very long proboscis, and the males have enormous eyes. In the genus *Tabanus*, common in Britain, the species are often one inch in length, and in the

Pangonia the proboscis of the female is about four times the length of its body. See also **CIRRYOPS**; **HORSE FLY**.

Cleisthenes (fl. 508 B.C.), Athenian reformer, the son of Megacles and Agariste, and grandson of Cleisthenes, the tyrant of Sicyon. He was the leader of the Alcmaeonidae, and after the expulsion of the Pisistratidae (510 B.C.), headed the democratic party. He was opposed by the whole party of nobles, and in particular by Hippas and Isagoras, the former of whom he expelled in accordance with the Delphic oracle. C.'s chief reforms were (1) the abolition of the four ancient tribes and the substitution of ten new ones; (2) the introduction of ostracism, by which a party leader might be got rid of without resorting to bloodshed; (3) the re-establishment of election by lot. Isagoras called in the help of the Spartans, and for a time C. was obliged to withdraw from Athens, but Isagoras was ultimately defeated, and C. was recalled and his laws made good.

Cleithros, in architecture, a covered, or roofed-in, Gk. temple, the open-roofed temple being known as hypæthral.

Cleitus, see **CIRIUS**.

Cleland, small tn. of Lanarkshire, Scotland, on S. Calder Water, situated 3 m. N.E. of Motherwell. There are collieries and iron works. Pop. (including the small suburb Omoa), 5000.

Cleland, William (c. 1661-89), Scottish soldier and poet, was brought up on the estate of the marquess of Douglas, to whom his father was gamekeeper. He joined the Covenanters, with whom he fought at Drumclog and Bothwell Bridge. Later, he was agent for William of Orange, and was made lieutenant-colonel of the Cameronian regiment which defended Dunkeld; he was there killed. His poems are written in Eng., with a plentiful sprinkling of Scottish words, but have no great literary merit.

Clematis, cosmopolitan genus of Ranunculaceae, consists largely of shrubs which have opposite leaves and climb by means of their petioles. *C. vitalba*, the traveller's joy or old man's beard, runs over the hedges in many parts of Britain. The greenish-white flowers are in clusters and later appear as heaps of feather-tailed silky tufts. Other species are, however, better known in cultivation, e.g. *C. flammula*, a fragrant plant with panicles of small white flowers; *C. cirrhosa*, *C. crispa*, and *C. florida*, all remarkable for the large size of their greenish-white flowers; *C. viticella*, an elegant and ornamental climber, which has purple or pink bells hanging gracefully from the festooning branches. The popular *C. jackmani* with purple velvety blooms is derived from *C. viticella* and *C. lanuginosa*, a large lilac-coloured species of Chinese origin. There are also American species which have the popular name virgin's bower.

Clemenceau, Georges Benjamin (1841-1929), Fr. statesman and journalist and the dominating figure in France during the First World War, b. at Mouilleron-en-Pareds, his father being an uncompromising Jacobin of the Vendée from

whom C. inherited his republican principles and his intransigence. His forbears having been in the medical profession for the previous three hundred years, C. studied medicine, first at Nantes and then in Paris, where he took his degree. At the Univ. he was a firebrand republican, remarkable for his polemics against Bonapartism. He was imprisoned for two months for celebrating the Feb. revolution in the Bastille square. Went to U.S.A. to study Amer. sociological conditions, maintaining himself by

Topical Press

M. CLEMENCEAU

teaching in a young ladies' school in Connecticut, whence he brought back to France his wife, Miss Mary Plummer, one of his pupils. Set up as a physician in Montmartre and became prominent in the revolution of 1870 at which period he was mayor of Montmartre and a deputy for Paris. He was vehemently attacked by both the Paris revolutionaries and the National Assembly in connection with the shooting, by the Communists, of two generals whom Thiers had dispatched to restore order in Montmartre. In 1870 as the representative of Paris in the Deputies, his biting eloquence marked him out as the radical spokesman. The revolutionaries had become bourgeois, but C. would have no compromise. Democratic to the core, he wanted political reconstruction, and thenceforth he was essentially the destroying force in Fr. politics—overthrowing with mordant wit and unflinching energy one gov. after

another. He brought about the fall of the Gambetta Cabinet in 1882, that of Ferry in 1885, and that of Brisson in 1886. Another victim was Boulanger during the Panama scandals, when C. was animated upon as the great corrupter; but when proofs were eventually forthcoming they were definitely estab. to be crude forgeries by one Norton, who committed suicide in gaol. In 1893 he took to journalism, collaborating in the editing of the *Écho de Paris*, *Figaro*, and other journals, and starting his own paper, *La Justice*. He was chief editor of *L'Aurore* in 1897 during the most famous period of his journalistic activities when he headed the campaign in favour of Dreyfus (q.v.).

In the Radical struggle against Rome he succeeded Sarrien as premier, but in 1909, after three years of office, his gov. was defeated after a violent debate in which he accused Delcassé of humiliating France in the Algeiras affair (q.v.). But his gov. had been very successful; he had ruled labour with firmness, as was proved during the strike of miners in the Pas-de-Calais in 1906, when he showed the iron hand by employing the military. It is true that he thereby alienated the sympathy of the Socialist party, but he had emerged as the strong man of France, an emergence which he was destined to repeat in the First World War with most dramatic effect. He had, besides, greatly enhanced Fr. prestige abroad, especially by his firm attitude towards Germany. His desire to redress the wrong done by Germany over Alsace-Lorraine was lifelong. His foreign policy was in line with the traditional Fr. view that their country's destiny was in the chancelleries of Europe and, consistently with this, he was an opponent of Fr. colonial expansion in rivalry with Britain. But if, during all his early and middle political career, he was the rebellious spirit and the iconoclast in Fr. politics, he flamed forth in the First World War as a single-minded patriot, whose fulminations in *L'Homme libre* breathed a noble love of country, and throughout the war he showed a truly extraordinary energy, both physical and mental, and, as has been well said, he became long before his death almost a legendary figure. Early in the war he vented his burning anger against the administration for the state of the Army and the inadequacy of the medical service; and the failure of each gov. to grapple with the problems of the war goaded him to such a pitch of fury that both as editor of *L'Homme libre* and as a senator he was the veritable scourge of the gov. The strength of his position lay partly in the negative fact that he was no petty intriguer manoeuvring for place or even for power. Defeatism was in the political air of France, and after the Salonika failure of Sarrail, the Painlevé Cabinet was driven from office and C., almost in spite of himself, was in undisputed power. Previously, his paper *L'Homme libre*, had been suppressed, his answer to which abuse of emergency powers was to produce a new paper ironically entitled *L'Homme enchaîné!*

But the time, however, was ripe for a man of resolution. France was weary of intrigue. The names of Holo, Malvy, Caillaux, and Charles Humbert had created uneasiness in allied countries, and tendencies to mutiny in the Army made it plain that the iron hand was wanted once more. Hence the formation of the Victory Cabinet in 1917 under C.'s celebrated slogan 'Je combattrai devant Paris. Je combattrai à Paris. Je combattrai derrière Paris.' In March 1918, during the dark days of the final Ger. offensive, he supported Lord Milner in the decision to appoint Marshal Foch as generalissimo of the allied armies. His endurance showed no abatement even after the war, for he presided and directed the proceedings at the Peace Conference in Paris in 1919, where he was tenacious of Fr. security. In this he was opposed to President Wilson's self-determinist views, and more than once waxed bitterly ironic over the latter's famous 'fourteen points.' Yet he forbore to carry his policy *à outrance*, and for the most part his keen sense of altered political values kept him in general agreement with Mr. Lloyd George. This equisense was especially fruitful in the decision of the Big Four (Clemenceau, Wilson, Lloyd George, and Orlando) to foster the growth of new or enlarged states in Central and E. Europe, though in this policy C., more than the other three, was actuated chiefly by the desire to create buffer states against Germany, whereas President Wilson and Mr. Lloyd George were concerned rather with removing causes of friction by the application of the principle of self-determination. C. persuaded both President Wilson and Mr. Lloyd George to sign treaties binding their nations to aid France against unprovoked aggression, but the treaties lapsed through the refusal of the Amer. Senate to ratify. In conveying to the Ger. representatives the terms of the treaty, which he did in a few curt words, C. permitted no oral discussion. His subsequent reply to the written Ger. observations was a brilliant document, the purport of which was that no peace could be founded on a condonation of the war which Germany had brought about and that reparation by Germany was a *sine qua non* of justice. During the conference in Feb. 1919 he was shot at and wounded by a young anarchist, but with a Stoic coolness he was soon at work again, delighting his colleagues with his wit and amazing energy. In 1920, after entering the political sphere again, he withdrew his candidature, recognising that his work was done, and spent some time in touring Egypt and India. His remaining years were passed at his quiet seaside house La Tranche, near Ste. Hermine in the Vendée, and in Paris in contributing articles and in writing a small book on Demosthenes. In his last illness he rallied more than once, and it was as if the Tiger, to give him his universal sobriquet, would defeat even death. It has been well said of him that, like Foch, he fired the soul of France and stole her will. His pub. works include

also *De la génération des éléments anatomiques*; *La Mêlée sociale* (1894); *Le Grand Pan* (1895); *Le Voile du bonheur* (1901); *Les Plus Forts* (1898); *Les Requins* (a play); *Grandeurs et misères d'une victoire* (memoirs) (1929); *Au soir de la pensée* (on philosophy and morals) (1927) (trans. *In the Evening of my Thought*, 1929). See also Clemenceau: *The Events of his Life as told by himself to his former secretary, Jean Martel*, trans. by M. Waldman, 1930; G. Adam, *The Tiger: Georges Clemenceau, 1811-1929*, 1930; G. Braun, *Clemenceau*, 1943.

Clemence Isaure, Fr. poetess, b. near Toulouse towards the early part of the fifteenth century. Guillaume Benoit, a jurist of the fifteenth century, ascribes to her the *jeux floraux*, held at Toulouse on May 3. There is a statue of her at Toulouse and another in the Jardin du Luxembourg, Paris.

Clemens, Samuel Langhorne (1835-1910), Amer. novelist and humorist, better known by his pen-name of Mark Twain, was b. at Florida, Missouri, U.S.A., and after an ordinary school education in his native tn., learnt the trade of a printer, at which he worked at St. Louis, New York, and other tns. In 1851 he gave up this trade and became a steamboat pilot on the Mississippi, and it was from a cry used in taking soundings here that his pseudonym was taken. On the outbreak of the Civil war he gave up this position and went to Nevada, becoming editor of the *Enterprise* at Virginia City. He also tried mining, journalism, and lecturing. In 1867 the *Jumping Frog*, etc., proved a sufficient success to enable him to make a tour through Europe, the account of which in *Innocents Abroad* (1869) firmly estab. his reputation as a humorist. From this time till 1871 he edited the *Buffalo Express*. In 1872 appeared *Roughing It*, where he made use of his experiences in the Far West. In 1874 came *The Gilded Age*, written in collaboration with C. W. Warner. Then appeared *The Adventures of Tom Sawyer* (1876); *A Tramp Abroad* (1880); *The Prince and the Pauper* (1882); *Life on the Mississippi* (1883); *The Adventures of Huckleberry Finn* (1884); *Pudd'nhead Wilson* (1894); *Personal Recollections of Joan of Arc* (1896); *More Tramps Abroad* (1897); *Ere's Diary* (1906); and others up to *The Mysterious Stranger: a Romance* (1916). In 1884 he had joined the publishing firm of Charles L. Webster & Co., and the failure of this concern in 1895 led to his making a lecture tour round the world which estab. his fortune once more. From this time till after 1900 he lived principally in Europe. His humour is spontaneous and free, and is varied by amusing character-sketches, grotesquely exaggerated. The picaresque novel is his favourite element. His *Autobiography of Mark Twain* was compiled and ed. by Albert Bigelow Paine (1924). See A. B. Paine, *Mark Twain, a Biography*, 1912; Van Wyck Brooks, *The Ordeal of Mark Twain*, 1920; C. Clemens, *My Father, Mark Twain*, 1931; S. Leacock, *Mark Twain*, 1933.

Clemens, Titus Flavius Alexandrinus (**Clement of Alexandria**) (b. c. A. D. 150), distinguished Christian writer. He is believed to have been b. at Athens, but spent most of his life in Alexandria, where he studied under Pantænus. During the persecutions of Severus, he and his master were obliged to take refuge in Palestine (c. 202-6), and in 211 he succeeded Pantænus as master of the school of Alexandria. The extant works of C. are *Λόγος προτρεπτικός πρὸς ἑλληνας*, *Παιδαγωγός*, *Στρωματεῖς*, and *Τὶς ὁ σωόμενος πλούσιος*. His works have been frequently pub., the best being one with a Lat. trans. by J. Potter (1715).

Clement, the name of fourteen popes:

Clement I., commonly known as C. of Rome (fl. A. D. 90). He is thought by some to be identical with C., the fellow-worker of Paul (see Phil. iv. 3). He succeeded Anacletus as bishop of Rome. He was the author of the *First Epistle of Clement*, written to the church at Corinth about A. D. 95. This early document is of great value to the student of primitive Church hist. A fragment of it was found at the end of the *Codex Alexandrinus*, and was pub. in 1633 by Patrick Young (Patricius Junius). A complete MS. found at Constantinople was pub. in 1875. Sev. other documents have, with little or no authority, been attributed to this C. Consult J. B. Lightfoot, *The Apostolic Fathers*, vol. I., *S. Clement of Rome*, 1869, 1877; J. A. F. Gregg, *The Epistle of Saint Clement*, 1899.

Clement II. (1046-47), formerly Sudiger, the chancellor of Emperor Henry III., who created him pope.

Clement III. (1187-91), Paolo Scolari, cardinal-bishop of Palestrina; urged the necessity of the third crusade upon Henry II. of England and Philip Augustus.

Clement IV. (1265-68), Guy Foulques le Gros, of a noble Provencal family, began life as a soldier, but later became cardinal-bishop of Sabina. He supported the claim of Charles of Anjou in Sicily, and was a friend to Roger Bacon.

Clement V. (1305-14), Bertrand de Goth, was unduly influenced by Philip the Fair, at whose suggestion he suppressed the Order of Templars. He removed the papal seat to Avignon. Consult Rabines, *Clement V. et Philippe le Bel* (1858).

Clement VI. (1342-52), Pierre Roger, a Frenchman, archbishop of Rouen. He took the part of Queen Joanna of Naples against her brother-in-law, Louis of Hungary, who had invaded her dominions to avenge the murder of her husband.

Clement VII. (1523-34), Giulio de' Medici. After the battle of Pavia (1525) he joined the It. cities in a Holy Alliance with France against the Emperor Charles V., but in 1527 Rome was sacked by the imperial troops, and he was kept prisoner in the castle of Sant' Angelo for six months. He refused to sanction Henry VIII.'s divorce from Catherine, which fact brought about the Reformation in England.

Clement VIII. (1592-1605), Ippolito

Aldobrandini, received the public profession of Catholicism made by Henry IV. of France, whom he reconciled with his subjects. He annexed the duchy of Ferrara to the papal states.

Clement IX. (1667-69), Giulio Rospigliosi, brought about the peace of Aix-la-Chapelle in 1668 between France and Spain; and for a while conciliated the Jansenists and Jesuits in France.

Clement X. (1670-76), Emilio Altieri, was eighty years of age at the time of his election, and left the administration of affairs to his adopted nephew, Cardinal Paluzzo Paluzzi.

Clement XI. (1700-21), Gian Francesco Albani, had trouble with the Jansenists in France, against whom he issued two bulls, *Ineam Domini Sabaoth* (1705) and *Unigenitus* (1713).

Clement XII. (1730-40), Lorenzo Corsini, condemned the Freemasons (1738), and restored the republic of San Marino to its liberties (1740).

Clement XIII. (1758-69), Carlo Rezzonico, endeavoured with little success, to support the Jesuit missionaries, but before his death they were expelled from France, Spain, and Portugal.

Clement XIV. (1769-74), Giovanni Vincenzo Antonio Ganganelli, succeeded C. XIII. in troublous times. After vain negotiation, he issued his famous brief, *Dominus ac Redemptor noster*, suppressing the Jesuits (1773). He was a liberal-minded statesman and a patron of art. He founded the Clementine Museum in the Vatican. Consult Raviknan, *Clement XIII. et Clement XIV.* (1851), and U'schner, *Clement XIV.* (1867).

Clement of Alexandria, see CLEMENS, TITUS FLAVIUS ALEXANDRINUS.

Clement (Frédéric Jean) Edmond (1867-1928), Fr. operatic tenor, b. in Paris. Studied under Warot at the Conservatoire. Made début at Opéra Comique in 1889 in *Mireille*, and, except for tours, remained with that house for life. Sang also at the Metropolitan Opera House, New York, and with the Boston Opera Company. His best parts were Don Jose (*Carmen*), Werther (in Massenet's opera), Dec Gricux (*Manon Lescaut*), Rodolfo (*La Bohème*), and Gerald (*Lakmé*).

Clement, Jacques (1564-89), Dominican friar, notorious as the murderer of Henry III. of France. He was himself killed by Henry's attendants, and was regarded as a martyr.

Clementi, Muzio (1752-1832), pianist and composer, b. at Rome, where he studied as a child under Cordicelli, and at the age of nine was appointed to a post as organist. He afterwards studied under Santarelli and Carpani, and by the age of fourteen had composed sev. contrapuntal works. He attracted the attention of Peter Beckford an M. P., who brought him to England, where C. continued to pursue his studies until the year 1773 when he made his début. He conducted the Royal It. Opera (1777-80); he then made a continental tour, and while at Vienna had a piano combat with Mozart, the victory being left undecided. On his return to England he founded a business

as pianoforte-maker and musical publisher in London. In 1813 he assisted in forming the Philharmonic concerts. C. left about a hundred sonatas, symphonies, and overtures, and was regarded as the father of modern pianoforte technique. His best known pieces are the *Op. 2* (1773) three sonatas which may be said to have established the form of the piano sonata, and *Gradius ad Parnassum* (1817)—a collection of progressive studies, which have remained the foundation of all piano technique (Thompson). He is buried in the cloisters of Westminster Abbey.

Clemmensen Reduction, in chem. a method of reduction (see REDUCING AGENT), applicable to a number of organic compounds, especially to aromatic ketones and secondary alcohols. It is named after the discoverer. The substance to be reduced is boiled in aqueous suspension or aqueous alcoholic solution with amalgamated zinc or zinc wool with sufficient hydrochloric acid to maintain its concentration above 6N. The presence of nitro or amino groups renders the reduction unsatisfactory. See also BENZOIN.

Clement's Inn, formerly an inn of chancery; took its name from the church of St. Clement Danes, which stands in the Strand, London, opposite the street called C. I. A considerable part of the former site of the inn is now occupied by the Law Courts, while its functions as an inn of Court are now performed by the Inner Temple.

Cleobis, see BITON AND CLEOBIS.

Cleobulus of Lindus in Rhodes, one of the Seven Sages; he lived about 560 B.C. He was distinguished for his strength, handsome person, and famous riddles.

Cleombrotus I. (380-371 B.C.), king of Sparta, brother and successor of Agesipolis. He waged war against the Thebans; in 371 B.C. he led the Spartans at Leuctra against the Thebans under Epaminondas, and was defeated and mortally wounded.

Cleombrotus II. (c. 243-240 B.C.), thirtieth king of Sparta. On the expulsion of his father-in-law, Leonidas II., he was elected king by the party of Agis IV. On his return, three years later, C. was deposed and banished to Tegea.

Cleomedes, Gk. mathematician, who probably flourished in the second century A.D. He wrote, in two books, a treatise *On the Circular Theory of the Heavenly Bodies*. It sets forth the Stoic system of the universe, and gives various arguments in proof of the rotundity of the earth. Ed. by BAKE (1820) and ZIEGLER (1891).

Cleomenes I. (520-491 B.C.), king of Sparta, son of Anaxandrides. In 510 B.C. he took part in the expulsion of Hippas, the last of the Pisistratids, from Athens. His assistance was called for by Isagoras and the aristocratical party in Athens against Cleisthenes, and he helped in the expulsion of 700 families. During the war with Argos he was successful in defeating the Argives near Thyrea.

Cleomenes II. (370-309 B.C.), king of Sparta, succeeded his brother Agesipolis III.

Cleomenes III. (c. 235-220 B.C.), king of Sparta, son of Leonidas II., last of the Agiads. He endeavoured to restore the ancient institutions of Lycurgus and strongly opposed Aratus and the Achaean League, by forming an alliance with Ptolemy, king of Egypt. He was at first successful in his campaigns against the Achaeans, but in 221 he was himself defeated at Sellasia in Laconica.

Cleon (d. 422 B.C.), Athenian democrat, the son of Cleaneetus. He was originally a tanner, and came forward into public life as an opponent of Pericles. During the Peloponnesian war, C. set himself up as the champion of the people and the leader of the peace party (428-422). In 427 he advocated in the assembly that the Mytilenian prisoners, sent to Athens by Paches, should be put to death, and in 424 he won great glory by his capture of the Spartans on the is. of Sphacteria. Much elated by his success, C. accepted the command of the Athenian army to oppose Brasidas in Macedonia and Thrace, but was defeated, and fell in battle under the walls of Amphipolis. C. is represented by Thucydides and Aristophanes as a demagogue of the lowest type, mean, ignorant, cowardly, self-seeking, and unscrupulous, pandering to the mob to obtain his own selfish ends. He is made to figure among the *dramatis personae* in Aristophanes' comedy, *The Knights*, but the poet was obliged to take the part himself as he could find no actor bold enough to personate C. It should, however, be remembered that both Thucydides and Aristophanes had a grudge against him, the former having been banished at his instance, and the latter's comedy, *The Babylonians*, was brought before the notice of the Senate by C. as an unpatriotic play and harmful to the country in time of war.

Cleonus, genus of Curculionidae, or weevils, consists of between one and two hundred species of beetles. They have elongated and convex bodies, and both larvae and perfect insects are vegetarian, feeding chiefly on coniferous trees, such as the larch and pine.

Cleopatra (51-30 B.C.), famous queen of Egypt. She was the eldest daughter of Ptolemy XIII., Auletes, and was b. in 69 or 68 B.C. Her father d. in 51, appointing her and her younger brother, Ptolemy, joint heirs of his kingdom, on the condition that they should marry. The will was ratified by the Rom. senate and C. ascended the throne at the age of seventeen. Two years later Ptolemy XIV., with the aid of his guardians, Pothinus and Achillas, drove his sister out of Egypt. She retreated to Syria to collect her forces, but in 47 Caesar arrived at Alexandria in pursuit of Pompey, and C. had little difficulty in exercising her fascinations over the susceptible Roman. Caesar became her lover and advocate, and, though repulsed at first, he ultimately defeated the Egyptians and reinstated C. on the throne. During the Alexandrian war Ptolemy XII. had perished, and accordingly C., with Caesar's advice, divided the rule with a

younger brother, Ptolemy XIII., whom she nominally married. C. remained the mistress of Caesar, and accompanied him to Rome, where she apparently was living at the time of his assassination in 44. On her return to Egypt, C. is supposed to have murdered her brother, and declared Caesarion, her son by Caesar, joint ruler of Egypt. In 41, during the civil war that followed Caesar's death, she met Antony in Cilicia, who fell a captive to her charms and became her infatuated lover and slave. From political motives Antony was obliged to return to Rome and marry Octavia, the sister of Augustus but he speedily returned to his mistress. Antony divorced his wife, and open war was declared between C. and Augustus. She was present with her lover at the naval battle of Actium (31), but, fearing the worst, retreated with her fleet to Alexandria. Antony was defeated, and, hearing a rumour of the queen's death, stabbed himself. C. made overtures to Augustus, but was unable to fascinate him, and, in order to avoid being led in triumph through Rome as a captive at the wheel of his chariot, she killed herself by a poisoned comb, or, traditionally, by an asp in her bosom (30). C. was a woman of great intellectual power and boundless ambition, and was quite unscrupulous in using her physical charms to attain her own ends. Her beauty and her fascinating personality have bewitched men throughout the ages, and have inspired poetry that is unsurpassed in the world's literature. See A. Stahr, *Cleopatra*, 1879; G. B. Shaw, *Caesar and Cleopatra*, 1898; Sir J. P. Mahaffy, *History of Egypt under the Ptolemaic Dynasty*, 1899; P. W. Sergeant, *Cleopatra of Egypt*, 1909.

Cleopatra's Needles, two granite obelisks erected by Thothmes III. at Heliopolis in Egypt (c. 1475 B.C.) and re-erected by Ramesses II. at Alexandria. During the removal to Alexandria the lower part broke away, and the Rom. engineers supported the angles on bronze slabs, one of which with three reproductions still supports the angles of the needle or obelisk which was placed on the Victoria Embankment in 1878. This needle weighs 186 tons and is 68½ ft. high. The other was presented by the khedive to the U.S.A., and in 1881 was erected in Central Park, New York.

Clepsydra, or water-clock, instrument for measuring time by the flow of water, which seems to have been in use among the Babylonians, Hindus, and Egyptians from the earliest times, and was regularly employed among the Gks. and Romans. It appears to have taken sev. forms. One of the earliest types was a copper vessel, having a small hole in the bottom, which was set to float in a vessel of water, and which necessarily sank within a certain time. The Gks. and Romans had a form somewhat resembling a sand-glass, and consisting of a pierced globe, through which the water gradually escaped. This was used to limit the length of the speeches in courts of law. Later, since the rate of flow lessened as the vessel grew empty, the globe was kept filled

with water, and that which escaped measured. Another type measured time by the rising of a float on water which was increased by a slow regular inflow, a constant and uniform supply being ensured by an intermediate cistern. All these were subject to variations caused by differences of atmospheric temp. and pressure, and also some arrangement was necessary to obviate the difficulty caused by the fact that an hour, being a twelfth part of the time from sunrise to sunset, varied with the season. The most successful invention to meet this seems to have been made by Ctesibius of Alexandria about 135 a.c.

CLEPSYDRA

Clercken, small tn. of Belgium, situated in W. Flanders, about 20 m. S.W. of Bruges. Pop. 3500.

Clerestory (also *Clear-story*; Fr. *claire-voie*), term used in architecture to denote the windows in the upper part of the central nave of a church. Its purpose is to admit clear light, and this method of lighting was constantly used by the Romans in their baths and palaces.

Clergy (from Low Lat. *clericatus*, which is derived from Gk. κληρος, an inheritance) is a collective term signifying men in holy orders. In the N.T. the Gk. word is used indifferently of the apostolic order and of the sev. congregations of the Christian Church. But very early the priests came to regard themselves as being peculiarly God's heritage, as opposed to the faithful people or laity (Gk. λαός) who were members of the Church. This distinction between C. and laity was accentuated by the adoption of sacerdotal vestments and official insignia; by the introduction of the tonsure; by the institution of monastic orders and of various titles and offices, and

above all by the growing tendency to regard ordination as the outward sign of a direct call from God, and as conferring privileges which could not be renounced without apostasy. But after the Reformation this distinction, which is still very strongly marked in the Rom. Catholic Church, was purposely diminished in Protestant communities. Thus in the Church of England to-day the ordinary garb of the C.; the cassock, for example, is peculiar only in so far as laymen have long ago discarded it through change in fashion. Moreover, the term C. has broadened in meaning so as to be applied frequently to nonconformist ministers, although 'clergyman' still properly refers only to priests of the Estab. Church. In the Middle Ages the claims insistently advanced by the papacy that, in its capacity of ruler over men's souls, it was above the merely temporal power of any sovereign, led as a natural corollary to the theory that the C., by virtue of their office, were entitled to many special immunities. Thus the C. claimed exemption from public burdens, from taxation as well as from civil office, and above all they insisted on their right to have eccles. courts instead of being subject to the ordinary lay jurisdiction. The result was that the offences of clerks were dealt with much more leniently than those of laymen. The major orders, including bishop, priest, deacon, and sub-deacon, are distinguished as the higher, whilst lectors, acolytes, etc., are the lower C. The C. are still technically one of the three estates of the realm. Though bishops, however, sit in the House of Lords, they do so by reason of the baronies attached to their sees and not because they are Church dignitaries.

Clergy, Benefit of, see BENEFIT OF CLERGY.

Clergy Discipline Act, 1892, relates to the consequences of crimes or offences against morality by clergymen, and, in regard to the latter, provided a new form of procedure. The Act is divided into two parts, the first of which renders a beneficed clergyman liable to deprivation who is convicted in temporal court of an indictable offence, or against whom a bastardy order has been made, or adultery found in a divorce suit. The second part of the Act provides that a clergyman convicted by a temporal court of an act constituting an eccles. offence, or against whom any immoral act, conduct, or habit, being an offence against morality and not doctrine or ritual, is alleged, may be prosecuted by any of the parishioners of the par. in which he holds preferment, or by the bishop of the diocese, or a person approved by the bishop, and tried in the consistory court of the diocese. A conviction under the Act enables the bishop to treat preferment of the convicted clergyman as void, while conviction for an immoral act under the second part of the Act renders the clergyman liable, subject to an appeal to the king in council, either to suspension or deprivation, with incapacity to hold another preferment. A clergyman may be re-

instituted if pardoned by the Crown and if the benefice has not been filled.

Clergymen, Deposition of, see DEPOSITION.

Clericis Laicos, first words of a bull of Pope Boniface VIII. (1294-1303). His arrogance made him many foes, his most noted conflict being that with Philip IV. of France. In 1296, by the bull named C. L., the pope forbade the levying of taxes, however disguised, on the clergy without his consent. Boniface was forced to recede from his position, and canonised Louis IX. Hostilities were later renewed, and in 1302 Boniface drafted and pub. himself the bull 'Unam Sanctam,' one of the strongest official statements of the papal prerogative ever made.

Clericus, Johannes, see LE CLERC, JEAN.
Cleridae, family of coleopterous insects, consists of numerous and very varied species, a few of which are Brit. The body is generally cylindrical, the eyes emarginated, the antennae usually terminated by a club. Most of the beetles are found on flowers, and some on old trees, but the larvae are often carnivorous.
Clerihew (from E. *Clerihew* Bentley), short nonsensical or satirical poem, usually of four lines of varying length, e.g.:

Sir Christopher Wren
Said, 'I'm going to dine with some men.
If any one calls
Say I'm designing St. Paul's.'

Clerk (from Lat. *clericus*, which comes from the Gk. *κληρος*, a lot, or inheritance), was at first a synonym of canon, and was used indifferently of all who were servants of the Church. Soon the term C. was used only of one in a minor as opposed to major or holy order. But C., in holy orders is still the legal designation of clergymen of the Eng. Church. After the Reformation it was applied to members of the laity who assisted at baptisms, marriages, etc., and who led the responses for the congregation. In this sense the C. became known as the par. C. But the word has had another distinct, though parallel, development. Chaucer's poor 'clerk of Oxenford' was, above all, a devotee of learning. This sense of the term arose from the fact that in mediæval times learning was confined to the clergy. Now this meaning is narrowed down and is applied especially to servants of corporations and courts who keep the records, to lawyers' assistants and to all employees who write, make entries, and discharge the correspondence of any firm or company. In America a C. is also a retail salesman. The word is thus an example of the many whose meaning has deteriorated.

Clerk, John (1728-1812), author of *Essay on Naval Tactics*, worked on his estate at Eldin at geology and etching, besides his new theories of naval manœuvres. His naval schemes were adopted with complete success in 1782 when Lord Rodney gained a complete victory at sea over the Fr. His essay was not pub. entire till 1804.

Clerke, Agnes Mary (1842-1907), Eng. astronomer and scientist, *b.* in London. Although not a practical astronomer in the true meaning of the word, she was endowed with remarkable talent for collecting and summarising results of scientific and astronomical research. Her chief works, which, however, are now out of date, are *A Popular History of Astronomy during the Nineteenth Century* (1885); *The System of the Stars* (1890); *Problems in Astrophysics* (1903).

Clerkenwell, dist. in the N. of London within the metropolitan bor. of Finsbury. It is so called from a well in Foy Street, near which the par. clerks occasionally acted mystery plays. The well is at what is now 18 Farringdon Street. In St. John's par. are the remains of the priory of the Knights of St. John of Jerusalem. A jail called the C. Bridewell was built here in 1615 for the punishment of rogues and vagabonds of Middlesex; it was burnt down in 1669 but was rebuilt. The prison built in 1775, called the House of Detention, was notorious as the scene of a Fenian outrage in 1867. Watch-making was for a long period a very important industry and is still carried on to a degree.

Clerk-Maxwell, see MAXWELL, JAMES CLERK.

Clermont-en-Beauvais, tn. of France, dept. of Oise, on r. b. of the brèche, 41 m. N.E. of Paris. The *hôtel de ville*, built by Charles IV. (b. 1294), is the oldest in the N. of France, and was founded during the Norman invasion. One-fifth of the tn.'s buildings were damaged or destroyed in the Second World War. Pop. 5500.

Clermont. The, was one of the earliest steamships. Its inventor and builder was an Amer., Robert Fulton (1765-1815), who in 1803 obtained jointly with Robert Livingston the exclusive privilege of navigating with steamers the waters of New York. The engines of the C. were provided by Boulton & Watt of Birmingham, and it traded on the Hudson between Albany and New York from 1807 onward.

Clermont-Ferrand (the anct. Augustonemetum, the chief city of the Arverni), cap. of the dept. Puy-de-Dôme, central France. The two tns. of which it is composed, C. and Mont-Ferrand, which are connected by a fine promenade, have grown up on the slopes of a small eminence. Its Gothic cathedral has fine stained glass of the thirteenth but it was not completed till the nineteenth century. In the cathedral square stands a statue of Pope Urban II., who here made in 1095 his memorable proclamation of the first crusade. The Romanesque church of Notre-Dame du Port is an eleventh-century structure. It is the seat of a bishopric, and from A.D. 535 to 1130 was the meeting-place of seven eccl. councils. The present name occurs as early as the eighth century, but was at first applied to the castle alone, in the Rom. form *Clarus Mons* or *Clarimontium*. The chief manus. are those of rubber goods and tyres, macaroni, semolina, preserved fruits and jams, chemical

products, boots and shoes, and linen and woollen goods. It has handsome squares, is an educational centre, and is famous also as the bp. of Pascal. Pop. 108,000.

Clermont-Ganneau, Charles Simon (1846-1923), Fr. orientalist, *b.* in Paris. His father was a sculptor of some repute. Ganneau was educated at the *École des Langues Orientales*, and afterwards entered the diplomatic service as dragoman to the consulate at Jerusalem, where he inaugurated his archaeological pursuits by the discovery and trans. of a theretofore unpublished story in the *Thousand and One Nights* (see below). Soon afterwards he occupied a similar position at Alexandria. In 1870 he discovered the *stèle* of Mesha, a stone bearing the oldest Semitic inscription known. He commanded a Brit. archaeological expedition to Palestine in 1874, and later a Fr. expedition to the Red Sea and Syria. Chevalier of the Legion of Honour 1875; vice-consul at Jaffa, 1880-1882. Subsequently he became director of the *École des Langues Orientales*. He became consul-general in 1896, and minister plenipotentiary in 1906. His chief publs. include *La Palestine inconnue* (1886); *Études d'archéologie orientale* (1880); *Les Fraudes archéologiques* (1885); and *Recueil d'archéologie orientale* (1885-1924). He was principally instrumental in exposing the Shapira forgeries of Heb. texts offered to Brit. Museum; other frauds were the Monbte potteries and the tiara of Saitaphernes (see his *Les Fraudes archéologiques* above).

Clermont l'Hérault, tn. in the dept. of Hérault, S. France, 11 m. S.S.E. of Lodève. Pop. 5600.

Clorodendron, genus of Verbenaceae, flourishes in its wild state in tropical and warm climates, but in Britain grows only in greenhouses. *C. Thompsonæ* is a commonly cultivated evergreen plant which bears red and white flowers. *C. fragrans* and *C. trichotomum* are both shrubs, the former with white, the latter with variegated flowers.

Clery, Sir Cornelius Francis (1838-1926), Eng. soldier. He saw active service in the Zulu war of 1879, where he was chief staff officer of the 'Flying Column.' He was present at the battles of Isandhlwana and Ulundi, when he was mentioned twice in dispatches. He fought in the battles of El Teb and Tamai, and was again mentioned in dispatches. He served in the Nile expedition in 1885 for the relief of Gordon, and during the years 1886-88 was chief of the staff of the army of occupation in Egypt. He commanded the 2nd Div. in the S. African war of 1899-1902, being again mentioned in dispatches. K.C.M.G., 1900.

Cléry-Saint-André, tn. in the dept. of Loiret, near Orleans. Near it is a tumulus, called by the peasants the tomb of Attila. Pop. 1800.

Clésinger, Jean Baptiste Auguste (1814-1883), Fr. sculptor, intimately connected with the story of George Sand and Chopin. George Sand's daughter Solange, who inherited her mother's passionate nature without any of her genius, eloped

with C. after sitting to him for her bust. The mother effected a private marriage, estab. the young people in Paris, and settled a large share of her property upon them. But C. proved himself an ungrateful rogue, and George Sand was obliged to disown him and her daughter. C. was nevertheless one of the leading sculptors of his day, and executed noteworthy portraits of George Sand and Chopin. Among his works, many of which were objected to on the ground of their immodesty, are allegorical representations of Tragedy and Literature and a marble statue of Louise of Savoy.

Clevedon, par. and attractive watering-place, 1 m. from the Severn and 16 m. S.W. of Bristol, in the N. div. of Somerset, England. Interesting for its associations, for here lived Coleridge and his bride at Myrtle Cottage (1795), and in the par. church lie Henry Hallam, the historian (d. 1859), and his poet son, Arthur (d. 1833), to whose memory *In Memoriam* was written, whilst the original of Thackeray's Castlewood in *Esmond* is C. Court. Pop. 9400.

Cleveland, one of the largest industrial cities of the U.S.A. in Ohio, and cap. of Cuyahoga co., is situated on the S. shores of Lake Erie, which is here connected with the Ohio R. by the Ohio Canal, 183 m. S.W. of Buffalo and 98 m. E. of Toledo; it is the terminus of seven railways, whilst two run through it from E. to W. The two divs. of C., on either side of the R. Cuyahoga, are united by two great viaducts. The first, built in 1873, is of stone, and spans the riv. at a height of 60 ft., whilst the second, of iron, which was erected in 1888, is 3931 ft. long, and rises 100 ft. above the valley's base. Numerous bridges cross the riv. harbour, whilst beyond the mouth a breakwater, 2 m. long, encloses an excellent outer roadstead. During 1890-1900 the tonnage of ships constructed in C. exceeded that of the vessels built in any other Amer. tn. A great deal of the traffic passes over the lake. But though C. is an important centre for corn and lumber, and is, moreover, the largest market for fresh fish in the U.S.A., the wealth of the city depends on its manufs., and above all on its flourishing iron industry. Thus engines, steel and iron vessels, automobiles, boilers, steel rails, and bridges are constructed at the various works, besides nails, agric. implements, and screws. The reason of this is that the city is centrally situated for obtaining the coal from N. Ohio, the iron ores from Lake Superior, and the limestone from the ls. of Lake Erie. It has over 3000 manufacturing plants employing 200,000 people, and is the seat of the Standard Oil Company. The Detroit-Superior high-level bridge affords a wide view of lake and riv., harbour and breakwater, iron and steel, lumber and coal, steam and sailing vessels, freighters and liners, blast furnaces and foundries, flour mills and grain elevators, and on the banks above the valley the vast manufacturing plants which furnish employment for more than half of its citizen workers. Rising from a plain from 50 to 140 ft.

above the lake, C., or the Forest City as it is called, from the abundance of its shady elms and maples, presents an imposing appearance, with its fine public buildings—including a free municipal library of 200,000 vols.—its large squares and stately mansions, its famous Euclid Avenue with winding walks and flower-bordered driveways, its univ., technical high school, public auditorium seating 12,000 people, and municipal airport, one of the largest in the world. Founded in 1796 by Moses Cleveland, it has doubled its pop. in twenty years and quadrupled its commerce, and is now the sixth city in the U.S.A. Pop. 878,300.

Cleveland, city in Tennessee, with iron and textile industries. Pop. 4300.

Cleveland (cliff-land), par. div. in the E. of the N. Riding of Yorkshire, extending from Whitley to the R. Tees. It received its name from the cliffs which form the N.E. borders of the Yorkshire moors. It is a dist. of wild highlands, interspersed with a few cultivated and pleasant valleys. Since the discovery of the rich beds of iron ore in its hills (see CLEVELAND IRONSTONE) C. has grown into a great industrial centre, with Middlesbrough as its chief tn., supplying Great Britain with one-third of its pig-iron. The pop. is not returned separately.

Cleveland Bay Breed, see under HORSE.

Cleveland Ironstone is mined in the Middle Lias of C., which is situated in the N. Riding of Yorkshire, between the Tees and Whitley. Certain geologists believe that this dark green clay ironstone, which is not so valuable as that of the coal measures, was 'derived partly from mechanical deposition and partly from subsequent chemical replacement of the originally deposited carbonate of lime.' The theory that once the bed was limestone is supported by the discovery of shells such as *Pecten* and *Avicula*. Only 60 per cent of the ore is carbonate of iron, the rest being composed of phosphates, silica, and argillaceous matter. It is found in seams 20 ft. thick, and is worked on the bord-and-pillar system, Middlesbrough being the centre. Its discovery, which dates from 1851, has revolutionised sleepy hamlets into industrial tns.

Cleveland, Barbara Villiers, Duchess of (1641-1704), mistress of Charles II. of England, daughter of Wm. Villiers, second Viscount Grandison. In 1659 she married Roger Palmer, who became earl of Castlemaine two years later. She became intimate with Charles II. about this time, and was created duchess of C. in 1670. Her sons by the king became dukes of C. Grafton, and Northumberland. D. at Chiswick, Oct. 9.

Cleveland, John (1613-58), Eng. satirist, who, during the Commonwealth, was one of many Royalist fugitives condemned to a life of wandering and abject poverty. In the ingenuity of his conceits he surpasses the so-called metaphysical poets. Though his vigorous satire, such as appears in his poems, *The Rebel Scot*, *Smectymnus*, and *Rupertismus*, may not long have survived the passions which called it forth, it won a contemporary

fame far greater than that of *Paradise Lost*.

Cleveland, Stephen Grover (1837-1908), twenty-second and twenty-fourth President of the U.S.A., *b.* at Caldwell, New Jersey, U.S.A., March 18. He was descended from Moses C. of England, who settled near Woburn, Massachusetts, in 1835. His father was the son of a watchmaker and was pastor of the Presbyterian church at Caldwell. When he was sixteen, his father *d.*, and the son left school to become a clerk in a store in Clinton, New York. For a time he taught at school, and then studied law, being admitted to the Bar at Buffalo in 1859. He entered politics as a Democrat, and his rise was rapid. In 1863 he became assistant dist. attorney for Erie co., in which Buffalo is situated. He was elected sheriff in 1870, and in 1881 he became mayor, being noted for his reforms. This attracted the attention of the state leaders, who brought about his nomination for governor, and he was elected to that office in 1882 by the hitherto unparalleled majority of 192,000 votes. He was nominated for the presidency in 1884, and was elected after an exceedingly bitter campaign, in which his Republican opponent was James G. Blaine (*q.v.*). C. entered the White House as the first bachelor the country had seen there in many years, but, later, married the lovely Miss Frances Folsom, daughter of a former law partner of the President and the ward of C., who became one of the most popular mistresses the White House had ever known. C. resisted the old system of 'to the victor belong the spoils,' by steadily advocating that an increasing number of governmental employees and officials should be placed in the civil service and, therefore, not removable except for cause. In 1887 in a message to Congress he pleaded for the admission to the country of raw materials needed in manufacturing, free from duty. This was his famous battle cry of 'Tariff for revenue only.' He was renominated by the Democrats for the presidency in 1888, and, much to the country's surprise, was defeated by Benjamin Harrison, the Republican candidate. In 1892 the Democrats nominated the once-victorious and the once-defeated C. for the presidency again, and he was triumphantly elected. The storm clouds soon gathered around him. In the first place he fought Republican tariff schemes. Then, against the wishes of many of his own party he forced Congress to repeal the Sherman Silver Purchasing Act, thereby safeguarding the gold standard. In 1895 his strong advocacy of the Monroe doctrine in a dispute between Great Britain and Venezuela over the boundaries between the latter country and Brit. Guiana almost involved the U.S.A. in a war with England. Feeling was tense in both nations, but the situation was saved by the statesmanship of Lord Salisbury, who was then Brit. Prime Minister. Before he left the White House, C. saw his gold-standard policy repudiated by his party, which had nominated to succeed him W. J. Bryan

(*q.v.*), who ran on a free silver platform. C. retired into private life without honour in his own party and settled quietly at Princeton, New Jersey. Before he *d.* there occurred a revulsion in public feeling, and it was generally realised that C. would be numbered among the greatest and most courageous of the line of Amer. Presidents.

Cleves (Ger. *Cleve* or *Kleve*): 1. Former duchy of Rhinish Prussia, united with Brandenburg in 1666. 2. Tn. of Rhineland, Germany; formerly cap. of duchy of same name, near the Rhine and the Netherlands frontier, 23 m. N.W. of Wesel. Its chief manufs. before the Second World War were linens, cottons, silks, woollens, and tobacco. The tn. was extensively damaged in the Second World War, and its anc. churches and Schwanenburg Castle were partly demolished or destroyed. Pop. 20,000.

Clew Bay, inlet on the W. coast of co. Mayo, Ireland. From the Atlantic it passes inland for 15 m., with an almost uniform breadth of 8½ m. Clare Is. faces its entrance, whilst the upper portion is dotted with an archipelago of some 300 fertile islets.

Clewer, vil. of Berkshire, England, on the R. Thames, 1 m. W. of Windsor. Here are the headquarters of an Anglican sisterhood. C. comprises two pars., C. Within and C. Without.

Clews, two, bottom corners of a square sail. In a fore-and-aft sail the aftmost corner is termed a clew, the other, or weather clew, being more generally called the tack.

Clianthus, genus of Leguminosæ cultivated in greenhouses on account of their showy flowers. *C. puniceus*, the parrot's beak, can be grown in the open air in Britain if carefully protected.

Cliché, Fr. term denoting the stamp of a die on any soft metal. By the impression made the die-sinker judges the effect of his work. The term is also used for any process (printing) block. From the connotation of repetitive reproduction, the word is employed for a trite or hackneyed phrase, or literary tag.

Clichy, or **Clichy-la-Garenne**, suburb N.W. of Paris, on the r. b. of the Seine, in the dept. of Seine, N. France. Its industries comprise the manufs. of chemicals, starch, soap, oil, and rubber. Merovingian kings lived at C. (anc. Clippiacum). Pop. 53,000.

Click-beetles, or *Elateridae*, form a family of coleopterous insects, most of which have the useful characteristic of being able to right themselves when fallen on their backs; this they accomplish by springing into the air by means of special processes in the back, and the movement is accompanied by a loud clicking sound. They are also called skip-jacks when possessed of this habit. The larvae are often known as wire-worms, and are very destructive; their home is usually underground, and their food the roots of crops.

Client, supposed by some writers to be derived from Lat. *cliere*, to hear. From the very beginnings of anc. Rome there appears to have existed the relation of

patronage (*patronatus*) and clientship (*clientela*). When a man manumitted (analogous to emancipated) a slave, he became the *patronus* instead of the *dominus* of the slave, who was thenceforth a freed man (*libertus*). The tutelage of the *patronus* entitled him to a specific share in the freedman's estate after death. This relationship at Rome fostered the formation of similar relationships between foreigners and Rom. citizens, the result being that the foreigner obtained a protector and the Roms. an accession of influence from occasionally becoming the patron of a man of letters. The poet Terence, for example, was a *libertus*, being manumitted by P. Terentius Lucarius, a Rom. senator. The Rom. C. was defended in lawsuits by his patron; hence the adoption of the term in modern legal practice.

Cliffden, mkt. tn. and port, 29 m. S.W. of Westport, in co. Galway, Ire. It is connected by rail with Galway. Pop. 800.

Cliff Dwellings, certain remarkable ruins of houses, built in horizontal recesses down precipitous cliffs in W. Colorado, Arizona, Utah, and New Mexico. The traveller, as he sees the remains of what must once have been a well-constructed dwelling of lime and stone, with windows and doors both rectangular in frame, is struck above all by its extreme solitude and inaccessibility. Its former inhab. must surely have been in hiding from his foes, for his home was built in a hollow, with beetling crags overhead, so that it was quite invisible from the cliff summit. In one such ruin the footholes carved in the rock-face may still be seen, but it seems certain that the ascent from the valley below was usually made by ladders or ropes, which could be carried up after use. For the most part these perilous homes are found dotted here and there along the great canyons or gorges, but in the Rio de Chelly there is a cluster of them large enough to be called a tn. There is one in Colorado above the R. Mancos, which looks down from a giddy height of 800 ft., but the most renowned in that country is the great cliff dwelling known as the palace of Chaplin's Mesa. These dwellings, which rose sometimes to two or even three storeys, so strongly resemble the pueblos of the Indians hard by that most archaeologists are agreed in referring their construction to the immediate forerunners of the Pueblo tribes. Another type of dwelling found in this region is in caves formed by volcanic action in the side of canyons. The honeycomb of openings formed similarly on the face of the cliffs provided windows for the Indian dwellers.

Clifford, name of a family descended from Richard Fitzponce. His son Walter, who adopted the name C. on acquiring by marriage C. Castle on the Wye, near Hereford, was the father of the ill-fated Fair Rosamond, whom Henry II. frankly declared to be his mistress. On her death in 1176 she was buried in Godstow nunnery, there being small foundation for the sinister legend that she was murdered

by Queen Eleanor. The soldier-judge, Roger, who won honour at the battle of Evesham (1065), was a great-grandson of Walter. Other of his descendants were John (1435-61) 'the savage Lancastrian'; Henry (1493-1542), fifteenth Lord C. and first earl of Cumberland; and another Henry (1591-1643), the fifth and last earl.

Clifford, Sir Hugh Charles (1886-1941), colonial governor; b. in London, eldest son of Maj.-Gen. the Hon. Sir H. H. C., V.C., C.B. In 1883 he became a cadet in the Malay States civil service. In Pahang he became Brit. resident (1896-99 and 1901). In later years he was associated first with Trinidad and Tobago (1903-7), and then with Ceylon (1907 and 1909), always as colonial secretary. Governor of the Gold Coast, 1912-19; of Nigeria, 1919-25. As governor of the Gold Coast was responsible for Brit. sphere of occupation in Togoland, 1914-19. Governor of Ceylon, 1924-27; then governor of Straits Settlements until 1929. G.C.M.G., 1921; and G.B.E., 1925. He married Mrs. Henry de la Pasture, the novelist and playwright who d. 1945. A constant contributor to the *Cornhill*, etc., was joint editor of a Malay language dictionary, and also pub. *In a Corner of Asia* (1899); *A Free Lance of To-day* (1903, revised ed. 1928); *Further India* (1904); *The Downfall of the Gods* (1911); *Malayan Monochromes* (1913); *The Further Side of Silence* (1916); *The German Colonies* (1918); *The Gold Coast Regiment in the East African Campaign* (1920); *In Days that are Dead* (1926); *Some Reflections on the Ceylon Land Question* (1927); *Bush-Whacking, and other Asiatic Tales and Memories* (1929).

Clifford, John (1836-1923), Baptist minister, was b. in poverty at Sawley, Derbyshire; eldest child of Samuel C. Chartist and Calvinist. As a child he worked in a lace factory. Some Baptists became interested in him, and started him in education at the Baptist College, Nottingham. He received a call to Praed Street Chapel, Paddington, in 1858, and while in that ministry he attended Univ. College. He took B.A. degree, Lond., in 1861; B.Sc. in 1862, with honours in logic, moral philosophy, geology, and paleontology. In 1864 he became M.A. (coming out first); in 1866, LL.B. The Geological Society made him a fellow in 1879. In 1883 he was made honorary D.D. of Bates College, Maine, U.S.A.; thereafter he was known as Doctor C. His ministry had been transferred to Westbourne Park when the chapel there opened in 1877; he was its minister till 1915, when he released himself for more general activity. In 1897 he made a tour round the world. He was president of the London Baptist Association, 1879; the Baptist Union, 1888 and 1899; the National Council of Evangelical Free Churches, 1898-99; the Brit. Chautauqua, 1899-1900; Baptist World Alliance, 1905 and 1911; and Baptist European Congress, 1918. He was an ardent and pugnacious Liberal; and many of his printed works (about a hundred titles) concern social problems.

They include *Is Life Worth Living?* (1880); *Inspiration and Authority of the Bible* (1892); *The Secret of Jesus* (1904); *The Ultimate Problems of Christianity* (1906); *State Education after the War* (1916); *The League of Free Nations* (1919); and *The World Brotherhood according to Jesus* (1920). He ed. the *General Baptist Magazine* (1870-83). He d. suddenly, after addressing a meeting, at Southampton Row, Bloomsbury, Nov. 20, 1923.

Clifford, Rosamand, see FAIR ROSAMOND.

Clifford, William Kingdon (1845-79), mathematician. His many able lectures before the Brit. Association and at the Royal Institution were exceedingly popular. Besides his *Essays and Lectures* (1879), which reveal his philosophy, he wrote many mathematical treatises.

Clifford's Inn, once the tn. house of the barons Clifford, was left to students of law. It became an inn of Chancery and, like Clement's Inn (q.v.), was subsequently absorbed by the Inner Temple.

Clifton, suburb and residential dist. of

Valentine and Sons Ltd., Dundee

CLIFTON SUSPENSION BRIDGE AND THE RIVER AVON

Clifford, Sophia Lucy, Mrs. William Kingdon, novelist and playwright, daughter of John Lane, a well-known Barbadian. She married in 1875 the mathematician Wm. Kingdon C. (q.v.). Her most popular novel is *Aunt Anne* (1893), in which she describes with sympathy and insight the sordid tragedy of an old lady's life. Her plays include *Hamilton's Second Marriage*, *A Supreme Moment* (1900); *The Searchlight* (1903), and *The Latch* (1908). Her latest books were *The House in Marylebone* (1917); *Mr. Webster and Others* (1918); *Miss Fingal* (1919). She d. in 1919.

Clifford, Thomas (1630-73), b. in Devonshire, was one of the members who formed the 'Cabal', being instrumental in arranging the treaty of Dover, 1670. In accordance with his professed views, he supported the Declaration of Indulgence issued by Charles II., and on the bringing in of the Test Act resigned from public life.

Bristol in Gloucestershire, England. The fine gorge of the Avon, spanned by Brunel's famous suspension bridge, cuts through the plateau on which the tn. is built. The bridge, which took from 1832 to 1864 to build, has a span of 702 ft., and is 245 ft. above high-tide level. The celebrated thermal springs are at the foot of St. Vincent's Rock. Pop. included in Bristol.

Clifton College, public school for boys, was founded in 1862. It consists of a preparatory and junior school and an upper school, the latter having classical, modern, and engineering depts., preparing boys for the univ., the army, or commercial life. There are sev. scholarships also open to the boys.

Climacteric Years (Gk. κλιμακτήρ, round of a ladder) were supposed to be certain years in a man's life which specially affected him as regards health and general circumstances of life. These years were those made up by the odd multiples of 7,

as 49, and the grand C. was reached at 63, when 9 and 7, the two mystical figures, were multiplied. As applied to a woman, it refers to the period known as the change of life, occurring usually between the ages of 45 and 50.

Climate (from Gk. *κλίμα*, to slope) means the average succession of atmospheric conditions for a long period of time, as opposed to weather, which is used of a single occurrence in the series of climatic conditions. The C. of a locality is thus its average weather. Wind, humidity, and temp. are the chief elements of C. As regards humidity, account must be taken of average ann. rainfall; the variations from season to season and year to year in rainfall; the proportions of precipitation which falls as rain and snow respectively; cloudiness, and relative and absolute humidity. As regards temp., it is important to notice the average ann. and seasonal temps., the extremes of temp. during a season and the temp. of exceptional seasons. There is a distinction between absolute temp. as measured by the thermometer, and sensible temp.—that is, the temp. as it appears. For example, air of a given temp. seems warmer at rest than in motion, and if the temp. is high, dry air seems colder than moist, and with a low temp. it is the other way round. A C. is said to be uniform when the winds are fairly constant in force and direction; when the range of temp. is small, and the distribution of rainfall fairly equal: otherwise it is variable. Thus at Duluth the average range of temp. from one year to another was as much as 120° and at Chicago 108° (for the same thirty years). Some places on the borders of the equatorial calms have their wet and dry seasons quite distinct. Where the monsoons blow, the winds regularly change from one season to another. Cs. are further classified according to parallel climatic zones, which have reference to the amount of heat received from the sun, and therefore represent what is called solar climate; or into oceanic and continental Cs., where the former refers to the effect of water, the latter of land upon C. The three climatic zones are the torrid or tropical, the temperate or intermediate, and the frigid or polar. Their limits are variously defined according to lat., winds, and temp. The latitudinal limits for the zones are as follows: 23½° N. to 23½° S. for tropical; 90° N. to 66½° N. and 90° S. to 66½° S. for the Arctic and Antarctic polar zones respectively, and 23° to 66½° (N. and S.) for the two intermediate zones. The zones can only be vaguely defined according to winds. Thus the trade-wind zone often overlaps the torrid zone to 30° or even 35° N. and S. Prevailing westerly winds and a variable C. characterise the intermediate zones which stretch polewards from the zone of the trade winds. If temp. be the standard of div., the isotherms are the boundaries of the various zones. A satisfactory div. is obtained if the intermediate zones are bounded on the equator side by the ann. isotherms of 68° and on the polar by the isotherm of 50°

for the warmest month. The C. of every zone may be subdivided into oceanic and continental. The following is a statement of the main differences between these subdivisions in oceanic Cs.: (1) The ann. range of temp. is much less. In Madeira (an is.) it is only 13°, whilst at Bagdad (in Asia Minor) it is 40° F. Both places lie in a low lat. (2) The 'annual march' of temp. is much more retarded by the sea. Thus over the ocean the springs are colder, the autumns warmer. (3) The humidity is greater. This results in more cloudiness and a higher rainfall. (4) The winds are, generally speaking, stronger. The leeward shores of the oceans, the W. coasts in the temperate zones, and the E. coasts in the trade-wind zones, have oceanic Cs. Under marine Cs. crops of wheat and potatoes, etc., are less nutritious owing to the excess of moisture, etc. Continental Cs. include desert, littoral or coastal, and mt. and plateau Cs. In the desert C. the daily variability of temp. is considerable, the nights being much cooler than the days. In the daytime the winds blow strong and carry great dust clouds. Rocks crack because of the violent changes in temp., and in consequence of the extreme dryness plants and animals cannot live. Mt. and plateau Cs. have greater insolation (warmth from the sun) and radiation because of the increased elevation, a lower absolute humidity, a lower temp., and a greater precipitation or rainfall. Highlands give rise to local winds and interfere with the horizontal passage of the atmosphere, so that on the two sides of a range the pressure and humidity may be quite different. Continental Cs. are influenced by forests. For by increasing the surfaces exposed to radiation and evaporation they lower the summer temps.: they also afford shelter from winds, and by retarding the permeation of rain and the melting of snow increase the relative moisture of the air.

Climatic Characteristics of the Various Zones.—In the Tropical Zone: The prevailing wind is easterly, N.-easterly above the equator, S.-easterly below. Usually the trade winds are dry: the Sahara and desert regions of Australia lie in their path. But in their passage over hills and plateaux they yield moisture, so that the tableland of Brazil and the E. slopes of the Andes have plentiful rain. The monsoon rains which fall when the monsoons blow from sea to land during the warm season, fall on regions that would otherwise be dry. In the 'doldrums'—a belt of calm between the two trade winds—convection currents lift up abundant moisture, which is precipitated after condensation as the daily afternoon rains. On the Sahara the extremes of temp. are great, 120° and 50° F., although the average ann. variation is slight. But high temp. is the chief distinction of this zone. In the Intermediate Zones: The average temp. is lower, the ann. range greater, and the daily range less, than in the tropical zone. The inequality of day and night and the considerable range in the angle of the sun's rays, and therefore of their heating power, account for the greater seasonal variability of

temp. In lat. 45° there are at the summer solstice 15½ hrs. of sunshine (and heating); at the winter solstice there are only 8½ hrs., the remaining hours being given over to night (and cooling). Moreover, in the same lat. the summer may be very hot, the winter very cold; for when the days are longest the sun's rays are almost vertical, and the heat per hour, therefore, is greatest. The winter's cold also has the effect of retarding the spring, and summer's heat of lengthening the autumn. For in spring the oblique sun's rays take a long time to melt all the snows and ice, and until this is done the air above cannot grow warm: in the autumn, on the contrary, the ground continually warms the atmosphere by giving up its stores of summer heat. The climates of the N. and S. intermediate zones differ in that the former, owing to the greater extent of earth, is on the whole continental, the latter oceanic. Thus the cool summers of the S. zone are unfavourable to agriculture. The winds for the most part are westerly. They are dry when they pass from the sea to warmer lands (for they take up moisture), and wet when the regions over which they blow have a cooler temp. than their own. Cyclones and anticyclones furnish the greatest ann. extremes both of heat (during cyclones) and of cold (during anticyclones). They also give moisture to the middle lats. The greatest ann. variability of temp. in the world is found in parts of Siberia remotest from the sea. Continental climates are prevalent on the E. borders of the continents, oceanic on the W. But the contrast is greater between opposite sides of the Atlantic (compare England and Kamchatka) than between opposite sides of the Pacific (compare Labrador and Vancouver). This is due to the warming power of the Gulf Stream and to the icy water which passes from the Arctic into the open Atlantic down the E. coast of America. In the Polar Zones: The unequal distribution of heat is very great, and at the poles the year is divided into two periods of perpetual day and perpetual night. Whilst snow is still on the ground the temp. of the surface, even in summer, cannot be raised above 32°, but where land is free of snow the range of temp. is great. The amount of rainfall necessary for agriculture depends on the temp. of the regions, the distribution of precipitation throughout the year (much rain is needed whilst the crops are growing), and the nature of the crops. In S. Australia 10 in. of rain support 9 sheep per sq. m.; in New S. Wales 14 in. support 96, and 20 in. 640 sheep per sq. m. A 34-in. rainfall in the Argentine will maintain 2630 sheep per sq. m. In prehistoric times, changes in C. have been brought about by atmospheric, astronomic (relating to changes in the earth's orbit), and geographic (relating to changes in the topography of land and its relation to water) causes. The petrified forests of Arizona prove that it once had a humid C. whilst gypsum deposits show that New York was once arid. At one time Greenland was warm enough to grow magnolias, and

glaciers were very much more widely distributed. See H. W. Dickson, *Climate and Weather*, 1928; A. A. Miller, *Climatology*, 1931; W. C. Kendrew, *The Climate of the Continents*, 1937; S. F. Markham, *Climate and the Energy of Nations*, 1942.

Climax (from Gk. κλίμαξ, a ladder), figure of speech much used in rhetoric. A series of words, phrases, or sentences, expressive of facts or ideas, is so arranged that the mind of the listener is led gradually, as by ladder rungs, from what is of least to what is of crowning importance. The impressiveness of Macaulay's style depends not a little on his appreciation of the effectiveness of this figure.

Climbers, popular form of the old term *Scansores*, which was applied to birds of a climbing habit, many of which were characterised by having two toes turned backwards and two forwards. Examples of this obsolete order are woodpeckers, parrots, cuckoos, and cockatoos.

Climbing, Mountain, see MOUNTAIN-CLIMBER; ROCK-CLIMBER.

Climbing Plants. There are at least six different methods of climbing adopted by plants; each is distinct in itself, although perhaps the casual observer would have some difficulty in enumerating them: (1) By means of the main stem which twines round the support; this occurs in hop, dodder, etc., the usual direction is anti-clockwise but the hop always twists clockwise; (2) by tendrils, as in passion flower, sweet pea, etc.; (3) by means of spines and prickles, as in rose and all brambles; (4) by aerial roots as in ivy; (5) by the petioles or leaf-stalks: this method is found in the garden nasturtium (*Tropaeolum*), clematis, and *Solanum jasminoides*; and (6) by the stipules of the leaf, which are modified as tendrils, as in *Smilax*. C. P. are commonly cultivated for decorative and useful purposes; they can easily be grown to hide bare walls, to cover trellis-work, to make a shelter from the sun, etc. Some are hardy, and both annuals and perennials are easily raised from seed out of doors, e.g. canary creeper. Others which are half-hardy must be raised under glass, and not put out in the open ground till mild weather is ensured. The majority of outdoor C. P. are deciduous, shedding their leaves once a year, but a few are evergreens, such as the ivy.

Clincher, see CLINKER.

Clinic, institution in which treatment is given to visiting patients, and where instruction is frequently given to medical students by the examination of patients. (The expression clinical medicine (Gk. κλινική, bed) denotes that method which deals with the treatment of a disease at the bedside of the patient and with lectures delivered there also.) The name C. may be applied to out-patient depts. of hospitals, bor. health centres, medical schools, or that part of any public institution where examination and treatment are carried out for the benefit of both patient and student.

Clinical Thermometer, see under THERMOMETER and THERMOMETRY.

Clinker, or *Clincher*: 1. Term used in small boat construction, to indicate that

the planking of the hull is laid with overlapping edges and not edge to edge as in carvel. 2. Incombustible residue left in coal and coke-fired furnaces. In the furnace it tends to collect in masses and would adhere to the fire-bars if not removed from time to time. When cold it hardens and is usually employed in concrete-mixing and in road-making.

Clinograph, draughtsman's instrument for drawing a number of similar triangles in succession. It resembles the carpenter's bevel in principle, but its stock and blade are of the same thickness. It is very useful in graphic calculations in statics.

Clinometer, instrument used by surveyors, geologists, etc., for measuring the dip or angle of inclination of surfaces. In its simplest form it consists of a graduated arc and a plummet. When the instrument is held level the plummet points to zero, but when it is held at an inclination it shows the number of degrees by which the upper surface of the C. differs from the horizontal. The most useful form of C., however, is that which is combined with a pocket compass, as it is generally necessary to know the direction of the slope as well as its amount.

Clinton: 1. Co. seat of C. co., Iowa, it stands on the Mississippi R. at a point where it is crossed by a railway bridge 4000 ft. long, and has important industries, with many beautiful old houses. Pop. 26,200. 2. Cap. of Henry co., Missouri, U.S.A., on the Grand It., with large flour-mills. Pop. 6000. 3. Tn. in co. Worcester, Massachusetts, on the R. Nashua, with extensive manufs. Pop. 12,400. 4. Co. seat of De Witt co., Illinois, U.S.A., with railroad shops and clothing factories. Pop. 6300. 5. City of Indiana on the Wabash R. with various manufs. in a farm and coal-mining region. Pop. 7000. 6. Vil. of Oneida co., New York, 9 m. S. of Utica, the seat of Hamilton College for men, founded in 1793 by Samuel Kirkland (1741-1808), a missionary to the Oneida Indians, President Washington expressing 'a warm interest in the institution.'

Clinton, Amer. family founded by Charles C. (1690-1773). b. in Ireland. He left Ireland for America and estab. himself in Ulster co., New York.

James Clinton (1736-1812) was the son of Charles C., and served in the U.S.A. army. He was the father of De Witt C.

George Clinton (1739-1812), son of Charles C.; in 1775 joined the army, after having sat in the New York Assembly. He held a high place in the army, and in 1777 was appointed governor of New York, becoming finally vice-president of the U.S.A., an office which he held till his death.

Clinton, De Witt (1769-1828), Amer. statesman, began his political career by acting as private secretary to his uncle, George, the leader of the Republican party at New York (1790-95). From 1798 to 1802 he was a member of the U.S. Senate, and three times (1803-7, 1808-1810, and 1811-15) he was mayor of New York City. He was governor of New

York State, 1817-23 and 1825-28. In Congress he identified himself with the movements for abolition of slavery and of imprisonment for debt, and for improvement of the free public schools system. In 1825 he was present at the opening of the canal between the Hudson R. and Lake Erie—an undertaking which had been carried through largely as the result of his persistent efforts.

Clinton, Sir Henry (c. 1738-95), son of Adm. George C. He began service in the militia in New York, but became lieutenant in the Grenadier Guards in England in 1751; and captain and lieutenant-colonel in 1758. He took part in the Seven Years war; also in the battles of Bunker's Hill and Long Is., and in 1778 became commander-in-chief in N. America. Owing to unpleasantness, however, he resigned his command. In 1772-84 and 1790 he sat in Parliament, and in 1794 was appointed governor of Gibraltar.

Clinton, Sir Henry (1771-1829), younger son of Gen. Sir Henry C. He served in the Corunna campaign, and distinguished himself in the Peninsula under Wellington, being made lieutenant-general. He was also to the fore at Waterloo.

Clinton Group, name assigned by geologists in New York to the Upper Silurian series of rocks, composed chiefly of argillaceous sandstone.

Clio, first of the nine muses, who presided over hist., and is represented as crowned with laurels, holding a book in one hand, and in the other a trumpet.

Clio, genus of naked marine gastropod or wing-footed molluscs so called because they are constructed for moving through water by means of fin-like membranes which are lateral expansions of the foot. *C. borealis* is a species which abounds in N. seas and constitutes a great portion of the food of the Greenland whale.

Clipper, sailing ship constructed for very rapid sailing. It is longer and narrower than an ordinary sailing vessel. Many of these Cs. which were used frequently in the transport of tea from the E., were built at Aberdeen, but they are not used now. The term has been borrowed for the craft of a U.S. airline which provides service on long sea routes. (See illustration, p. 736.)

Clipperton, Is. in the Pacific Ocean. The Is. is of coral formation, and its highest point rises to more than 150 ft above sea level.

Clippacum, see **CLICHY**.

Clissold Park, public park in Stoke Newington, N. London. It was acquired in 1887 at the cost of £96,000, and opened in 1889 by the earl of Rosebery, the first chairman of the London Co. Council. The mansion of the park was formerly the residence of a Mr. Crawshaw, who rented it, with its adjacent grounds, from the Eccles. Commissioners at an annual sum of £109 and a fat turkey.

Clisson, tn. in the dept. Loire-Inférieure, France, 17 m. S.E. of Nantes. The tn. and castle, belonging to the celebrated C. family, were destroyed in 1792-93 during the Vendean wars; the former was

rebuilt in the nineteenth century. Pop. 2700.

Clitheroe, mrkt. tn. and municipal bor. on the Ribble, at the foot of Pendle Hill, in the C. parl. div. of Lancashire, England, 35 m. N. by W. from Manchester. C. has paper and cotton mills, breweries, foundries, printing establs., and important lime and cement works in the neighbourhood. Its free grammar school was estab. in 1554, and there are still some remains of an eleventh-century castle, which with the grounds were purchased for the tn. as a memorial of the First World War. Pop. 12,000.

the man. Though dull at books, he was notorious for reckless courage; and there is the tradition, most delightfully prophetic, that as a lad he formed a small army of boys and levied a tax on the shopkeepers of Market Drayton, which they paid lest otherwise their windows should be broken. In his eighteenth year he received the offer of a writership in the Honourable E. India Company's service at Madras, an opening which, needless to say, was as welcome to him as to his parents. He scented adventure in the E., adventure that was to come surely enough, though not quite so soon as

'Picture Post' Library

THE CLIPPERS 'ARIEL' AND 'TEAPING,' 1866

A contemporary print of the meeting of the two vessels off the downs after a voyage of ninety-nine days from Foochow.

Clitus, or Cleitus, surnamed *Μολαις*, 'The Black,' was the brother of Alexander's nurse, Helleniké. C. was made one of Alexander's lieutenants, and saved the latter's life at the battle of Granicus in 334 B.C. He was made satrap of Bactriana in place of Artabazus in 328. At a banquet, when Alexander was present, he dared to criticise the luxury of the latter's court, and to extol the virtues of Philip. Alexander, who was drunk, killed C. on the spot, and was afterwards overcome by remorse.

Clive, Caroline (1801-73), authoress, was the daughter of Edmund Meysey-Wigley, and was b. in London. In 1840 she married the Rev. Archer C. She wrote sev. sets of poems, signed 'V.,' but her best book is a novel, *Paul Ferrol* (1841).

Clive, Robert Clive, Baron (1725-74), Indian administrator, came of an old Shropshire family. Many stories are told of his schooldays, which go far to prove that in this case the boy was father of

he expected. The outward voyage was unduly protracted, and he did not arrive at his destination until late in 1744. The long delay had swallowed up the contents of a meagre purse, and he reached Madras in debt. In that city he knew no one, and was far too shy to take advantage of such opportunities to make acquaintance as did occur. Loneliness and the slenderness of his resources made him so miserable that after a few months' sojourn in India he decided to commit suicide, and he desisted only when he had pointed a pistol at his head and twice pulled the trigger without obtaining the desired result. He then examined the weapon, and finding that it was properly loaded, he put it aside, remarking that it was evident from this intervention of providence that he was intended for something great. Fate did not keep him waiting long. In 1746 Labourdonnais captured Madras, and among many took C. prisoner. The young man escaped, however, to

Fort St. David. He now desired to abandon the civil and enter the military side of the company's service, and he applied for, and in 1747 obtained, an ensign's commission. Though he had had no previous training in arms, he showed signs of military genius, and elicited the commendation of Maj. Lawrence. A treaty of peace between England and France was signed at Aix-la-Chapelle in Oct. 1748, and C. returned to his former occupation. He was not destined long to remain at his desk. He was given a command, again under Maj. Lawrence, in the expedition against the rajah of Tanjore, during which he showed the same bravery that he had previously displayed in the unsuccessful siege of Pondicherry. After the conclusion of this campaign he was appointed commissariat officer to the Brit. troops, and shortly after was promoted captain. He submitted in 1751 a plan for the capture of Arcot, the cap. of the Carnatic, and was, to his great delight, permitted to endeavour to carry it out. He occupied the tn., and held it for two months, with his 500 men, of whom only 200 were Eng., against an army of 10,000. At the end of that period the enemy retired. The defence of Arcot, Malleson, the military historian, has said, may be regarded as 'the turning-point in the career of the English.' Though not at the time regarded as so important as, in the light of subsequent events, it is now, C.'s defence made a great reputation for him, which was enhanced by his later achievement in the campaign. C. was in 1753 invalided home, and was welcomed by the court of directors of the E. India Company, who, as a token of the high esteem in which they held him, presented him with a very valuable sword mounted in diamonds, which, very properly and modestly, he declined to receive unless a similar mark of honour was bestowed upon Maj. Lawrence. He returned to India in 1756, and, after serving for a short time in Bombay, went to Madras, where the news came that Suraj-ud-Dowlah had captured Calcutta and imprisoned the Eng. captives in the Black Hole (q.v.). C. went forth to retake Calcutta and to avenge the victims of the outrage. He defeated Suraj-ud-Dowlah at Plassey (June 23, 1757), and dethroned him in favour of Jafar Ali. From 1757 C. was governor of Bengal until 1760, when he returned to England, where he was received as a popular hero by every one, from the king to the mob. He was elected member of Parliament for Shrewsbury, and in 1762 was created Baron C. in the Irish peerage. Two years later he went out as governor of Bengal to put the administration on a sound footing. This he did, but in 1766 he had to return owing to ill health. In England he was attacked for having abused his position, and many charges were brought against him. A parl. inquiry was held, and the House of Commons unanimously accepted a resolution that he had rendered 'great and meritorious services to the State.' He d. by his own hand, after long suffering severe bodily agony, on Nov. 23, 1774, at

the age of forty-nine. C. no doubt often acted in a way that in a twentieth-century official would be regarded as little less than criminal: thus he accepted vast sums from native princes, but that was the custom of his day, when the Englishman in India was not as a rule, and was not expected to be, very scrupulous as to the manner in which he acquired a fortune. On the other hand, he was a just administrator, a great ruler, and a brilliant soldier; and he it was who securely laid the foundation of the Brit. Empire in

ROBERT CLIVE

India. See Sir J. Malcolm, *The Life of Robert, Lord Clive*, 1836 (reviewed by Macaulay, 1840); C. Wilson, *Clive*, 1890; Sir G. W. Forrest, *Life of Lord Clive*, 1918; R. J. Minney, *Clive*, 1931.

Clive, Catherine (Kitty) (1711-85), actress, daughter of Wm. Rafter, a man of good family. About 1727 she came under the notice of Colley Cibber, manager of Drury Lane, and as she showed decided talent for the stage, a place was found for her in the company, where she played Ismenes, the page in *Mitridates*. Not long after this she married George C., a barrister, but they separated very soon after their marriage. She joined Garrick in 1746 and remained with his company until 1769. She won recognition as a comedy actress by her performance in *The Devil to Pay* (1731). She took part also in some oratorios, possessing a fine, well-trained voice.

Cloaca, in zoology, is the name given to the common chamber in some vertebrates into which open the alimentary canal, the genital and urinary ducts; it is present in all amphibians, birds, and reptiles, in the monotremes and some fishes. In

higher mammals the urinogenital orifice and the anus take the place of the C.

Cloacæ, sewers of ant. Rome. The fact that Pliny called the city 'urbs pensilis' (hanging) shows to what an extent they undermined it. Ruins of many still exist buried underground. The most famous, known as Cloaca Maxima, was built by a Tarquin (sixth century B.C.) to drain the forum which stood on marshy ground between the Palatine and Capitoline hills. It was 14 ft. high and 10½ ft. wide. Under the republic C. were supervised by the censors; under the empire by the *curatores cloacarum*.

Clobbering, in pottery-making, a mode of decoration of Chinese blue and white china with flowers, etc., painted in enamel and fired. Used considerably in the Netherlands from the early eighteenth century and, in England from the same time until the middle nineteenth century.

Clocks. A clock is any mechanism for measuring and indicating time other than a watch or chronometer (*q.v.*). Its essentials are a motive power and its control. In the sand-glass, attraction due to gravity is the motive power, and the hole in the tube the control. In modern C. a spring is the motive power, and this power is subjected to intermittent restraint by a part known as the escapement, which is released by the swing of a pendulum. C. may be broadly classified according to the driving mechanism—weight-driven, spring-driven, or electric, or again, according to their general design or use—*e.g.* alarm C., coach or carriage C., long-case C. regulators, turret C. All long-case C. were formerly weight-driven, but they may now be spring or electrically driven. Astronomical C. are precision C. indicating sidereal time. The perfecting of the electric clock, first invented by Alexander Bain in 1843, is a recent development. In one type electricity is used to wind the clock by means of a simple direct current motor, operated from a battery. In others the clock is a simple synchronous motor running in step with the alternators of the power station which supplies the electricity. The frequency of the current generated is constant, being 50 cycles per sec. and (in the United Kingdom) is constant for all electricity stations. The radium clock is not yet a commercial concern. The action of rays from radium in a vacuum tube containing strips of tinfoil causes the strips to repel each other and then fall back into position at regular intervals, but time-keeping by these means has not yet been devised. Radium, however, is used commercially to illuminate the dials of C. and watches. Clock-making used to be the work of one man, and it is traditionally supposed that the Glastonbury Abbey clock was made by one man in the fourteenth century. By the nineteenth century, however, when Eng. clock- and watch-making were flourishing, the work was divided into about forty branches. At this time the movement or working part of the clock

was roughly made by a manufacturer and then passed on to the clock-maker to be finished by hand. After 1865 some parts were made and polished by machinery, and the Eng. lever watch became very popular. Watch-makers were divided between the fusee type of watch and the going-barrel watch. Eng. manufacturers favoured the former, but owing to this preference they failed to satisfy the growing demand for reliable, inexpensive watches such as were supplied by Swiss and Amer. manufacturers. This distinction has remained until the present day, when the construction of C. and watches is done largely by automatic machinery (*see further* under WATCHES). The Amer. trade has from the first concentrated on the mass-production of C. and the perfecting of them by machinery, but in England manufacturers are mostly concerned with high-grade C. Of cheap C. Germany and the U.S.A. have the largest manuf., and Switzerland and the U.S.A. of cheap watches. The Eng. industry has been aided by an import duty, but in spite of this 3,000,000 complete C., of which two-thirds were from Germany, and 4,000,000 complete watches, were imported into England annually in the period immediately prior to the outbreak of the Second World War, the total average value being £1,200,000. Apart from this there is a considerable trade in parts of C. and watches. The Clockmakers' Company, one of the city livery companies of London, was incorporated in 1631. *See also* HOROLOGY. *See* J. F. Britten, *Old Clocks and Watches and their Makers*, 1904; C. H. Baillie, *Watchmakers and Clockmakers of the World*, 1929; J. Smith, *Old Scottish Clockmakers (1153-1850)*, 1933; S. F. Philpott, *Modern Electric Clocks*, 1945.

Clodd, Edward (1840-1930), *b.* at Margate. He began his career in the London Joint-Stock Bank, and held the post of secretary to that bank 1872-1915. He was an ardent rationalist. His chief works are *The Childhood of the World* (1873); *The Childhood of Religion* (1875); *Myths and Dreams* (1885); *The Story of Creation: a Plain Account of Evolution* (1888); and *Primitive Man* (1895). He pub. his interesting *Memoirs* in 1916 and his Royal Institution lectures on *Occultism* in 1922.

Clodius, *see* CLAUDIUS, PUBLIUS.

Clodius, or **Claudius**, Albinus (*d. A.D.* 197), whose full name was Decimus Clodius Celonius Septimius Albinus, was *b.* at Adrumetum in Africa. He entered the army at an early age, and served with distinction under Marcus Aurelius, especially during the rebellion of Avidius Cassius, A.D. 175. He was raised to the consulate in 176, and appointed to the governorship of Gaul and afterwards of Britain by the Emperor Commodus. On the death of Commodus and that of his successor, Pertinax, 193, Septimius Severus declared C. Caesar, in order to secure his neutrality, while he himself marched on Rome. Having there defeated his rival Pescennius Niger, he resolved to get rid of C. also. A great

battle was fought at Lugdunum (Lyons), in which Severus was victorious and C. killed.

Cloelia, Rom. maiden sent as a hostage to Porsena. After escaping by swimming the Tiber, she was sent back by the Romans to Porsena, who released her on account of her bravery. She was allowed also to choose other hostages for release, and she chose the youngest. A statue was erected to her in the Via Sacra.

Cloister (Lat. *claustrum*, an enclosure; Fr. *cloître*), quadrilateral space, surrounded by an ambulatory or covered passage, to shelter from rain, etc., attached to monastic buildings and cathedrals, and often also to colleges. The C. was usually built on the S. side of the church, so as to benefit by the sunshine. Canterbury, Chester, and Gloucester have fine examples of Benedictine Cs. In the old days the church would be on one side

THE CLOISTERS OF ST. JOHN LATERAN (SAN GIOVANNI), ROME

Anderson

Clog Almanac, anct. kind of calendar, usually made of wood, though sometimes of metal. It was square in shape, and on it were notched the months and the days with special marks for saints' days. It was supposed to have originated in Denmark.

Clogheen, tn. of Eire in the co. of Tipperary, about 13½ m. W.S.W. of Clonmel. Pop. 700.

Clogher, vil. in the S. of co. Tyrone, Eire, 14 m. S.S.E. of Omagh, on the C. Valley light railway. The Protestant cathedral of St. Macartin dates from the end of the eighteenth century. C. also gives its name to a Rom. Catholic diocese, but the bishop's seat is at Monaghan. Pop. 200.

Clogs, shoes worn by peasant people in sev. countries of the Continent, and also used in the N. of England and parts of Scotland and Wales. The uppers are of leather and the soles are made of wood.

Cloisonnée, see under ENAMELS AND ENAMELLING.

of the ambulatory and the refectory on the side opposite whilst E. and W. were the chapter-house and the larders and cellars. Almost invariably the dormitories would be on the upper storey. On the side skirting the quadrangle, pillars and arches, sometimes decorated with elaborate carving and delicate-patterned traceries, supported the cloistral roof, which was often vaulted. At Gloucester, the exquisite fan-traceried vaulting is still in perfect preservation. Besides walking daily in the Cs. for recreation—from the ambulatory at Mont St. Michel they could see on all sides the great Atlantic—the monks used also to hold schools for novices and to paint, carve, and read theology in the recesses or stalls on the inner side. Here, too, they could talk at certain hours. The square grass plot was sometimes unfortunately shut out from view by glazed windows, as at Westminster Abbey. Among the many beautiful Cs. still in existence may be cited those of St. John

Lateran at Rome, of Monreale in Sicily, and of Campo Santo at Pisa, where the spacious ambulatories are actually four in number.

Clonakilty, seaport and mnrkt. tn., on O. Bay in S.W. of co. Cork, Eire. It is the terminus of a branch of the Cork, Handon, and S. Coast Railway. Pop. 3000.

Clones, tn. of Eire, in the co. of Monaghan. It possesses the ruins of an old abbey. Pop. 2400.

Clonfer: 1. Par. on the Allow, in the N. of co. Cork, Eire. Pop. 7791. 2. Par. and tn. on the Shannon and the Grand Canal, in the S.E. of co. Galway, Eire. Pop. 1633.

Clonmacnoise, par. of Offaly, Eire, area 21,918 ac. Has ruins of the cathedral and other churches, two round towers, and was the cemetery of Irish kings. Pop. 1899.

Clonmel, municipal bor. and co. tn. of co. Tipperary, Eire, on the Suir, 130 m. S.W. of Dublin by rail. It is still a tourist centre, and is famous also as the bp. of Sterne. Formerly the centre for Bianconi's system of jaunting cars (1815). Besides exporting agric. produce, it has tanneries and flour-mills. Pop. 10,209.

Clontarf, tn. of Eire, situated on the bay of Dublin and in the co. of that name. A battle was fought here in 1014, which ended in the Danes being defeated by the Irish. Pop. 4613.

Clonus, or **Reflexes**, series of spasmodic muscular movements not controlled by volition. The jerks are occasioned by alternate contractions and relaxations of certain muscles and are usually characteristic of an abnormal state of health. Even when nerves are perfectly healthy, clonic spasms may be produced by the sudden stretching of the muscles, and may vary in degree from contractions of considerable force and amplitude to scarcely perceptible tremors. The term **C.** is particularly associated with rhythmic and involuntary movements of the ankle, jaw, and wrist, and such conditions are known as ankle, jaw, and wrist **C.** They do not differ in kind, however, from many other movements which are generically termed reflexes. The question of the causation and process of reflex action has received much attention at the hands of physiologists, and the association of different parts of the nervous system with the various reflexes has been well investigated by observation and experiment. Muscular movements may be divided into **voluntary** and **involuntary**. Voluntary movements involve a certain degree of consciousness, not only as regards perception of the movements, but also with respect to their origin. The stimulus which evokes a voluntary movement may be a sensation carried to the brain by a peripheral nerve, but the brain process involves a reaction between the new perception and perceptions already existent in consciousness, so that the resulting movement corresponds in only a modified manner with the external stimulus. Involuntary movements, on the other hand, bear a certain definite relation

to the stimuli which evoke them; if the same stimulus be repeated, the same movement will follow, unless other nervous forces interfere to modify or inhibit that movement. It may be said, however, that many movements which are usually reflex may come under the dominion of the will if attention be attracted towards them. Breathing, for instance, is usually reflex, and the muscles associated with that function adapt themselves to any variation required by altered conditions without disturbing consciousness, but if the conditions are particularly unusual, or if the trend of thought leads to the subject of breathing, the muscular movements may be consciously directed. The part of the central nervous system associated with voluntary action is the brain, while reflexes constitute the special function of the spinal cord. A reflex is a reaction which is started by a stimulus acting on some nerve; the stimulus is conveyed by afferent nerves to the spinal cord, whence an impulse starts towards appropriate muscles or glands. The spinal cord therefore functions as an exchange, by which certain stimuli are made effective in near or distant quarters. Many reflexes are very complex and have been highly differentiated in the striving of the organism after economy of effort; the higher the degree of differentiation the greater is the possibility of the reflex being disturbed by cross reflexes or voluntary control. Some reflexes, particularly where nerves are tapped, as it were, on their way to the central system, are peculiarly invariable, at any rate in ordinary health. The absence or modification of such a reflex is therefore often an important indication of a morbid condition otherwise difficult to diagnose. It is in this connection that clonic movements are useful. The occurrence of a reflex when none should be expected argues that certain abnormalities connected with the nervous structure exist, and these abnormalities have gradually been classified in the light of clinical and experimental knowledge. The knee-jerk, for instance, obtained by striking the patellar tendon when the knee is flexed at a right angle, is absent in locomotor ataxia, destructive lesions of the lower part of the spinal cord, diabetes, infantile paralysis, etc. It is increased in tumours of the brain, cerebrospinal sclerosis, after epileptic seizures, etc. Ankle-**C.** is obtained by sudden flexion of the foot by pressing the hand against the sole. It is rarely manifest in perfect health, and indicates some degree of spinal disturbance. Jaw-**C.** is also present in health, but is plainly shown if there is sclerosis of the lateral columns of the spinal cord. It is obtained by a firm blow on the lower jaw hanging passively or gently supported by the hand; a series of contractions and relaxations causing jerky movements of the jaw results. Wrist-**C.** is obtained by pressing the hand backward to extreme extension; it is observable in hemiplegia. There are many other reflexes not of a clonic or rhythmic character which occur or disappear in

certain diseased conditions, particularly those associated with the spinal cord. The specific character of C. as distinguished from other reflexes lies in its rhythmic or periodic quality. Rhythm is, of course, present in such reflexes as breathing, walking, and the beating of the heart, but such processes are fairly complex. Rapid rhythmic movements, such as the scratching of its hide by a dog, can be produced even when voluntary action is rendered impossible by removal of part of the brain. If the skin of the shoulder be irritated the stimulus is conveyed to the spinal cord, and the afferent nerves carry alternate impulses to the flexor and extensor muscles of the hind leg, so that an almost perfect rhythm of about four beats to the second can be produced. It is obvious that in such a movement the contraction of the flexor muscles must be followed by a pause, after which the extensor muscles reverse the movement of the limb. These movements appear to resist fatigue for a long time. Tremulous movements of the limbs seems to argue an irritability of the nerves, causing a rhythmic though feeble contraction and relaxation.

Clouts, or **Cloutz**, Jean Baptiste du Val, de Grâce, Baron von (1755-94), was b. at the Château de Mandenthal near Cleeves, Rhineland. He was of Prussian nationality, and took a prominent part in the affairs of the Fr. Revolution. After travelling in Europe, he returned to Paris in 1789, on the outbreak of the Fr. Revolution, and joined the Jacobin Club. In the following year, at the bar of the Assembly, he declared his and others' adherence to the Declaration of the Rights of Man. From that time he assumed the appellation 'orator of the human race,' and took the name of 'Anarcharis C.' In 1792 he became a Fr. citizen, and at the same time extended his revolutionary opinions to the denunciation of religion. He was also chosen to be a member of the Convention. He was eventually condemned to death on a false charge by the tribune of the revolution and was guillotined.

Cloquet, city in the co. of Carlton, Minnesota, U.S.A., and stands on the N. Pacific and the Great N. Railway. It is an important centre of the lumbering trade, and it also manufactures paper. Pop. 7000.

Close (Lat. *clausum*, shut), an enclosed space, used in England for the precincts of a cathedral or an abbey. In Scotland and in colloquial Eng. the word is used for a narrow passage leading to a block of tenement houses, to the entrance of a court, or from a main street.

Close Shop, term, first used in America, to indicate those shops or factories from which non-union labour is excluded at the insistence of trade-union workers. Such action is not of modern growth, because the guildsmen or craftsmen of the late Middle Ages vigorously insisted in England on the exclusion from their work of workers who were not of their crafts or guilds. The Eng. term corresponding to C. S. is union shop, but the former term is now widely used. In the U.S.A. (where there is no political levy) a C. S. is an

industrial estab. in which the employer prescribes, as a condition of employment, that each worker shall belong to his appropriate trade union. Where two trade unions compete for the support of a particular craft, the union which is accepted as 'appropriate' is determined by a somewhat intricate process operated by a Federal Board of Industrial Relations, a gov. body the like of which does not exist in Britain. The position of the employer is that the unions compel him to lay down the condition of union membership, and the board tells him which is the union, in each craft, to which a monopoly has been granted. In effect he acts as honorary treasurer of the monopoly union, deducting its subscriptions from the employees' wages. In Britain, theoretically at least, an employer insists only upon trade-union membership, while leaving the employee free to choose his union. The net effect of the C. S. is, and can only be, to compel men, under pain of industrial outlawry, to associate with a movement which is, at least, quasi-political.

Close-hauled, term applied to the general arrangement of the sails of a ship when she is travelling as near as possible to the direction of the wind. Square-rigged vessels when C. make a small angle with the line of the wind's direction, but cutters and luggers can sail very much nearer to it.

Close Times, those seasons of the year during which, by law or by mutual agreement, game, wild birds, salmon, certain animals, and certain fish may not be shot or caught. These C. T. vary to a certain extent in different countries and localities, but they will generally be found to include the breeding or spawning times of the species in question. In most cases the C. T. in Great Britain are fixed by the game laws and a series of Wild Birds Protection Acts, of which the chief were passed in 1880, 1904, and 1908, but in some cases sportsmen are ruled by unwritten but equally binding rules. There is, for example, no statutory C. T. for foxes and rabbits, but in practice there is no fox-hunting from April till Nov. 1. Unwritten law likewise fixes the deer-hunting period for stags from about Aug. 12 to Oct. 12, and for hinds from Nov. 10 to the end of March. An Act of 1892 prohibits the sale of hares or leverets caught in Great Britain from March to July, under penalty of a heavy fine, and this has the effect of creating a close time. In Ireland this period is fixed from the beginning of April to Aug. 12. The close time for wild birds in the United Kingdom is from March 2 to the end of July, and certain eggs are also protected under the same Acts. In England and Wales hares, rabbits, woodcock, snipe, quail, landrail, and heath or moor game (and the eggs of swan, wild duck, teal, and widgeon) are protected under the game laws, though no close time is fixed for them by those laws. In Scotland the same remarks apply to deer and hares, to the first four birds, and to wild duck. The close time for all these birds is, under the

Wild Birds Protection Acts, 1880 to 1939, from March 2 to July 31 (inclusive). Otherwise this close time applies to all wild birds throughout Great Britain. The game laws fix the following times for various kinds of game, all dates inclusive: black game or heath fowl, Dec. 11 to Aug. 19 (in certain parts Aug. 31); grouse, Dec. 11 (Dec. 10, Scotland) to Aug. 11 in all parts of the United Kingdom; ptarmigan in England none, in Scotland Dec. 11 to Aug. 11, in Ireland Dec. 11 to Aug. 19; partridge Feb. 2 to Aug. 31 throughout; pheasant Feb. 2 to Sept. 30 throughout. Christmas Day and all Sundays are C. T. for game. In Ireland male deer are protected from Jan. 1 to June 9, fallow deer from Sept. 29 to June 9, hares from April 20 to Aug. 12, landrail from Jan. 11 to Sept. 19, and quail from Jan. 11 to Sept. 19. In England and Scotland the two last-named come under the Wild Birds Protection Acts already referred to. Otter-hunting lasts from April 15 to Sept. 15. In addition to these general rules, provisions are made by the secretary of state by which protection may be granted to certain birds in particular localities at other times on application from the local authorities. The Salmon Fisheries Act, fixing the close time in England and Wales for nets from Sept. 1 to Feb. 1, and for rods from Nov. 2 to Feb. 1, has been varied considerably in different parts of the country, but it always begins for nets not later than Nov. 1, and lasts for a minimum of 154 days. For rods it must not begin later than Dec. 1, and the minimum period is ninety-two days. In Scotland the close time for salmon, usually lasting from Aug. 27 to Feb. 10 for nets, and from Nov. 1 to Feb. 10 for rods, must not be less than 168 days for nets, either in England and Wales, or in Ireland. There are also weekly C. T., including Sunday, which vary from twenty-four to forty-eight hours. The Fresh-water Fisheries Act of 1874 fixed a close time for fresh-water fish not caught in private waters from mid March to mid June, except for certain specified parts of the country. Crabs and lobsters under a certain size (crabs 4½ in. across back, lobsters 8 in. in length) may not be sold, and protection is also given to soft crabs and crabs with spawn. The protection of oysters varies according to local regulations. A general close time for deep-sea oysters is fixed by the Fisheries Act of 1877 in Great Britain from June 15 to Aug. 4. There are game laws and various regulations for the protection of animals in most countries, sometimes of an extremely stringent nature.

Closure, or *Clôture*, in parl. procedure a method of putting an end to a debate which compels the House to decide upon the matter under discussion. The C. was first authorised by the Urgency Rules of Feb. 3, 1881, upon a motion to vest in the Speaker the powers of the House for the regulation of its business. The obstructionist methods of the Irish Nationalist members during the debates on the Protection of Person and Property (Ire-

land) Bill, the Prevention of Crimes (Ireland) Bill, and the Place Preservation (Ireland) Bill induced the House to carry the motion, which was afterwards permanently estab. by a standing order in 1882. That order provides that the opinion of the House may be taken forthwith upon any motion, 'that the question be now put'; the C. may be moved either at the conclusion of a speech or whilst a member is addressing the House, and, in the latter event, it intercepts any motion which it was the Speaker's intention to submit. The Speaker (or chairman of ways and means) has an absolute discretion in allowing a C. motion to be put; but in practice he only intervenes where such a motion is in his opinion an abuse of the rules of the House or an infringement of the rights of the minority. Analogous to the C. are the motions 'that certain words in the clause stand part of the clause', or 'that a clause stand part of (or be added to) the Bill'; such motions override all power of amendment. C. may also be moved at the moment for 'interruption of business'—that is, at the expiration of the time fixed for the transaction of certain business when the Speaker adjourns the debate and vacates the chair to make his report to the House. Reflections on the vote of C. are out of order, as are also questions to ministers respecting C. The presence of more than one hundred members is required to make the C. vote effectual, or twenty in the case of the C. being put in a standing committee. A far more drastic method of curtailing the length of a debate is that of C. by compartments, called also the guillotine. This is a device whereby a definite period or periods may be set apart by the rules of the House for the discussion of the various stages and portions of a Bill; at the expiration of each period of time the discussion is automatically closed, whether concluded or not, without the leave of the Speaker or chairman being required, and the majority in the House carry that portion of the Bill. It was first used in 1887 on the occasion of the Common Law Procedure (Ireland) Bill; it was also used in the debates on the Home Rule Bill, 1893, and the Education Bill, 1902. From the return of the Liberals in 1906 it became a characteristic feature of parl. procedure.

Clotaire I. (A.D. 558-61), king of Gaul, was one of the four sons of Clovis, who, at his father's death, received his share of the kingdom, including the cities of Soissons, Cambrai, and Laon. By arranging for the murder of his brother's children, he secured Tours and Poitiers in 524, and ten years later, after the fall of Burgundy, acquired Grenoble. In fact his whole reign was one of annexations. At the death of Childbert, his brother, with whom he had warred against the Visigoths, he became king of all Gaul (558), and he also ruled over most of Germany and exacted tribute from the Saxons. He d. of remorse, because he had burnt alive his rebel son, Chram, with his wife and children.

Clotaire II. (d. 629), after varying fortunes of war finally became king of the whole Frankish kingdom in 613. The many concessions he made account for the comparative tranquillity of his rule. To the Burgundian nobles he gave the option of a special mayor, and to his own barons he allowed some freedom to draw up laws. In his reign unjust taxes were repealed.

Cloth, see **CLOTH MANUFACTURE AND FINISHING; COTTON, FABRICS, TEXTILE.**

Clothilde, or **Clotilda**, St. (475-545), daughter of Chlperic, king of Burgundy, and the wife of Clovis, king of the Franks. She exerted great influence over her husband, and persuaded him to become a Christian. Together they built the church of the Holy Apostles at Paris, afterwards called Ste. Geneviève, in which they were both buried. At the death of Clovis, C. retired to the abbey of St. Martin at Tours.

Cloth Manufacture and Finishing. All cloth on leaving the loom presents a loose and thready appearance. The type of weave, however, is carefully chosen with a view to the use to which the material is to be put, but the essentials of weaving do not vary with the raw materials used, whether they are vegetable products—cotton, jute, artificial silk, etc.—or animal products—wool, camel-hair, alpaca, silk, etc. Metal threads of gold and silver are also used for decoration, and asbestos fibres for fireproof curtains, etc. (see under **FABRICS, TEXTILE**). Cloth is manufactured in variable widths according to its uses, but modern manufacturers favour broad looms, wide fabrics being economical in use. Besides width, weight is an important factor in the manufacture of cloth, especially of woollens and worsteds, and cloth also undergoes tests to estimate its tensile strength. After the cloth is woven, the finishing processes to which it is then submitted vary according to the material. The purpose of finishing is to smarten the cloth and to bring out the valuable properties peculiar to the stuff of which it is made. If nothing but cleaning and pressing is needed, the appearance of the cloth is not very much altered from when it first left the loom, but generally the alteration is considerable. The first stage in the finishing process is to remedy all defects in the weaving. The examination of the cloth is called *perching*, and this is followed by another exercise, called *picking*, which, as the name implies, means picking out all foreign matter such as hairs, straws, etc. *Burling* is to ensure that the cloth is perfectly smooth and free from knots, for every knot has to be unravelled and every missing thread replaced by hand. The grade of quality obtained is decided by the purpose for which the cloth was woven. It is nearly always necessary to pass the cloth through a bath of soapy water to wash out any dirt or oil accumulated during weaving. The washing softens the cloth and brings out a fuzzy nap which may be removed by singeing. In some woollen fabrics, however, the surface nap is desirable, and may be

further brushed up with a wire brush. One of the processes through which cotton fabrics may be passed is known as *beetling*. This, which can be done by machinery, consists in hammering the surface of the cloth to close up the threads and produce a hard bright finish. A similar process applied to woollen fabrics is *milling*. After scouring the fibres of the soapy wool curl up, and they are felted together and the cloth is thickened by pressure and friction applied alternately. Wool can also be put through a process of raising, which is effected by the *teasel* in a machine called the *raising-gig*. The teasel raises a pile on the surface of the cloth, either an erect pile, termed *velvet*, or a laid pile, smoothed in one direction. Raising gives an increased softness, conceals the threads, and subdues the colour and patterns of the cloth. Usually the cloth is milled before raising, but if the pile is raised immediately after the cloth has been scoured, it becomes much softer. Union fabrics, woven with cotton-warp and wool-weft, undergo an additional treatment called *crabbing*, the purpose of this being to straighten out the cotton threads and submerge them beneath the woollen surface of the weft. If during these processes the length and breadth of the cloth have been altered, the cloth is brought back to the required dimensions by '*stentering*.' The stenter is a frame on which the cloth is stretched and straightened out. Stentering is particularly applied to light cotton cloths which require dressing or which have been *mercerised*. If it is required to stiffen the cotton, this is done by applying a starch mixture while the cloth is being passed through a mangle. The final finishing treatment is to press the cloth and, if a lustrous surface is desired, to apply heat and moisture at the same time. In addition to finishing in the sense of cloth development, the work of preparing cloth includes bleaching, dyeing, and printing. All cloth on leaving the looms has a dull colour, and is spoken of as being '*in the grey*.' Cotton goods are bleached with chlorine, but wool is generally passed through sulphur fumes, and if further whiteness is required peroxide is used. Silk can be whitened by boiling in soap solution. Coloured cloth is either made from dyed yarn or else is dyed in the piece. Dyeing machines are generally made to take a number of pieces at once, and the cloth is immersed in a heated solution. Cotton and silk cloths may be readily printed with patterns and designs. Printing is done by a machine consisting of a revolving drum with sometimes as many as twenty rollers, each having a separate trough of colour, and the cloth receives an impression from each roller which is engraved with the desired pattern. For the treatment of separate stuffs see under **COTTON, WOOL, SILK**. See also J. A. Hunter, *Cloths and the Cloth Trade*, 1926; R. Beaumont, *The Finishing of Textile Fabrics*, 1926; E. Midgley, *The Finishing of Woollen Fabrics*, 1929; H. Greenwood, *Handbook of Weaving and Manufacture*, 1926; S. R. Trotman and

Clothing, see FASHION.

Cloth, one of the Fates. See MOIRÉ.
Clothyrod, yard-rod, once used for measuring cloth. The length of the arrow was taken from it.

Closure, see CLOSURE.

Cloud, mass of mist consisting of minute globules of water formed of condensed aqueous vapour floating in the atmosphere. Sometimes the condensed vapour is solidified into minute fragments of ice or snow, this being particularly the case with cirrus, cirro-stratus, and cirro-cumulus Cs., where the refraction of light by the ice-crystals often gives the appearance of a halo. In outline the classification of the Cs. is based upon that originally put forward by Luke Howard at the beginning of the nineteenth century, namely, cirrus, the thread C.; cumulus, the heap C.; stratus, the flat C. or level sheet; and nimbus, the rain C. The details of a more precise classification occupied the attention of meteorologists in many countries during the latter part of the century, among whom were specially prominent the Englishmen, the Rev. Clement Ley and the Honourable Ralph Abercromby. Other meteorologists who were specially active in this work were Prof. H. H. Hildebrandsson, of Uppsala, Sweden; M. Léon Teisserenc de Bort, of Paris; and M. A. Riggenbach, of Zürich, Switzerland. A classification was agreed at the international conference at Munich in 1891, and as a sequel the first ed. of the *International Atlas of Clouds* appeared in 1895; the last appeared in 1910, and is now out of print. After the First World War the need for a new atlas was acutely felt, and an international commission for the study of Cs. was set up in 1922, under the presidency of Gen. E. Delcambre, the director of the Office National Météorologique de France, to undertake this work. An 'Abridged edition for the use of observers' was produced in 1930, and the complete atlas with separate eds. having the text in Fr., Eng., and Ger. was pub. in 1932. In this atlas a modification was introduced which was of very great importance. In the earlier atlas the C. had been considered as an entity rather than as a feature of the sky which should be considered in relation, not only to all the other Cs. present, but also to the development in time. This involved some radical changes in the conception of how Cs. should be viewed, and some differences in the nomenclature of clouds. This conception has led to the international codes for reporting C. types, and in the atlas an attempt was made to give in order examples not only of the basic classification but also of the sky types to which numbers are given in the reporting codes. After the Second World War, 1939-45, some amendments were made to the reporting codes at the twelfth conference of directors, held at Washington, D.C., in 1947: the most important new features are the omission of 'nimbus' and the inclusion of the new type 'nimbostratus.'

The following summary of the international classification is based on Part I. of the Eng. ed. of the *International Atlas of Clouds*.

TABLE OF CLOUD CLASSIFICATION.

At nearly all levels Cs. may appear under the following forms: (a) Isolated, heap Cs. with vertical development during their formation, and a spreading out when they are dissolving; (b) Sheet Cs. which are divided up into filaments, scales, or rounded masses, and which are often stable or in process of disintegration; (c) More or less continuous C. sheets, often in process of formation or growth.

Classification into families and genera is as follows:

Family A consists of high Cs. (mean lower level 6000 metres (20,000 ft.)). It should be noted that the heights given are for temperate lat., and refer, not to sea level, but to the general level of the land in the region. In certain cases there may be large departures from the given mean heights, especially as regards cirrus, which may be found at any height where ice crystals can exist.

Form b 1. Genus Cirrus.

2. Genus Cirrocumulus.

Form c 3. Genus Cirrostratus.

Family B: Middle Cs. (mean upper level 6000 metres (20,000 ft.), mean lower level 2000 metres (6500 ft.)).

Form a } 4. Genus Altopcumulus.

Form b }

Most altocumulus and stratocumulus Cs. come under category b; but the varieties cumuliformis and particularly castellatus belong to category a.

Form c 5. Genus Altostratus.

Family C: Low Cs. (mean upper level 2000 metres (6500 ft.), mean lower level close to the ground).

Form a } 6. Genus Stratocumulus.

Form b }

Most altocumulus and stratocumulus Cs. come under category b; but the varieties cumuliformis and particularly castellatus belong to category a.

Form c 7. Genus Stratus.

Form d 8. Genus Nimbostratus.

Family D: Cs. with vertical development (mean upper level that of the cirrus, mean lower level 500 metres (1600 ft.)).

Form a } 9. Genus Cumulus.

Form b } 10. Genus Cumulonimbus.

DEFINITIONS AND DESCRIPTIONS OF THE FORMS OF CLOUDS.

(1) *Cirrus* (Ci.), detached clouds of delicate and fibrous appearance, without shading, generally white in colour, often of a silky appearance. Cirrus appears in the most varied forms such as isolated tufts, lines drawn across a blue sky, branching feather-like plumes, curved lines ending in tufts, etc.; they are often arranged in bands which cross the sky like meridian lines, and which, owing to the effect of perspective, converge to a

point on the horizon, or to two opposite points (cirrostratus and cirrocumulus often take part in the formation of these bands).

(2) *Cirrocumulus* (Cc.), cirriform layer or patch composed of small white flakes or of very small globular masses, without shadows, which are arranged in groups or lines, or more often in ripples resembling those of the sand on the sea shore. In general cirrocumulus represents a degraded state of cirrus and cirrostratus both of which may change into it. In this case the changing patches often retain some fibrous structure in places.

Real cirrocumulus is uncommon. It must not be confused with small altocumulus on the edges of altocumulus sheets.

(3) *Cirrostratus* (Cs.), thin whitish veil, which does not blur the outlines of the sun or moon, but gives rise to halos. Sometimes it is quite diffuse and merely gives the sky a milky look; sometimes it more or less distinctly shows a fibrous structure with disordered filaments.

(4) *Altostratus* (Ac.), layer (or patches), composed of laminae or rather flattened globular masses, the smallest elements of the regularly arranged layer being fairly small and thin, with or without shading. These elements are arranged in groups, in lines or waves, following one or two directions, and are sometimes so close together that their edges join. The thin and translucent edges of the elements often show *tristations* which are rather characteristic of this class of C.

(5) *Altostratus* (As.), striated or fibrous veil, more or less grey or bluish in colour. This C. is like thick cirrostratus, but without halo phenomena; the sun or moon shows vaguely, with a faint gleam, as though through ground glass. Sometimes the sheet is thin with forms intermediate with cirrostratus (*altostratus translucidus*). Sometimes it is very thick and dark (*altostratus opacus*), sometimes even completely hiding the sun or moon. In this case differences of thickness may cause relatively light patches between very dark parts; but the surface never shows real relief, and the striated or fibrous structure is always seen in places in the body of the C.

(6) *Stratocumulus* (Sc.), layer (or patches) composed of globular masses or rolls; the smallest of the regularly arranged elements are fairly large; they are soft and grey, with darker parts. These elements are arranged in groups, in lines, or in waves, aligned in one or in two directions. Very often the rolls are so close that their edges join together; when they cover the whole sky—on the Continent, especially in winter—they have a wavy appearance.

(7) *Stratus* (St.), uniform layer of C., resembling fog, but not resting on the ground. When this very low layer is broken up into irregular shreds it is designated *fractostratus* (Fs.).

(8) *Nimbostratus* (Ns.), low, amorphous and rainy layer, of a dark grey colour and nearly uniform. It appears as though feebly illuminated seemingly from inside.

When it gives precipitation this is in the form of continuous rain or snow. But precipitation alone is not sufficient criterion to distinguish the C. which should be called *nimbostratus* even when no rain or snow falls from it. There is often precipitation which does not reach the ground; in this case the base of the C. is always diffuse and looks 'wet' on account of the general trailing precipitation, *virga*, so that it is not possible to determine the limit of its lower surface.

(9) *Cumulus* (Cu.), thick Cs. with vertical development; the upper surface is dome shaped and exhibits rounded protuberances, while the base is nearly horizontal. When the C. is opposite the sun the surfaces normal to the observer are brighter than the edges of the protuberances. When the light comes from the side the Cs. exhibit strong contrasts of light and shade; against the sun, on the other hand, they look dark with a bright edge. True cumulus is definitely limited above and below; its surface often appears hard and clear cut. But one may also observe a C. resembling ragged cumulus in which the different parts show constant change. This C. is designated *fractocumulus* (Fc.).

(10) *Cumulonimbus* (Cb.), heavy masses of C., with great vertical development, whose cumuliform summits rise in the form of mts. or towers, the upper parts having a fibrous texture and often spreading out in the shape of an anvil. The base resembles *nimbostratus*, and one generally notices *virga*. This base has often a layer of very low ragged Cs. below it (*fractostratus*, *fractocumulus*). *Cumulonimbus* Cs. generally produce showers of rain or snow and sometimes of hail or soft hail, and often thunderstorms as well. If the whole of the C. cannot be seen the fall of a real shower is enough to characterise the C. as a *cumulonimbus*.

PRINCIPAL VARIETIES OF CLOUDS.

In addition to *families* and *genera* which suffice for the broad classification of C. forms, the new International Atlas also recognises *sub-genera*, *species*, *varieties*, and *casual details* to which distinguishing Lat. adjectives are applied for purposes of more precise differentiation. For details of these sub-classifications reference should be made to the atlas. Among the most important of these sub-classifications are those distinguished by the adjectives 'cumuliformis,' 'lenticularis,' 'castellatus,' and 'mammatus.'

See Air Ministry (Meteorological Office) N.O. 233, *Cloud Forms* (1949), from which the above text is reprinted, by permission of the Controller of His Majesty's Stationery Office; also G. A. Clarke, *Clouds*, 1920; A. W. Clayton, *Cloud Studies*, 1925; C. J. P. Cave, *Clouds and Weather Phenomena*, 1928, 1943.

Cloudberry, see *RUBUS CHAMAMORUS*.
Clouded Leopard, see *LEOPARD*.

Clouet, François (c. 1610-72), Fr. painter, son of Jean C. the Younger (c. 1485-1545). Father and son were noted miniaturists. He succeeded his father in the

twofold office of *valet de chambre* and painter-in-ordinary to Francis I. in 1545 and held the post under Henry II. and Charles IX. He executed portraits of Henry II., Mary Queen of Scots, and Catherine de' Medici (now in Castle Howard, Yorkshire). There is a portrait of Francis II. as an infant in the Antwerp Museum, and sev. of his paintings are in the Louvre, Vienna, Florence, and other European cities and there is a fine series of his drawings in the National Library, Paris, some crayon heads in the Brit. Museum and examples of his portraiture in Hampton Court and Hertford House, London.

Clough, Anne Jemima (1820-92), pioneer in the higher education of women, appointed the first principal of Newnham College, Cambridge. B. in Liverpool, Jan. 20, sister of Arthur Hugh C. In 1871 she became head of the first house for women students in Cambridge. This house developed into Newnham Hall and, in 1880, into Newnham College.

Clough, Arthur Hugh (1819-61), Eng. poet, b. at Liverpool. In 1822 his father, a cotton merchant, emigrated to Charleston, S. Carolina, U.S.A., with his family. In 1828 C. returned to England to school at Chester; from there he passed to Rugby, then under Dr. Arnold, and to Balliol College, Oxford. In 1842 he was elected to a fellowship at Oriel College, Oxford at this time was in the throes of fierce theological controversy, and C. fell for a time under the influence of Newman's High Church principles; this was followed by a period of scepticism, and in 1848 he felt called upon to resign his post. Then he travelled for a time, and was in Paris during the revolutionary movements of 1849, and at Rome during its siege by the Fr. From 1849 to 1852 he was principal of Univ. Hall, London. In 1854 he married, and in 1856 was appointed secretary to the commission for examining scientific military schools on the Continent. In 1848 he pub. *The Bohemian of Tober-na-Vuolich*, a 'long-vacation pastoral' in hexameters; in 1849 a collection of poems, called *Ambarvalia*, with his friend, Thomas Burbidge. In the same year he wrote *Amours de Voyage*, a novel in verse, at Rome; *Dipsychus*, a satire, at Venice, 1850; and *Mari Magno*, or *Tales on Board*, a series of idylls, 1861. *Plutarch's Lives* (1859) was a revision of Dryden's and other seventeenth-century translators' ed. of Plutarch. His work contains much deep thought and clever experiment with hexameters, but, except in the case of a few of his lyrics, never rises to great worth or beauty. C. is the subject of Matthew Arnold's beautiful elegy, *Thyrsis*. His collected *Poems* were ed., with a memoir by F. T. Palgrave, 1862. See monographs by S. Waddington, 1833, J. I. Osborne, 1920, and G. Levy, 1938.

Clovelly, fishing vil. of N. Devon, 11 m. W.S.W. of Bideford in the Barnstaple pari. div. of Devonshire. It is situated in a cleft of the rocks, sheltered on three sides by thick woods and in the midst of magnificent scenery. Its main street,

composed of rough steps between white-washed houses, descends 400 ft. to a rude little pier. There is an anct. Brit. encampment a mile away. Pop. 650.

Clover, name given to various species of *Trifolium*, the leguminous genus to which belong the shamrock and trefoil. C. was introduced into the agriculture of Great Britain about the sixteenth century from the Low Countries, where it had long been cultivated as green food for cattle in situations where natural pastures were scarce. The species are ann., biennial, or perennial plants, and of these the biennial produces the richest crop. Red C. is the most approved variety, and is usually sown with barley or oats, sometimes among wheat or rye in spring. The first crop is generally mown and made into hay, which must be perfectly dry before it is stacked, and in winter it provides a very nutritious food for cattle. White C. is a perennial which grows rapidly and forms excellent pasture, especially for sheep; a light calcareous soil is best adapted for its growth. It is also valuable to man as a source of honey. Another perennial C. is the cow-grass, which is found in all rich meadows, and is often sown in conjunction with white C. *T. minus*, the lesser yellow trefoil, and *T. procumbens*, the hop trefoil, are also valuable varieties found in good pastures. The only ann. C. which is cultivated is *T. incarnatum*, a species which has been brought from the E. The lt. rye-grass, *Lolium perenne italicum*, is often sown with it and will grow as rapidly; it is a good corrective of the heating qualities of C. hay. The prin. use of this C. is to raise very early food for ewes and lambs.

Cloves (M.E. *clow* (e) from Fr. *clou*, a nail), dried, unexpanding flower-buds of the clove-tree (*Eugenia caryophyllata*), a plant belonging to the order Myrtaceae, a native of the Molucca Is. The tree is an evergreen, growing to about 40 ft. in height, with large oval leaves and small flowers, produced in great numbers in cymes, which become red when ready for picking. The entire plant has an aromatic odour. The buds, when gathered, are a little over half an inch long, and consist of a cylindrical calyx, at the end of which are four extended sepals and a ball formed by four unopened petals. They are dried either in the sun or by wood smoke, and then become of a reddish-brown colour. They have a very powerful odour and a hot and acrid taste, and on pressure exude a volatile oil, of which they contain a large proportion, about one-fifth of their entire weight. C. are mainly used for flavouring in cookery and confectionery, and also to preserve clothing from moths. The essential oil is extracted by means of repeated distillation with water, and when carefully prepared is of a pale yellow colour, later turning to brown, and with the taste and odour of C. It is known to the pharmacopoeia as *Oleum caryophylli*, and is a mixture of eugenol ($C_{11}H_{12}O_2$) and a hydrocarbon ($C_{11}H_{14}$). The oil is soluble in alcohol, ether, and fixed oils.

It is used in medicine as a flavouring agent and to prevent nausea and griping caused by purgatives. Its volatile qualities make it valuable to relieve toothache, and it is also used as a local anæsthetic. C. are now chiefly cultivated in Amboyna, Canzibar, Pemba, Java, Sumatra, Réunion, and the W. Indies. The Dutch long held the monopoly of clove-growing in the Moluccas.

Clovis, **Chlodowech**, or **Chlodwig**, name of two Merovingian kings of the Franks:

Clovis I. (c. 465-511) succeeded his father Childeric in the year 481, as king of the Salian Franks, whose cap. was Tournai, in the modern Hainaut. In 486 he overthrew the Gallo-Roms. under Syagrius, near Soissons; in 493 married Clotilda, a Christian Burgundian princess, and in 496 embraced her faith. In 507 he defeated and killed Alaric II., the Arian king of the Visigoths, at Vouillé, but was checked at Arles by Theodoric, king of the Ostrogoths. He then settled in Paris, where he d. His chief aim was a united Frankish kingdom.

Clovis II. (633-56), succeeded his father, Dagobert I. in 638 as king of Neustria and Burgundy. In 656 he procured the assassination of the usurping king of Austrasia, annexed his dominions, and thus became king of the whole Frankish empire.

Clowes, **William** (c. 1540-1604), eminent Eng. surgeon in the reign of Elizabeth. He was surgeon at St. Bartholomew's Hospital, served in the Netherlands with Leicester, and took part in the defeat of the Sp. Armada, becoming surgeon to the queen later. He wrote sev. books, the chief of which are *The Approved Practice for all Young Surgeons* (1591) and *A Treatise on the Struma* (1602).

Clowes, **William** (1780-1851), joint founder with Hugh Bourne of Primitive Methodism, was a native of Burslem, who came to live at Tunstall. Here he worked as a potter and gained a reputation as an excellent dancer. Attracted by the open-air meetings of Bourne, which differed from Wesley's 'camp meeting' in having both prayers and singing, he early joined a Methodist class, visited the country cottages as an evangelist, and held prayer meetings and love-feasts in his home. C. supported Bourne in his efforts to hold religious meetings, which should persuade men to renounce their par. wakes and the drunkenness and other vicious habits there practised. The new brotherhood, which had at first availed itself of Wesleyan Methodist protection, definitely repudiated all connection with Wesleyans in 1810. Even C., who had leanings towards the older sect, was cut off from his church in 1808 and 1810 for officiating at camp meetings in Ramsor. In 1811 he became the preacher at a chapel in Tunstall of a small society of Primitive Methodists who had first met together in a kitchen. After 1827 C. gave up circuit work, but continued his mission of evangelisation till his death. He was a man of fine presence and engaging disposition, and his strong personality, with which was combined a fine and enthusi-

astic delivery, secured many converts to his cause. The influence of the movement to which C. gave his life is well reflected in the works of George Eliot, George Borrow, and Arnold Bennett.

Clowes, **Sir William Laird** (1856-1906), Brit. naval writer and historian. His series of articles, under the pseudonym 'Nauticus,' in the *Daily Graphic* (1893) entitled 'The Needs of the Navy,' had an enormous influence on public and official opinion. In 1891 he had been largely instrumental in the foundation of the Navy Records Society, and between 1897 and 1903 he compiled *The Royal Navy: its History from the Earliest Times*, in collaboration with Sir Clements Markham and others. Among his other works are *Black America: a Study of the Ex-Slave and his Late Master* (1891); *The Great Peril* (1893); *The Naval Campaign of Lissa* (1901); *The Mercantile Marine in War Time* (1902); *Four Modern Naval Campaigns* (1902).

Clown, buffoon, formerly attached to the households of nobles, now a comic character in a pantomime. See **JESTER**.

Cloyne, mkt. tn. of co. Cork, Eire, 15 m. E.S.E. of Cork. It gives its name to a Rom. Catholic diocese, the cathedral of which is at Queenstown, but it has a Protestant cathedral of its own, founded by St. Colman in the sixth century. Opposite the cathedral is a splendid and well-preserved round tower which rises to a height of 90 ft. Pop. 700.

Clubbing, or **Club-root**, disease which often attacks the roots of turnips, cabbages, and other cruciferous plants, usually the result of improper cultivation. It is due to the ravages of a slime-fungus, *Plasmodiophora brassicæ*. It causes the host plant to send out nodular outgrowths from the root with subsequent gradual decay of the plant itself; the skin becomes broken and scabbed, in this way differing from 'finger-and-toe' (dactylorhiza) disease, which is rather a gradual degeneration of the plant than a disease; in this case the skin remains unbroken. Lime is the best disinfectant against C., because the spores of the lime fungus cannot germinate in it or penetrate it. Any cruciferous plant can spread the disease, so it is not safe to grow them in soil that has once been infected, unless it is previously thoroughly dressed with lime. The spores will lie dormant for sev. years if no suitable host presents itself, but germinates actively as soon as any crucifer is present.

Club-foot (*Talipes*), deformity of the foot depending on contraction of certain muscles or tendons. It may be congenital or acquired. If congenital, the cause may be malnutrition or a long-sustained pressure upon the foot in the womb. Many cases of the congenital defect, however, submit to early treatment, and no further evidence of spinal lesion has appeared. When the deformity is acquired, it is almost invariably the result of infantile paralysis; certain muscles retain their function, and their prolonged contraction is followed by shortening of the ligaments connecting

the bones. The varieties of C. are (1) *T. equinus*, where the subject walks upon the fore part of the foot, the heel not touching the ground; (2) *T. varus* where the outer edge of the sole touches the ground, the foot being turned inwards; (3) *T. calcaneus*, where the heel only touches the ground, the toes being pointed upwards; and (4) *T. valgus*, where the subject walks upon the inner edge of the sole. The former two are the congenital types, and are often combined, when the deformity is known as *T. equino-varus*. The latter two are nearly always acquired. Somewhat similar conditions are *T. cavus*, where the bony arch is unusually concave, and *T. planus*, where the bony arch has been too weak to bear the weight of the body. This defect is popularly known as flatfoot, and is often developed through much standing, particularly in poorly nourished persons. Treatment of C. should, above all, be prompt. If it is congenital, efforts should be made by constant manipulation to encourage the foot to take up a normal position. If this is unsuccessful, it may be necessary to separate the contracted tendons by surgical operation. The foot is then kept immovable in the normal position by being set in plaster of Paris until the tendons and ligaments have grown to the required extent. Generally it is also necessary to apply a splint which keeps the foot in the correct position, so that, as growth goes on, the bones are moulded to the proper shape in a few months.

Club-hand, deformity of the hand similar to that of club-foot. The hand is permanently bent at the wrist, by contraction of the flexor muscles, or is bent backwards, as by contraction of the extensors. It is a result of poor nutrition, and is often associated with other deformities. The fingers of the affected hand are weak or useless.

Club-root, see CLUBBING.

Clubs, associations of people united in pursuance of a common interest. All through Gk. hist. there were both oligarchic and democratic *traipeiai* or political organisations among the people. At Rome associations similar to the latter were called *sodalitates*. Thus about 204 B.C. a *sodalitas* was formed for the worship of Mater Magna, and under the empire the deification of Augustus and other emperors was promoted by prov. *sodalitates*. The *collegia opificum* of the republic corresponded to the medieval trade guilds. In Cicero's day these had been supplanted by the *collegia compitalicia* or *sodalicia*, which were political institutions finally suppressed by Cæsar as a public menace. The most obvious purpose of C. to-day is the promotion of social intercourse, but many C. have been formed for the serious discussion of politics, literature, science, and art. The meetings at the Mermaid Tavern (q.v.) in Bread Street, were gatherings of literary friends fond of good-fellowship, who would sit together over their cups and discuss books and men till daybreak. It was an illustrious company who passed their evenings at the 'Mer-

maid,' including Shakespeare, Beaumont and Fletcher, and many another Elizabethan playwright. Some of the Stuart C. were professedly political, as, for example, the Rota and the Calves Head C. (founded 1659 and 1693). Addison was a member of the famous Kit-Cat Club (1700) and in the *Spectator* he refers to the coffee-houses which were the haunts of men of very varied tastes; one coffee-house was reserved for Whigs, another for lawyers, and a third for men of letters. The Tories used to fraternise at White's Chocolate House (1698), and 'The Club' (1764) was the resort of the most talented men of the times. There are upwards of 120 C. in London distinguished for their excellent traditions and organisation. Among them may be mentioned the Carlton (1832) and Constitutional (1840), both Conservative; the National Liberal (1881) and the Reform (1837); St. James's (1837), frequented by diplomats; the Garrick (1831), for artists and actors; the Travelers' (1819), and the Turf (1868); also Brooks's (1764); Junior Carlton (1864), United Service (1815), Devonshire (1875), United University (1821), Boodle's (1763), Conservative (1840), Eccentric (1890), Junior Army and Navy (1911), Marlborough (1869), Naval and Military (1862), and Savage (1857). In 1919 a club called the American was founded for Amers. in London. The Kildare Street Club of Dublin (1790) and the New Club (1787) of Edinburgh vie in excellence with those of the metropolis. Continental C. are often centres for gambling as well as for concerts, plays, etc. The modern club is not complete without its dining, smoking, newspaper, writing, billiard, and drawing rooms. The Athenæum (1824) possesses a unique library, and the Garrick a fine collection of dramatic pictures. New members are usually elected by a ballot of the whole club, or by a chosen committee. Some C. are reserved for gentlemen, others for ladies, whilst in a few both sexes are admitted on equal terms. Among the last type are the Sesame Imperial and Pioneer, the Curzon House Club—which absorbed the former Albemarle Club—and the Univ. of London Club (1914), which is open to all graduates. In this connection, it may be noted that the Authors' Club (1891) strictly excludes women, whilst the Empress Club (1897) is open only to women. Ann. subscriptions, entrance fees, and profits derived from the sale of provisions and wines consumed within the house are the main sources of revenue. After the First World War sev. C. sprang up as a direct after-effect, e.g. nursing or service C.; while sev. women's C. have been founded since the complete political emancipation of the sex. The Cowdray (1922) and the United Nursing Services (1921) are both C. for women nurses. The Royal Air Force Club (1917) in Piccadilly is open to flying officers of the R.A.F. (including ex-officers of the R.F.C. and R.N.A.S.). The English Speaking Union and the Overseas League both possess excellent premises and a large membership of both sexes on each

side of the Atlantic. The Connaught (1921) is open to public school men, either of professional standing or in one of the services. There are, of course, many C. devoted to some specialised interest, professional, financial, agric., sporting, etc., e.g. the Kennel Club (1873), Gresham (1843) and the City of London (1832), both for bankers and merchants, Farmers' Club (1842), Flyfishers' Club (1844), and the M.C.C. (q.v.). C. formed during the Second World War include the King Alfred Club (1944), for officers of the R.N.V.R.; the Women's Press Club (1944), United Nations Services Officers' (1942), and Women's United Services (1942) for women officers.

pest, on the Little Szamor R. Formerly the cap. of Transylvania, the tn. is well built and has a Gothic church, museum, and a citadel. There are four bishoprics—National Orthodox Church of Rumania, Gk. Catholic (Uniate), Reformed Church, and Unitarian; the tn. is the literary centre of Transylvania and has many educational establs., including a univ. Before the Second World War there were manufs. of linen and woollen goods, earthenware, beer, sugar, paper, and soap. Formerly Hungarian, it passed to Rumania after the First World War, and is now known by its Rumanian name of C. By the end of Aug. 1944 Soviet forces were consolidating their grip on the chief

Cadbury Brothers Ltd.

WHITE'S CHOCOLATE HOUSE, ST. JAMES'S, IN 1708

A modern painting by H. W. White.

The tendency of inferior C. and of some C. for working men to degenerate into mere drinking and sometimes gambling saloons, led to their inclusion in the Licensing Act of 1902. The terms of this Act, designed above all to check the private sale of intoxicating liquors, apply indifferently to all C. Not only must every club register its name, object, membership, rules, hours of opening and closing, etc., but heavy penalties are attached to the traffic in liquor at an unregistered association or to granting habitual facilities to any one to become a member within forty-eight hours of nomination. Under the Act of 1921, a club in which the sale of intoxicants is made only as part of a meal may sell intoxicants for the space of one hour after the close of the permitted hours. See M. E. G. Duff, *The Club, 1764-1905*, 1905; R. J. Allen, *Clubs of Augustan London*, 1933; B. Darwin, *British Clubs*, 1943. See also under LICENCES AND LICENSING LAW.

Club-shell, see CLAVAGELLA.

Clugia, see CHIOGUA.

Cluj (Hungarian Kolozsvar, Ger. Klausenburg), tn. and episcopal see of Transylvania, Rumania, 248 m. E.S.E. of Buda-

pest, on the Little Szamor R. Formerly the cap. of Transylvania, the tn. is well built and has a Gothic church, museum, and a citadel. There are four bishoprics—National Orthodox Church of Rumania, Gk. Catholic (Uniate), Reformed Church, and Unitarian; the tn. is the literary centre of Transylvania and has many educational establs., including a univ. Before the Second World War there were manufs. of linen and woollen goods, earthenware, beer, sugar, paper, and soap. Formerly Hungarian, it passed to Rumania after the First World War, and is now known by its Rumanian name of C. By the end of Aug. 1944 Soviet forces were consolidating their grip on the chief

passes leading into Transylvania, and C. would have fallen had that event not been forestalled by the Rumanian gov.'s surrender. Pop. 98,000.

Clumber Spaniel, see under SPANIEL.

Clunes, tn. of Talbot co., Victoria, Australia, 97 m. N.W. of Melbourne by rail. It is in the gold-mining dist. opened up in 1851, and is also the centre of an agric. and pastoral industry. Pop. 1225.

Cluny, tn. on the Grosne, 14½ m. N.W. of Mâcon by rail, in the dept. of Saône-et-Loire, Central France. A vil. in 910, the year of the abbey foundation, it owed its later importance entirely to the C. monastery. The fame of the order of Cluniac Benedictines is due to the greatness of its abbots, who from 910 to 1157 were, with one exception, conspicuous alike for their piety and strength of will. Odo, the second abbot, made C. the centre of a great monastic revival. The result of his work and that of his successors was that, by 1150, 314 monasteries in all parts of Europe had embraced the C. regime, and were completely subject. The order declined rapidly after the death of Peter the Venerable in 1157, so that in 1528 the monastery fell into 'commendam' (q.v.) in 1790, after a regrettable schism between

the Reformed and Unreformed, the order was finally abolished. As commendatory abbots both Richelieu and Mazarin had initiated projects of reform. A great normal school was estab. here in 1865. Pop. 4100.

Clupeidae, family of malacopterygious fishes, contains many well-known species, such as the anchovy, herring, pilchard, and sprat. They have scaly bodies and a naked head, and the species inhabit temperate and tropical seas near the coast.

Cluseret, Gustave Paul (1823-1900), Fr. soldier and politician. He served in the Crimean war, as a *garde mobile* in the revolution of 1848, in sev. expeditions in Algeria under Garibaldi in 1860, and in 1861 on the side of the Federals in America. On his return to France he became a member of the Internationale, and on the proclamation of the Third Republic (1871) was the leading spirit of the social revolution at Lyons and Marseilles. In 1871 he was for a short time at the head of the military operations of the Paris Com., but narrowly escaped arrest by fleeing to London; in his absence he was condemned to death by the Third Council of War, 1872. In 1884 under an amnesty he returned to France, and in 1888-89 sat in the Chamber as deputy for Toulon.

Clusia, Amer. genus of Guttiferae, consists of climbing trees and shrubs, usually parasitical, which yield a viscid resinous juice of a balsamic flavour; hence they are in England called balsam-trees. *C. alba* has a scarlet fruit with seeds embedded in scarlet pulp. The plant abounds in balsamic juice of a green colour, which becomes brown when exposed to the air; the seeds are a favourite food of birds, and are plucked from the fruit while hanging on the tree. *C. quapoya* is a climbing shrub with yellow flowers, and yields a white, transparent juice.

Clusium, see CHIUSI.

Clusone, tn. and riv. of Italy. The riv. is a trib. of the Po, and has its source among the Alps about 12½ m. eastward of Mt. Genève. It flows in a S.-easterly direction, passing the tns. of Fenestrelle and Pinerolo. After a course of 50 m., it joins the R. Po, 13 m. from Turin. The tn. is in Lombardy, 16 m. N.E. of Bergamo. There are copper, iron, and vitrol works, and a trade in corn. Pop. 6000.

Cluster. In astronomy a C. is a group of stars which differs from other groups (i.e. constellations and asterisms) in that the members of the group would seem to have some physical connection. In other words, the stars in a C. are not a mere optical group which happen to lie nearly in the line of sight, but have certain attributes in common. Thus they may have similar spectra and the group of stars may be moving together. The sky contains many Cs., of which the Pleiades are the best known. Most people can see with the naked eye six stars in this group, though especially keen-sighted people may discern six or seven more, but with the aid of an opera glass or a small telescope a

great many more are visible. The proper motion of the chief stars of the Pleiades and of some of the fainter ones has been shown to be the same, viz. 7" a century. The Pleiades belong to what are called irregular Cs.; the main part of the Cs. are globular in shape. Sir John Herschel's catalogue of nebulae (1864) contained a list of 110 globular Cs., and in the transactions pub. by the Lick Observatory there are many fine photographs of Cs. made by Messrs. Keeler and Perrins. Cs.

New Zealand Gov

THE CLUTHA RIVER, SOUTH ISLAND,
NEW ZEALAND

were often in the early days taken for nebulae, until resolved into separate stars by instruments of higher power. The number of stars in a C. is often very great, and in the photograph of the well-known C. round Omega Centauri Prof. Bailey found more than 5000 stars in an area occupying about as much space as the moon appears, to the naked eye, to occupy. A remarkable fact about globular Cs. is that they contain a large number of short-period variable stars, as many as 128 being found in the group mentioned immediately above. Most of the Cs. of both kinds are to be found in the neighbourhood of the Milky Way.

Clutch, device by which one shaft may be coupled to another, or released. It consists of a fixed and a movable part and when these parts are in contact the two shafts revolve together, and when the C. is disengaged or its one part moved away from the other, the shafts are independent of one another. The friction C. is commoner than the dog C., which operates rather in the manner of a zip fastener. But the materials used, the method of pressing the two surfaces together and the details of construction vary widely according to the conditions in which the C. is used. Cast-iron in contact with

cast-iron, steel on bronze, and steel or cast-iron on a fabric lining, are commonly used. The fabric lining consists mostly of asbestos and brass wire. In the magnetic C., the operating force, provided by a spring in other Cs. of the axial type, is produced by the magnetic attraction of one plate towards the other, acting as an electro-magnet.

Clutha, or **Molynieux**, riv. in the S. Is. of New Zealand. It rises in Lake Wanaka, and traversing the prov. of Otago, falls into the sea at Molyneux.

Cluthalite, mineral obtaining its name from the Clyde valley, where it was found. It is a red, flesh-coloured variety of analcime (a zeolite mineral which occurs as pellucid crystals in basalt). It occurs in vitreous crystals, and is a hydrous silicate of the zeolite section.

Cluwer (or **Cluverius**), **Philp** (1580-1623), Ger. geographer and historian, was a great traveller. He served as a soldier in Bohemia and Hungary, and was for a time in prison. After further tours in France and the Brit. Isles, he returned to Leyden, where the academy allowed him a regular pension. His chief works were *Germania Antiqua* (1616); a treatise on auct. Sicily, Sardinia, and Corsica (1619); and his *Introductio in Universam Geographiam*, pub. posthumously in 1629.

Clywd, riv. which rises in S. Denbighshire, Wales, and flows past St. Asaph and Rhuddlan to the Irish Sea at Rhyl. The Elwy is the chief trib. Its valley is noted for its fine scenery.

Clyde (Welsh *Clywd*, meaning strong), chief riv. of Lanarkshire, Scotland, and one of the world's greatest commercial waterways. Its estuary forms the firth of Clyde, the finest on the W. coast. Daer Water, which rises in the Lowthers at Gana Hill (2190 ft.), and Potrail Water, which unite near Elvanfoot, are the chief head-streams of the C. It rounds Tinto Hill, and its course is fairly devious till a point 4 m. above Lanark is reached, after which it is, broadly speaking, N.-westerly as far as Dumbarton, where it discharges itself into the Firth. On the l. b. the prin. tribs. are the Duncaton (19 m. long), entering above Robertson; the Douglas (20 m.), above Bonnington; the Avon (28 m.), at Hamilton; and the White Cart (19 m.), below Renfrew; the affluents on the right are the Medwin (16 m.), joining the main stream near Carnwath; the Mouse, at Lanark; the S. Calder (16 m.), above Bothwell; the N. Calder (12 m.); and the Kelvin (21 m.), at Glasgow. Near Lanark the C. rapidly falls 230 ft. within 3½ m., forming the four famous falls of C., namely, the Bonnington Linn, which is the most graceful; the Corra Linn, which in three leaps makes a magnificent cascade 84 ft. in height; and the Dundaff and the Stonebyres Linn, the latter of which resembles the Corra. In flood-time both the Corra and the Stonebyres Falls make a single descent of 80 ft. or more. Stretching some 106 m. from its source in the Daer to Dumbarton, the C. is the third longest riv. in the country, the other two being the Spey and the Tay. Altogether

it drains an area of 1481 sq. m. Above the falls it is a pure trout stream, watering pastoral uplands. Below it traverses a fertile valley, sometimes pent up between wooded slopes, sometimes broadening out into a plain. But long before the riv. reaches Glasgow, where the pollution is completed, it grows every mile more sluggish and begrimed as it receives the contamination of various trade effluents. Even in the eighteenth century the C. was fordable in the heart of Glasgow. But neither effort nor money has been spared in deepening the channel, which is now 19 ft. at Glasgow even at low tide. Thus the docks at Glasgow can hold the largest vessels, and since Henry Bell launched the first steamer, the *Comet*, on the C. in 1812, the shipbuilding and shipping traffic has increased by leaps and bounds. A weir prevents the further ascent of the tide above Glasgow. The chief tns. on its banks from Elvanfoot to Glasgow are Crawford, Lanark, Hamilton, Bothwell, and Blantyre. The junction for the Forth and C. Canal is a Bowling. The ports are Glasgow, Port Glasgow, Greenock, Ardrossan, Troon, Ayr, and Campbelltown. The fairway of the Firth, which reaches from Dumbarton to Ailsa Craig, measures over 60 m., and from the Mull of Kintyre to Girvan is nearly 40 m. across. The chief is. in the firth are Arran, Bute, and the Cumbraes, and among the sea lochs, many of which are popular holiday and health resorts, are Gareloch, Loch Long, Holy Loch, and Loch Fyne. These are all on the Highland coast.

There were savage air raids on the Clydeside, notably on March 13-14, 1941 and on May 5-6, 1941, when 460 and 350 machines respectively were used by the enemy. The number of persons killed was 1828. Incendiaries were dropped in masses like a locust-storm. Fires, spread by high explosives, raged with tremendous fierceness. But the raiders conspicuously failed to destroy the docks and shipyards. In Glasgow and Clydeside some 40,000 houses were damaged on those four nights, and great destruction was wrought to the large tenement blocks in Glasgow.

* **Clyde** The, name of a transport which landed Brit. troops on the Gallipoli Peninsula in the First World War in 1915. (See GALLIOLI CAMPAIGN.)

Clyde, Baron, see CAMPBELL, SIR COLIN. **Clydebank**, burgh of Dumbartonshire, Scotland, on the r. b. of the Clyde, 6 m. N.W. of Glasgow. Since 1886 Kilbowie and Dalmuir have been included in the burgh. At C. there are a shipbuilding yard and engineering works, at Kilbowie the factories of the Singer Manufacturing Company, and at Dalmuir a shipbuilding yard, a new tn. hall, and public library. Pop. (estimated) 34,500.

Clydesdale, valley of the Clyde (q.v.), in Lanarkshire, Scotland. Iron and coal are mined in it, and there are many orchards. It gives its name to a well-known breed of heavy horses.

Clydesdale Breed, see under HORSES. **Clydesdale Terrier**, or **Paisley Terrier**, resembles the prick-eared variety of Skye

terrier. It was only introduced about fifty years ago, and is kept entirely as a house-dog. It has a long, silky coat, and is light-coloured with tan legs. Weight 15 to 20 lb.

Clynes, John Robert, Brit. statesman, was b. at Oldham, March 27, 1869; son of Patrick Clynes, who had been evicted from his holding in Ireland in 1851, and had become a labourer in the employ of Oldham Corporation. J. R. C. attended St. Anne's elementary school when a half-timer in a cotton mill; but he began self-education as a piecer aged seventeen. He was small and weak for his age. Under the name of 'Piecer' he contributed to the correspondence columns of Oldham papers. He took part in the estab. of a (short-lived) Piecers' Union, which helped to make a speaker of him. He was enlisted by Will Thorne, M.P., as an unpaid speaker at his organising meetings of the Gas and General Workers throughout Lancashire. At twenty-two he was appointed organiser at 30s. a week; he held the post for six years, and then became secretary of the Lancashire dist. of the union. He tried repeatedly but unsuccessfully to enter Oldham tn. council. He held the secretaryship of Oldham Trades and Labour Council for twenty-one years. In 1906, he won, at first a empty, a parl. seat, becoming Labour member for N.E. Manchester—a constituency he represented till his disappearance in 1918; after that he sat for the Plating div. He was parl. secretary to the Ministry of Food, 1917-18; became food controller (and Privy Councillor) in the latter year, but resigned at the call of party. Vice-chairman of the Labour party, 1919; chairman, 1921—but in 1922 was relegated to deputy-chairmanship. In Labour Gov. of 1924 was Lord Privy Seal and deputy-leader of Commons. When the party took office again in 1929, he became home secretary. In 1931 he introduced a Bill to legalise Sunday entertainments. Defeated in general election, 1931, but elected in 1935. He did not contest the general election of 1945. Pub. his *Memoirs* in 1935. He is president of the National Union of Municipal Workers.

Clypeus Sobieski (Lat. *clypeus*, a shield), constellation formed by Hevelius (1611-1687) out of some small stars below Aquila. It was named in honour of John Sobieski III., king of Poland (1674-96).

Clysters, or Enemas, are liquid medicines which are introduced by means of an enema syringe into the lower end of the intestines or the rectum. The injection may be made for various purposes, and is generally made when the ordinary method of taking is impossible owing to the condition of the patient; thus, for the purpose of evacuating the bowels in cases of constipation, or for conveying stimulants into the system, and in cases of diarrhoea. Warm water is the common form of C. for evacuation, and beef-tea for strengthening. The use of C. is much more common in France, where they are termed *lavements*.

Clytemnestra, daughter of Leda, wife of Tyndareus, king of Sparta, by Jupiter,

and the sister of Castor. C. married Agamemnon, king of Argos. During the absence of Agamemnon at Troy, C. formed a guilty connection with his cousin, Ægisthus, and to save herself, on his return murdered him in his bath (according to some accounts the murder was committed in revenge for the supposed sacrifice of her beloved daughter, Iphigenia). C. then married Ægisthus, who usurped the throne of Argos. Orestes, her son, concealed himself in the house of his sister Electra, and killed the guilty pair on their way from the temple of Apollo. See AGAMEMNON; ÆGISTHUS; ELECTRA; IPHIGENIA; ORESTES.

Clytie, sea-nymph, daughter of Oceanus, in love with Apollo, who deserted her for Leucothoe. She pined and was eventually turned into a sunflower or heliotropium.

Cnidoblasts, see THREAD CRILLS.

Cnidus (Κνίδος), anct. Gk. city on the coast of Caria, Asia Minor, at the end of the peninsula of Triopium (Cape Krio); colonised from the Peloponnesus, said to be both Laconian and Argolic. One of the six cities of the Dorian League. Originally on an is. the settlement spread to the mainland. The city was famed for its worship of Aphrodite, her celebrated statue (by Praxiteles) being in one of its temples. In 394 B.C. the Athenian admiral Conon, commanding a Persian fleet, defeated the Spartan fleet under Pisander near C. The fine seated statue of Demeter (Brit. Museum) was excavated from the ruins of C. See C. T. Newton and R. P. Pullen, *Discoveries at Halicarnassus, Cnidus, and Branchidæ*, 1862-63; and *Travels and Discoveries in the Levant*, 1865.

Cnossus, Gnossus, or Knossos, anct. tn. of Crete, sometimes called Cærat, from the small riv. which flowed beneath its walls. Its foundation is attributed to Minos, king of Crete. The locality was the scene of the birth of Jupiter and of his marriage with Hera. The Cretan labyrinth, built by Dædalus, and the abode of the Minotaur, was also attributed to C. the explanation of the origin of this legend is given by Dr. Evans in his account of the excavations, *Scripta Minoa* (1909). It was peopled by Dorians, was prominent in the civil wars of Crete, and finally became a Rom. colony. See also CRETE.

Coach and Coaching (Magyar *kocsi*, the kind of vehicle used at Kocs, W. Hungary, fifteenth century). A coach is a large, enclosed four-wheeled carriage for passengers. As a general term it may be used for all carriages (e.g. in C.-building), or combined with other words for special forms (e.g. stage-C., mail-C., hackney-C., mourning-C.). The typical C., however, has as special characteristics four wheels, springs, a roof forming part of the framing of the body, and more than one seat for passengers. It was perhaps a later development of the huge agric. wagons in use on the Continent in the twelfth and thirteenth centuries. In the Middle Ages very elaborate Cs. were used by royalty and nobility and for State purposes. The first C. in England was made by Walter

Rippon (1555) for the earl of Rutland; in 1564 he also made one for Elizabeth. The stage-C. had seats outside and in, and was much used in England as a public conveyance from the sixteenth century. At least six existed in 1675, but they did not enter very largely into Eng. life till the eighteenth century. In earlier times broad-wheeled vans or wagons were used to convey passengers who could not afford to travel on horseback. Fares were naturally very high, as the pace was slow. At first there were no actual seats outside,

came into use (c. 1840) Cs. had regular routes all over the country; similar ones were used in America and on the Continent, where alternative names, such as *Diligence*, *Stellwagen*, and *Ekuvagen*, were used for vehicles of the kind. The earliest railway vehicles were merely road Cs. adapted to run on rails. In the United Kingdom the two best-known Cs. of historical interest are the king's state C., and the lord mayor's (which figures yearly in the procession of the lord mayor of London, Nov. 9). This is the oldest, first

Corporation of London: Guildhall Library

MEETING OF THE FOUR-IN-HAND CLUB, HYDE PARK, LONDON

An aquatint by J. Harris after James Pollard

but 'outsides' were taken at a reduced rate (about half-price), and had to cling on by the luggage as best they could. In 1767 a basket, called the conveyency, was attached to the back of the C. for half-price passengers. In 1659 the first stage-C. ran between London and Coventry. In 1784 the mail-C. system was introduced by John Palmer, M.P. for Bath, to replace the post-boys who were employed up to that time. The post office vehemently opposed his suggestion, but it was carried out, the first mail-C. running between London and Bristol in 1784. In 1789 springs were introduced by John Warde, the 'father of fox-hunting.' Tubbs and Davis's 'machine' was one of the first fast Cs. that ran between London and Brighton. In 1791 lighter vehicles were introduced. Some Cs. took only eleven hours to Brighton from London, 'flying' Cs. could even do it in eight. The fare for a single journey was 14s. or 16s. Before railways

used for the procession of Sir Charles Asgill, lord mayor elect, 1757. The body is hung on leather straps, and has much ornamental carving, gilding, and paintwork. The panels and doors are covered with various allegorical groups of figures and heraldic devices. The king's C. was designed by Sir Wm. Chambers and described as 'the most superb carriage ever built.' The paintings were done by Cipriani, the whole being completed in 1761. In the later years of Victoria's reign it was rarely seen, but on the accession of Edward VII. it was again made fit for use on State occasions. In 1824 the art of coaching had been perfected; it was often a form of sport, and the custom of driving for high wagers was very popular. When steam conveyances had ousted mail-Cs. as a necessity, coaching still continued to a certain extent as an amusement for the richer classes. In the early nineteenth century McAdam and Telford improved road-making to such an

extent that the conditions for driving were much pleasanter. Considering the unprotected state of the roads, highway robberies were not so frequent as might be expected, though, of course, many tales of them survive (Dick Turpin). Much skill was needed to drive four horses, and the difficulties and humours of 'the road' are very often referred to in Eng. literature. From the sense of driving, the word C. came to be applied to a tutor for examinations or for athletic contests, especially rowing (army C., varsity boat-race C.). By 1824 over 300 Cs. used to pass Hyde Park daily. The most famous coaching-clubs of England have been the old Bensington Driving Club, 1807-52, and the Four Horse Club, 1808-29. These drove a kind of landau. The Richmond Driving Club (promoted by Lord Chesterfield) was instituted in 1838. The Four-in-Hand Club was started in 1856, with the duke of Beaufort as president, and the Coaching Club in 1870. In America the New York Coaching Club was formed in 1875. Coaching was chiefly the sport of the richer classes, but has been ousted by motoring. From 1890 coaching became a favourite pastime of Amer. millionaires, but its true home was in England. Professional drivers of the 'Brighton Age' were Charles Jones, Sir St. Vincent Cotton, Dick Brackenbury, and others. Robert Parks for eighteen seasons in succession drove the C. from Keswick Hotel to Windermere and back (42½ m.) every week-day. The last sensational driving-match was in July 1888, when James Selby drove the 'Old Times' from London to Brighton in 3 hrs. 56 min., and back in 3 hrs. 54 min. The average speed is 10 to 11 m.p.h. In some parts of England (London to Brighton, Lake Dist.), in America and Europe, public Cs. ran until comparatively recent years at regular times along certain routes. A modern C. has two parts, the carriage and the body. The latter usually measures 4 ft. 10 in. long, 4 ft. wide, 4 ft. 2 in. high. They have brakes, but good drivers only need them in emergencies. The Amer. Concord C. has no springs, but leather straps. See *New Remarks on London*, by the Company of Par. Clerks, issued 1732; 'Nimrod' (C. J. Apperley), *Essays on the Road*, 1786; duke of Beaufort, *Driving* (Badminton Library), 1889; F. Rogers, *Manual of Driving*, 1900; R. Straus, *Carriages and Coaches*, 1912; H. Belloc, *The Highway and its Vehicles*, 1926; T. Read, *The Evolution of Horse-drawn Vehicles*, 1933; O. O. Winthorpe, *Express and Stage-coach Days in California, 1835-1860*, 1936; B. Darwin, *British Clubs*, 1943; H. McCausland, *The English Carriage*, 1948.

Coach-building, or Coach-making, name given to the carriage-manufacturing industry. As a matter of fact, C. calls for the services of craftsmen in many different trades. The variety of materials used in the manuf. of a first-class carriage is so great—iron, steel, silk, leather, glass, etc., being utilised—that many classes of highly skilled labour are employed. Body-makers manufacture the part where the

persons are seated, carriage-makers the parts on which the body rests, and wheelwrights, joiners, and fitters, sev. classes of smiths, painters, and trimmers, all are needed. Various thicknesses of planks are used, and for every inch of thickness a year is required to season the wood effectively. Ash is the best wood; for the body a full-grown variety of a mild nature is used, and for the carriage poles younger, straight, and tougher pieces. The framework of the body is panelled with quarter-inch planks of Honduras mahogany with no grain; this is then coated with ground white lead until it is completely weather-proof. The roof is covered with wide pine boards, a quarter of an inch thick, and three thicknesses of wood, exceedingly thin, are then glued together under pressure, so that the grain of the centre piece runs across that of the outer pieces. Thus a good solid covering without joints is obtained. Birch and elm are also used, and pine for the flooring-boards. It is perhaps in the wheel-making dept. that most improvements can be traced in carriage-making. For the nave of a wheel, wych elm is the best wood; heart of oak is used for the spokes, and ash for the felloes. For light wheels Amer. hickory has been much used of late years, and the Amer. method of making the wheel in two sections is also an improvement in this class. The Warner nave is a solid iron casting, with mortises for the spokes; this also is more used on light carriages. When indiarubber tyres are used, the felloes need not be so deep as in the case of metal. The best springs are made of Swedish ore, though Eng. spring steel is very good. Axle-trees are of two kinds, mail and collinge; the former are secured to the wheel by three bolts through the nave, the latter by a gun-metal cone secured by collies and nuts. Cast, chilled, or wrought iron is the material used for axle-boxes, the first being the cheapest. The painting of a carriage is most delicate work, and a special class of painters is employed to paint the coats of arms when required; these are known as heraldry painters. The woodwork is first treated with copal varnishes, and then with successive coats of paint; in first-class work as many as twenty coats are applied. After a year's wear, the gloss of the work may be revived by rubbing with oil and rotten stone; this is a delicate process, requiring highly skilled labour. The interior of a modern carriage is more luxurious than formerly; satin and tabaret were largely used in the nineteenth century, but morocco superseded them as seat material; silk curtains, carpet, electric light, flower-vases, etc., complete the furnishings.

Coadjutor, assistant of a bishop who is unable to perform his work owing to either ill-health or old age. He often succeeds to the bishop's see when that dignity dies.

Coagulation, change which occurs in the physical properties of certain proteins when heated or subjected to various chemical actions. The typical examples are egg-albumin, or white of egg, which is

a colourless, sticky fluid, miscible in water at ordinary temps., but solidifying into an opaque white mass when placed in boiling water; and blood-albumin, which clots on exposure to the air, thus serving a useful purpose in preventing escape of blood from small wounds.

Coahuila, one of the twenty-seven states of Mexico in N. America. It lies inland, and is bounded on the N. by the U.S.A., and has an area of 62,376 sq. m. The climate is salubrious, although there are somewhat rapid changes in the thermometer. Agriculture and cattle-farming form the chief occupations. It is the only Mexican state in which coal is produced (856,000 metric tons in 1941). This state is rising in importance owing to the extensive railway development; it possesses five dists., and the chief products are cotton, wheat, maize, sugar, and linseed. Its cap. is Saltillo (50,000). Pop. (1940) 550,700.

Coal, meaning, in its broad sense, any fuel, is used in England to signify that form of fuel which is obtained as a mineral from pits. This form of fuel is one of the organically formed rocks, and occurs chiefly in the Carboniferous system, or rather in the C. measures. As can be inferred from this, C. chiefly consists of carbon, and is regarded as being derived from plant remains. It is a black or blackish-brown rock, with a low specific gravity, and having hydrogen and oxygen as its chief constituents other than carbon, and it is now the prin. domestic and commercial fuel. C. may be divided into two classes: (1) *Bituminous*, (2) *Anthracite*; while *lignite*, or brown C., may be taken as a stage in the process of the conversion of vegetable matter into bituminous C. Graphite would further be added by some authorities as the final stage in the transition. The most general theory of the formation of C. is that which considers that in the Carboniferous age great masses of luxuriant vegetation grew near sea levels. In the process of time the land covered with this vegetation became submerged, and sediments of mud and sand, etc., formed over it. By processes, again well known to geologists, this land became raised again above sea level, and new vegetation grew, which, in its turn, would undergo a similar treatment to the other. These processes would at length produce stratified measures, which, under the ensuing great pressure and certain chemical changes which would inevitably be caused, would

result in the formation of seams of C. From microscopical examinations it may be inferred that a large number of the C. seams were formed from great jungles and swamps. Now, if wood, peat, lignite, bituminous and anthracite Cs., and graphite be analysed, a table similar to that below (compiled by Prof. J. W. Gregory) may be obtained if the small amounts of nitrogen and sulphur be neglected.

It may be stated as a general truth that anthracite is always found deeper in the earth than bituminous, bituminous than lignite, and that peat is found on the surface. Of course this generality is not always borne out, but this fact and the above table uphold the generally accepted theory that hydrogen and oxygen are, by heat and pressure, caused to separate from the vegetable matter as marsh gas and carbon dioxide. The deeper the layer the greater the heat and the pressure, and as a result the greater is the evolution of the separating gases. As this process proceeds it is evident that an increasing percentage of the C. will be carbon, the sp. gr. will rise, the colour darken, and we shall arrive at a rock formation. If the leaves and branches of trees accumulate a mould will be formed which will be rich in carbon, while mosses growing in swamps will form peat. If either or both be preserved, the carbonaceous layer will be preserved. As stated above, heat and pressure will cause some of the volatile elements (oxygen and hydrogen) to pass off, leaving lignite. Greater pressure will resolve this into bituminous C., while the same process intensified will produce the hard lustrous form of C. known as anthracite, which is free of dust and will burn without smoke or flame. It might also be formed by the intrusion of igneous rock. Igneous rock, having intense heat, flowing into dykes in this anthracite would convert it into graphite, which is practically pure carbon. This theory is partly illustrated in the S. Wales coal-field. If we pass from the S.E. to the N.W. of the field, we pass from bituminous C. seams through steam C. to the anthracite, steam C. being intermediate in composition and properties between the bituminous and anthracite. It may be pointed out here, though that not all graphite formations can be ascribed to this process of formation; and in some cases it may be noticed that anthracite and bituminous C. occur together, and seem to have been formed under the same conditions. Greater heat and pressure

	Carbon per cent	Hydrogen per cent	Oxygen per cent	Ash per cent	Moisture per cent
Air-dried Wood . . .	39	4.5	35.5	1	20
Air-dried Peat . . .	44.5	4.5	26.5	8.5	16
Air-dried Lignite . . .	45	3.75	26.25	10*	15
Bituminous Coal . . .	72	4.0	11.0	10*	3
Anthracite . . .	91.5	2.5	1.0	3	2
Graphite . . .	95	—	—	5	—

* Very variable

not accounting for these cases, it has been thought that in these cases, and perhaps in all, anthracite C. is formed from a different kind of vegetation from that which gives bituminous C., although this has not yet been thoroughly proved. Microscopic examination shows that C. consists of four main constituents, called durain, clarain, fusain, and vitrain. As a whole, C. appears to be a colloidal substance (see COLLOIDS), but the general structure is so complicated and so variable that the problem of its constitution can hardly yet be said to have advanced beyond the fringe of a solution.

will give a percentage of ash of ten or under. This ash, or incombustible inorganic matter, occurs in all Cs., and consists of sand and mud which has mixed with the layer of C. at the time of its formation. In some Cs. (mainly continental) the percentage of ash may rise to over thirty. When a large amount of these impurities enter, causing a great lowering of the value of the seam as fuel, it is called bituminous shale or sandstone, not C. From some of these shales and cannel C., oil is obtained by processes of distillation. Bituminous Cs. are also used for obtaining gas. They are heated in

General view, showing the two shafts and pithead baths.

National Coal Board

All C., as would be expected from its vegetable origin, contains a proportion of nitrogen, and is important as the source of the ammonia obtained as a by-product in the manuf. of C. gas.

The effect of heat on C. in the absence of air varies according to the conditions, especially the temp. (see CARBONISATION (Low Temperature)). Gaseous and liquid products are always found, however (see GAS MANUFACTURE and COAL TAR), while a residue of coke is left in the retorts.

Lignites (q.v.).—Taking our div. of the kinds of C., lignite would first demand attention. It is sometimes termed brown C., although it is inferior altogether to true C. It is, however, used a good deal in N. America, where a variety is found which cokes well and is a good substitute for C.

Bituminous coals form the greater part of the C. measures, and are the forms in general use for domestic and commercial purposes. They are black, brittle, and opaque, and have a cross-jointed structure,

closed ovens, and the C. gas, together with C. tar and ammonia, is formed, leaving coke as a residue. This coke is practically carbon, and is used in smelting. There are many different varieties of bituminous C., and sev. ways of classifying them are adopted. In S. Wales the general classification would be into house C. and steam C. Under the first heading would be placed all those Cs. with a fairly low percentage of carbon which, possessing comparatively large amounts of gas occluded in them, will burn with a large amount of flame. These seams are found all over the coal-field, and are those nearest the surface, in some places outcropping from the mt. side. The steam C., on the other hand, is always derived from pits of a fair depth. It has a higher percentage of carbon, is harder, and has a greater lustre; and as a consequence of its comparatively small amount of composing gases, it burns without a great deal of flame or smoke, and has a greater amount of available heat. Local names are given to those seams which are first worked near them, and these names remain with the seams

wherever they may be worked. This holds good everywhere, as will be seen from the names Wallend, Derby Brights, Mynyddyslwyn, etc. To take an example, the Mynyddyslwyn is regarded as being perhaps the finest house C. found in Wales, but it is not worked near the place of that name now. It was at first, and the name has remained. As has been stated before, steam C. is intermediate between bituminous and anthracite C., and the finest steam C. in the world is that found in S. Wales and Monmouthshire. While it is true to say that progressing from the S.E. to the N.W. in this field results in passing from bituminous to anthracite C., it would probably be truer to say that while only anthracite is found in the W., bituminous and steam C. (if steam C. be considered as distinct from bituminous), or house and steam C. (if the distinction be not recognised) can be found right to the E. of the field. The Monmouthshire coal-field contains vast supplies of steam C., which are not inferior to those of Glamorgan, and they are at present being developed. Another mode of distinguishing varieties of bituminous C. is that of dividing them into caking and non-caking Cs. This has an economic value. Caking Cs. require a great deal of work in stoking, since while they will burn freely, with great flame and smoke, at the same time they will cake up together into clinkers. These prevent perfect combustion, and, further, require a deal of efforts to free them in some cases from the fire-bars. Non-caking Cs. burn free, and since the ash remains separate, are easy to stoke. To obtain the good qualities of the caking and the non-caking Cs. mixtures are made of different varieties. Newcastle C. is among the caking varieties. Among other well-known forms of bituminous C. may be mentioned splint C. This is a hard C., found in Scotland, which is used in smelting as the cokes of other Cs. would be. Then there is that known as cannel C., which may have obtained its name from the tradition that, since it burns with a bright flame like a candle, torches used to be made of it. It also burns with a crackling noise, and is therefore sometimes known as parrot C. It is hard, and does not soil the fingers, and some forms of it can be polished and made into inkstands, etc. Some forms of Amer. C. are capable of this also. It is much used as a gas-producing C., and also in some dists. for burning in open grates.

Anthracite is a hard, rocky form of C. with an almost metallic lustre. It is difficult to kindle, but when burning it gives out great heat. It is found in the W. of the S. Wales coal-field and also in America. It burns practically without smoke and flame, and has a greater heating power than any other form of C.

Heating Power of Coal.—C. is judged by the number of pounds of water which will be raised 1° F. by the burning of 1 lb. of the fuel, by the amount of water evaporated at 212° F. by 1 lb. of it, and these tests are always carried out on boilers of the type in which it is to be used, for it is

found that the heating power of any variety of C. varies considerably, according to the conditions under which it is to be burnt. See W. A. Bone, *Coal and its Scientific Uses*, 1918; E. S. Moore, *Coal, its Properties, Analyses, etc.*, 1922; A. L. Summers, *Anthracite*, 1922; W. A. Bone and G. W. Himus, *Coal, its Constitution and Uses*, 1936. See also bibliographies for COAL-FIELDS; COAL SUPPLIES; COAL-MINING.

Coalbrookdale, dist. in Shropshire owning an iron industry, situated on the banks of the Severn for a distance of 8 m. along its course. The vil. of that name is 11 m. from Shrewsbury. Pop. 1400.

Coal-fields are constituted of those areas where the coal-bearing strata appear at the surface, or where their coal and ironstones can be worked at a profit. In England very few workable seams are found lower than the coal measures or the Upper Carboniferous div. of the Carboniferous system. The two other divs. are the millstone grit and the carboniferous limestone. In Scotland, however, valuable seams are found lower than the millstone grit, while oil shale is obtained even below the Carboniferous limestone. Coal is, however, worked from other strata both older and younger than the Carboniferous, being worked from the Devonian, Miocene, Pliocene, Oolitic, and other formations, although coal obtained from these seams is of relatively small commercial value as compared with that obtained from the coal measures. It may here be noticed that C. are usually found in the form of a syncline or basin, dipping inwards at the edges and lying more or less level at the centre, thus causing the seams to crop out very frequently at the surface. This gives rise to two important factors: (1) it allows the coal to be easily reached and worked, because but for this fact a large amount of it would be too deep in the earth to be reached; and (2) it has saved the C. from the destroying effects of denudation, to which they would have been very susceptible owing to the comparative softness of the coal-bearing strata. Coal is, of course, the chief mineral wealth of the Brit. Isles, and is the source of its commercial prosperity. Among the many C. in the Brit. Isles are the following: in the neighbourhood of the Bristol Channel, the S. Wales coal-field, and that of the Forest of Dean, with a small one at Bristol; in the Midlands occur the C. of Leicestershire, E. Warwickshire, S. Staffordshire, Coalbrookdale, Shrewsbury, and Flint; around the Pennine chain occur those of N. Staffordshire, Yorkshire, Lancashire, Durham, Northumberland, and Cumberland; in Scotland occur the Lanarkshire, Ayrshire, and Fifeshire, and in Ireland the Tyrone, Kilkenny, and Clare C. The S. Wales coal-field is famous all over the world as providing the greater proportion of the steam and anthracite coals used in the various mercantile marines and navies, while at the same time it provides coals of the kinds suited for smelting, manufacturing, and

house coals, together with those varieties used in the production of gas. The coal from the Midlands and the N. is generally used in all those branches, except that it is not of such great value for shipping purposes, and that it is chiefly used in the great manufacturing and engineering centres of the N. Large quantities are exported from S. Wales all over the world, and from the fields of Fife-shire and the N.E. of England thousands of tons are exported to the Continent. The largest C. are probably those of America, which are over eighty times as large as the whole of those of Great Britain, covering as they do nearly 200,000 sq. m. The term coal is used in the U.S.A. with no such narrow restriction as in England to varieties occurring in the older Carboniferous formations; but, as on the Continent of Europe, includes anthracite and bituminous coals, lignitic coal, cannel coal, and ordinary lignite, or, in other words, embraces both the black or stone coal of Great Britain and the so-called brown coal of the continent. The coal output of the U.S.A., no less than the splendid quality of the numerous varieties, surpasses that of any other country. The coal-bearing areas are to be found scattered over more than thirty of the states, and indeed it is only in a few of the New England states that no coal occurs. The Appalachian mt. system, extending from E. Pennsylvania to the S., indicates the line of the prin. coal-bearing country, and it is here that the most valuable deposits of hard anthracite are to be found. The group of fields of next importance is the E. interior group in Illinois, Kentucky, Indiana, Ohio, where are to be found the best qualities of bituminous and cannel coal. In the W. interior group of Missouri, Iowa, Kansas, the output of the same varieties is no less important. Next in importance come the large lignitic and bituminous C. of Arkansas, Texas, Oklahoma, Colorado, and New Mexico, which last-mentioned fields continue along the line of the Rockies northward into Canada. Anthracite also occurs in Massachusetts, Arkansas, and Virginia; bituminous coal in Nebraska, Michigan, and Alabama; and lignitic coal in nearly all the states W. of 105° W. long., especially New Mexico, Colorado, California, and Utah. Lignite is found mainly in the W. states. Speaking geologically, the better qualities of both the anthracite and bituminous coals belong to the Carboniferous formations, but the quality varies only to a very uncertain degree with the geologic age, and it is curious that whereas up to about 1870 more anthracite was mined in Pennsylvania than bituminous coal throughout

the country, since that year the production of bituminous coal has far exceeded the former. According to the U.S. Geological Survey, the geologic age of the coal-beds ranges from Carboniferous in the Appalachian and Mississippi valley provs. to Miocene on the Atlantic coast provs. After Great Britain and the U.S.A., Germany (prior to the Second World War) was the prin. exporting country, and remained so, after having lost, as a result of the First World War, the Alsace-Lorraine coal-field, the Saar dist., and almost the whole of the coal-field of Upper Silesia. (See statistics under COAL SUPPLIES.) The partition of Silesia, with its rich coal-field, was hotly contested after the First World War, and settlement was attempted by plebiscite in 1920. Eventually the mining area of Teschen, Lower Silesia, formerly Austrian, was allotted to Czechoslovakia, already rich in minerals, while Upper Silesia, formerly Ger., was given to Poland. Other productive European fields are located in Belgium (Charleroi, Mons, Liège; and the Kempen, yet to be exploited), France (St. Etienne), Germany (Westphalia and Rhineland), Spain (Asturias), and Russia (Donetz), while coal is also found in the Alps, the Urals, and even at Spitzbergen. Other C. are those in China, India, Japan, the Malay Archipelago, Australia, New Zealand, S. Africa, and Canada. Most of the Chinese provs. contain coal, and China, judging by its immense estimated resources, may be regarded as one of the leading coal countries of the world. Japan and India, however, actually produce considerably more coal than China. Except in Nigeria, little C. is produced in the Brit. Colonial Empire. Coal exports are believed to be extensive in the S.W. of Tanganyika, but conditions are unfavourable for their development. Coal is not the only commercial product obtained in the C., for included in the same strata are ironstone, oil shale, fire-clay, sandstone, and igneous rocks which supply a good paving and building stone. In fact the oil shales and sandstones usually make up by far the greatest proportion of the thickness of the coal-bearing strata. See also GEOLOGY; CARBONIFEROUS SYSTEM. See Sir A. G. Ramsay, *Physical Geography and Geology of Great Britain*, 1863; J. Park, *Mining Geology*, 1918; E. A. N. Arber, *The Natural History of Coal*, 1912; J.
